LAMMPS DOCUMENTATION

About LAMMPS and this manual 1

I User Guide 5

1 Introduction 7

1.1 Overview of LAMMPS . . . 7
1.2 What does a LAMMPS version mean . . . 8
1.2.1 Identifying the Version . . . 8
1.2.2 LAMMPS releases, branches, and tags . . . 8
1.3 LAMMPS features . . . 9
1.3.1 General features . . . 9
1.3.2 Particle and model types . . . 10
1.3.3 Interatomic potentials (force fields) . . . 10
1.3.4 Atom creation . . . 11
1.3.5 Ensembles, constraints, and boundary conditions . . . 12
1.3.6 Integrators . . . 12
1.3.7 Diagnostics . . . 12
1.3.8 Output . . . 12
1.3.9 Multi-replica models . . . 13
1.3.10 Pre- and post-processing . . . 13
1.3.11 Specialized features . . . 13
1.4 LAMMPS non-features . . . 14
1.5 LAMMPS portability and compatibility . . . 15
1.5.1 Programming language standards . . . 15
1.5.2 Build systems . . . 15
1.5.3 Operating systems . . . 16
1.5.4 Compilers . . . 16
1.5.5 CPU architectures . . . 16
1.5.6 Portability compliance . . . 16
1.6 LAMMPS open-source license . . . 16
1.6.1 GPL version of LAMMPS . . . 16
1.6.2 LGPL version of LAMMPS . . . 17
1.7 Authors of LAMMPS . . . 17
1.8 Citing LAMMPS . . . 18
1.8.1 Core Algorithms . . . 18
1.8.2 DOI for the LAMMPS source code . . . 19
1.8.3 Home page . . . 19
1.8.4 Citing contributions . . . 19
1.9 Additional website links . . . 19

2 Install LAMMPS **21**
2.1 Download an executable for Linux . . . 21
2.1.1 Pre-built static Linux x86_64 executables . . . 22
2.1.2 Pre-built Ubuntu and Debian Linux executables . . . 22
2.1.3 Pre-built Fedora Linux executables . . . 23
2.1.4 Pre-built EPEL Linux executable . . . 23
2.1.5 Pre-built OpenSuse Linux executable . . . 23
2.1.6 Gentoo Linux executable . . . 24
2.1.7 Archlinux build-script . . . 24
2.2 Download an executable for macOS . . . 25
2.3 Download an executable for Windows . . . 25
2.4 Download an executable for Linux or macOS via Conda . . . 26
2.5 Download source and documentation as a tarball . . . 26
2.6 Download the LAMMPS source with git . . . 27

3 Build LAMMPS **31**
3.1 Prerequisites . . . 31
3.2 Build LAMMPS with CMake . . . 31
3.2.1 Advantages of using CMake . . . 32
3.2.2 Getting started . . . 32
3.2.3 Configuration and build options . . . 33
3.2.4 Multi-configuration build systems . . . 33
3.2.5 Installing CMake . . . 34
3.3 Build LAMMPS with make . . . 34
3.3.1 Requirements . . . 34
3.3.2 Getting started . . . 35
3.3.3 Customized builds and alternate makefiles . . . 35
3.4 Link LAMMPS as a library to another code . . . 36
3.4.1 Link with LAMMPS as a static library . . . 36
3.4.2 Link with LAMMPS as a shared library . . . 37
3.5 Basic build options . . . 38
3.5.1 Serial vs parallel build . . . 39
3.5.2 Choice of compiler and compile/link options . . . 41
3.5.3 Build the LAMMPS executable and library . . . 43
3.5.4 Including or removing debug support . . . 44
3.5.5 Build LAMMPS tools . . . 45
3.5.6 Install LAMMPS after a build . . . 45
3.6 Optional build settings . . . 47
3.6.1 C++17 standard compliance . . . 47
3.6.2 FFT library . . . 47
3.6.3 Size of LAMMPS integer types and size limits . . . 52
3.6.4 Output of JPEG, PNG, and movie files . . . 53
3.6.5 Read or write compressed files . . . 54
3.6.6 Support for downloading files from the input . . . 54
3.6.7 Prevent download of large potential files . . . 55
3.6.8 Memory allocation alignment . . . 55
3.6.9 Workaround for long long integers . . . 56
3.6.10 Exception handling when using LAMMPS as a library . . . 56
3.7 Include packages in build . . . 56
3.7.1 Information for both build systems . . . 58
3.7.2 CMake presets for installing many packages . . . 58
3.7.3 Make shortcuts for installing many packages . . . 60
3.8 Packages with extra build options . . . 60
3.8.1 COMPRESS package . . . 61

3.8.2 GPU package . . . 61
3.8.3 KIM package . . . 64
3.8.4 KOKKOS package . . . 66
3.8.5 LEPTON package . . . 71
3.8.6 MACHDYN package . . . 71
3.8.7 ML-IAP package . . . 71
3.8.8 OPT package . . . 72
3.8.9 PYTHON package . . . 72
3.8.10 VORONOI package . . . 73
3.8.11 ADIOS package . . . 73
3.8.12 APIP package . . . 74
3.8.13 COLVARS package . . . 74
3.8.14 ELECTRODE package . . . 75
3.8.15 ML-PACE package . . . 75
3.8.16 ML-POD package . . . 76
3.8.17 ML-QUIP package . . . 76
3.8.18 PLUMED package . . . 77
3.8.19 H5MD package . . . 78
3.8.20 ML-HDNNP package . . . 78
3.8.21 INTEL package . . . 79
3.8.22 MDI package . . . 80
3.8.23 MISC package . . . 80
3.8.24 MOLFILE package . . . 81
3.8.25 NETCDF package . . . 81
3.8.26 OPENMP package . . . 82
3.8.27 QMMM package . . . 82
3.8.28 RHEO package . . . 83
3.8.29 SCAFACOS package . . . 84
3.8.30 VTK package . . . 84
3.9 Build the LAMMPS documentation . . . 85
3.9.1 Build using GNU make . . . 85
3.9.2 Build using CMake . . . 86
3.9.3 Prerequisites for HTML . . . 86
3.9.4 Prerequisites for PDF . . . 87
3.9.5 Prerequisites for ePUB and MOBI . . . 87
3.9.6 Instructions for Developers . . . 87
3.10 Notes for building LAMMPS on Windows . . . 89
3.10.1 General remarks . . . 89
3.10.2 Running Linux on Windows . . . 89
3.10.3 Using a GNU GCC ported to Windows . . . 89
3.10.4 Using Microsoft Visual Studio . . . 90
3.10.5 Using Intel oneAPI Compilers and Libraries . . . 90
3.10.6 Using a cross-compiler . . . 91
3.11 Notes for saving disk space when building LAMMPS from source . . . 91
3.12 Development build options . . . 92
3.12.1 Monitor compilation flags (CMake only) . . . 92
3.12.2 Report missing and unneeded '#include' statements (CMake only) . . . 92
3.12.3 Address, Leak, Undefined Behavior, and Thread Sanitizer Support (CMake only) . . . 93
3.12.4 Code Coverage and Unit Testing (CMake only) . . . 93
3.12.5 Coding style utilities . . . 98
3.12.6 Clang-format support . . . 101
3.12.7 GitHub command-line interface . . . 101

4 Available optional packages **103**

4.1 Package details . . . 107
4.1.1 ADIOS package . . . 108
4.1.2 AMOEBA package . . . 109
4.1.3 APIP package . . . 109
4.1.4 ASPHERE package . . . 110
4.1.5 BOCS package . . . 110
4.1.6 BODY package . . . 111
4.1.7 BPM package . . . 111
4.1.8 BROWNIAN package . . . 112
4.1.9 CG-DNA package . . . 112
4.1.10 CG-SPICA package . . . 112
4.1.11 CLASS2 package . . . 113
4.1.12 COLLOID package . . . 113
4.1.13 COLVARS package . . . 114
4.1.14 COMPRESS package . . . 114
4.1.15 CORESHELL package . . . 115
4.1.16 DIELECTRIC package . . . 115
4.1.17 DIFFRACTION package . . . 116
4.1.18 DIPOLE package . . . 116
4.1.19 DPD-BASIC package . . . 117
4.1.20 DPD-MESO package . . . 117
4.1.21 DPD-REACT package . . . 118
4.1.22 DPD-SMOOTH package . . . 118
4.1.23 DRUDE package . . . 119
4.1.24 EFF package . . . 119
4.1.25 ELECTRODE package . . . 120
4.1.26 EXTRA-COMMAND package . . . 120
4.1.27 EXTRA-COMPUTE package . . . 121
4.1.28 EXTRA-DUMP package . . . 121
4.1.29 EXTRA-FIX package . . . 121
4.1.30 EXTRA-MOLECULE package . . . 121
4.1.31 EXTRA-PAIR package . . . 122
4.1.32 FEP package . . . 122
4.1.33 GPU package . . . 122
4.1.34 GRANULAR package . . . 123
4.1.35 H5MD package . . . 124
4.1.36 INTEL package . . . 124
4.1.37 INTERLAYER package . . . 125
4.1.38 KIM package . . . 125
4.1.39 KOKKOS package . . . 126
4.1.40 KSPACE package . . . 127
4.1.41 LATBOLTZ package . . . 127
4.1.42 LEPTON package . . . 128
4.1.43 MACHDYN package . . . 128
4.1.44 MANIFOLD package . . . 129
4.1.45 MANYBODY package . . . 129
4.1.46 MC package . . . 130
4.1.47 MDI package . . . 130
4.1.48 MEAM package . . . 131
4.1.49 MESONT package . . . 131
4.1.50 MGPT package . . . 132
4.1.51 MISC package . . . 132
4.1.52 ML-HDNNP package . . . 133
4.1.53 ML-IAP package . . . 133

4.1.54 ML-PACE package . . . 134
4.1.55 ML-POD package . . . 134
4.1.56 ML-QUIP package . . . 135
4.1.57 ML-RANN package . . . 135
4.1.58 ML-SNAP package . . . 135
4.1.59 ML-UF3 package . . . 136
4.1.60 MOFFF package . . . 136
4.1.61 MOLECULE package . . . 137
4.1.62 MOLFILE package . . . 137
4.1.63 NETCDF package . . . 138
4.1.64 OPENMP package . . . 138
4.1.65 OPT package . . . 139
4.1.66 ORIENT package . . . 140
4.1.67 PERI package . . . 140
4.1.68 PHONON package . . . 140
4.1.69 PLUGIN package . . . 141
4.1.70 PLUMED package . . . 141
4.1.71 PTM package . . . 142
4.1.72 PYTHON package . . . 142
4.1.73 QEQ package . . . 143
4.1.74 QMMM package . . . 143
4.1.75 QTB package . . . 143
4.1.76 REACTION package . . . 144
4.1.77 REAXFF package . . . 144
4.1.78 REPLICA package . . . 145
4.1.79 RHEO package . . . 145
4.1.80 RIGID package . . . 146
4.1.81 SCAFACOS package . . . 147
4.1.82 SHOCK package . . . 147
4.1.83 SMTBQ package . . . 147
4.1.84 SPH package . . . 148
4.1.85 SPIN package . . . 148
4.1.86 SRD package . . . 149
4.1.87 TALLY package . . . 149
4.1.88 UEF package . . . 150
4.1.89 VORONOI package . . . 150
4.1.90 VTK package . . . 151
4.1.91 YAFF package . . . 151

5 Auxiliary tools **153**
5.1 Pre-processing tools . . . 153
5.2 Post-processing tools . . . 153
5.3 Miscellaneous tools . . . 154
5.4 Tool descriptions . . . 154
5.4.1 amber2lmp tool . . . 154
5.4.2 binary2txt tool . . . 154
5.4.3 ch2lmp tool . . . 154
5.4.4 chain tool . . . 155
5.4.5 LAMMPS coding standard . . . 155
5.4.6 colvars tools . . . 155
5.4.7 createatoms tool . . . 156
5.4.8 drude tool . . . 156
5.4.9 eam database tool . . . 156
5.4.10 eam generate tool . . . 156

5.4.11 eff tool . . . 157
5.4.12 emacs tool . . . 157
5.4.13 fep tool . . . 157
5.4.14 i-PI tool . . . 157
5.4.15 ipp tool . . . 158
5.4.16 JSON support files . . . 158
5.4.17 kate tool . . . 159
5.4.18 LAMMPS-GUI . . . 159
5.4.19 lmp2arc tool . . . 159
5.4.20 lmp2cfg tool . . . 159
5.4.21 Magic patterns for the "file" command . . . 159
5.4.22 matlab tool . . . 160
5.4.23 micelle2d tool . . . 160
5.4.24 moltemplate tool . . . 160
5.4.25 msi2lmp tool . . . 161
5.4.26 Scripts for building LAMMPS when offline . . . 161
5.4.27 phonon tool . . . 162
5.4.28 polybond tool . . . 162
5.4.29 pymol_asphere tool . . . 163
5.4.30 python tool . . . 163
5.4.31 Regression tester tool . . . 163
5.4.32 replica tool . . . 163
5.4.33 smd tool . . . 164
5.4.34 spin tool . . . 164
5.4.35 singularity/apptainer tool . . . 164
5.4.36 stl_bin2txt tool . . . 164
5.4.37 SWIG interface . . . 164
5.4.38 tabulate tool . . . 166
5.4.39 tinker tool . . . 166
5.4.40 valgrind tool . . . 166
5.4.41 vim tool . . . 166
5.4.42 xmgrace tool . . . 167

6 Run LAMMPS **169**
6.1 Basics of running LAMMPS . . . 169
6.2 Command-line options . . . 170
6.3 Screen and logfile output . . . 178
6.4 Error message output . . . 180
6.4.1 A single line . . . 180
6.4.2 Two lines . . . 181
6.4.3 Three lines . . . 181
6.4.4 Four lines . . . 181
6.5 File formats used by LAMMPS . . . 181
6.5.1 Character Encoding . . . 182
6.5.2 Number Formatting . . . 182
6.5.3 Input file . . . 182
6.5.4 Data file . . . 184
6.5.5 Molecule file . . . 186
6.5.6 Restart file . . . 187
6.6 Running LAMMPS on Windows . . . 187

7 Errors **189**
7.1 Common issues that are often regarded as bugs . . . 189
7.2 Errors and warnings details . . . 191

7.2.1 General troubleshooting advice . . . 192
7.2.2 Unknown identifier in data file . . . 195
7.2.3 Incorrect format in ... section of data file . . . 195
7.2.4 Illegal variable command: expected X arguments but found Y . . . 196
7.2.5 Out of range atoms - cannot compute 196
7.2.6 Bond (or angle, dihedral, improper, cmap, or shake) atoms missing . . . 196
7.2.7 Non-numeric atom coords or pressure or box dimensions - simulation unstable . . . 197
7.2.8 Fix used in ... not computed at compatible time . . . 197
7.2.9 Lost atoms 197
7.2.10 Too many neighbor bins . . . 197
7.2.11 Unrecognized ... style ... is part of ... package which is not enabled in this LAMMPS binary . . . 197
7.2.12 Energy or stress was not tallied by pair style . . . 198
7.2.13 fmt::format_error . . . 198
7.2.14 Substitution for illegal variable . . . 198
7.2.15 Bond atom missing in image check or box size check . . . 198
7.2.16 Cannot use neighbor bins - box size << cutoff . . . 198
7.2.17 Did not assign all atoms correctly . . . 198
7.2.18 Domain too large for neighbor bins . . . 199
7.2.19 Step X: (h)bondchk failed . . . 199
7.2.20 Numeric index X is out of bounds . . . 199
7.2.21 Compute, fix, or variable vector or array is accessed out-of-range . . . 199
7.2.22 Incorrect args for pair coefficients (also bond/angle/dihedral/improper coefficients) . . . 199
7.2.23 Energy was not tallied on needed timestep (also virial, per-atom energy, per-atom virial) 200
7.2.24 Molecule auto special bond generation overflow . . . 200
7.2.25 Molecule topology/atom exceeds system topology/atom . . . 200
7.2.26 Molecule topology type exceeds system topology type . . . 201
7.2.27 Molecule attributes do not match system attributes . . . 201
7.2.28 Inconsistent image flags . . . 201
7.2.29 No fixes with time integration, atoms won't move . . . 201
7.2.30 System is not charge neutral, net charge = ... 201
7.2.31 Variable evaluation before simulation box is defined . . . 202
7.2.32 Invalid thermo keyword 'X' in variable formula . . . 202
7.2.33 One or more atoms are time integrated more than once . . . 202
7.2.34 XXX command before simulation box is defined . . . 202
7.2.35 XXX command after simulation box is defined . . . 202
7.2.36 Error messages ending in 'Please contact the LAMMPS developers' . . . 203
7.2.37 Neighbor list overflow, boost neigh_modify one . . . 203
7.3 Reporting bugs . . . 204
7.4 Debugging crashes . . . 204
7.4.1 Using the GDB debugger to get a stack trace . . . 205
7.4.2 Using valgrind to get a stack trace . . . 207
7.5 Debugging when LAMMPS appears to be stuck . . . 208
7.6 Error messages . . . 209
7.7 Warning messages . . . 278

8 Commands **289**
8.1 LAMMPS input scripts . . . 289
8.2 Parsing rules for input scripts . . . 290
8.3 Input script structure . . . 292
8.3.1 Initialization . . . 292
8.3.2 System definition . . . 293
8.3.3 Simulation settings . . . 293
8.3.4 Run a simulation . . . 293

8.4 Commands by category . . . 294
8.4.1 Initialization . . . 294
8.4.2 Setup simulation box . . . 294
8.4.3 Setup atoms . . . 294
8.4.4 Force fields . . . 294
8.4.5 Settings . . . 294
8.4.6 Operations within timestepping (fixes) and diagnostics (computes) . . . 294
8.4.7 Output . . . 295
8.4.8 Actions . . . 295
8.4.9 Input script control . . . 295
8.5 General commands . . . 296
8.6 Fix styles . . . 296
8.7 Compute styles . . . 298
8.8 Pair styles . . . 299
8.9 Bond styles . . . 301
8.10 Angle styles . . . 301
8.11 Dihedral styles . . . 301
8.12 Improper styles . . . 302
8.13 KSpace styles . . . 302
8.14 Dump styles . . . 302
8.15 Removed commands and packages . . . 302
8.15.1 ATC, AWPMD, and POEMS packages . . . 303
8.15.2 Neighbor style and comm mode multi/old . . . 303
8.15.3 LAMMPS-GUI source code . . . 303
8.15.4 GJF formulation in fix langevin . . . 304
8.15.5 LAMMPS shell . . . 304
8.15.6 i-PI tool . . . 304
8.15.7 USER-REAXC package . . . 304
8.15.8 MPIIO package . . . 304
8.15.9 MSCG package . . . 304
8.15.10 LATTE package . . . 304
8.15.11 Minimize style fire/old . . . 305
8.15.12 Pair style mesont/tpm, compute style mesont, atom style mesont . . . 305
8.15.13 Box command . . . 305
8.15.14 Reset_ids, reset_atom_ids, reset_mol_ids commands . . . 305
8.15.15 MESSAGE package . . . 305
8.15.16 REAX package . . . 305
8.15.17 MEAM package . . . 305
8.15.18 USER-CUDA package . . . 306
8.15.19 Compute atom/molecule . . . 306
8.15.20 Fix ave/spatial and fix ave/spatial/sphere . . . 306
8.15.21 restart2data tool . . . 306

9 Accelerate performance **307**
9.1 Benchmarks . . . 307
9.2 Measuring performance . . . 308
9.2.1 Factors that influence performance . . . 308
9.2.2 Examples comparing serial performance . . . 309
9.2.3 Examples comparing parallel performance . . . 311
9.2.4 Measuring performance of your input deck . . . 311
9.3 General tips . . . 312
9.4 Accelerator packages . . . 313
9.4.1 GPU package . . . 313
9.4.2 INTEL package . . . 317

9.4.3 KOKKOS package . . . 325
9.4.4 OPENMP package . . . 333
9.4.5 OPT package . . . 335
9.5 Comparison of various accelerator packages . . . 337

10 Howto discussions **341**
10.1 General howto . . . 341
10.1.1 Restart a simulation . . . 341
10.1.2 Visualize LAMMPS snapshots . . . 342
10.1.3 Run multiple simulations from one input script . . . 342
10.1.4 Multi-replica simulations . . . 344
10.1.5 Library interface to LAMMPS . . . 345
10.1.6 Coupling LAMMPS to other codes . . . 345
10.1.7 Using LAMMPS with the MDI library for code coupling . . . 346
10.1.8 Broken Bonds . . . 348
10.2 Settings howto . . . 348
10.2.1 2d simulations . . . 348
10.2.2 Type labels . . . 350
10.2.3 Triclinic (non-orthogonal) simulation boxes . . . 351
10.2.4 Thermostats . . . 356
10.2.5 Barostats . . . 358
10.2.6 Walls . . . 359
10.2.7 NEMD simulations . . . 360
10.2.8 Long-range dispersion settings . . . 360
10.2.9 Convert bulk system to slab . . . 361
10.3 Analysis howto . . . 364
10.3.1 Output from LAMMPS (thermo, dumps, computes, fixes, variables) . . . 364
10.3.2 Use chunks to calculate system properties . . . 369
10.3.3 Using distributed grids . . . 372
10.3.4 Calculate temperature . . . 373
10.3.5 Calculate elastic constants . . . 374
10.3.6 Calculate thermal conductivity . . . 375
10.3.7 Calculate viscosity . . . 376
10.3.8 Calculate diffusion coefficients . . . 378
10.3.9 Output structured data from LAMMPS . . . 378
10.4 Force fields howto . . . 384
10.4.1 Some general force field considerations . . . 384
10.4.2 CHARMM, AMBER, COMPASS, DREIDING, and OPLS force fields . . . 385
10.4.3 AMOEBA and HIPPO force fields . . . 389
10.4.4 TIP3P water model . . . 394
10.4.5 TIP4P and OPC water models . . . 397
10.4.6 TIP5P water model . . . 403
10.4.7 SPC and SPC/E water model . . . 405
10.5 Packages howto . . . 408
10.5.1 Finite-size spherical and aspherical particles . . . 408
10.5.2 Granular models . . . 411
10.5.3 Body particles . . . 412
10.5.4 Bonded particle models . . . 418
10.5.5 Polarizable models . . . 420
10.5.6 Adiabatic core/shell model . . . 421
10.5.7 Drude induced dipoles . . . 425
10.5.8 Tutorial for Thermalized Drude oscillators in LAMMPS . . . 425
10.5.9 Peridynamics with LAMMPS . . . 432
10.5.10 Manifolds (surfaces) . . . 448

10.5.11 Reproducing hydrodynamics and elastic objects (RHEO) . . . 449
10.5.12 Magnetic spins . . . 450
10.5.13 Adaptive-precision interatomic potentials (APIP) . . . 451
10.6 Tutorials howto . . . 454
10.6.1 Using CMake with LAMMPS . . . 454
10.6.2 LAMMPS GitHub tutorial . . . 461
10.6.3 Using LAMMPS-GUI . . . 474
10.6.4 Moltemplate Tutorial . . . 474
10.6.5 LAMMPS Python Tutorial . . . 482
10.6.6 Using LAMMPS on Windows 10 with WSL . . . 493

11 Example scripts **505**
11.1 Lowercase directories . . . 505
11.2 Uppercase directories . . . 507

II Programmer Guide **509**

1 LAMMPS Library Interfaces **511**
1.1 LAMMPS C Library API . . . 511
1.1.1 Creating or deleting a LAMMPS object . . . 512
1.1.2 Executing commands . . . 517
1.1.3 System properties . . . 520
1.1.4 Per-atom properties . . . 533
1.1.5 Computes, fixes, variables . . . 534
1.1.6 Scatter/gather operations . . . 544
1.1.7 Neighbor list access . . . 558
1.1.8 Configuration information . . . 560
1.1.9 Utility functions . . . 568
1.1.10 Extending the C API . . . 576
1.2 LAMMPS Python API . . . 577
1.3 LAMMPS Fortran API . . . 577
1.3.1 The LIBLAMMPS Fortran Module . . . 577
1.3.2 Creating or deleting a LAMMPS object . . . 578
1.3.3 Executing LAMMPS commands . . . 579
1.3.4 Accessing system properties . . . 579
1.3.5 The LIBLAMMPS module API . . . 581
1.4 LAMMPS C++ API . . . 627
1.4.1 Using the C++ API directly . . . 627
1.4.2 Creating or deleting a LAMMPS object . . . 627
1.4.3 Executing LAMMPS commands . . . 628

2 Use Python with LAMMPS **629**
2.1 Overview . . . 629
2.2 Installation . . . 630
2.2.1 Installing the LAMMPS Python Module and Shared Library . . . 631
2.2.2 Extending Python to run in parallel . . . 634
2.3 Run LAMMPS from Python . . . 635
2.3.1 Running LAMMPS and Python in serial . . . 635
2.3.2 Running LAMMPS and Python in parallel with MPI . . . 636
2.3.3 Running Python scripts . . . 636
2.3.4 Creating or deleting a LAMMPS object . . . 637
2.3.5 Executing commands . . . 638
2.3.6 System properties . . . 640

2.3.7 Per-atom properties . . . 641
2.3.8 Compute, fixes, variables . . . 642
2.3.9 Scatter/gather operations . . . 642
2.3.10 Neighbor list access . . . 644
2.3.11 Configuration information . . . 645
2.4 The lammps Python module . . . 646
2.4.1 The lammps class API . . . 647
2.4.2 Additional components of the lammps module . . . 674
2.5 Extending the Python interface . . . 676
2.6 Calling Python from LAMMPS . . . 676
2.7 Output Readers . . . 677
2.8 Example Python scripts . . . 678
2.9 Using LAMMPS in IPython notebooks and Jupyter . . . 679
2.9.1 Interactive Python Examples . . . 679
2.10 Handling LAMMPS errors . . . 680
2.11 Troubleshooting . . . 680
2.11.1 Testing if Python can launch LAMMPS . . . 680

3 Modifying & extending LAMMPS 683
3.1 Overview . . . 683
3.2 Submitting new features for inclusion in LAMMPS . . . 684
3.2.1 Communication with the LAMMPS developers . . . 685
3.2.2 Time and effort required . . . 685
3.2.3 Submission procedure . . . 685
3.2.4 External contributions . . . 685
3.2.5 Location of files: individual files and packages . . . 685
3.2.6 Changes to core LAMMPS files . . . 686
3.3 Requirements for contributions to LAMMPS . . . 686
3.3.1 Motivation . . . 686
3.3.2 Licensing requirements (strict) . . . 686
3.3.3 Integration testing (strict) . . . 687
3.3.4 Documentation (strict) . . . 687
3.3.5 Build system (strict) . . . 688
3.3.6 Command or style names, file names, and keywords (strict) . . . 689
3.3.7 Programming style requirements (varied) . . . 689
3.3.8 Examples (preferred) . . . 689
3.3.9 Error or warning messages and explanations (preferred) . . . 689
3.3.10 Citation reminder (optional) . . . 690
3.3.11 Testing (optional) . . . 690
3.4 LAMMPS programming style . . . 690
3.4.1 Include files (varied) . . . 690
3.4.2 Whitespace (preferred) . . . 691
3.4.3 Constants (strongly preferred) . . . 691
3.4.4 Placement of braces (strongly preferred) . . . 692
3.4.5 Miscellaneous standards (varied) . . . 692
3.5 Atom styles . . . 693
3.6 Pair styles . . . 695
3.7 Bond, angle, dihedral, improper styles . . . 697
3.8 Compute styles . . . 698
3.9 Fix styles . . . 699
3.10 Input script command style . . . 701
3.11 Dump styles . . . 701
3.12 Kspace styles . . . 701
3.13 Minimization styles . . . 702

3.14 Region styles . . . 702
3.15 Body styles . . . 702
3.16 Granular Sub-Model styles . . . 703
3.17 Thermodynamic output options . . . 705
3.18 Variable options . . . 706

4 Information for Developers **707**
4.1 Source files . . . 707
4.2 Class topology . . . 708
4.3 Code design . . . 711
4.3.1 Object-oriented code . . . 711
4.3.2 I/O and output formatting . . . 714
4.3.3 JSON format input and output . . . 716
4.3.4 Memory management . . . 716
4.4 Parallel algorithms . . . 717
4.4.1 Partitioning . . . 717
4.4.2 Communication . . . 718
4.4.3 Neighbor lists . . . 720
4.4.4 Long-range interactions . . . 722
4.4.5 OpenMP Parallelism . . . 724
4.5 Accessing per-atom data . . . 725
4.5.1 Owned and ghost atoms . . . 725
4.5.2 Atom indexing . . . 726
4.5.3 Atom class versus AtomVec classes . . . 726
4.6 Communication patterns . . . 726
4.6.1 Owned and ghost atoms . . . 727
4.6.2 Higher level communication . . . 728
4.7 How a timestep works . . . 729
4.8 Writing new styles . . . 732
4.8.1 Writing new pair styles . . . 732
4.8.2 Package and build system considerations . . . 733
4.8.3 Case 1: a pairwise additive model . . . 733
4.8.4 Case 2: a many-body potential . . . 746
4.8.5 Case 3: a potential requiring communication . . . 749
4.8.6 Case 4: potentials without a compute() function . . . 751
4.8.7 Writing a new fix style . . . 752
4.8.8 Writing a new command style . . . 756
4.8.9 Case 1: Implementing the geturl command . . . 756
4.9 Notes for developers and code maintainers . . . 761
4.9.1 Reading and parsing of text and text files . . . 762
4.9.2 Requesting and accessing neighbor lists . . . 762
4.9.3 Errors, warnings, and informational messages . . . 764
4.9.4 Choosing between a custom atom style, fix property/atom, and fix STORE/ATOM . . . 766
4.9.5 Fix contributions to instantaneous energy, virial, and cumulative energy . . . 766
4.9.6 KSpace PPPM FFT grids . . . 768
4.10 Notes for updating code written for older LAMMPS versions . . . 769
4.10.1 Setting flags in the constructor . . . 770
4.10.2 Rename of pack/unpack_comm() to pack/unpack_forward_comm() . . . 770
4.10.3 Use ev_init() to initialize variables derived from eflag and vflag . . . 771
4.10.4 Use utils::count_words() functions instead of atom->count_words() . . . 771
4.10.5 Use utils::numeric() functions instead of force->numeric() . . . 772
4.10.6 Use utils::open_potential() function to open potential files . . . 772
4.10.7 Use symbolic Atom and AtomVec constants instead of numerical values . . . 772
4.10.8 Simplify customized error messages . . . 773

4.10.9 Use of "override" instead of "virtual" . . . 773
4.10.10 Simplified function names for forward and reverse communication . . . 774
4.10.11 Simplified and more compact neighbor list requests . . . 774
4.10.12 Split of fix STORE into fix STORE/GLOBAL and fix STORE/PERATOM . . . 775
4.10.13 Rename of fix STORE/PERATOM to fix STORE/ATOM and change of arguments . . . 776
4.10.14 Use Output::get_dump_by_id() instead of Output::find_dump() . . . 776
4.10.15 Refactored grid communication using Grid3d/Grid2d classes instead of GridComm . . . 777
4.10.16 FLERR as first argument to minimum image functions in Domain class . . . 778
4.10.17 Use utils::logmesg() instead of error->warning() . . . 778
4.11 Writing plugins . . . 779
4.11.1 Members of lammpsplugin_t . . . 779
4.11.2 Pair style example . . . 780
4.11.3 Fix style example . . . 780
4.11.4 Command style example . . . 781
4.11.5 Additional Details . . . 782
4.11.6 Compiling plugins . . . 783
4.12 Adding tests for unit testing . . . 783
4.12.1 Tests for utility functions . . . 783
4.12.2 Tests for individual LAMMPS commands . . . 785
4.12.3 Tests for the C-style library interface . . . 786
4.12.4 Tests for the Python module and package . . . 786
4.12.5 Tests for the Fortran interface . . . 786
4.12.6 Tests for the C++-style library interface . . . 786
4.12.7 Tests for reading and writing file formats . . . 787
4.12.8 Tests for styles computing or modifying forces . . . 787
4.12.9 Tests for programs in the tools folder . . . 790
4.12.10 Troubleshooting failed unit tests . . . 790
4.13 C++ base classes . . . 791
4.13.1 LAMMPS Class . . . 792
4.13.2 LAMMPS Atom and AtomVec Base Classes . . . 793
4.13.3 LAMMPS Input Base Class . . . 798
4.14 Platform abstraction functions . . . 799
4.14.1 Time functions . . . 799
4.14.2 Platform information functions . . . 799
4.14.3 File and path functions and global constants . . . 800
4.14.4 Standard I/O function wrappers . . . 803
4.14.5 Environment variable functions . . . 804
4.14.6 Dynamically loaded object or library functions . . . 805
4.14.7 Compressed file I/O functions . . . 805
4.15 Utility functions . . . 806
4.15.1 I/O with status check and similar functions . . . 806
4.15.2 String to number conversions with validity check . . . 808
4.15.3 String processing . . . 811
4.15.4 Potential file functions . . . 816
4.15.5 Argument processing . . . 817
4.15.6 Convenience functions . . . 820
4.15.7 Customized standard functions . . . 822
4.16 Special Math functions . . . 823
4.17 Tokenizer classes . . . 825
4.18 Argument parsing classes . . . 830
4.19 File reader classes . . . 833
4.20 Memory pool classes . . . 838
4.21 Eigensolver functions . . . 841
4.22 Communication buffer coding with *ubuf* . . . 842

4.23 Internal Styles . . . 843
4.23.1 DEPRECATED Styles . . . 843
4.23.2 Internal fix styles . . . 844
4.24 Use of distributed grids within style classes . . . 845
4.24.1 Style commands . . . 845
4.24.2 Grid data allocation and access . . . 846
4.24.3 Grid class constructors . . . 847
4.24.4 Grid class set methods . . . 848
4.24.5 Grid class setup_grid method . . . 849
4.24.6 More grid class set methods . . . 849
4.24.7 Grid class get methods . . . 849
4.24.8 Grid class owned/ghost communication . . . 850
4.24.9 Grid class remap methods for load balancing . . . 852
4.24.10 Grid class I/O methods . . . 853
4.24.11 Style class grid access methods . . . 854
4.24.12 Final notes . . . 855

III Command Reference 857

1 Commands 859
1.1 angle_coeff command . . . 859
1.1.1 Syntax . . . 859
1.1.2 Examples . . . 859
1.1.3 Description . . . 859
1.1.4 Restrictions . . . 860
1.1.5 Related commands . . . 860
1.1.6 Default . . . 860
1.2 angle_style command . . . 860
1.2.1 Syntax . . . 860
1.2.2 Examples . . . 860
1.2.3 Description . . . 860
1.2.4 Restrictions . . . 862
1.2.5 Related commands . . . 862
1.2.6 Default . . . 862
1.3 angle_write command . . . 862
1.3.1 Syntax . . . 862
1.3.2 Examples . . . 862
1.3.3 Description . . . 862
1.3.4 Restrictions . . . 863
1.3.5 Related commands . . . 863
1.3.6 Default . . . 863
1.4 atom_modify command . . . 863
1.4.1 Syntax . . . 863
1.4.2 Examples . . . 864
1.4.3 Description . . . 864
1.4.4 Restrictions . . . 865
1.4.5 Related commands . . . 866
1.4.6 Default . . . 866
1.5 atom_style command . . . 866
1.5.1 Syntax . . . 866
1.5.2 Examples . . . 866
1.5.3 Description . . . 867
1.5.4 Atom style attributes . . . 867

1.5.5 Particle size and mass . . . 869
1.5.6 Additional information about specific atom styles . . . 869
1.5.7 Restrictions . . . 871
1.5.8 Related commands . . . 872
1.5.9 Default . . . 872
1.6 balance command . . . 872
1.6.1 Syntax . . . 872
1.6.2 Examples . . . 873
1.6.3 Description . . . 873
1.6.4 Restrictions . . . 879
1.6.5 Related commands . . . 879
1.6.6 Default . . . 879
1.7 bond_coeff command . . . 879
1.7.1 Syntax . . . 879
1.7.2 Examples . . . 879
1.7.3 Description . . . 880
1.7.4 Restrictions . . . 880
1.7.5 Related commands . . . 880
1.7.6 Default . . . 880
1.8 bond_style command . . . 881
1.8.1 Syntax . . . 881
1.8.2 Examples . . . 881
1.8.3 Description . . . 881
1.8.4 Restrictions . . . 882
1.8.5 Related commands . . . 883
1.8.6 Default . . . 883
1.9 bond_write command . . . 883
1.9.1 Syntax . . . 883
1.9.2 Examples . . . 883
1.9.3 Description . . . 883
1.9.4 Restrictions . . . 883
1.9.5 Related commands . . . 884
1.9.6 Default . . . 884
1.10 boundary command . . . 884
1.10.1 Syntax . . . 884
1.10.2 Examples . . . 884
1.10.3 Description . . . 884
1.10.4 Restrictions . . . 885
1.10.5 Related commands . . . 885
1.10.6 Default . . . 885
1.11 change_box command . . . 885
1.11.1 Syntax . . . 885
1.11.2 Examples . . . 886
1.11.3 Description . . . 886
1.11.4 Restrictions . . . 890
1.11.5 Related commands . . . 890
1.11.6 Default . . . 890
1.12 clear command . . . 890
1.12.1 Syntax . . . 890
1.12.2 Examples . . . 890
1.12.3 Description . . . 890
1.12.4 Restrictions . . . 891
1.12.5 Related commands . . . 891
1.12.6 Default . . . 891

1.13 comm_modify command . . . 891
1.13.1 Syntax . . . 891
1.13.2 Examples . . . 891
1.13.3 Description . . . 891
1.13.4 Restrictions . . . 893
1.13.5 Related commands . . . 893
1.13.6 Default . . . 893
1.14 comm_style command . . . 893
1.14.1 Syntax . . . 893
1.14.2 Examples . . . 893
1.14.3 Description . . . 894
1.14.4 Restrictions . . . 894
1.14.5 Related commands . . . 894
1.14.6 Default . . . 894
1.15 compute command . . . 894
1.15.1 Syntax . . . 894
1.15.2 Examples . . . 894
1.15.3 Description . . . 895
1.15.4 Restrictions . . . 901
1.15.5 Related commands . . . 902
1.15.6 Default . . . 902
1.16 compute_modify command . . . 902
1.16.1 Syntax . . . 902
1.16.2 Examples . . . 902
1.16.3 Description . . . 902
1.16.4 Restrictions . . . 902
1.16.5 Related commands . . . 903
1.16.6 Default . . . 903
1.17 create_atoms command . . . 903
1.17.1 Syntax . . . 903
1.17.2 Examples . . . 904
1.17.3 Description . . . 904
1.17.4 Restrictions . . . 911
1.17.5 Related commands . . . 911
1.17.6 Default . . . 911
1.18 create_bonds command . . . 911
1.18.1 Syntax . . . 911
1.18.2 Examples . . . 912
1.18.3 Description . . . 912
1.18.4 Restrictions . . . 914
1.18.5 Related commands . . . 914
1.18.6 Default . . . 914
1.19 create_box command . . . 914
1.19.1 Syntax . . . 914
1.19.2 Examples . . . 915
1.19.3 Description . . . 915
1.19.4 Restrictions . . . 917
1.19.5 Related commands . . . 917
1.19.6 Default . . . 917
1.20 delete_atoms command . . . 917
1.20.1 Syntax . . . 917
1.20.2 Examples . . . 918
1.20.3 Description . . . 918
1.20.4 Restrictions . . . 920

1.20.5 Related commands . . . 920
1.20.6 Default . . . 920
1.21 delete_bonds command . . . 920
1.21.1 Syntax . . . 920
1.21.2 Examples . . . 921
1.21.3 Description . . . 921
1.21.4 Restrictions . . . 922
1.21.5 Related commands . . . 922
1.21.6 Default . . . 923
1.22 dielectric command . . . 923
1.22.1 Syntax . . . 923
1.22.2 Examples . . . 923
1.22.3 Description . . . 923
1.22.4 Restrictions . . . 923
1.22.5 Related commands . . . 923
1.22.6 Default . . . 923
1.23 dihedral_coeff command . . . 923
1.23.1 Syntax . . . 923
1.23.2 Examples . . . 923
1.23.3 Description . . . 924
1.23.4 Restrictions . . . 925
1.23.5 Related commands . . . 925
1.23.6 Default . . . 925
1.24 dihedral_style command . . . 925
1.24.1 Syntax . . . 925
1.24.2 Examples . . . 925
1.24.3 Description . . . 925
1.24.4 Restrictions . . . 927
1.24.5 Related commands . . . 927
1.24.6 Default . . . 927
1.25 dihedral_write command . . . 927
1.25.1 Syntax . . . 927
1.25.2 Examples . . . 927
1.25.3 Description . . . 927
1.25.4 Restrictions . . . 928
1.25.5 Related commands . . . 928
1.25.6 Default . . . 928
1.26 dimension command . . . 928
1.26.1 Syntax . . . 928
1.26.2 Examples . . . 928
1.26.3 Description . . . 929
1.26.4 Restrictions . . . 929
1.26.5 Related commands . . . 929
1.26.6 Default . . . 929
1.27 displace_atoms command . . . 929
1.27.1 Syntax . . . 929
1.27.2 Examples . . . 930
1.27.3 Description . . . 930
1.27.4 Restrictions . . . 931
1.27.5 Related commands . . . 931
1.27.6 Default . . . 931
1.28 dynamical_matrix command . . . 931
1.28.1 Syntax . . . 931
1.28.2 Examples . . . 931

1.28.3 Description . . . 931

1.95 run command . . . 1164
1.95.1 Syntax . . . 1164
1.95.2 Examples . . . 1164
1.95.3 Description . . . 1164
1.95.4 Restrictions . . . 1166
1.95.5 Related commands . . . 1167
1.95.6 Default . . . 1167
1.96 run_style command . . . 1167
1.96.1 Syntax . . . 1167
1.96.2 Examples . . . 1168

1.96.3 Description . . . 1168
1.96.4 Restrictions . . . 1171
1.96.5 Related commands . . . 1171
1.96.6 Default . . . 1171
1.97 set command . . . 1171
1.97.1 Syntax . . . 1171
1.97.2 Examples . . . 1174
1.97.3 Description . . . 1174
1.97.4 Restrictions . . . 1179
1.97.5 Related commands . . . 1180
1.97.6 Default . . . 1180
1.98 shell command . . . 1180
1.98.1 Syntax . . . 1180
1.98.2 Examples . . . 1180
1.98.3 Description . . . 1180
1.98.4 Restrictions . . . 1181
1.98.5 Related commands . . . 1181
1.98.6 Default . . . 1181
1.99 special_bonds command . . . 1181
1.99.1 Syntax . . . 1181
1.99.2 Examples . . . 1182
1.99.3 Description . . . 1182
1.99.4 Restrictions . . . 1185
1.99.5 Related commands . . . 1185
1.99.6 Default . . . 1185
1.100 suffix command . . . 1185
1.100.1 Syntax . . . 1185
1.100.2 Examples . . . 1185
1.100.3 Description . . . 1185
1.100.4 Restrictions . . . 1186
1.100.5 Related commands . . . 1186
1.100.6 Default . . . 1187
1.101 tad command . . . 1187
1.101.1 Syntax . . . 1187
1.101.2 Examples . . . 1187
1.101.3 Description . . . 1188
1.101.4 Restrictions . . . 1190
1.101.5 Related commands . . . 1190
1.101.6 Default . . . 1190
1.102 temper command . . . 1190
1.102.1 Syntax . . . 1190
1.102.2 Examples . . . 1191
1.102.3 Description . . . 1191
1.102.4 Restrictions . . . 1193
1.102.5 Related commands . . . 1193
1.102.6 Default . . . 1193
1.103 temper/grem command . . . 1193
1.103.1 Syntax . . . 1193
1.103.2 Examples . . . 1193
1.103.3 Description . . . 1193
1.103.4 Restrictions . . . 1194
1.103.5 Related commands . . . 1194
1.103.6 Default . . . 1194
1.104 temper/npt command . . . 1194

1.104.1 Syntax . . . 1194
1.104.2 Examples . . . 1195
1.104.3 Description . . . 1195
1.104.4 Restrictions . . . 1195
1.104.5 Related commands . . . 1195
1.104.6 Default . . . 1195
1.105 thermo command . . . 1195
1.105.1 Syntax . . . 1195
1.105.2 Examples . . . 1196
1.105.3 Description . . . 1196
1.105.4 Restrictions . . . 1196
1.105.5 Related commands . . . 1196
1.105.6 Default . . . 1196
1.106 thermo_modify command . . . 1196
1.106.1 Syntax . . . 1196
1.106.2 Examples . . . 1197
1.106.3 Description . . . 1197
1.106.4 Restrictions . . . 1200
1.106.5 Related commands . . . 1200
1.106.6 Default . . . 1200
1.107 thermo_style command . . . 1200
1.107.1 Syntax . . . 1200
1.107.2 Examples . . . 1202
1.107.3 Description . . . 1202
1.107.4 Restrictions . . . 1206
1.107.5 Related commands . . . 1207
1.107.6 Default . . . 1207
1.108 third_order command . . . 1207
1.108.1 Syntax . . . 1207
1.108.2 Examples . . . 1207
1.108.3 Description . . . 1207
1.108.4 Restrictions . . . 1208
1.108.5 Related commands . . . 1208
1.108.6 Default . . . 1208
1.109 timer command . . . 1208
1.109.1 Syntax . . . 1208
1.109.2 Examples . . . 1208
1.109.3 Description . . . 1208
1.109.4 Restrictions . . . 1209
1.109.5 Related commands . . . 1210
1.109.6 Default . . . 1210
1.110 timestep command . . . 1210
1.110.1 Syntax . . . 1210
1.110.2 Examples . . . 1210
1.110.3 Description . . . 1210
1.110.4 Restrictions . . . 1210
1.110.5 Related commands . . . 1210
1.110.6 Default . . . 1210
1.111 uncompute command . . . 1211
1.111.1 Syntax . . . 1211
1.111.2 Examples . . . 1211
1.111.3 Description . . . 1211
1.111.4 Restrictions . . . 1211
1.111.5 Related commands . . . 1211

1.111.6 Default . . . 1211
1.112 undump command . . . 1211
1.112.1 Syntax . . . 1211
1.112.2 Examples . . . 1211
1.112.3 Description . . . 1211
1.112.4 Restrictions . . . 1211
1.112.5 Related commands . . . 1212
1.112.6 Default . . . 1212
1.113 unfix command . . . 1212
1.113.1 Syntax . . . 1212
1.113.2 Examples . . . 1212
1.113.3 Description . . . 1212
1.113.4 Restrictions . . . 1212
1.113.5 Related commands . . . 1212
1.113.6 Default . . . 1212
1.114 units command . . . 1212
1.114.1 Syntax . . . 1212
1.114.2 Examples . . . 1212
1.114.3 Description . . . 1213
1.114.4 Restrictions . . . 1217
1.114.5 Related commands . . . 1217
1.114.6 Default . . . 1217
1.115 variable command . . . 1217
1.115.1 Syntax . . . 1217
1.115.2 Examples . . . 1218
1.115.3 Description . . . 1219
1.115.4 Immediate Evaluation of Variables . . . 1237
1.115.5 Variable Accuracy . . . 1238
1.115.6 Restrictions . . . 1239
1.115.7 Related commands . . . 1239
1.115.8 Default . . . 1239
1.116 velocity command . . . 1239
1.116.1 Syntax . . . 1239
1.116.2 Examples . . . 1240
1.116.3 Description . . . 1240
1.116.4 Restrictions . . . 1242
1.116.5 Related commands . . . 1242
1.116.6 Default . . . 1242
1.117 write_coeff command . . . 1243
1.117.1 Syntax . . . 1243
1.117.2 Examples . . . 1243
1.117.3 Description . . . 1243
1.117.4 Restrictions . . . 1243
1.117.5 Related commands . . . 1243
1.118 write_data command . . . 1243
1.118.1 Syntax . . . 1243
1.118.2 Examples . . . 1244
1.118.3 Description . . . 1244
1.118.4 Restrictions . . . 1245
1.118.5 Related commands . . . 1245
1.118.6 Default . . . 1245
1.119 write_dump command . . . 1246
1.119.1 Syntax . . . 1246
1.119.2 Examples . . . 1246

1.119.3 Description . . . 1246
1.119.4 Restrictions . . . 1247
1.119.5 Related commands . . . 1247
1.119.6 Default . . . 1247
1.120 write_restart command . . . 1247
1.120.1 Syntax . . . 1247
1.120.2 Examples . . . 1247
1.120.3 Description . . . 1247
1.120.4 Restrictions . . . 1248
1.120.5 Related commands . . . 1248
1.120.6 Default . . . 1248

2 Fix Styles **1249**
2.1 fix accelerate/cos command . . . 1249
2.1.1 Syntax . . . 1249
2.1.2 Examples . . . 1249
2.1.3 Description . . . 1249
2.1.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1250
2.1.5 Restrictions . . . 1250
2.1.6 Related commands . . . 1250
2.1.7 Default . . . 1250
2.2 fix acks2/reaxff command . . . 1250
2.2.1 Syntax . . . 1250
2.2.2 Examples . . . 1251
2.2.3 Description . . . 1251
2.2.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1251
2.2.5 Restrictions . . . 1252
2.2.6 Related commands . . . 1252
2.2.7 Default . . . 1252
2.3 fix adapt command . . . 1252
2.3.1 Syntax . . . 1252
2.3.2 Examples . . . 1253
2.3.3 Description . . . 1253
2.3.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1259
2.3.5 Restrictions . . . 1260
2.3.6 Related commands . . . 1260
2.3.7 Default . . . 1260
2.4 fix adapt/fep command . . . 1260
2.4.1 Syntax . . . 1260
2.4.2 Examples . . . 1261
2.4.3 Description . . . 1261
2.4.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1264
2.4.5 Restrictions . . . 1264
2.4.6 Related commands . . . 1264
2.4.7 Default . . . 1264
2.5 fix add/heat command . . . 1264
2.5.1 Syntax . . . 1264
2.5.2 Examples . . . 1265
2.5.3 Description . . . 1265
2.5.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1265
2.5.5 Restrictions . . . 1265
2.5.6 Related commands . . . 1265
2.5.7 Default . . . 1265
2.6 fix addforce command . . . 1266

2.6.1 Syntax . . . 1266
2.6.2 Examples . . . 1266
2.6.3 Description . . . 1266
2.6.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1267
2.6.5 Restrictions . . . 1268
2.6.6 Related commands . . . 1268
2.6.7 Default . . . 1268
2.7 fix addtorque command . . . 1268
2.7.1 Syntax . . . 1268
2.7.2 Examples . . . 1268
2.7.3 Description . . . 1268
2.7.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1268
2.7.5 Restrictions . . . 1269
2.7.6 Related commands . . . 1269
2.7.7 Default . . . 1269
2.8 fix alchemy command . . . 1269
2.8.1 Syntax . . . 1269
2.8.2 Examples . . . 1269
2.8.3 Description . . . 1270
2.8.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1271
2.8.5 Restrictions . . . 1271
2.8.6 Related commands . . . 1271
2.8.7 Default . . . 1271
2.9 fix amoeba/bitorsion command . . . 1271
2.9.1 Syntax . . . 1271
2.9.2 Examples . . . 1272
2.9.3 Description . . . 1272
2.9.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1273
2.9.5 Restrictions . . . 1273
2.9.6 Related commands . . . 1273
2.9.7 Default . . . 1273
2.10 fix amoeba/pitorsion command . . . 1273
2.10.1 Syntax . . . 1273
2.10.2 Examples . . . 1274
2.10.3 Description . . . 1274
2.10.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1275
2.10.5 Restrictions . . . 1275
2.10.6 Related commands . . . 1275
2.10.7 Default . . . 1276
2.11 fix append/atoms command . . . 1276
2.11.1 Syntax . . . 1276
2.11.2 Examples . . . 1276
2.11.3 Description . . . 1276
2.11.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1277
2.11.5 Restrictions . . . 1277
2.11.6 Related commands . . . 1277
2.11.7 Default . . . 1277
2.12 fix atom/swap command . . . 1277
2.12.1 Syntax . . . 1277
2.12.2 Examples . . . 1278
2.12.3 Description . . . 1278
2.12.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1279
2.12.5 Restrictions . . . 1280
2.12.6 Related commands . . . 1280

2.12.7 Default . . . 1280
2.13 fix atom_weight/apip command . . . 1280
2.13.1 Syntax . . . 1280
2.13.2 Examples . . . 1280
2.13.3 Description . . . 1281
2.13.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1281
2.13.5 Restrictions . . . 1282
2.13.6 Related commands . . . 1282
2.13.7 Default . . . 1282
2.14 fix ave/atom command . . . 1282
2.14.1 Syntax . . . 1282
2.14.2 Examples . . . 1282
2.14.3 Description . . . 1283
2.14.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1284
2.14.5 Restrictions . . . 1284
2.14.6 Related commands . . . 1284
2.14.7 Default . . . 1284
2.15 fix ave/chunk command . . . 1284
2.15.1 Syntax . . . 1284
2.15.2 Examples . . . 1286
2.15.3 Description . . . 1286
2.15.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1291
2.15.5 Restrictions . . . 1291
2.15.6 Related commands . . . 1291
2.15.7 Default . . . 1291
2.16 fix ave/correlate command . . . 1291
2.16.1 Syntax . . . 1291
2.16.2 Examples . . . 1292
2.16.3 Description . . . 1292
2.16.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1295
2.16.5 Restrictions . . . 1296
2.16.6 Related commands . . . 1296
2.16.7 Default . . . 1296
2.17 fix ave/correlate/long command . . . 1296
2.17.1 Syntax . . . 1296
2.17.2 Examples . . . 1297
2.17.3 Description . . . 1297
2.17.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1298
2.17.5 Restrictions . . . 1298
2.17.6 Related commands . . . 1298
2.17.7 Default . . . 1298
2.18 fix ave/grid command . . . 1298
2.18.1 Syntax . . . 1298
2.18.2 Examples . . . 1300
2.18.3 Description . . . 1300
2.18.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1304
2.18.5 Restrictions . . . 1304
2.18.6 Related commands . . . 1304
2.18.7 Default . . . 1305
2.19 fix ave/histo command . . . 1305
2.20 fix ave/histo/weight command . . . 1305
2.20.1 Syntax . . . 1305
2.20.2 Examples . . . 1306
2.20.3 Description . . . 1306

2.20.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1309
2.20.5 Restrictions . . . 1310
2.20.6 Related commands . . . 1310
2.20.7 Default . . . 1310
2.21 fix ave/moments command . . . 1310
2.21.1 Syntax . . . 1310
2.21.2 Examples . . . 1311
2.21.3 Description . . . 1311
2.21.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1313
2.21.5 Restrictions . . . 1313
2.21.6 Related commands . . . 1313
2.21.7 Default . . . 1313
2.22 fix ave/spatial command . . . 1314
2.23 fix ave/spatial/sphere command . . . 1314
2.24 fix ave/time command . . . 1314
2.24.1 Syntax . . . 1314
2.24.2 Examples . . . 1315
2.24.3 Description . . . 1315
2.24.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1318
2.24.5 Restrictions . . . 1318
2.24.6 Related commands . . . 1319
2.24.7 Default . . . 1319
2.25 fix aveforce command . . . 1319
2.25.1 Syntax . . . 1319
2.25.2 Examples . . . 1319
2.25.3 Description . . . 1319
2.25.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1320
2.25.5 Restrictions . . . 1320
2.25.6 Related commands . . . 1320
2.25.7 Default . . . 1320
2.26 fix balance command . . . 1320
2.26.1 Syntax . . . 1320
2.26.2 Examples . . . 1321
2.26.3 Description . . . 1321
2.26.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1325
2.26.5 Restrictions . . . 1326
2.26.6 Related commands . . . 1326
2.26.7 Default . . . 1326
2.27 fix bocs command . . . 1326
2.27.1 Syntax . . . 1326
2.27.2 Examples . . . 1326
2.27.3 Description . . . 1327
2.27.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1327
2.27.5 Restrictions . . . 1327
2.27.6 Further information . . . 1328
2.28 fix bond/break command . . . 1328
2.28.1 Syntax . . . 1328
2.28.2 Examples . . . 1328
2.28.3 Description . . . 1328
2.28.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1329
2.28.5 Restrictions . . . 1330
2.28.6 Related commands . . . 1330
2.28.7 Default . . . 1330
2.29 fix bond/create command . . . 1330

2.30 fix bond/create/angle command . . . 1330
2.30.1 Syntax . . . 1330
2.30.2 Examples . . . 1331
2.30.3 Description . . . 1331
2.30.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1333
2.30.5 Restrictions . . . 1334
2.30.6 Related commands . . . 1334
2.30.7 Default . . . 1334
2.31 fix bond/react command . . . 1334
2.31.1 Syntax . . . 1334
2.31.2 Examples . . . 1335
2.31.3 Description . . . 1336
2.31.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1343
2.31.5 Restrictions . . . 1344
2.31.6 Related commands . . . 1344
2.31.7 Default . . . 1344
2.32 fix bond/swap command . . . 1344
2.32.1 Syntax . . . 1344
2.32.2 Examples . . . 1344
2.32.3 Description . . . 1345
2.32.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1347
2.32.5 Restrictions . . . 1347
2.32.6 Related commands . . . 1347
2.32.7 Default . . . 1347
2.33 fix box/relax command . . . 1348
2.33.1 Syntax . . . 1348
2.33.2 Examples . . . 1348
2.33.3 Description . . . 1348
2.33.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1351
2.33.5 Restrictions . . . 1352
2.33.6 Related commands . . . 1352
2.33.7 Default . . . 1352
2.34 fix brownian command . . . 1352
2.35 fix brownian/sphere command . . . 1352
2.36 fix brownian/asphere command . . . 1352
2.36.1 Syntax . . . 1352
2.36.2 Examples . . . 1353
2.36.3 Description . . . 1353
2.36.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1355
2.36.5 Restrictions . . . 1355
2.36.6 Related commands . . . 1355
2.36.7 Default . . . 1355
2.37 fix charge/regulation command . . . 1356
2.37.1 Syntax . . . 1356
2.37.2 Examples . . . 1356
2.37.3 Description . . . 1357
2.37.4 Output . . . 1358
2.37.5 Restrictions . . . 1359
2.37.6 Related commands . . . 1359
2.37.7 Default . . . 1359
2.38 fix cmap command . . . 1359
2.38.1 Syntax . . . 1359
2.38.2 Examples . . . 1360
2.38.3 Description . . . 1360

2.38.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1361
2.38.5 Restrictions . . . 1361
2.38.6 Related commands . . . 1361
2.38.7 Default . . . 1362
2.39 fix colvars command . . . 1362
2.39.1 Syntax . . . 1362
2.39.2 Examples . . . 1362
2.39.3 Description . . . 1362
2.39.4 Restarting . . . 1363
2.39.5 Output . . . 1364
2.39.6 Controlling Colvars via *fix_modify* . . . 1364
2.39.7 Restrictions . . . 1364
2.39.8 Related commands . . . 1365
2.40 fix controller command . . . 1365
2.40.1 Syntax . . . 1365
2.40.2 Examples . . . 1365
2.40.3 Description . . . 1365
2.40.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1367
2.40.5 Restrictions . . . 1367
2.40.6 Related commands . . . 1368
2.40.7 Default . . . 1368
2.41 fix damping/cundall command . . . 1368
2.41.1 Syntax . . . 1368
2.41.2 Examples . . . 1368
2.41.3 Description . . . 1368
2.41.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1369
2.41.5 Restrictions . . . 1369
2.41.6 Related commands . . . 1369
2.41.7 Default . . . 1369
2.41.8 References . . . 1370
2.42 fix deform command . . . 1370
2.42.1 Syntax . . . 1370
2.42.2 Examples . . . 1371
2.42.3 Description . . . 1371
2.42.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1377
2.42.5 Restrictions . . . 1377
2.42.6 Related commands . . . 1377
2.42.7 Default . . . 1377
2.43 fix deform/pressure command . . . 1378
2.43.1 Syntax . . . 1378
2.43.2 Examples . . . 1379
2.43.3 Description . . . 1380
2.43.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1382
2.43.5 Restrictions . . . 1382
2.43.6 Related commands . . . 1383
2.43.7 Default . . . 1383
2.44 fix deposit command . . . 1383
2.44.1 Syntax . . . 1383
2.44.2 Examples . . . 1384
2.44.3 Description . . . 1384
2.44.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1387
2.44.5 Restrictions . . . 1387
2.44.6 Related commands . . . 1387
2.44.7 Default . . . 1387

2.45 fix dpd/energy command . . . 1387
2.45.1 Syntax . . . 1387
2.45.2 Examples . . . 1388
2.45.3 Description . . . 1388
2.45.4 Restrictions . . . 1388
2.45.5 Related commands . . . 1388
2.45.6 Default . . . 1388
2.46 fix edpd/source command . . . 1389
2.47 fix tdpd/source command . . . 1389
2.47.1 Syntax . . . 1389
2.47.2 Examples . . . 1389
2.47.3 Description . . . 1389
2.47.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1390
2.47.5 Restrictions . . . 1390
2.47.6 Related commands . . . 1390
2.47.7 Default . . . 1390
2.48 fix drag command . . . 1390
2.48.1 Syntax . . . 1390
2.48.2 Examples . . . 1390
2.48.3 Description . . . 1391
2.48.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1391
2.48.5 Restrictions . . . 1391
2.48.6 Related commands . . . 1391
2.48.7 Default . . . 1391
2.49 fix drude command . . . 1391
2.49.1 Syntax . . . 1391
2.49.2 Examples . . . 1391
2.49.3 Description . . . 1392
2.49.4 Restrictions . . . 1392
2.49.5 Related commands . . . 1392
2.49.6 Default . . . 1392
2.50 fix drude/transform/direct command . . . 1392
2.51 fix drude/transform/inverse command . . . 1392
2.51.1 Syntax . . . 1392
2.51.2 Examples . . . 1392
2.51.3 Description . . . 1392
2.51.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1394
2.51.5 Restrictions . . . 1394
2.51.6 Related commands . . . 1395
2.51.7 Default . . . 1395
2.52 fix dt/reset command . . . 1395
2.52.1 Syntax . . . 1395
2.52.2 Examples . . . 1395
2.52.3 Description . . . 1395
2.52.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1396
2.52.5 Restrictions . . . 1396
2.52.6 Related commands . . . 1396
2.52.7 Default . . . 1397
2.53 fix efield command . . . 1397
2.54 fix efield/tip4p command . . . 1397
2.54.1 Syntax . . . 1397
2.54.2 Examples . . . 1397
2.54.3 Description . . . 1397
2.54.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1399

2.54.5 Restrictions . . . 1399
2.54.6 Related commands . . . 1400
2.54.7 Default . . . 1400
2.55 fix efield/lepton command . . . 1400
2.55.1 Syntax . . . 1400
2.55.2 Examples . . . 1400
2.55.3 Description . . . 1400
2.55.4 Lepton expression syntax and features . . . 1401
2.55.5 Restart, fix_modify, output, run start/stop, minimize info . . . 1402
2.55.6 Restrictions . . . 1402
2.55.7 Related commands . . . 1403
2.55.8 Default . . . 1403
2.56 fix ehex command . . . 1403
2.56.1 Syntax . . . 1403
2.56.2 Examples . . . 1403
2.56.3 Description . . . 1404
2.56.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1405
2.56.5 Restrictions . . . 1405
2.56.6 Related commands . . . 1405
2.56.7 Default . . . 1405
2.57 fix electrode/conp command . . . 1405
2.58 fix electrode/conq command . . . 1406
2.59 fix electrode/thermo command . . . 1406
2.59.1 Syntax . . . 1406
2.59.2 Examples . . . 1407
2.59.3 Description . . . 1407
2.59.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1409
2.59.5 Restrictions . . . 1410
2.59.6 Default . . . 1411
2.60 fix electron/stopping command . . . 1411
2.61 fix electron/stopping/fit command . . . 1411
2.61.1 Syntax . . . 1411
2.61.2 Examples . . . 1412
2.61.3 Description . . . 1412
2.61.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1414
2.61.5 Restrictions . . . 1414
2.61.6 Default . . . 1414
2.62 fix enforce2d command . . . 1414
2.62.1 Syntax . . . 1414
2.62.2 Examples . . . 1414
2.62.3 Description . . . 1415
2.62.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1415
2.62.5 Restrictions . . . 1415
2.62.6 Related commands . . . 1415
2.62.7 Default . . . 1415
2.63 fix eos/cv command . . . 1415
2.63.1 Syntax . . . 1415
2.63.2 Examples . . . 1415
2.63.3 Description . . . 1416
2.63.4 Restrictions . . . 1416
2.63.5 Related commands . . . 1416
2.63.6 Default . . . 1416
2.64 fix eos/table command . . . 1416
2.64.1 Syntax . . . 1416

2.64.2 Examples . . . 1416
2.64.3 Description . . . 1417
2.64.4 Restrictions . . . 1418
2.64.5 Related commands . . . 1418
2.64.6 Default . . . 1418
2.65 fix eos/table/rx command . . . 1418
2.65.1 Syntax . . . 1418
2.65.2 Examples . . . 1418
2.65.3 Description . . . 1418
2.65.4 Restrictions . . . 1420
2.65.5 Related commands . . . 1421
2.65.6 Default . . . 1421
2.66 fix evaporate command . . . 1421
2.66.1 Syntax . . . 1421
2.66.2 Examples . . . 1421
2.66.3 Description . . . 1421
2.66.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1422
2.66.5 Restrictions . . . 1422
2.66.6 Related commands . . . 1422
2.66.7 Default . . . 1422
2.67 fix external command . . . 1422
2.67.1 Syntax . . . 1422
2.67.2 Examples . . . 1422
2.67.3 Description . . . 1423
2.67.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1424
2.67.5 Restrictions . . . 1424
2.67.6 Related commands . . . 1425
2.67.7 Default . . . 1425
2.68 fix ffl command . . . 1425
2.68.1 Syntax . . . 1425
2.68.2 Examples . . . 1425
2.68.3 Description . . . 1425
2.68.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1426
2.68.5 Restrictions . . . 1426
2.68.6 Related commands . . . 1426
2.69 fix filter/corotate command . . . 1426
2.69.1 Syntax . . . 1426
2.69.2 Examples . . . 1427
2.69.3 Description . . . 1427
2.69.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1427
2.69.5 Restrictions . . . 1427
2.69.6 Related commands . . . 1427
2.69.7 Default . . . 1427
2.70 fix flow/gauss command . . . 1427
2.70.1 Syntax . . . 1427
2.70.2 Examples . . . 1428
2.70.3 Description . . . 1428
2.70.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1429
2.70.5 Restrictions . . . 1429
2.70.6 Related commands . . . 1429
2.70.7 Default . . . 1429
2.71 fix freeze command . . . 1430
2.71.1 Syntax . . . 1430
2.71.2 Examples . . . 1430

2.71.3 Description . . . 1430
2.71.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1430
2.71.5 Restrictions . . . 1431
2.71.6 Related commands . . . 1431
2.71.7 Default . . . 1431
2.72 fix gcmc command . . . 1431
2.72.1 Syntax . . . 1431
2.72.2 Examples . . . 1432
2.72.3 Description . . . 1432
2.72.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1436
2.72.5 Restrictions . . . 1436
2.72.6 Related commands . . . 1437
2.72.7 Default . . . 1437
2.73 fix gjf command . . . 1437
2.73.1 Syntax . . . 1437
2.73.2 Examples . . . 1438
2.73.3 Description . . . 1438
2.73.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1439
2.73.5 Restrictions . . . 1439
2.73.6 Related commands . . . 1439
2.73.7 Default . . . 1439
2.74 fix gld command . . . 1440
2.74.1 Syntax . . . 1440
2.74.2 Examples . . . 1440
2.74.3 Description . . . 1440
2.74.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1441
2.74.5 Restrictions . . . 1442
2.74.6 Related commands . . . 1442
2.74.7 Default . . . 1442
2.75 fix gle command . . . 1442
2.75.1 Syntax . . . 1442
2.75.2 Examples . . . 1442
2.75.3 Description . . . 1443
2.75.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1443
2.75.5 Restrictions . . . 1444
2.75.6 Related commands . . . 1444
2.76 fix gravity command . . . 1444
2.76.1 Syntax . . . 1444
2.76.2 Examples . . . 1445
2.76.3 Description . . . 1445
2.76.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1446
2.76.5 Restrictions . . . 1446
2.76.6 Related commands . . . 1446
2.76.7 Default . . . 1446
2.77 fix grem command . . . 1446
2.77.1 Syntax . . . 1446
2.77.2 Examples . . . 1446
2.77.3 Description . . . 1447
2.77.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1447
2.77.5 Restrictions . . . 1447
2.77.6 Related commands . . . 1447
2.77.7 Default . . . 1448
2.78 fix halt command . . . 1448
2.78.1 Syntax . . . 1448

2.78.2 Examples . . . 1448
2.78.3 Description . . . 1448
2.78.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1450
2.78.5 Restrictions . . . 1450
2.78.6 Related commands . . . 1450
2.78.7 Default . . . 1450
2.79 fix heat command . . . 1450
2.79.1 Syntax . . . 1450
2.79.2 Examples . . . 1451
2.79.3 Description . . . 1451
2.79.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1452
2.79.5 Restrictions . . . 1452
2.79.6 Related commands . . . 1452
2.79.7 Default . . . 1452
2.80 fix heat/flow command . . . 1452
2.80.1 Syntax . . . 1452
2.80.2 Examples . . . 1453
2.80.3 Description . . . 1453
2.80.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1453
2.80.5 Restrictions . . . 1453
2.80.6 Related commands . . . 1453
2.80.7 Default . . . 1453
2.81 fix hmc command . . . 1453
2.81.1 Syntax . . . 1453
2.81.2 Examples . . . 1454
2.81.3 Description . . . 1454
2.81.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1456
2.81.5 Restrictions . . . 1456
2.81.6 Related commands . . . 1456
2.81.7 Default . . . 1456
2.82 fix hyper/global command . . . 1456
2.82.1 Syntax . . . 1456
2.82.2 Examples . . . 1457
2.82.3 Description . . . 1457
2.82.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1459
2.82.5 Restrictions . . . 1460
2.82.6 Related commands . . . 1460
2.82.7 Default . . . 1460
2.83 fix hyper/local command . . . 1460
2.83.1 Syntax . . . 1460
2.83.2 Examples . . . 1460
2.83.3 Description . . . 1461
2.83.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1464
2.83.5 Restrictions . . . 1467
2.83.6 Related commands . . . 1467
2.83.7 Default . . . 1467
2.84 fix imd command . . . 1467
2.84.1 Syntax . . . 1467
2.84.2 Examples . . . 1468
2.84.3 Description . . . 1468
2.84.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1469
2.84.5 Restrictions . . . 1469
2.84.6 Related commands . . . 1469
2.84.7 Default . . . 1469

2.85 fix indent command . . . 1469
2.85.1 Syntax . . . 1469
2.85.2 Examples . . . 1470
2.85.3 Description . . . 1470
2.85.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1472
2.85.5 Restrictions . . . 1472
2.85.6 Related commands . . . 1472
2.85.7 Default . . . 1473
2.86 fix ipi command . . . 1473
2.86.1 Syntax . . . 1473
2.86.2 Examples . . . 1473
2.86.3 Description . . . 1473
2.86.4 Obtaining i-PI . . . 1474

2.92.1 Syntax . . . 1490
2.92.2 Examples . . . 1490
2.92.3 Description . . . 1490
2.92.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1490
2.92.5 Restrictions . . . 1491
2.92.6 Related commands . . . 1491
2.92.7 Default . . . 1491
2.93 fix lb/fluid command . . . 1491
2.93.1 Syntax . . . 1491
2.93.2 Examples . . . 1492
2.93.3 Description . . . 1492
2.93.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1495
2.93.5 Restrictions . . . 1496
2.93.6 Related commands . . . 1496
2.93.7 Default . . . 1496
2.94 fix lb/momentum command . . . 1496
2.94.1 Syntax . . . 1496
2.94.2 Examples . . . 1497
2.94.3 Description . . . 1497
2.94.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1497
2.94.5 Restrictions . . . 1497
2.94.6 Related commands . . . 1497
2.94.7 Default . . . 1498
2.95 fix lb/viscous command . . . 1498
2.95.1 Syntax . . . 1498
2.95.2 Examples . . . 1498
2.95.3 Description . . . 1498
2.95.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1498
2.95.5 Restrictions . . . 1498
2.95.6 Related commands . . . 1499
2.95.7 Default . . . 1499
2.96 fix lineforce command . . . 1499
2.96.1 Syntax . . . 1499
2.96.2 Examples . . . 1499
2.96.3 Description . . . 1499
2.96.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1499
2.96.5 Restrictions . . . 1499
2.96.6 Related commands . . . 1499
2.96.7 Default . . . 1500
2.97 fix manifoldforce command . . . 1500
2.97.1 Syntax . . . 1500
2.97.2 Examples . . . 1500
2.97.3 Description . . . 1500
2.97.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1500
2.97.5 Restrictions . . . 1500
2.97.6 Related commands . . . 1500
2.98 fix mdi/qm command . . . 1500
2.98.1 Syntax . . . 1500
2.98.2 Examples . . . 1501
2.98.3 Description . . . 1501
2.98.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1503

2.98.5 Restrictions . . . 1504
2.98.6 Related commands . . . 1504
2.98.7 Default . . . 1504
2.99 fix mdi/qmmm command . . . 1504
2.99.1 Syntax . . . 1504
2.99.2 Examples . . . 1505
2.99.3 Description . . . 1505
2.99.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1507
2.99.5 Restrictions . . . 1507
2.99.6 Related commands . . . 1507
2.99.7 Default . . . 1508
2.100 fix meso/move command . . . 1508
2.100.1 Syntax . . . 1508
2.100.2 Examples . . . 1508
2.100.3 Description . . . 1508
2.100.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1510
2.100.5 Restrictions . . . 1511
2.100.6 Related commands . . . 1511
2.100.7 Default . . . 1511
2.101 fix mol/swap command . . . 1511
2.101.1 Syntax . . . 1511
2.101.2 Examples . . . 1512
2.101.3 Description . . . 1512
2.101.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1513
2.101.5 Restrictions . . . 1513
2.101.6 Related commands . . . 1513
2.101.7 Default . . . 1513
2.102 fix momentum command . . . 1513
2.103 fix momentum/chunk command . . . 1514
2.103.1 Syntax . . . 1514
2.103.2 Examples . . . 1514
2.103.3 Description . . . 1514
2.103.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1515
2.103.5 Restrictions . . . 1515
2.103.6 Related commands . . . 1515
2.103.7 Default . . . 1515
2.104 fix move command . . . 1515
2.104.1 Syntax . . . 1515
2.104.2 Examples . . . 1516
2.104.3 Description . . . 1516
2.104.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1518
2.104.5 Restrictions . . . 1519
2.104.6 Related commands . . . 1519
2.104.7 Default . . . 1519
2.105 fix msst command . . . 1519
2.105.1 Syntax . . . 1519
2.105.2 Examples . . . 1519
2.105.3 Description . . . 1519
2.105.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1520
2.105.5 Restrictions . . . 1521
2.105.6 Related commands . . . 1521
2.105.7 Default . . . 1521
2.106 fix mvv/dpd command . . . 1522
2.107 fix mvv/edpd command . . . 1522

2.108 fix mvv/tdpd command . . . 1522
2.108.1 Syntax . . . 1522
2.108.2 Examples . . . 1522
2.108.3 Description . . . 1522
2.108.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1523
2.108.5 Restrictions . . . 1523
2.108.6 Related commands . . . 1523
2.108.7 Default . . . 1523
2.109 fix neb command . . . 1523
2.109.1 Syntax . . . 1523
2.109.2 Examples . . . 1524
2.109.3 Description . . . 1524
2.109.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1526
2.109.5 Restrictions . . . 1526
2.109.6 Related commands . . . 1526
2.109.7 Default . . . 1526
2.110 fix neb/spin command . . . 1526
2.110.1 Syntax . . . 1526
2.110.2 Examples . . . 1527
2.110.3 Description . . . 1527
2.110.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1527
2.110.5 Restrictions . . . 1527
2.110.6 Related commands . . . 1527
2.110.7 Default . . . 1527
2.111 fix neighbor/swap command . . . 1527
2.111.1 Syntax . . . 1527
2.111.2 Examples . . . 1528
2.111.3 Description . . . 1528
2.111.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1530
2.111.5 Restrictions . . . 1530
2.111.6 Related commands . . . 1530
2.111.7 Default . . . 1531
2.112 fix nvt command . . . 1531
2.113 fix npt command . . . 1531
2.114 fix nph command . . . 1531
2.114.1 Syntax . . . 1531
2.114.2 Examples . . . 1532
2.114.3 Description . . . 1532
2.114.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1538
2.114.5 Restrictions . . . 1539
2.114.6 Related commands . . . 1539
2.114.7 Default . . . 1539
2.115 fix nvt/eff command . . . 1540
2.116 fix npt/eff command . . . 1540
2.117 fix nph/eff command . . . 1540
2.117.1 Syntax . . . 1540
2.117.2 Examples . . . 1540
2.117.3 Description . . . 1540
2.117.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1541
2.117.5 Restrictions . . . 1541
2.117.6 Related commands . . . 1541
2.117.7 Default . . . 1542
2.118 fix nvt/uef command . . . 1542
2.119 fix npt/uef command . . . 1542

2.119.1 Syntax . . . 1542
2.119.2 Examples . . . 1542
2.119.3 Description . . . 1542
2.119.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1544
2.119.5 Restrictions . . . 1545
2.119.6 Related commands . . . 1545
2.119.7 Default . . . 1545
2.120 fix nonaffine/displacement command . . . 1545
2.120.1 Syntax . . . 1545
2.120.2 Examples . . . 1546
2.120.3 Description . . . 1546
2.120.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1546
2.120.5 Restrictions . . . 1547
2.120.6 Related commands . . . 1547
2.120.7 Default . . . 1547
2.121 fix nph/asphere command . . . 1547
2.121.1 Syntax . . . 1547
2.121.2 Examples . . . 1547
2.121.3 Description . . . 1547
2.121.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1548
2.121.5 Restrictions . . . 1549
2.121.6 Related commands . . . 1549
2.121.7 Default . . . 1549
2.122 fix nph/body command . . . 1549
2.122.1 Syntax . . . 1549
2.122.2 Examples . . . 1549
2.122.3 Description . . . 1549
2.122.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1550
2.122.5 Restrictions . . . 1550
2.122.6 Related commands . . . 1550
2.122.7 Default . . . 1550
2.123 fix nph/sphere command . . . 1551
2.123.1 Syntax . . . 1551
2.123.2 Examples . . . 1551
2.123.3 Description . . . 1551
2.123.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1552
2.123.5 Restrictions . . . 1552
2.123.6 Related commands . . . 1552
2.123.7 Default . . . 1553
2.124 fix nphug command . . . 1553
2.124.1 Syntax . . . 1553
2.124.2 Examples . . . 1553
2.124.3 Description . . . 1553
2.124.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1555
2.124.5 Restrictions . . . 1555
2.124.6 Related commands . . . 1556
2.124.7 Default . . . 1556
2.125 fix npt/asphere command . . . 1556
2.125.1 Syntax . . . 1556
2.125.2 Examples . . . 1556
2.125.3 Description . . . 1556
2.125.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1557
2.125.5 Restrictions . . . 1558
2.125.6 Related commands . . . 1558

2.125.7 Default . . . 1558
2.126 fix npt/body command . . . 1558
2.126.1 Syntax . . . 1558
2.126.2 Examples . . . 1558
2.126.3 Description . . . 1558
2.126.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1559
2.126.5 Restrictions . . . 1560
2.126.6 Related commands . . . 1560
2.126.7 Default . . . 1560
2.127 fix npt/cauchy command . . . 1560
2.127.1 Syntax . . . 1560
2.127.2 Examples . . . 1561
2.127.3 Description . . . 1561
2.127.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1566
2.127.5 Restrictions . . . 1567
2.127.6 Related commands . . . 1567
2.127.7 Default . . . 1567
2.128 fix npt/sphere command . . . 1568
2.128.1 Syntax . . . 1568
2.128.2 Examples . . . 1568
2.128.3 Description . . . 1568
2.128.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1569
2.128.5 Restrictions . . . 1570
2.128.6 Related commands . . . 1570
2.128.7 Default . . . 1570
2.129 fix numdiff command . . . 1570
2.129.1 Syntax . . . 1570
2.129.2 Examples . . . 1570
2.129.3 Description . . . 1570
2.129.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1571
2.129.5 Restrictions . . . 1571
2.129.6 Related commands . . . 1571
2.129.7 Default . . . 1571
2.130 fix numdiff/virial command . . . 1572
2.130.1 Syntax . . . 1572
2.130.2 Examples . . . 1572
2.130.3 Description . . . 1572
2.130.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1573
2.130.5 Restrictions . . . 1573
2.130.6 Related commands . . . 1573
2.130.7 Default . . . 1573
2.131 fix nve command . . . 1573
2.131.1 Syntax . . . 1573
2.131.2 Examples . . . 1573
2.131.3 Description . . . 1573
2.131.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1574
2.131.5 Restrictions . . . 1574
2.131.6 Related commands . . . 1574
2.131.7 Default . . . 1574
2.132 fix nve/asphere command . . . 1574
2.132.1 Syntax . . . 1574
2.132.2 Examples . . . 1574
2.132.3 Description . . . 1574
2.132.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1575

2.132.5 Restrictions . . . 1575
2.132.6 Related commands . . . 1575
2.132.7 Default . . . 1575
2.133 fix nve/asphere/noforce command . . . 1575
2.133.1 Syntax . . . 1575
2.133.2 Examples . . . 1575
2.133.3 Description . . . 1576
2.133.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1576
2.133.5 Restrictions . . . 1576
2.133.6 Related commands . . . 1576
2.133.7 Default . . . 1576
2.134 fix nve/body command . . . 1576
2.134.1 Syntax . . . 1576
2.134.2 Examples . . . 1576
2.134.3 Description . . . 1576
2.134.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1577
2.134.5 Restrictions . . . 1577
2.134.6 Related commands . . . 1577
2.134.7 Default . . . 1577
2.135 fix nve/bpm/sphere command . . . 1577
2.135.1 Syntax . . . 1577
2.135.2 Examples . . . 1577
2.135.3 Description . . . 1577
2.135.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1578
2.135.5 Restrictions . . . 1578
2.135.6 Related commands . . . 1578
2.135.7 Default . . . 1578
2.136 fix nve/dot command . . . 1578
2.136.1 Syntax . . . 1578
2.136.2 Examples . . . 1578
2.136.3 Description . . . 1578
2.136.4 Restrictions . . . 1579
2.136.5 Related commands . . . 1579
2.136.6 Default . . . 1579
2.137 fix nve/dotc/langevin command . . . 1579
2.137.1 Syntax . . . 1579
2.137.2 Examples . . . 1579
2.137.3 Description . . . 1580
2.137.4 Restrictions . . . 1581
2.137.5 Related commands . . . 1581
2.137.6 Default . . . 1581
2.138 fix nve/eff command . . . 1581
2.138.1 Syntax . . . 1581
2.138.2 Examples . . . 1581
2.138.3 Description . . . 1581
2.138.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1582
2.138.5 Restrictions . . . 1582
2.138.6 Related commands . . . 1582
2.138.7 Default . . . 1582
2.139 fix nve/limit command . . . 1582
2.139.1 Syntax . . . 1582
2.139.2 Examples . . . 1582
2.139.3 Description . . . 1582
2.139.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1583

2.139.5 Restrictions . . . 1583
2.139.6 Related commands . . . 1583
2.139.7 Default . . . 1583
2.140 fix nve/line command . . . 1583
2.140.1 Syntax . . . 1583
2.140.2 Examples . . . 1584
2.140.3 Description . . . 1584
2.140.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1584
2.140.5 Restrictions . . . 1584
2.140.6 Related commands . . . 1584
2.140.7 Default . . . 1584
2.141 fix nve/manifold/rattle command . . . 1584
2.141.1 Syntax . . . 1584
2.141.2 Examples . . . 1585
2.141.3 Description . . . 1585
2.141.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1585
2.141.5 Restrictions . . . 1585
2.141.6 Related commands . . . 1585
2.141.7 Default . . . 1585
2.142 fix nve/noforce command . . . 1586
2.142.1 Syntax . . . 1586
2.142.2 Examples . . . 1586
2.142.3 Description . . . 1586
2.142.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1586
2.142.5 Restrictions . . . 1586
2.142.6 Related commands . . . 1586
2.142.7 Default . . . 1586
2.143 fix nve/sphere command . . . 1586
2.143.1 Syntax . . . 1586
2.143.2 Examples . . . 1587
2.143.3 Description . . . 1587

2.159.6 Related commands . . . 1613
2.159.7 Default . . . 1613
2.160 fix pimd/langevin command . . . 1614
2.161 fix pimd/nvt command . . . 1614
2.162 fix pimd/langevin/bosonic command . . . 1614
2.163 fix pimd/nvt/bosonic command . . . 1614
2.163.1 Syntax . . . 1614
2.163.2 Examples . . . 1615
2.163.3 Description . . . 1615
2.163.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1620
2.163.5 Restrictions . . . 1622
2.163.6 Related commands . . . 1622

2.163.7 Default . . . 1623
2.164 fix planeforce command . . . 1623
2.164.1 Syntax . . . 1623
2.164.2 Examples . . . 1624
2.164.3 Description . . . 1624
2.164.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1624
2.164.5 Restrictions . . . 1624
2.164.6 Related commands . . . 1624
2.164.7 Default . . . 1624
2.165 fix plumed command . . . 1624
2.165.1 Syntax . . . 1624
2.165.2 Examples . . . 1624
2.165.3 Description . . . 1624
2.165.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1625
2.165.5 Restrictions . . . 1625
2.165.6 Related commands . . . 1626
2.165.7 Default . . . 1626
2.166 fix polarize/bem/gmres command . . . 1626
2.167 fix polarize/bem/icc command . . . 1626
2.168 fix polarize/functional command . . . 1626
2.168.1 Syntax . . . 1626
2.168.2 Examples . . . 1626
2.168.3 Description . . . 1626
2.168.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1627
2.168.5 Restrictions . . . 1628
2.168.6 Related commands . . . 1629
2.168.7 Default . . . 1629
2.169 fix pour command . . . 1629
2.169.1 Syntax . . . 1629
2.169.2 Examples . . . 1630
2.169.3 Description . . . 1630
2.169.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1632
2.169.5 Restrictions . . . 1632
2.169.6 Related commands . . . 1633
2.169.7 Default . . . 1633
2.170 fix precession/spin command . . . 1633
2.170.1 Syntax . . . 1633
2.170.2 Examples . . . 1633
2.170.3 Description . . . 1633
2.170.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1635
2.170.5 Restrictions . . . 1635
2.170.6 Related commands . . . 1635
2.170.7 Default . . . 1635
2.171 fix press/berendsen command . . . 1636
2.171.1 Syntax . . . 1636
2.171.2 Examples . . . 1636
2.171.3 Description . . . 1636
2.171.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1638
2.171.5 Restrictions . . . 1638
2.171.6 Related commands . . . 1638
2.171.7 Default . . . 1638
2.172 fix press/langevin command . . . 1639
2.172.1 Syntax . . . 1639
2.172.2 Examples . . . 1639

2.172.3 Description . . . 1639
2.172.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1642
2.172.5 Restrictions . . . 1642
2.172.6 Related commands . . . 1642
2.172.7 Default . . . 1642
2.173 fix print command . . . 1642
2.173.1 Syntax . . . 1642
2.173.2 Examples . . . 1643
2.173.3 Description . . . 1643
2.173.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1644
2.173.5 Restrictions . . . 1644
2.173.6 Related commands . . . 1644
2.173.7 Default . . . 1644
2.174 fix propel/self command . . . 1644
2.174.1 Syntax . . . 1644
2.174.2 Examples . . . 1644
2.174.3 Description . . . 1645
2.174.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1646
2.174.5 Restrictions . . . 1646
2.174.6 Related commands . . . 1646
2.174.7 Default . . . 1646
2.175 fix property/atom command . . . 1646
2.175.1 Syntax . . . 1646
2.175.2 Examples . . . 1647
2.175.3 Description . . . 1647
2.175.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1650
2.175.5 Restrictions . . . 1650
2.175.6 Related commands . . . 1650
2.175.7 Default . . . 1650
2.176 fix python/invoke command . . . 1651
2.176.1 Syntax . . . 1651
2.176.2 Examples . . . 1651
2.176.3 Description . . . 1651
2.176.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1652
2.176.5 Restrictions . . . 1652
2.176.6 Related commands . . . 1652
2.177 fix python/move command . . . 1652
2.177.1 Syntax . . . 1652
2.177.2 Examples . . . 1652
2.177.3 Description . . . 1652
2.177.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1653
2.177.5 Restrictions . . . 1653
2.177.6 Related commands . . . 1653
2.177.7 Default . . . 1653
2.178 fix qbmsst command . . . 1654
2.178.1 Syntax . . . 1654
2.178.2 Examples . . . 1654
2.178.3 Description . . . 1655
2.178.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1656
2.178.5 Restrictions . . . 1657
2.178.6 Related commands . . . 1657
2.178.7 Default . . . 1657
2.179 fix qeq/point command . . . 1657
2.180 fix qeq/shielded command . . . 1657

2.181 fix qeq/slater command . . . 1657
2.182 fix qeq/ctip command . . . 1657
2.183 fix qeq/dynamic command . . . 1657
2.184 fix qeq/fire command . . . 1657
2.184.1 Syntax . . . 1657
2.184.2 Examples . . . 1658
2.184.3 Description . . . 1658
2.184.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1661
2.184.5 Restrictions . . . 1661
2.184.6 Related commands . . . 1661
2.184.7 Default . . . 1661
2.185 fix qeq/comb command . . . 1661
2.185.1 Syntax . . . 1661
2.185.2 Examples . . . 1662
2.185.3 Description . . . 1662
2.185.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1662
2.185.5 Restrictions . . . 1663
2.185.6 Related commands . . . 1663
2.185.7 Default . . . 1663
2.186 fix qeq/reaxff command . . . 1663
2.186.1 Syntax . . . 1663
2.186.2 Examples . . . 1663
2.186.3 Description . . . 1664
2.186.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1664
2.186.5 Restrictions . . . 1665
2.186.6 Related commands . . . 1665
2.186.7 Default . . . 1665
2.187 fix qeq/rel/reaxff command . . . 1665
2.187.1 Syntax . . . 1665
2.187.2 Examples . . . 1666
2.187.3 Description . . . 1666
2.187.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1667

2.225.6 Related commands . . . 1735
2.225.7 Default . . . 1735
2.226 fix smd/setvel command . . . 1735
2.226.1 Syntax . . . 1735
2.226.2 Examples . . . 1736
2.226.3 Description . . . 1736
2.226.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1736
2.226.5 Restrictions . . . 1736
2.226.6 Related commands . . . 1736
2.226.7 Default . . . 1736
2.227 fix smd/wall_surface command . . . 1737
2.227.1 Syntax . . . 1737
2.227.2 Examples . . . 1737

2.227.3 Description . . . 1737
2.227.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1737
2.227.5 Restrictions . . . 1737
2.227.6 Related commands . . . 1737
2.227.7 Default . . . 1738
2.228 fix sph command . . . 1738
2.228.1 Syntax . . . 1738
2.228.2 Examples . . . 1738
2.228.3 Description . . . 1738
2.228.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1738
2.228.5 Restrictions . . . 1738
2.228.6 Related commands . . . 1738
2.228.7 Default . . . 1738
2.229 fix sph/stationary command . . . 1739
2.229.1 Syntax . . . 1739
2.229.2 Examples . . . 1739
2.229.3 Description . . . 1739
2.229.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1739
2.229.5 Restrictions . . . 1739
2.229.6 Related commands . . . 1739
2.229.7 Default . . . 1739
2.230 fix spring command . . . 1739
2.230.1 Syntax . . . 1739
2.230.2 Examples . . . 1740
2.230.3 Description . . . 1740
2.230.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1741
2.230.5 Restrictions . . . 1741
2.230.6 Related commands . . . 1741
2.230.7 Default . . . 1741
2.231 fix spring/chunk command . . . 1742
2.231.1 Syntax . . . 1742
2.231.2 Examples . . . 1742
2.231.3 Description . . . 1742
2.231.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1742
2.231.5 Restrictions . . . 1743
2.231.6 Related commands . . . 1743
2.231.7 Default . . . 1743
2.232 fix spring/rg command . . . 1743
2.232.1 Syntax . . . 1743
2.232.2 Examples . . . 1743
2.232.3 Description . . . 1743
2.232.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1744
2.232.5 Restrictions . . . 1744
2.232.6 Related commands . . . 1744
2.232.7 Default . . . 1744
2.233 fix spring/self command . . . 1744
2.233.1 Syntax . . . 1744
2.233.2 Examples . . . 1744
2.233.3 Description . . . 1745
2.233.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1745
2.233.5 Restrictions . . . 1746
2.233.6 Related commands . . . 1746
2.233.7 Default . . . 1746
2.234 fix srd command . . . 1746

2.234.1 Syntax . . . 1746
2.234.2 Examples . . . 1747
2.234.3 Description . . . 1747
2.234.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1750
2.234.5 Restrictions . . . 1751
2.234.6 Related commands . . . 1751
2.234.7 Default . . . 1751
2.235 fix store/force command . . . 1751
2.235.1 Syntax . . . 1751
2.235.2 Examples . . . 1751
2.235.3 Description . . . 1751
2.235.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1752
2.235.5 Restrictions . . . 1752
2.235.6 Related commands . . . 1752
2.235.7 Default . . . 1752
2.236 fix store/state command . . . 1752
2.236.1 Syntax . . . 1752
2.236.2 Examples . . . 1753
2.236.3 Description . . . 1753
2.236.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1754
2.236.5 Restrictions . . . 1754
2.236.6 Related commands . . . 1754
2.236.7 Default . . . 1754
2.237 fix temp/berendsen command . . . 1754
2.237.1 Syntax . . . 1754
2.237.2 Examples . . . 1755
2.237.3 Description . . . 1755
2.237.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1756
2.237.5 Restrictions . . . 1756
2.237.6 Related commands . . . 1757
2.237.7 Default . . . 1757
2.238 fix temp/csvr command . . . 1757
2.239 fix temp/csld command . . . 1757
2.239.1 Syntax . . . 1757
2.239.2 Examples . . . 1757
2.239.3 Description . . . 1757
2.239.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1758
2.239.5 Restrictions . . . 1759
2.239.6 Related commands . . . 1759
2.239.7 Default . . . 1759
2.240 fix temp/rescale command . . . 1759
2.240.1 Syntax . . . 1759
2.240.2 Examples . . . 1760
2.240.3 Description . . . 1760
2.240.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1761
2.240.5 Restrictions . . . 1761
2.240.6 Related commands . . . 1762
2.240.7 Default . . . 1762
2.241 fix temp/rescale/eff command . . . 1762
2.241.1 Syntax . . . 1762
2.241.2 Examples . . . 1762
2.241.3 Description . . . 1762
2.241.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1762
2.241.5 Restrictions . . . 1763

2.241.6 Related commands . . . 1763
2.241.7 Default . . . 1763
2.242 fix tfmc command . . . 1763
2.242.1 Syntax . . . 1763
2.242.2 Examples . . . 1763
2.242.3 Description . . . 1763
2.242.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1764
2.242.5 Restrictions . . . 1764
2.242.6 Related commands . . . 1765
2.242.7 Default . . . 1765
2.243 fix tgnvt/drude command . . . 1765
2.244 fix tgnpt/drude command . . . 1765
2.244.1 Syntax . . . 1765
2.244.2 Examples . . . 1766
2.244.3 Description . . . 1766
2.244.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1768
2.244.5 Restrictions . . . 1768
2.244.6 Related commands . . . 1769
2.244.7 Default . . . 1769
2.245 fix thermal/conductivity command . . . 1769
2.245.1 Syntax . . . 1769
2.245.2 Examples . . . 1769
2.245.3 Description . . . 1769
2.245.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1770
2.245.5 Restrictions . . . 1771
2.245.6 Related commands . . . 1771
2.245.7 Default . . . 1771
2.246 fix ti/spring command . . . 1771
2.246.1 Syntax . . . 1771
2.246.2 Example . . . 1772
2.246.3 Description . . . 1772
2.246.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1773
2.246.5 Related commands . . . 1773
2.246.6 Restrictions . . . 1773
2.246.7 Default . . . 1773
2.247 fix tmd command . . . 1773
2.247.1 Syntax . . . 1773
2.247.2 Examples . . . 1774
2.247.3 Description . . . 1774
2.247.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1775
2.247.5 Restrictions . . . 1775
2.247.6 Related commands . . . 1775
2.247.7 Default . . . 1775
2.248 fix ttm command . . . 1775
2.249 fix ttm/grid command . . . 1775
2.250 fix ttm/mod command . . . 1775
2.250.1 Syntax . . . 1775
2.250.2 Examples . . . 1776
2.250.3 Description . . . 1776
2.250.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1780
2.250.5 Restrictions . . . 1780
2.250.6 Related commands . . . 1780
2.250.7 Default . . . 1780
2.251 fix tune/kspace command . . . 1781

2.251.1 Syntax . . . 1781
2.251.2 Examples . . . 1781
2.251.3 Description . . . 1781
2.251.4 Restrictions . . . 1782
2.251.5 Related commands . . . 1782
2.251.6 Default . . . 1782
2.252 fix vector command . . . 1782
2.252.1 Syntax . . . 1782
2.252.2 Examples . . . 1782
2.252.3 Description . . . 1783
2.252.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1784
2.252.5 Restrictions . . . 1784
2.252.6 Related commands . . . 1784
2.252.7 Defaults . . . 1784
2.253 fix viscosity command . . . 1784
2.253.1 Syntax . . . 1784
2.253.2 Examples . . . 1785
2.253.3 Description . . . 1785
2.253.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1786
2.253.5 Restrictions . . . 1786
2.253.6 Related commands . . . 1786
2.253.7 Default . . . 1787
2.254 fix viscous command . . . 1787
2.254.1 Syntax . . . 1787
2.254.2 Examples . . . 1787
2.254.3 Description . . . 1787
2.254.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1788
2.254.5 Restrictions . . . 1788
2.254.6 Related commands . . . 1788
2.254.7 Default . . . 1788
2.255 fix viscous/sphere command . . . 1788
2.255.1 Syntax . . . 1788
2.255.2 Examples . . . 1789
2.255.3 Description . . . 1789
2.255.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1789
2.255.5 Restrictions . . . 1790
2.255.6 Related commands . . . 1790
2.255.7 Default . . . 1790
2.256 fix wall/lj93 command . . . 1790
2.257 fix wall/lj126 command . . . 1790
2.258 fix wall/lj1043 command . . . 1790
2.259 fix wall/colloid command . . . 1790
2.260 fix wall/harmonic command . . . 1790
2.261 fix wall/lepton command . . . 1790
2.262 fix wall/morse command . . . 1790
2.263 fix wall/table command . . . 1790
2.263.1 Syntax . . . 1790
2.263.2 Examples . . . 1792
2.263.3 Description . . . 1792
2.263.4 Lepton expression syntax and features . . . 1795
2.263.5 Table file format . . . 1796

2.274.7 Default . . . 1823
2.275 fix wall/srd command . . . 1823
2.275.1 Syntax . . . 1823
2.275.2 Examples . . . 1824
2.275.3 Description . . . 1824
2.275.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1825
2.275.5 Restrictions . . . 1826
2.275.6 Related commands . . . 1826
2.275.7 Default . . . 1826
2.276 fix widom command . . . 1826
2.276.1 Syntax . . . 1826
2.276.2 Examples . . . 1826
2.276.3 Description . . . 1826
2.276.4 Restart, fix_modify, output, run start/stop, minimize info . . . 1828
2.276.5 Restrictions . . . 1828
2.276.6 Related commands . . . 1828
2.276.7 Default . . . 1828

3 Compute Styles 1831
3.1 compute ackland/atom command . . . 1831
3.1.1 Syntax . . . 1831
3.1.2 Examples . . . 1831
3.1.3 Description . . . 1831
3.1.4 Output info . . . 1832
3.1.5 Restrictions . . . 1832
3.1.6 Related commands . . . 1832
3.1.7 Default . . . 1832
3.2 compute adf command . . . 1832

3.2.1 Syntax . . . 1832
3.2.2 Examples . . . 1833
3.2.3 Description . . . 1833
3.2.4 Output info . . . 1834
3.2.5 Restrictions . . . 1835
3.2.6 Related commands . . . 1835
3.2.7 Default . . . 1835
3.3 compute angle command . . . 1835
3.3.1 Syntax . . . 1835
3.3.2 Examples . . . 1835
3.3.3 Description . . . 1835
3.3.4 Output info . . . 1836
3.3.5 Restrictions . . . 1836
3.3.6 Related commands . . . 1836
3.3.7 Default . . . 1836
3.4 compute angle/local command . . . 1836
3.4.1 Syntax . . . 1836
3.4.2 Examples . . . 1836
3.4.3 Description . . . 1837
3.4.4 Output info . . . 1838
3.4.5 Restrictions . . . 1838
3.4.6 Related commands . . . 1838
3.4.7 Default . . . 1838
3.5 compute angmom/chunk command . . . 1838
3.5.1 Syntax . . . 1838
3.5.2 Examples . . . 1838
3.5.3 Description . . . 1838
3.5.4 Output info . . . 1839
3.5.5 Restrictions . . . 1839
3.5.6 Related commands . . . 1839
3.5.7 Default . . . 1839
3.6 compute ave/sphere/atom command . . . 1839
3.6.1 Syntax . . . 1839
3.6.2 Examples . . . 1840
3.6.3 Description . . . 1840
3.6.4 Output info . . . 1840
3.6.5 Restrictions . . . 1841
3.6.6 Related commands . . . 1841
3.6.7 Default . . . 1841
3.7 compute basal/atom command . . . 1841
3.7.1 Syntax . . . 1841
3.7.2 Examples . . . 1841
3.7.3 Description . . . 1841
3.7.4 Output info . . . 1841
3.7.5 Restrictions . . . 1842
3.7.6 Related commands . . . 1842
3.7.7 Default . . . 1842
3.8 compute body/local command . . . 1842
3.8.1 Syntax . . . 1842
3.8.2 Examples . . . 1842
3.8.3 Description . . . 1842
3.8.4 Output info . . . 1843
3.8.5 Restrictions . . . 1843
3.8.6 Related commands . . . 1843

3.8.7 Default . . . 1843
3.9 compute bond command . . . 1843
3.9.1 Syntax . . . 1843
3.9.2 Examples . . . 1843
3.9.3 Description . . . 1844
3.9.4 Output info . . . 1844
3.9.5 Restrictions . . . 1844
3.9.6 Related commands . . . 1844
3.9.7 Default . . . 1844
3.10 compute bond/local command . . . 1844
3.10.1 Syntax . . . 1844
3.10.2 Examples . . . 1845
3.10.3 Description . . . 1845
3.10.4 Output info . . . 1847
3.10.5 Restrictions . . . 1847
3.10.6 Related commands . . . 1847
3.10.7 Default . . . 1847
3.11 compute born/matrix command . . . 1847
3.11.1 Syntax . . . 1847
3.11.2 Examples . . . 1848
3.11.3 Description . . . 1848
3.11.4 Restrictions . . . 1850
3.11.5 Default . . . 1850
3.12 compute centro/atom command . . . 1850
3.12.1 Syntax . . . 1850
3.12.2 Examples . . . 1850
3.12.3 Description . . . 1850
3.12.4 Output info . . . 1851
3.12.5 Restrictions . . . 1852
3.12.6 Related commands . . . 1852
3.12.7 Default . . . 1852
3.13 compute chunk/atom command . . . 1852
3.13.1 Syntax . . . 1852
3.13.2 Examples . . . 1853
3.13.3 Description . . . 1854
3.13.4 Output info . . . 1860
3.13.5 Restrictions . . . 1860
3.13.6 Related commands . . . 1860
3.13.7 Default . . . 1860
3.14 compute chunk/spread/atom command . . . 1860
3.14.1 Syntax . . . 1860
3.14.2 Examples . . . 1861
3.14.3 Description . . . 1861
3.14.4 Output info . . . 1863
3.14.5 Restrictions . . . 1863
3.14.6 Related commands . . . 1863
3.14.7 Default . . . 1863
3.15 compute cluster/atom command . . . 1863
3.16 compute fragment/atom command . . . 1863
3.17 compute aggregate/atom command . . . 1863
3.17.1 Syntax . . . 1863
3.17.2 Examples . . . 1864
3.17.3 Description . . . 1864
3.17.4 Output info . . . 1865

3.17.5 Restrictions . . . 1865
3.17.6 Related commands . . . 1865
3.17.7 Default . . . 1865
3.18 compute cna/atom command . . . 1865
3.18.1 Syntax . . . 1865
3.18.2 Examples . . . 1865
3.18.3 Description . . . 1865
3.18.4 Output info . . . 1866
3.18.5 Restrictions . . . 1866
3.18.6 Related commands . . . 1866
3.18.7 Default . . . 1866
3.19 compute cnp/atom command . . . 1867
3.19.1 Syntax . . . 1867
3.19.2 Examples . . . 1867
3.19.3 Description . . . 1867
3.19.4 Output info . . . 1868
3.19.5 Restrictions . . . 1868
3.19.6 Related commands . . . 1868
3.19.7 Default . . . 1868
3.20 compute com command . . . 1868
3.20.1 Syntax . . . 1868
3.20.2 Examples . . . 1868
3.20.3 Description . . . 1868
3.20.4 Output info . . . 1869
3.20.5 Restrictions . . . 1869
3.20.6 Related commands . . . 1869
3.20.7 Default . . . 1869
3.21 compute com/chunk command . . . 1869
3.21.1 Syntax . . . 1869
3.21.2 Examples . . . 1869
3.21.3 Description . . . 1869
3.21.4 Output info . . . 1870
3.21.5 Restrictions . . . 1870
3.21.6 Related commands . . . 1870
3.21.7 Default . . . 1870
3.22 compute composition/atom command . . . 1870
3.22.1 Syntax . . . 1870
3.22.2 Examples . . . 1871
3.22.3 Description . . . 1871
3.22.4 Output info . . . 1872
3.22.5 Restrictions . . . 1872
3.22.6 Related commands . . . 1872
3.22.7 Default . . . 1872
3.23 compute contact/atom command . . . 1872
3.23.1 Syntax . . . 1872
3.23.2 Examples . . . 1872
3.23.3 Description . . . 1872
3.23.4 Output info . . . 1873
3.23.5 Restrictions . . . 1873
3.23.6 Related commands . . . 1873
3.23.7 Default . . . 1873
3.24 compute coord/atom command . . . 1873
3.24.1 Syntax . . . 1873
3.24.2 Examples . . . 1873

3.24.3 Description . . . 1874
3.24.4 Output info . . . 1875
3.24.5 Restrictions . . . 1875
3.24.6 Related commands . . . 1875
3.24.7 Default . . . 1875
3.25 compute count/type command . . . 1875
3.25.1 Syntax . . . 1875
3.25.2 Examples . . . 1875
3.25.3 Description . . . 1876
3.25.4 Output info . . . 1877
3.25.5 Restrictions . . . 1877
3.25.6 Related commands . . . 1877
3.25.7 Default . . . 1877
3.26 compute damage/atom command . . . 1877
3.26.1 Syntax . . . 1877
3.26.2 Examples . . . 1877
3.26.3 Description . . . 1877
3.26.4 Output info . . . 1878
3.26.5 Restrictions . . . 1878
3.26.6 Related commands . . . 1878
3.26.7 Default . . . 1878
3.27 compute dihedral command . . . 1878
3.27.1 Syntax . . . 1878
3.27.2 Examples . . . 1878
3.27.3 Description . . . 1878
3.27.4 Output info . . . 1878
3.27.5 Restrictions . . . 1879
3.27.6 Related commands . . . 1879
3.27.7 Default . . . 1879
3.28 compute dihedral/local command . . . 1879
3.28.1 Syntax . . . 1879
3.28.2 Examples . . . 1879
3.28.3 Description . . . 1879
3.28.4 Output info . . . 1880
3.28.5 Restrictions . . . 1880
3.28.6 Related commands . . . 1880
3.28.7 Default . . . 1881
3.29 compute dilatation/atom command . . . 1881
3.29.1 Syntax . . . 1881
3.29.2 Examples . . . 1881
3.29.3 Description . . . 1881
3.29.4 Output info . . . 1881
3.29.5 Restrictions . . . 1881
3.29.6 Related commands . . . 1881
3.29.7 Default . . . 1881
3.30 compute dipole command . . . 1882
3.31 compute dipole/tip4p command . . . 1882
3.31.1 Syntax . . . 1882
3.31.2 Examples . . . 1882
3.31.3 Description . . . 1882
3.31.4 Output info . . . 1882
3.31.5 Restrictions . . . 1882
3.31.6 Related commands . . . 1883
3.31.7 Default . . . 1883

3.32 compute dipole/chunk command . . . 1883
3.33 compute dipole/tip4p/chunk command . . . 1883
3.33.1 Syntax . . . 1883
3.33.2 Examples . . . 1883
3.33.3 Description . . . 1883
3.33.4 Output info . . . 1884
3.33.5 Restrictions . . . 1884
3.33.6 Related commands . . . 1884
3.33.7 Default . . . 1884
3.34 compute displace/atom command . . . 1884
3.34.1 Syntax . . . 1884
3.34.2 Examples . . . 1885
3.34.3 Description . . . 1885
3.34.4 Output info . . . 1886
3.34.5 Restrictions . . . 1886
3.34.6 Related commands . . . 1886
3.34.7 Default . . . 1886
3.35 compute dpd command . . . 1886
3.35.1 Syntax . . . 1886
3.35.2 Examples . . . 1886
3.35.3 Description . . . 1887
3.35.4 Output info . . . 1887
3.35.5 Restrictions . . . 1887
3.35.6 Related commands . . . 1887
3.35.7 Default . . . 1887
3.36 compute dpd/atom command . . . 1888
3.36.1 Syntax . . . 1888
3.36.2 Examples . . . 1888
3.36.3 Description . . . 1888
3.36.4 Output info . . . 1888
3.36.5 Restrictions . . . 1888
3.36.6 Related commands . . . 1888
3.36.7 Default . . . 1888
3.37 compute edpd/temp/atom command . . . 1888
3.37.1 Syntax . . . 1888
3.37.2 Examples . . . 1889
3.37.3 Description . . . 1889
3.37.4 Output info . . . 1889
3.37.5 Restrictions . . . 1889
3.37.6 Related commands . . . 1889
3.37.7 Default . . . 1889
3.38 compute efield/atom command . . . 1889
3.38.1 Syntax . . . 1889
3.38.2 Examples . . . 1890
3.38.3 Description . . . 1890
3.38.4 Output info . . . 1890
3.38.5 Restrictions . . . 1890
3.38.6 Related commands . . . 1890
3.38.7 Default . . . 1890
3.39 compute efield/wolf/atom command . . . 1890
3.39.1 Syntax . . . 1890
3.39.2 Examples . . . 1891
3.39.3 Description . . . 1891
3.39.4 Output info . . . 1891

3.39.5 Restrictions . . . 1892
3.39.6 Related commands . . . 1892
3.39.7 Default . . . 1892
3.40 compute entropy/atom command . . . 1892
3.40.1 Syntax . . . 1892
3.40.2 Examples . . . 1892
3.40.3 Description . . . 1892
3.40.4 Output info . . . 1893
3.40.5 Restrictions . . . 1893
3.40.6 Related commands . . . 1893
3.40.7 Default . . . 1894
3.41 compute erotate/asphere command . . . 1894
3.41.1 Syntax . . . 1894
3.41.2 Examples . . . 1894
3.41.3 Description . . . 1894
3.41.4 Output info . . . 1894
3.41.5 Restrictions . . . 1894
3.41.6 Related commands . . . 1895
3.41.7 Default . . . 1895
3.42 compute erotate/rigid command . . . 1895
3.42.1 Syntax . . . 1895
3.42.2 Examples . . . 1895
3.42.3 Description . . . 1895
3.42.4 Output info . . . 1895
3.42.5 Restrictions . . . 1895
3.42.6 Related commands . . . 1895
3.42.7 Default . . . 1896
3.43 compute erotate/sphere command . . . 1896
3.43.1 Syntax . . . 1896
3.43.2 Examples . . . 1896
3.43.3 Description . . . 1896
3.43.4 Output info . . . 1896
3.43.5 Restrictions . . . 1897
3.43.6 Related commands . . . 1897
3.43.7 Default . . . 1897
3.44 compute erotate/sphere/atom command . . . 1897
3.44.1 Syntax . . . 1897
3.44.2 Examples . . . 1897
3.44.3 Description . . . 1897
3.44.4 Output info . . . 1897
3.44.5 Restrictions . . . 1898
3.44.6 Related commands . . . 1898
3.44.7 Default . . . 1898
3.45 compute event/displace command . . . 1898
3.45.1 Syntax . . . 1898
3.45.2 Examples . . . 1898
3.45.3 Description . . . 1898
3.45.4 Output info . . . 1898
3.45.5 Restrictions . . . 1899
3.45.6 Related commands . . . 1899
3.45.7 Default . . . 1899
3.46 compute fabric command . . . 1899
3.46.1 Syntax . . . 1899
3.46.2 Examples . . . 1899

3.46.3 Description . . . 1899
3.46.4 Output info . . . 1901
3.46.5 Restrictions . . . 1901
3.46.6 Related commands . . . 1901
3.46.7 Default . . . 1901
3.47 compute fep command . . . 1901
3.47.1 Syntax . . . 1901
3.47.2 Examples . . . 1902
3.47.3 Description . . . 1902
3.47.4 Output info . . . 1904
3.47.5 Restrictions . . . 1904
3.47.6 Related commands . . . 1905
3.47.7 Default . . . 1905
3.48 compute fep/ta command . . . 1905
3.48.1 Syntax . . . 1905
3.48.2 Examples . . . 1905
3.48.3 Description . . . 1905
3.48.4 Output info . . . 1906
3.48.5 Restrictions . . . 1906
3.48.6 Related commands . . . 1906
3.48.7 Default . . . 1906
3.49 compute gaussian/grid/local command . . . 1906
3.49.1 Syntax . . . 1906
3.49.2 Examples . . . 1907
3.49.3 Description . . . 1907
3.49.4 Output info . . . 1907
3.49.5 Restrictions . . . 1907
3.49.6 Related commands . . . 1907
3.50 compute global/atom command . . . 1908
3.50.1 Syntax . . . 1908
3.50.2 Examples . . . 1908
3.50.3 Description . . . 1908
3.50.4 Output info . . . 1910
3.50.5 Restrictions . . . 1910
3.50.6 Related commands . . . 1910
3.50.7 Default . . . 1911
3.51 compute group/group command . . . 1911
3.51.1 Syntax . . . 1911
3.51.2 Examples . . . 1911
3.51.3 Description . . . 1911
3.51.4 Output info . . . 1912
3.51.5 Restrictions . . . 1912
3.51.6 Related commands . . . 1913
3.51.7 Default . . . 1913
3.52 compute gyration command . . . 1913
3.52.1 Syntax . . . 1913
3.52.2 Examples . . . 1913
3.52.3 Description . . . 1913
3.52.4 Output info . . . 1914
3.52.5 Restrictions . . . 1914
3.52.6 Related commands . . . 1914
3.52.7 Default . . . 1914
3.53 compute gyration/chunk command . . . 1914
3.53.1 Syntax . . . 1914

3.53.2 Examples . . . 1914
3.53.3 Description . . . 1914
3.53.4 Output info . . . 1915
3.53.5 Restrictions . . . 1915
3.53.6 Related commands . . . 1915
3.53.7 Default . . . 1916
3.54 compute gyration/shape command . . . 1916
3.54.1 Syntax . . . 1916
3.54.2 Examples . . . 1916
3.54.3 Description . . . 1916
3.54.4 Output info . . . 1917
3.54.5 Restrictions . . . 1917
3.54.6 Related commands . . . 1917
3.54.7 Default . . . 1917
3.55 compute gyration/shape/chunk command . . . 1917
3.55.1 Syntax . . . 1917
3.55.2 Examples . . . 1917
3.55.3 Description . . . 1917
3.55.4 Output info . . . 1918
3.55.5 Restrictions . . . 1918
3.55.6 Related commands . . . 1918
3.55.7 Default . . . 1918
3.56 compute heat/flux command . . . 1918
3.56.1 Syntax . . . 1918
3.56.2 Examples . . . 1919
3.56.3 Description . . . 1919
3.56.4 Output info . . . 1920
3.56.5 Restrictions . . . 1921
3.56.6 Related commands . . . 1921
3.56.7 Default . . . 1921
3.57 compute hexorder/atom command . . . 1922
3.57.1 Syntax . . . 1922
3.57.2 Examples . . . 1922
3.57.3 Description . . . 1923
3.57.4 Output info . . . 1923
3.57.5 Restrictions . . . 1923
3.57.6 Related commands . . . 1924
3.57.7 Default . . . 1924
3.58 compute hma command . . . 1924
3.58.1 Syntax . . . 1924
3.58.2 Examples . . . 1924
3.58.3 Description . . . 1924
3.58.4 Output info . . . 1926
3.58.5 Restrictions . . . 1926
3.58.6 Related commands . . . 1926
3.58.7 Default . . . 1926
3.59 compute improper command . . . 1927
3.59.1 Syntax . . . 1927
3.59.2 Examples . . . 1927
3.59.3 Description . . . 1927
3.59.4 Output info . . . 1927
3.59.5 Restrictions . . . 1927
3.59.6 Related commands . . . 1927
3.59.7 Default . . . 1927

3.60 compute improper/local command . . . 1927
3.60.1 Syntax . . . 1927
3.60.2 Examples . . . 1928
3.60.3 Description . . . 1928
3.60.4 Output info . . . 1928
3.60.5 Restrictions . . . 1928
3.60.6 Related commands . . . 1928
3.60.7 Default . . . 1928
3.61 compute inertia/chunk command . . . 1929
3.61.1 Syntax . . . 1929
3.61.2 Examples . . . 1929
3.61.3 Description . . . 1929
3.61.4 Output info . . . 1929
3.61.5 Restrictions . . . 1930
3.61.6 Related commands . . . 1930
3.61.7 Default . . . 1930
3.62 compute ke command . . . 1930
3.62.1 Syntax . . . 1930
3.62.2 Examples . . . 1930
3.62.3 Description . . . 1930
3.62.4 Output info . . . 1930
3.62.5 Restrictions . . . 1930
3.62.6 Related commands . . . 1931
3.62.7 Default . . . 1931
3.63 compute ke/atom command . . . 1931
3.63.1 Syntax . . . 1931
3.63.2 Examples . . . 1931
3.63.3 Description . . . 1931
3.63.4 Output info . . . 1931
3.63.5 Restrictions . . . 1931
3.63.6 Related commands . . . 1931
3.63.7 Default . . . 1931
3.64 compute ke/atom/eff command . . . 1931
3.64.1 Syntax . . . 1931
3.64.2 Examples . . . 1932
3.64.3 Description . . . 1932
3.64.4 Output info . . . 1932
3.64.5 Restrictions . . . 1932
3.64.6 Related commands . . . 1932
3.64.7 Default . . . 1933
3.65 compute ke/eff command . . . 1933
3.65.1 Syntax . . . 1933
3.65.2 Examples . . . 1933
3.65.3 Description . . . 1933
3.65.4 Output info . . . 1933
3.65.5 Restrictions . . . 1934
3.65.6 Related commands . . . 1934
3.65.7 Default . . . 1934
3.66 compute ke/rigid command . . . 1934
3.66.1 Syntax . . . 1934
3.66.2 Examples . . . 1934
3.66.3 Description . . . 1934
3.66.4 Output info . . . 1934
3.66.5 Restrictions . . . 1934

3.66.6 Related commands . . . 1935
3.66.7 Default . . . 1935
3.67 compute mliap command . . . 1935
3.67.1 Syntax . . . 1935
3.67.2 Examples . . . 1935
3.67.3 Description . . . 1935
3.67.4 Output info . . . 1937
3.67.5 Restrictions . . . 1937
3.67.6 Related commands . . . 1937
3.67.7 Default . . . 1937
3.68 compute momentum command . . . 1937
3.68.1 Syntax . . . 1937
3.68.2 Examples . . . 1937
3.68.3 Description . . . 1937
3.68.4 Output info . . . 1938
3.68.5 Restrictions . . . 1938
3.68.6 Related commands . . . 1938
3.68.7 Default . . . 1938
3.69 compute msd command . . . 1938
3.69.1 Syntax . . . 1938
3.69.2 Examples . . . 1938
3.69.3 Description . . . 1938
3.69.4 Output info . . . 1939
3.69.5 Restrictions . . . 1939
3.69.6 Related commands . . . 1939
3.69.7 Default . . . 1939
3.70 compute msd/chunk command . . . 1940
3.70.1 Syntax . . . 1940
3.70.2 Examples . . . 1940
3.70.3 Description . . . 1940
3.70.4 Output info . . . 1941
3.70.5 Restrictions . . . 1941
3.70.6 Related commands . . . 1941
3.70.7 Default . . . 1941
3.71 compute msd/nongauss command . . . 1941
3.71.1 Syntax . . . 1941
3.71.2 Examples . . . 1942
3.71.3 Description . . . 1942
3.71.4 Output info . . . 1942
3.71.5 Restrictions . . . 1942
3.71.6 Related commands . . . 1942
3.71.7 Default . . . 1942
3.72 compute nbond/atom command . . . 1943
3.72.1 Syntax . . . 1943
3.72.2 Examples . . . 1943
3.72.3 Description . . . 1943
3.72.4 Output info . . . 1943
3.72.5 Restrictions . . . 1943
3.72.6 Related commands . . . 1943
3.72.7 Default . . . 1943
3.73 compute omega/chunk command . . . 1943
3.73.1 Syntax . . . 1943
3.73.2 Examples . . . 1944
3.73.3 Description . . . 1944

3.73.4 Output info . . . 1944
3.73.5 Restrictions . . . 1944
3.73.6 Related commands . . . 1945
3.73.7 Default . . . 1945
3.74 compute orientorder/atom command . . . 1945
3.74.1 Syntax . . . 1945
3.74.2 Examples . . . 1945
3.74.3 Description . . . 1945
3.74.4 Output info . . . 1947
3.74.5 Restrictions . . . 1947
3.74.6 Related commands . . . 1947
3.74.7 Default . . . 1947
3.75 compute pace command . . . 1948
3.75.1 Syntax . . . 1948
3.75.2 Examples . . . 1948
3.75.3 Description . . . 1948
3.75.4 Output info . . . 1950
3.75.5 Restrictions . . . 1950
3.75.6 Related commands . . . 1950
3.75.7 Default . . . 1951
3.76 compute pair command . . . 1951
3.76.1 Syntax . . . 1951
3.76.2 Examples . . . 1951
3.76.3 Description . . . 1951
3.76.4 Output info . . . 1952
3.76.5 Restrictions . . . 1952
3.76.6 Related commands . . . 1952
3.76.7 Default . . . 1952
3.77 compute pair/local command . . . 1952
3.77.1 Syntax . . . 1952
3.77.2 Examples . . . 1953
3.77.3 Description . . . 1953
3.77.4 Output info . . . 1954
3.77.5 Restrictions . . . 1954
3.77.6 Related commands . . . 1954
3.77.7 Default . . . 1954
3.78 compute pe command . . . 1955
3.78.1 Syntax . . . 1955
3.78.2 Examples . . . 1955
3.78.3 Description . . . 1955
3.78.4 Output info . . . 1955
3.78.5 Restrictions . . . 1956
3.78.6 Related commands . . . 1956
3.78.7 Default . . . 1956
3.79 compute pe/atom command . . . 1956
3.79.1 Syntax . . . 1956
3.79.2 Examples . . . 1956
3.79.3 Description . . . 1956
3.79.4 Output info . . . 1957
3.79.5 Restrictions . . . 1957
3.79.6 Related commands . . . 1957
3.79.7 Default . . . 1957
3.80 compute plasticity/atom command . . . 1957
3.80.1 Syntax . . . 1957

3.80.2 Examples . . . 1958
3.80.3 Description . . . 1958
3.80.4 Output info . . . 1958
3.80.5 Restrictions . . . 1958
3.80.6 Related commands . . . 1958
3.80.7 Default . . . 1958
3.81 compute pod/atom command . . . 1958
3.82 compute podd/atom command . . . 1958
3.83 compute pod/local command . . . 1958
3.84 compute pod/global command . . . 1958
3.84.1 Syntax . . . 1958
3.84.2 Examples . . . 1959
3.84.3 Description . . . 1959
3.84.4 Output info . . . 1959
3.84.5 Restrictions . . . 1960
3.84.6 Related commands . . . 1960
3.84.7 Default . . . 1960
3.85 compute pressure command . . . 1960
3.85.1 Syntax . . . 1960
3.85.2 Examples . . . 1960
3.85.3 Description . . . 1960
3.85.4 Output info . . . 1961
3.85.5 Restrictions . . . 1962
3.85.6 Related commands . . . 1962
3.85.7 Default . . . 1962
3.86 compute pressure/alchemy command . . . 1962
3.86.1 Syntax . . . 1962
3.86.2 Examples . . . 1962
3.86.3 Description . . . 1962
3.86.4 Output info . . . 1963
3.86.5 Restrictions . . . 1963
3.86.6 Related commands . . . 1963
3.86.7 Default . . . 1963
3.87 compute pressure/uef command . . . 1963
3.87.1 Syntax . . . 1963
3.87.2 Examples . . . 1963
3.87.3 Description . . . 1963
3.87.4 Restrictions . . . 1964
3.87.5 Related commands . . . 1964
3.87.6 Default . . . 1964
3.88 compute property/atom command . . . 1964
3.88.1 Syntax . . . 1964
3.88.2 Examples . . . 1966
3.88.3 Description . . . 1966
3.88.4 Output info . . . 1967
3.88.5 Restrictions . . . 1967
3.88.6 Related commands . . . 1967
3.88.7 Default . . . 1967
3.89 compute property/chunk command . . . 1967
3.89.1 Syntax . . . 1967
3.89.2 Examples . . . 1967
3.89.3 Description . . . 1967
3.89.4 Output info . . . 1968
3.89.5 Restrictions . . . 1968

3.89.6 Related commands . . . 1969
3.89.7 Default . . . 1969
3.90 compute property/grid command . . . 1969
3.90.1 Syntax . . . 1969
3.90.2 Examples . . . 1969
3.90.3 Description . . . 1969
3.90.4 Output info . . . 1970
3.90.5 Restrictions . . . 1970
3.90.6 Related commands . . . 1970
3.90.7 Default . . . 1970
3.91 compute property/local command . . . 1970
3.91.1 Syntax . . . 1970
3.91.2 Examples . . . 1971
3.91.3 Description . . . 1971
3.91.4 Output info . . . 1972
3.91.5 Restrictions . . . 1972
3.91.6 Related commands . . . 1973
3.91.7 Default . . . 1973
3.92 compute ptm/atom command . . . 1973
3.92.1 Syntax . . . 1973
3.92.2 Examples . . . 1973
3.92.3 Description . . . 1973
3.92.4 Output info . . . 1974
3.92.5 Restrictions . . . 1974
3.92.6 Related commands . . . 1975
3.92.7 Default . . . 1975
3.93 compute rattlers/atom command . . . 1975
3.93.1 Syntax . . . 1975
3.93.2 Examples . . . 1975
3.93.3 Description . . . 1975
3.93.4 Output info . . . 1976
3.93.5 Restrictions . . . 1976
3.93.6 Related commands . . . 1976
3.93.7 Default . . . 1976
3.94 compute rdf command . . . 1976
3.94.1 Syntax . . . 1976
3.94.2 Examples . . . 1976
3.94.3 Description . . . 1976
3.94.4 Output info . . . 1978
3.94.5 Restrictions . . . 1978
3.94.6 Related commands . . . 1979
3.94.7 Default . . . 1979
3.95 compute reaxff/atom command . . . 1979
3.95.1 Syntax . . . 1979
3.95.2 Examples . . . 1979
3.95.3 Description . . . 1979
3.95.4 Output info . . . 1980
3.95.5 Restrictions . . . 1980
3.95.6 Related commands . . . 1980
3.95.7 Default . . . 1980
3.96 compute reduce command . . . 1980
3.97 compute reduce/region command . . . 1980
3.97.1 Syntax . . . 1980
3.97.2 Examples . . . 1981

3.97.3 Description . . . 1981
3.97.4 Output info . . . 1983
3.97.5 Restrictions . . . 1983
3.97.6 Related commands . . . 1983
3.97.7 Default . . . 1983
3.98 compute reduce/chunk command . . . 1983
3.98.1 Syntax . . . 1983
3.98.2 Examples . . . 1984
3.98.3 Description . . . 1984
3.98.4 Output info . . . 1985
3.98.5 Restrictions . . . 1986
3.98.6 Related commands . . . 1986
3.98.7 Default . . . 1986
3.99 compute rheo/property/atom command . . . 1986
3.99.1 Syntax . . . 1986
3.99.2 Examples . . . 1987
3.99.3 Description . . . 1987
3.99.4 Output info . . . 1987
3.99.5 Restrictions . . . 1987
3.99.6 Related commands . . . 1988
3.99.7 Default . . . 1988
3.100 compute rigid/local command . . . 1988
3.100.1 Syntax . . . 1988
3.100.2 Examples . . . 1988
3.100.3 Description . . . 1988
3.100.4 Output info . . . 1990
3.100.5 Restrictions . . . 1990
3.100.6 Related commands . . . 1990
3.100.7 Default . . . 1990
3.101 compute saed command . . . 1990
3.101.1 Syntax . . . 1990
3.101.2 Examples . . . 1991
3.101.3 Description . . . 1991
3.101.4 Output info . . . 1994
3.101.5 Restrictions . . . 1994
3.101.6 Related commands . . . 1994
3.101.7 Default . . . 1994
3.102 compute slcsa/atom command . . . 1994
3.102.1 Syntax . . . 1994
3.102.2 Examples . . . 1995
3.102.3 Description . . . 1995
3.102.4 Output info . . . 1996
3.102.5 Restrictions . . . 1996
3.102.6 Related commands . . . 1996
3.102.7 Default . . . 1996
3.103 compute slice command . . . 1996
3.103.1 Syntax . . . 1996
3.103.2 Examples . . . 1997
3.103.3 Description . . . 1997
3.103.4 Output info . . . 1997
3.103.5 Restrictions . . . 1998
3.103.6 Related commands . . . 1998
3.103.7 Default . . . 1998
3.104 compute smd/contact/radius command . . . 1998

3.104.1 Syntax . . . 1998
3.104.2 Examples . . . 1998
3.104.3 Description . . . 1998
3.104.4 Output info . . . 1998
3.104.5 Restrictions . . . 1998
3.104.6 Related commands . . . 1998
3.104.7 Default . . . 1999
3.105 compute smd/damage command . . . 1999
3.105.1 Syntax . . . 1999
3.105.2 Examples . . . 1999
3.105.3 Description . . . 1999
3.105.4 Restrictions . . . 1999
3.105.5 Related commands . . . 1999
3.105.6 Default . . . 1999
3.106 compute smd/hourglass/error command . . . 1999
3.106.1 Syntax . . . 1999
3.106.2 Examples . . . 2000
3.106.3 Description . . . 2000
3.106.4 Restrictions . . . 2000
3.106.5 Related commands . . . 2000
3.106.6 Default . . . 2000
3.107 compute smd/internal/energy command . . . 2000
3.107.1 Syntax . . . 2000
3.107.2 Examples . . . 2000
3.107.3 Description . . . 2000
3.107.4 Output Info . . . 2001
3.107.5 Restrictions . . . 2001
3.107.6 Related commands . . . 2001
3.107.7 Default . . . 2001
3.108 compute smd/plastic/strain command . . . 2001
3.108.1 Syntax . . . 2001
3.108.2 Examples . . . 2001
3.108.3 Description . . . 2001
3.108.4 Restrictions . . . 2001
3.108.5 Related commands . . . 2002
3.108.6 Default . . . 2002
3.109 compute smd/plastic/strain/rate command . . . 2002
3.109.1 Syntax . . . 2002
3.109.2 Examples . . . 2002
3.109.3 Description . . . 2002
3.109.4 Restrictions . . . 2002
3.109.5 Related commands . . . 2002
3.109.6 Default . . . 2002
3.110 compute smd/rho command . . . 2002
3.110.1 Syntax . . . 2002
3.110.2 Examples . . . 2003
3.110.3 Description . . . 2003
3.110.4 Output info . . . 2003
3.110.5 Restrictions . . . 2003
3.110.6 Related commands . . . 2003
3.110.7 Default . . . 2003
3.111 compute smd/tlsph/defgrad command . . . 2003
3.111.1 Syntax . . . 2003
3.111.2 Examples . . . 2003

3.111.3 Description . . . 2004
3.111.4 Output info . . . 2004
3.111.5 Restrictions . . . 2004
3.111.6 Related commands . . . 2004
3.111.7 Default . . . 2004
3.112 compute smd/tlsph/dt command . . . 2004
3.112.1 Syntax . . . 2004
3.112.2 Examples . . . 2004
3.112.3 Description . . . 2004
3.112.4 Output info . . . 2005
3.112.5 Restrictions . . . 2005
3.112.6 Related commands . . . 2005
3.112.7 Default . . . 2005
3.113 compute smd/tlsph/num/neighs command . . . 2005
3.113.1 Syntax . . . 2005
3.113.2 Examples . . . 2005
3.113.3 Description . . . 2005
3.113.4 Output info . . . 2005
3.113.5 Restrictions . . . 2005
3.113.6 Related commands . . . 2006
3.113.7 Default . . . 2006
3.114 compute smd/tlsph/shape command . . . 2006
3.114.1 Syntax . . . 2006
3.114.2 Examples . . . 2006
3.114.3 Description . . . 2006
3.114.4 Output info . . . 2006
3.114.5 Restrictions . . . 2006
3.114.6 Related commands . . . 2006
3.114.7 Default . . . 2006
3.115 compute smd/tlsph/strain command . . . 2007
3.115.1 Syntax . . . 2007
3.115.2 Examples . . . 2007
3.115.3 Description . . . 2007
3.115.4 Output info . . . 2007
3.115.5 Restrictions . . . 2007
3.115.6 Related commands . . . 2007
3.115.7 Default . . . 2007
3.116 compute smd/tlsph/strain/rate command . . . 2007
3.116.1 Syntax . . . 2007
3.116.2 Examples . . . 2008
3.116.3 Description . . . 2008
3.116.4 Output info . . . 2008
3.116.5 Restrictions . . . 2008
3.116.6 Related commands . . . 2008
3.116.7 Default . . . 2008
3.117 compute smd/tlsph/stress command . . . 2008
3.117.1 Syntax . . . 2008
3.117.2 Examples . . . 2008
3.117.3 Description . . . 2009
3.117.4 Output info . . . 2009
3.117.5 Restrictions . . . 2009
3.117.6 Related commands . . . 2009
3.117.7 Default . . . 2009
3.118 compute smd/triangle/vertices command . . . 2009

3.118.1 Syntax . . . 2009
3.118.2 Examples . . . 2009
3.118.3 Description . . . 2009
3.118.4 Output info . . . 2010
3.118.5 Restrictions . . . 2010
3.118.6 Related commands . . . 2010
3.118.7 Default . . . 2010
3.119 compute smd/ulsph/effm command . . . 2010
3.119.1 Syntax . . . 2010
3.119.2 Examples . . . 2010
3.119.3 Description . . . 2010
3.119.4 Output info . . . 2010
3.119.5 Restrictions . . . 2011
3.119.6 Related commands . . . 2011
3.119.7 Default . . . 2011
3.120 compute smd/ulsph/num/neighs command . . . 2011
3.120.1 Syntax . . . 2011
3.120.2 Examples . . . 2011
3.120.3 Description . . . 2011
3.120.4 Output info . . . 2011
3.120.5 Restrictions . . . 2011
3.120.6 Related commands . . . 2011
3.120.7 Default . . . 2012
3.121 compute smd/ulsph/strain command . . . 2012
3.121.1 Syntax . . . 2012
3.121.2 Examples . . . 2012
3.121.3 Description . . . 2012
3.121.4 Output info . . . 2012
3.121.5 Restrictions . . . 2012
3.121.6 Related commands . . . 2012
3.121.7 Default . . . 2012
3.122 compute smd/ulsph/strain/rate command . . . 2012
3.122.1 Syntax . . . 2012
3.122.2 Examples . . . 2013
3.122.3 Description . . . 2013
3.122.4 Output info . . . 2013
3.122.5 Restrictions . . . 2013
3.122.6 Related commands . . . 2013
3.122.7 Default . . . 2013
3.123 compute smd/ulsph/stress command . . . 2013
3.123.1 Syntax . . . 2013
3.123.2 Examples . . . 2013
3.123.3 Description . . . 2014
3.123.4 Output info . . . 2014
3.123.5 Restrictions . . . 2014
3.123.6 Related commands . . . 2014
3.123.7 Default . . . 2014
3.124 compute smd/vol command . . . 2014
3.124.1 Syntax . . . 2014
3.124.2 Examples . . . 2014
3.124.3 Description . . . 2014
3.124.4 Output info . . . 2015
3.124.5 Restrictions . . . 2015
3.124.6 Related commands . . . 2015

3.124.7 Default . . . 2015
3.125 compute sna/atom command . . . 2015
3.126 compute snad/atom command . . . 2015
3.127 compute snav/atom command . . . 2015
3.128 compute snap command . . . 2015
3.129 compute sna/grid command . . . 2015
3.130 compute sna/grid/kk command . . . 2015
3.131 compute sna/grid/local command . . . 2015
3.131.1 Syntax . . . 2015
3.131.2 Examples . . . 2017
3.131.3 Description . . . 2017
3.131.4 Output info . . . 2021
3.131.5 Restrictions . . . 2023
3.131.6 Related commands . . . 2023
3.131.7 Default . . . 2023
3.132 compute sph/e/atom command . . . 2023
3.132.1 Syntax . . . 2023
3.132.2 Examples . . . 2023
3.132.3 Description . . . 2023
3.132.4 Output info . . . 2024
3.132.5 Restrictions . . . 2024
3.132.6 Related commands . . . 2024
3.132.7 Default . . . 2024
3.133 compute sph/rho/atom command . . . 2024
3.133.1 Syntax . . . 2024
3.133.2 Examples . . . 2024
3.133.3 Description . . . 2024
3.133.4 Output info . . . 2025
3.133.5 Restrictions . . . 2025
3.133.6 Related commands . . . 2025
3.133.7 Default . . . 2025
3.134 compute sph/t/atom command . . . 2025
3.134.1 Syntax . . . 2025
3.134.2 Examples . . . 2025
3.134.3 Description . . . 2025
3.134.4 Output info . . . 2026
3.134.5 Restrictions . . . 2026
3.134.6 Related commands . . . 2026
3.134.7 Default . . . 2026
3.135 compute spin command . . . 2026
3.135.1 Syntax . . . 2026
3.135.2 Examples . . . 2026
3.135.3 Description . . . 2026
3.135.4 Output info . . . 2027
3.135.5 Restrictions . . . 2027
3.135.6 Default . . . 2027
3.136 compute stress/atom command . . . 2027
3.137 compute centroid/stress/atom command . . . 2027
3.137.1 Syntax . . . 2027
3.137.2 Examples . . . 2028
3.137.3 Description . . . 2028
3.137.4 Output info . . . 2030
3.137.5 Restrictions . . . 2030
3.137.6 Related commands . . . 2031

3.137.7 Default . . . 2031
3.138 compute stress/cartesian command . . . 2031
3.138.1 Syntax . . . 2031
3.138.2 Examples . . . 2031
3.138.3 Description . . . 2031
3.138.4 Output info . . . 2032
3.138.5 Restrictions . . . 2032
3.138.6 Related commands . . . 2032
3.139 compute stress/cylinder command . . . 2032
3.140 compute stress/spherical command . . . 2032
3.140.1 Syntax . . . 2032
3.140.2 Examples . . . 2033
3.140.3 Description . . . 2033
3.140.4 Output info . . . 2033
3.140.5 Restrictions . . . 2034
3.140.6 Related commands . . . 2034
3.140.7 Default . . . 2034
3.141 compute stress/mop command . . . 2034
3.142 compute stress/mop/profile command . . . 2034
3.142.1 Syntax . . . 2034
3.142.2 Examples . . . 2034
3.142.3 Description . . . 2035
3.142.4 Output info . . . 2035
3.142.5 Restrictions . . . 2035
3.142.6 Related commands . . . 2036
3.142.7 Default . . . 2036
3.143 compute force/tally command . . . 2036
3.144 compute heat/flux/tally command . . . 2036
3.145 compute heat/flux/virial/tally command . . . 2036
3.146 compute pe/tally command . . . 2036
3.147 compute pe/mol/tally command . . . 2036
3.148 compute stress/tally command . . . 2036
3.148.1 Syntax . . . 2036
3.148.2 Examples . . . 2036
3.148.3 Description . . . 2036
3.148.4 Output info . . . 2038
3.148.5 Restrictions . . . 2038
3.148.6 Related commands . . . 2038
3.148.7 Default . . . 2039
3.149 compute tdpd/cc/atom command . . . 2039
3.149.1 Syntax . . . 2039
3.149.2 Examples . . . 2039
3.149.3 Description . . . 2039
3.149.4 Output info . . . 2039
3.149.5 Restrictions . . . 2039
3.149.6 Related commands . . . 2039
3.149.7 Default . . . 2039
3.150 compute temp command . . . 2039
3.150.1 Syntax . . . 2040
3.150.2 Examples . . . 2040
3.150.3 Description . . . 2040
3.150.4 Output info . . . 2041
3.150.5 Restrictions . . . 2041
3.150.6 Related commands . . . 2041

3.150.7 Default . . . 2041
3.151 compute temp/asphere command . . . 2041
3.151.1 Syntax . . . 2041
3.151.2 Examples . . . 2041
3.151.3 Description . . . 2042
3.151.4 Output info . . . 2043
3.151.5 Restrictions . . . 2043
3.151.6 Related commands . . . 2043
3.151.7 Default . . . 2043
3.152 compute temp/body command . . . 2043
3.152.1 Syntax . . . 2043
3.152.2 Examples . . . 2044
3.152.3 Description . . . 2044
3.152.4 Output info . . . 2045
3.152.5 Restrictions . . . 2045
3.152.6 Related commands . . . 2045
3.152.7 Default . . . 2045
3.153 compute temp/chunk command . . . 2045
3.153.1 Syntax . . . 2045
3.153.2 Examples . . . 2046
3.153.3 Description . . . 2046
3.153.4 Output info . . . 2048
3.153.5 Restrictions . . . 2048
3.153.6 Related commands . . . 2048
3.153.7 Default . . . 2048
3.154 compute temp/com command . . . 2048
3.154.1 Syntax . . . 2048
3.154.2 Examples . . . 2049
3.154.3 Description . . . 2049
3.154.4 Output info . . . 2049
3.154.5 Restrictions . . . 2049
3.154.6 Related commands . . . 2050
3.154.7 Default . . . 2050
3.155 compute temp/cs command . . . 2050
3.155.1 Syntax . . . 2050
3.155.2 Examples . . . 2050
3.155.3 Description . . . 2050
3.155.4 Output info . . . 2051
3.155.5 Restrictions . . . 2051
3.155.6 Related commands . . . 2051
3.155.7 Default . . . 2051
3.156 compute temp/deform command . . . 2051
3.156.1 Syntax . . . 2051
3.156.2 Examples . . . 2052
3.156.3 Description . . . 2052
3.156.4 Output info . . . 2053
3.156.5 Restrictions . . . 2053
3.156.6 Related commands . . . 2053
3.156.7 Default . . . 2053
3.157 compute temp/deform/eff command . . . 2053
3.157.1 Syntax . . . 2053
3.157.2 Examples . . . 2054
3.157.3 Description . . . 2054
3.157.4 Output info . . . 2054

3.157.5 Restrictions . . . 2054
3.157.6 Related commands . . . 2054
3.157.7 Default . . . 2054
3.158 compute temp/drude command . . . 2054
3.158.1 Syntax . . . 2054
3.158.2 Examples . . . 2055
3.158.3 Description . . . 2055
3.158.4 Output info . . . 2055
3.158.5 Restrictions . . . 2055
3.158.6 Related commands . . . 2055
3.158.7 Default . . . 2056
3.159 compute temp/eff command . . . 2056
3.159.1 Syntax . . . 2056
3.159.2 Examples . . . 2056
3.159.3 Description . . . 2056
3.159.4 Output info . . . 2057
3.159.5 Restrictions . . . 2057
3.159.6 Related commands . . . 2057
3.159.7 Default . . . 2057
3.160 compute temp/partial command . . . 2057
3.160.1 Syntax . . . 2057
3.160.2 Examples . . . 2057
3.160.3 Description . . . 2057
3.160.4 Output info . . . 2058
3.160.5 Restrictions . . . 2058
3.160.6 Related commands . . . 2058
3.160.7 Default . . . 2058
3.161 compute temp/profile command . . . 2058
3.161.1 Syntax . . . 2058
3.161.2 Examples . . . 2059
3.161.3 Description . . . 2059
3.161.4 Output info . . . 2060
3.161.5 Restrictions . . . 2061
3.161.6 Related commands . . . 2061
3.161.7 Default . . . 2061
3.162 compute temp/ramp command . . . 2061
3.162.1 Syntax . . . 2061
3.162.2 Examples . . . 2061
3.162.3 Description . . . 2061
3.162.4 Output info . . . 2062
3.162.5 Restrictions . . . 2062
3.162.6 Related commands . . . 2062
3.162.7 Default . . . 2062
3.163 compute temp/region command . . . 2063
3.163.1 Syntax . . . 2063
3.163.2 Examples . . . 2063
3.163.3 Description . . . 2063
3.163.4 Output info . . . 2064
3.163.5 Restrictions . . . 2064
3.163.6 Related commands . . . 2064
3.163.7 Default . . . 2064
3.164 compute temp/region/eff command . . . 2064
3.164.1 Syntax . . . 2064
3.164.2 Examples . . . 2064

3.164.3 Description . . . 2064
3.164.4 Output info . . . 2064
3.164.5 Restrictions . . . 2065
3.164.6 Related commands . . . 2065
3.164.7 Default . . . 2065
3.165 compute temp/rotate command . . . 2065
3.165.1 Syntax . . . 2065
3.165.2 Examples . . . 2065
3.165.3 Description . . . 2065
3.165.4 Output info . . . 2066
3.165.5 Restrictions . . . 2066
3.165.6 Related commands . . . 2066
3.165.7 Default . . . 2066
3.166 compute temp/sphere command . . . 2066
3.166.1 Syntax . . . 2066
3.166.2 Examples . . . 2067
3.166.3 Description . . . 2067
3.166.4 Output info . . . 2068
3.166.5 Restrictions . . . 2068
3.166.6 Related commands . . . 2068
3.166.7 Default . . . 2068
3.167 compute temp/uef command . . . 2068
3.167.1 Syntax . . . 2068
3.167.2 Examples . . . 2068
3.167.3 Description . . . 2068
3.167.4 Restrictions . . . 2069
3.167.5 Related commands . . . 2069
3.167.6 Default . . . 2069
3.168 compute ti command . . . 2069
3.168.1 Syntax . . . 2069
3.168.2 Examples . . . 2069
3.168.3 Description . . . 2069
3.168.4 Output info . . . 2070
3.168.5 Restrictions . . . 2070
3.168.6 Related commands . . . 2070
3.168.7 Default . . . 2071
3.169 compute torque/chunk command . . . 2071
3.169.1 Syntax . . . 2071
3.169.2 Examples . . . 2071
3.169.3 Description . . . 2071
3.169.4 Output info . . . 2072
3.169.5 Restrictions . . . 2072
3.169.6 Related commands . . . 2072
3.169.7 Default . . . 2072
3.170 compute vacf command . . . 2072
3.170.1 Syntax . . . 2072
3.170.2 Examples . . . 2072
3.170.3 Description . . . 2072
3.170.4 Output info . . . 2073
3.170.5 Restrictions . . . 2073
3.170.6 Related commands . . . 2073
3.170.7 Default . . . 2073
3.171 compute vacf/chunk command . . . 2073
3.171.1 Syntax . . . 2073

3.171.2 Examples . . . 2073
3.171.3 Description . . . 2073
3.171.4 Output info . . . 2074
3.171.5 Restrictions . . . 2075
3.171.6 Related commands . . . 2075
3.171.7 Default . . . 2075
3.172 compute vcm/chunk command . . . 2075
3.172.1 Syntax . . . 2075
3.172.2 Examples . . . 2075
3.172.3 Description . . . 2075
3.172.4 Output info . . . 2076
3.172.5 Restrictions . . . 2076
3.172.6 Related commands . . . 2076
3.172.7 Default . . . 2076
3.173 compute viscosity/cos command . . . 2076
3.173.1 Syntax . . . 2076
3.173.2 Examples . . . 2076
3.173.3 Description . . . 2076
3.173.4 Output info . . . 2077
3.173.5 Restrictions . . . 2078
3.173.6 Related commands . . . 2078
3.173.7 Default . . . 2078
3.174 compute voronoi/atom command . . . 2078
3.174.1 Syntax . . . 2078
3.174.2 Examples . . . 2079
3.174.3 Description . . . 2079
3.174.4 Output info . . . 2080
3.174.5 Restrictions . . . 2081
3.174.6 Related commands . . . 2081
3.174.7 Default . . . 2081
3.175 compute xrd command . . . 2081
3.175.1 Syntax . . . 2081
3.175.2 Examples . . . 2081
3.175.3 Description . . . 2082
3.175.4 Output info . . . 2084
3.175.5 Restrictions . . . 2084
3.175.6 Related commands . . . 2084
3.175.7 Default . . . 2084

4 Pair Styles 2085
4.1 pair_style adp command . . . 2085
4.1.1 Syntax . . . 2085
4.1.2 Examples . . . 2085
4.1.3 Description . . . 2085
4.1.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2087
4.1.5 Restrictions . . . 2087
4.1.6 Related commands . . . 2087
4.1.7 Default . . . 2087
4.2 pair_style agni command . . . 2087
4.2.1 Syntax . . . 2087
4.2.2 Examples . . . 2088
4.2.3 Description . . . 2088
4.2.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2089
4.2.5 Restrictions . . . 2089

4.2.6 Related commands . . . 2089
4.2.7 Default . . . 2089
4.3 pair_style aip/water/2dm command . . . 2089
4.3.1 Syntax . . . 2089
4.3.2 Examples . . . 2089
4.3.3 Description . . . 2090
4.3.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2091
4.3.5 Restrictions . . . 2091
4.3.6 Related commands . . . 2092
4.3.7 Default . . . 2092
4.4 pair_style airebo command . . . 2092
4.5 pair_style airebo/morse command . . . 2092
4.6 pair_style rebo command . . . 2092
4.6.1 Syntax . . . 2092
4.6.2 Examples . . . 2092
4.6.3 Description . . . 2093
4.6.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2095
4.6.5 Restrictions . . . 2095
4.6.6 Related commands . . . 2095
4.6.7 Default . . . 2095
4.7 pair_style amoeba command . . . 2095
4.8 pair_style hippo command . . . 2095
4.8.1 Syntax . . . 2095
4.8.2 Examples . . . 2096
4.8.3 Additional info . . . 2096
4.8.4 Description . . . 2096
4.8.5 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2098
4.8.6 Restrictions . . . 2098
4.8.7 Related commands . . . 2099
4.8.8 Default . . . 2099
4.9 pair_style atm command . . . 2099
4.9.1 Syntax . . . 2099
4.9.2 Examples . . . 2100
4.9.3 Description . . . 2100
4.9.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2101
4.9.5 Restrictions . . . 2102
4.9.6 Related commands . . . 2102
4.9.7 Default . . . 2102
4.10 pair_style beck command . . . 2102
4.10.1 Syntax . . . 2102
4.10.2 Examples . . . 2102
4.10.3 Description . . . 2102
4.10.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2103
4.10.5 Restrictions . . . 2103
4.10.6 Related commands . . . 2103
4.10.7 Default . . . 2103
4.11 pair_style body/nparticle command . . . 2103
4.11.1 Syntax . . . 2103
4.11.2 Examples . . . 2104
4.11.3 Description . . . 2104
4.11.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2105
4.11.5 Restrictions . . . 2105
4.11.6 Related commands . . . 2105
4.11.7 Default . . . 2105

4.12 pair_style body/rounded/polygon command . . . 2105
4.12.1 Syntax . . . 2105
4.12.2 Examples . . . 2105
4.12.3 Description . . . 2105
4.12.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2108
4.12.5 Restrictions . . . 2108
4.12.6 Related commands . . . 2108
4.12.7 Default . . . 2108
4.13 pair_style body/rounded/polyhedron command . . . 2108
4.13.1 Syntax . . . 2108
4.13.2 Examples . . . 2108
4.13.3 Description . . . 2108
4.13.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2111
4.13.5 Restrictions . . . 2111
4.13.6 Related commands . . . 2111
4.13.7 Default . . . 2111
4.14 pair_style bop command . . . 2111
4.14.1 Syntax . . . 2111
4.14.2 Examples . . . 2111
4.14.3 Description . . . 2111
4.14.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2116
4.14.5 Restrictions . . . 2116
4.14.6 Related commands . . . 2116

4.15 pair_style born command . . . 2117
4.16 pair_style born/coul/long command . . . 2117
4.17 pair_style born/coul/msm command . . . 2117
4.18 pair_style born/coul/wolf command . . . 2117
4.19 pair_style born/coul/dsf command . . . 2117
4.19.1 Syntax . . . 2117
4.19.2 Examples . . . 2117
4.19.3 Description . . . 2118
4.19.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2119
4.19.5 Restrictions . . . 2119
4.19.6 Related commands . . . 2119
4.19.7 Default . . . 2120
4.20 pair_style born/gauss command . . . 2120
4.20.1 Syntax . . . 2120
4.20.2 Examples . . . 2120
4.20.3 Description . . . 2120
4.20.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2120
4.20.5 Restrictions . . . 2121
4.20.6 Related commands . . . 2121
4.20.7 Default . . . 2121
4.21 pair_style bpm/spring command . . . 2121
4.21.1 Syntax . . . 2121
4.21.2 Examples . . . 2121
4.21.3 Description . . . 2121
4.21.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2122
4.21.5 Restrictions . . . 2123
4.21.6 Related commands . . . 2123
4.21.7 Default . . . 2123
4.22 pair_style brownian command . . . 2123
4.23 pair_style brownian/poly command . . . 2123

4.23.1 Syntax . . . 2123
4.23.2 Examples . . . 2123
4.23.3 Description . . . 2123
4.23.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2124
4.23.5 Restrictions . . . 2125
4.23.6 Related commands . . . 2125
4.23.7 Default . . . 2125
4.24 pair_style buck command . . . 2125
4.25 pair_style buck/coul/cut command . . . 2125
4.26 pair_style buck/coul/long command . . . 2125
4.27 pair_style buck/coul/msm command . . . 2125
4.27.1 Syntax . . . 2125
4.27.2 Examples . . . 2126
4.27.3 Description . . . 2126
4.27.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2127
4.27.5 Restrictions . . . 2127
4.27.6 Related commands . . . 2127
4.27.7 Default . . . 2128
4.28 pair_style buck6d/coul/gauss/dsf command . . . 2128
4.29 pair_style buck6d/coul/gauss/long command . . . 2128
4.29.1 Syntax . . . 2128
4.29.2 Examples . . . 2128
4.29.3 Description . . . 2128
4.29.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2129
4.29.5 Restrictions . . . 2129
4.29.6 Related commands . . . 2129
4.29.7 Default . . . 2130
4.30 pair_style buck/long/coul/long command . . . 2130
4.30.1 Syntax . . . 2130
4.30.2 Examples . . . 2130
4.30.3 Description . . . 2130
4.30.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2131
4.30.5 Restrictions . . . 2132
4.30.6 Related commands . . . 2132
4.30.7 Default . . . 2132
4.31 pair_style lj/charmm/coul/charmm command . . . 2132
4.32 pair_style lj/charmm/coul/charmm/implicit command . . . 2132

4.259.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2450
4.259.5 Restrictions . . . 2451
4.259.6 Related commands . . . 2451
4.259.7 Default . . . 2451
4.260 pair_style sph/lj command . . . 2451
4.260.1 Syntax . . . 2451
4.260.2 Examples . . . 2451
4.260.3 Description . . . 2451
4.260.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2452
4.260.5 Restrictions . . . 2452
4.260.6 Related commands . . . 2452
4.260.7 Default . . . 2452
4.261 pair_style sph/rhosum command . . . 2452
4.261.1 Syntax . . . 2452
4.261.2 Examples . . . 2452
4.261.3 Description . . . 2453
4.261.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2453
4.261.5 Restrictions . . . 2453
4.261.6 Related commands . . . 2453
4.261.7 Default . . . 2453
4.262 pair_style sph/taitwater command . . . 2453
4.262.1 Syntax . . . 2453
4.262.2 Examples . . . 2454
4.262.3 Description . . . 2454
4.262.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2454
4.262.5 Restrictions . . . 2455
4.262.6 Related commands . . . 2455
4.262.7 Default . . . 2455
4.263 pair_style sph/taitwater/morris command . . . 2455
4.263.1 Syntax . . . 2455
4.263.2 Examples . . . 2455
4.263.3 Description . . . 2455

4.263.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2456
4.263.5 Restrictions . . . 2456
4.263.6 Related commands . . . 2456
4.263.7 Default . . . 2456
4.264 pair_style lj/spica command . . . 2456
4.265 pair_style lj/spica/coul/long command . . . 2456
4.266 pair_style lj/spica/coul/msm command . . . 2456
4.266.1 Syntax . . . 2456
4.266.2 Examples . . . 2457
4.266.3 Description . . . 2457
4.266.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2458
4.266.5 Restrictions . . . 2458
4.266.6 Related commands . . . 2458
4.266.7 Default . . . 2458
4.267 pair_style spin/dipole/cut command . . . 2459
4.268 pair_style spin/dipole/long command . . . 2459
4.268.1 Syntax . . . 2459
4.268.2 Examples . . . 2459
4.268.3 Description . . . 2459
4.268.4 Restrictions . . . 2460
4.268.5 Related commands . . . 2460
4.268.6 Default . . . 2460
4.269 pair_style spin/dmi command . . . 2460
4.269.1 Syntax . . . 2460
4.269.2 Examples . . . 2460
4.269.3 Description . . . 2460
4.269.4 Restrictions . . . 2461
4.269.5 Related commands . . . 2461
4.269.6 Default . . . 2461
4.270 pair_style spin/exchange command . . . 2461
4.271 pair_style spin/exchange/biquadratic command . . . 2461
4.271.1 Syntax . . . 2461
4.271.2 Examples . . . 2461
4.271.3 Description . . . 2462
4.271.4 Restrictions . . . 2463
4.271.5 Related commands . . . 2464
4.271.6 Default . . . 2464
4.272 pair_style spin/magelec command . . . 2464
4.272.1 Syntax . . . 2464
4.272.2 Examples . . . 2464
4.272.3 Description . . . 2464
4.272.4 Restrictions . . . 2465
4.272.5 Related commands . . . 2465
4.272.6 Default . . . 2465
4.273 pair_style spin/neel command . . . 2465
4.273.1 Syntax . . . 2465
4.273.2 Examples . . . 2465
4.273.3 Description . . . 2465
4.273.4 Restrictions . . . 2466
4.273.5 Related commands . . . 2466
4.273.6 Default . . . 2466
4.274 pair_style srp command . . . 2466
4.275 pair_style srp/react command . . . 2466
4.275.1 Syntax . . . 2466

4.275.2 Examples . . . 2467
4.275.3 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2468
4.275.4 Restrictions . . . 2469
4.275.5 Related commands . . . 2469
4.275.6 Default . . . 2469
4.276 pair_style sw command . . . 2469
4.277 pair_style sw/mod command . . . 2469
4.277.1 Syntax . . . 2469
4.277.2 Examples . . . 2469
4.277.3 Description . . . 2470
4.277.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2473
4.277.5 Restrictions . . . 2473
4.277.6 Related commands . . . 2473
4.277.7 Default . . . 2473
4.278 pair_style sw/angle/table command . . . 2474
4.278.1 Syntax . . . 2474
4.278.2 Examples . . . 2474
4.278.3 Description . . . 2474
4.278.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2477
4.278.5 Restrictions . . . 2477
4.278.6 Related commands . . . 2477
4.279 pair_style table command . . . 2477
4.279.1 Syntax . . . 2477
4.279.2 Examples . . . 2478
4.279.3 Description . . . 2478
4.279.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2480
4.279.5 Restrictions . . . 2481
4.279.6 Related commands . . . 2481
4.279.7 Default . . . 2481
4.280 pair_style table/rx command . . . 2481
4.280.1 Syntax . . . 2481
4.280.2 Examples . . . 2481
4.280.3 Description . . . 2481
4.280.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2484
4.280.5 Restrictions . . . 2484
4.280.6 Related commands . . . 2484
4.280.7 Default . . . 2484
4.281 pair_style tersoff command . . . 2484
4.282 pair_style tersoff/table command . . . 2484
4.282.1 Syntax . . . 2485
4.282.2 Examples . . . 2485
4.282.3 Description . . . 2485
4.282.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2488
4.282.5 Restrictions . . . 2488
4.282.6 Related commands . . . 2489
4.282.7 Default . . . 2489
4.283 pair_style tersoff/mod command . . . 2489
4.284 pair_style tersoff/mod/c command . . . 2489
4.284.1 Syntax . . . 2489
4.284.2 Examples . . . 2489
4.284.3 Description . . . 2489
4.284.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2492
4.284.5 Restrictions . . . 2492
4.284.6 Related commands . . . 2492

4.284.7 Default . . . 2492
4.285 pair_style tersoff/zbl command . . . 2492
4.285.1 Syntax . . . 2493
4.285.2 Examples . . . 2493
4.285.3 Description . . . 2493
4.285.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2496
4.285.5 Restrictions . . . 2496
4.285.6 Related commands . . . 2497
4.285.7 Default . . . 2497
4.286 pair_style thole command . . . 2497
4.287 pair_style lj/cut/thole/long command . . . 2497
4.287.1 Syntax . . . 2497
4.287.2 Examples . . . 2497
4.287.3 Description . . . 2497
4.287.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2499
4.287.5 Restrictions . . . 2499
4.287.6 Related commands . . . 2499
4.287.7 Default . . . 2499
4.288 pair_style threebody/table command . . . 2499
4.288.1 Syntax . . . 2499
4.288.2 Examples . . . 2500
4.288.3 Description . . . 2500
4.288.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2502
4.288.5 Restrictions . . . 2502
4.288.6 Related commands . . . 2503
4.289 pair_style tracker command . . . 2503
4.289.1 Syntax . . . 2503
4.289.2 Examples . . . 2503
4.289.3 Description . . . 2504
4.289.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2504
4.289.5 Restrictions . . . 2505
4.289.6 Related commands . . . 2505
4.289.7 Default . . . 2505
4.290 pair_style tri/lj command . . . 2505
4.290.1 Syntax . . . 2505
4.290.2 Examples . . . 2505
4.290.3 Description . . . 2505
4.290.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2506

4.292.6 Related commands . . . 2511
4.292.7 Default . . . 2511
4.293 pair_style vashishta command . . . 2512
4.294 pair_style vashishta/table command . . . 2512
4.294.1 Syntax . . . 2512
4.294.2 Examples . . . 2512
4.294.3 Description . . . 2512
4.294.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2514
4.294.5 Restrictions . . . 2515
4.294.6 Related commands . . . 2515
4.294.7 Default . . . 2515
4.295 pair_style wf/cut command . . . 2515
4.295.1 Syntax . . . 2515
4.295.2 Examples . . . 2515
4.295.3 Description . . . 2515
4.295.4 Restrictions . . . 2516
4.295.5 Related commands . . . 2517
4.296 pair_style ylz command . . . 2517
4.296.1 Syntax . . . 2517
4.296.2 Examples . . . 2517
4.296.3 Description . . . 2517
4.296.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2518
4.296.5 Restrictions . . . 2518
4.296.6 Related commands . . . 2519
4.296.7 Default . . . 2519
4.297 pair_style yukawa command . . . 2519
4.297.1 Syntax . . . 2519
4.297.2 Examples . . . 2519
4.297.3 Description . . . 2519
4.297.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2520
4.297.5 Restrictions . . . 2520
4.297.6 Related commands . . . 2520
4.297.7 Default . . . 2520
4.298 pair_style yukawa/colloid command . . . 2520
4.298.1 Syntax . . . 2520
4.298.2 Examples . . . 2521
4.298.3 Description . . . 2521
4.298.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2522
4.298.5 Restrictions . . . 2522
4.298.6 Related commands . . . 2522
4.298.7 Default . . . 2522
4.299 pair_style zbl command . . . 2523
4.299.1 Syntax . . . 2523
4.299.2 Examples . . . 2523
4.299.3 Description . . . 2523
4.299.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2524
4.299.5 Restrictions . . . 2524
4.299.6 Related commands . . . 2524
4.299.7 Default . . . 2524
4.300 pair_style zero command . . . 2525
4.300.1 Syntax . . . 2525
4.300.2 Examples . . . 2525
4.300.3 Description . . . 2525

4.300.4 Mixing, shift, table, tail correction, restart, rRESPA info . . . 2525
4.300.5 Restrictions . . . 2526
4.300.6 Related commands . . . 2526
4.300.7 Default . . . 2526

5 Bond Styles 2527
5.1 bond_style bpm/rotational command . . . 2527
5.1.1 Syntax . . . 2527
5.1.2 Examples . . . 2527
5.1.3 Description . . . 2528
5.1.4 Restart and other info . . . 2529
5.1.5 Restrictions . . . 2530
5.1.6 Related commands . . . 2530
5.1.7 Default . . . 2530
5.2 bond_style bpm/spring command . . . 2530
5.2.1 Syntax . . . 2530
5.2.2 Examples . . . 2531
5.2.3 Description . . . 2531
5.2.4 Restart and other info . . . 2533
5.2.5 Restrictions . . . 2533
5.2.6 Related commands . . . 2533
5.2.7 Default . . . 2534
5.3 bond_style bpm/spring/plastic command . . . 2534
5.3.1 Syntax . . . 2534
5.3.2 Examples . . . 2534
5.3.3 Description . . . 2535
5.3.4 Restart and other info . . . 2536
5.3.5 Restrictions . . . 2536
5.3.6 Related commands . . . 2536
5.3.7 Default . . . 2536
5.4 bond_style class2 command . . . 2536
5.4.1 Syntax . . . 2536
5.4.2 Examples . . . 2536
5.4.3 Description . . . 2537
5.4.4 Restrictions . . . 2537
5.4.5 Related commands . . . 2537
5.4.6 Default . . . 2537
5.5 bond_style fene command . . . 2537
5.6 bond_style fene/nm command . . . 2538
5.6.1 Syntax . . . 2538
5.6.2 Examples . . . 2538
5.6.3 Description . . . 2538
5.6.4 Restrictions . . . 2539
5.6.5 Related commands . . . 2539
5.6.6 Default . . . 2539
5.7 bond_style fene/expand command . . . 2539
5.7.1 Syntax . . . 2539
5.7.2 Examples . . . 2539
5.7.3 Description . . . 2540
5.7.4 Restrictions . . . 2540
5.7.5 Related commands . . . 2540
5.7.6 Default . . . 2540
5.8 bond_style gaussian command . . . 2541
5.8.1 Syntax . . . 2541

5.8.2 Examples . . . 2541
5.8.3 Description . . . 2541
5.8.4 Restrictions . . . 2541
5.8.5 Related commands . . . 2541
5.8.6 Default . . . 2541
5.9 bond_style gromos command . . . 2542
5.9.1 Syntax . . . 2542
5.9.2 Examples . . . 2542
5.9.3 Description . . . 2542
5.9.4 Restrictions . . . 2542
5.9.5 Related commands . . . 2542
5.9.6 Default . . . 2542
5.10 bond_style harmonic command . . . 2543
5.10.1 Syntax . . . 2543
5.10.2 Examples . . . 2543
5.10.3 Description . . . 2543
5.10.4 Restrictions . . . 2543
5.10.5 Related commands . . . 2543
5.10.6 Default . . . 2543
5.11 bond_style harmonic/restrain command . . . 2544
5.11.1 Syntax . . . 2544
5.11.2 Examples . . . 2544
5.11.3 Description . . . 2544
5.11.4 Restart info . . . 2544
5.11.5 Restrictions . . . 2544
5.11.6 Related commands . . . 2544
5.11.7 Default . . . 2545
5.12 bond_style harmonic/shift command . . . 2545
5.12.1 Syntax . . . 2545
5.12.2 Examples . . . 2545
5.12.3 Description . . . 2545
5.12.4 Restrictions . . . 2545
5.12.5 Related commands . . . 2546
5.12.6 Default . . . 2546
5.13 bond_style harmonic/shift/cut command . . . 2546
5.13.1 Syntax . . . 2546
5.13.2 Examples . . . 2546
5.13.3 Description . . . 2546
5.13.4 Restrictions . . . 2547
5.13.5 Related commands . . . 2547
5.13.6 Default . . . 2547
5.14 bond_style hybrid command . . . 2547
5.14.1 Syntax . . . 2547
5.14.2 Examples . . . 2547
5.14.3 Description . . . 2547
5.14.4 Restrictions . . . 2548
5.14.5 Related commands . . . 2548
5.14.6 Default . . . 2548
5.15 bond_style lepton command . . . 2548
5.15.1 Syntax . . . 2548
5.15.2 Examples . . . 2548
5.15.3 Description . . . 2549
5.15.4 Lepton expression syntax and features . . . 2549
5.15.5 Restrictions . . . 2550

5.15.6 Related commands . . . 2550
5.15.7 Default . . . 2551
5.16 bond_style mesocnt command . . . 2551
5.16.1 Syntax . . . 2551
5.16.2 Examples . . . 2551
5.16.3 Description . . . 2551
5.16.4 Restrictions . . . 2551
5.16.5 Related commands . . . 2552
5.16.6 Default . . . 2552
5.17 bond_style mm3 command . . . 2552
5.17.1 Syntax . . . 2552
5.17.2 Examples . . . 2552
5.17.3 Description . . . 2552
5.17.4 Restrictions . . . 2552
5.17.5 Related commands . . . 2552
5.17.6 Default . . . 2552
5.18 bond_style morse command . . . 2553
5.18.1 Syntax . . . 2553
5.18.2 Examples . . . 2553
5.18.3 Description . . . 2553
5.18.4 Restrictions . . . 2553
5.18.5 Related commands . . . 2553
5.18.6 Default . . . 2554
5.19 bond_style none command . . . 2554
5.19.1 Syntax . . . 2554
5.19.2 Examples . . . 2554
5.19.3 Description . . . 2554
5.19.4 Restrictions . . . 2554
5.19.5 Related commands . . . 2554
5.19.6 Default . . . 2554
5.20 bond_style nonlinear command . . . 2554
5.20.1 Syntax . . . 2554
5.20.2 Examples . . . 2554
5.20.3 Description . . . 2555
5.20.4 Restrictions . . . 2555
5.20.5 Related commands . . . 2555
5.20.6 Default . . . 2555
5.21 bond_style oxdna/fene command . . . 2555
5.22 bond_style oxdna2/fene command . . . 2555
5.23 bond_style oxrna2/fene command . . . 2555
5.23.1 Syntax . . . 2555
5.23.2 Examples . . . 2556
5.23.3 Description . . . 2556
5.23.4 Potential file reading . . . 2557
5.23.5 Restrictions . . . 2558
5.23.6 Related commands . . . 2558
5.23.7 Default . . . 2558
5.24 bond_style quartic command . . . 2558
5.24.1 Syntax . . . 2558
5.24.2 Examples . . . 2558
5.24.3 Description . . . 2559
5.24.4 Restrictions . . . 2560
5.24.5 Related commands . . . 2560
5.24.6 Default . . . 2560

5.25 bond_style rheo/shell command . . . 2560
5.25.1 Syntax . . . 2560
5.25.2 Examples . . . 2560
5.25.3 Description . . . 2561
5.25.4 Restart and other info . . . 2562
5.25.5 Restrictions . . . 2562
5.25.6 Related commands . . . 2562
5.25.7 Default . . . 2562
5.26 bond_style special command . . . 2562
5.26.1 Syntax . . . 2562
5.26.2 Examples . . . 2562
5.26.3 Description . . . 2563
5.26.4 Restrictions . . . 2563
5.26.5 Related commands . . . 2563
5.26.6 Default . . . 2564
5.27 bond_style table command . . . 2564
5.27.1 Syntax . . . 2564
5.27.2 Examples . . . 2564
5.27.3 Description . . . 2564
5.27.4 Restart info . . . 2566
5.27.5 Restrictions . . . 2566
5.27.6 Related commands . . . 2566
5.27.7 Default . . . 2566
5.28 bond_style zero command . . . 2566
5.28.1 Syntax . . . 2566
5.28.2 Examples . . . 2566
5.28.3 Description . . . 2566
5.28.4 Restrictions . . . 2567
5.28.5 Related commands . . . 2567
5.28.6 Default . . . 2567

6 Angle Styles 2569
6.1 angle_style amoeba command . . . 2569
6.1.1 Syntax . . . 2569
6.1.2 Examples . . . 2569
6.1.3 Description . . . 2569
6.1.4 Restrictions . . . 2570
6.1.5 Related commands . . . 2570
6.1.6 Default . . . 2571
6.2 angle_style charmm command . . . 2571
6.2.1 Syntax . . . 2571
6.2.2 Examples . . . 2571
6.2.3 Description . . . 2571
6.2.4 Restrictions . . . 2572
6.2.5 Related commands . . . 2572
6.2.6 Default . . . 2572
6.3 angle_style class2 command . . . 2572
6.4 angle_style class2/p6 command . . . 2572
6.4.1 Syntax . . . 2572
6.4.2 Examples . . . 2572
6.4.3 Description . . . 2572
6.4.4 Restrictions . . . 2574
6.4.5 Related commands . . . 2574
6.4.6 Default . . . 2574

6.5 angle_style cosine command . . . 2574
6.5.1 Syntax . . . 2574
6.5.2 Examples . . . 2574
6.5.3 Description . . . 2574
6.5.4 Restrictions . . . 2575
6.5.5 Related commands . . . 2575
6.5.6 Default . . . 2575
6.6 angle_style cosine/buck6d command . . . 2575
6.6.1 Syntax . . . 2575
6.6.2 Examples . . . 2575
6.6.3 Description . . . 2575
6.6.4 Restrictions . . . 2576
6.6.5 Related commands . . . 2576
6.6.6 Default . . . 2576
6.7 angle_style cosine/delta command . . . 2576
6.7.1 Syntax . . . 2576
6.7.2 Examples . . . 2576
6.7.3 Description . . . 2576
6.7.4 Restrictions . . . 2577
6.7.5 Related commands . . . 2577
6.7.6 Default . . . 2577
6.8 angle_style cosine/periodic command . . . 2577
6.8.1 Syntax . . . 2577
6.8.2 Examples . . . 2577
6.8.3 Description . . . 2577
6.8.4 Restrictions . . . 2578
6.8.5 Related commands . . . 2578
6.8.6 Default . . . 2578
6.9 angle_style cosine/shift command . . . 2578
6.9.1 Syntax . . . 2578
6.9.2 Examples . . . 2578
6.9.3 Description . . . 2579
6.9.4 Restrictions . . . 2579
6.9.5 Related commands . . . 2579
6.9.6 Default . . . 2579
6.10 angle_style cosine/shift/exp command . . . 2579
6.10.1 Syntax . . . 2579
6.10.2 Examples . . . 2579
6.10.3 Description . . . 2580
6.10.4 Restrictions . . . 2580
6.10.5 Related commands . . . 2580
6.10.6 Default . . . 2580
6.11 angle_style cosine/squared command . . . 2581
6.11.1 Syntax . . . 2581
6.11.2 Examples . . . 2581
6.11.3 Description . . . 2581
6.11.4 Restrictions . . . 2581
6.11.5 Related commands . . . 2582
6.11.6 Default . . . 2582
6.12 angle_style cosine/squared/restricted command . . . 2582
6.12.1 Syntax . . . 2582
6.12.2 Examples . . . 2582
6.12.3 Description . . . 2582
6.12.4 Restrictions . . . 2583

6.12.5 Related commands . . . 2583
6.12.6 Default . . . 2583
6.13 angle_style cross command . . . 2583
6.13.1 Syntax . . . 2583
6.13.2 Examples . . . 2583
6.13.3 Description . . . 2583
6.13.4 Restrictions . . . 2584
6.13.5 Related commands . . . 2584
6.13.6 Default . . . 2584
6.14 angle_style dipole command . . . 2584
6.14.1 Syntax . . . 2584
6.14.2 Examples . . . 2584
6.14.3 Description . . . 2584
6.14.4 Restrictions . . . 2585
6.14.5 Related commands . . . 2585
6.14.6 Default . . . 2585
6.15 angle_style fourier command . . . 2586
6.15.1 Syntax . . . 2586
6.15.2 Examples . . . 2586
6.15.3 Description . . . 2586
6.15.4 Restrictions . . . 2586
6.15.5 Related commands . . . 2586
6.15.6 Default . . . 2587
6.16 angle_style fourier/simple command . . . 2587
6.16.1 Syntax . . . 2587
6.16.2 Examples . . . 2587
6.16.3 Description . . . 2587
6.16.4 Restrictions . . . 2587
6.16.5 Related commands . . . 2588
6.16.6 Default . . . 2588
6.17 angle_style gaussian command . . . 2588
6.17.1 Syntax . . . 2588
6.17.2 Examples . . . 2588
6.17.3 Description . . . 2588
6.17.4 Restrictions . . . 2588
6.17.5 Related commands . . . 2589
6.17.6 Default . . . 2589
6.18 angle_style harmonic command . . . 2589
6.18.1 Syntax . . . 2589
6.18.2 Examples . . . 2589
6.18.3 Description . . . 2589
6.18.4 Restrictions . . . 2590
6.18.5 Related commands . . . 2590
6.18.6 Default . . . 2590
6.19 angle_style hybrid command . . . 2590
6.19.1 Syntax . . . 2590
6.19.2 Examples . . . 2590
6.19.3 Description . . . 2590
6.19.4 Restrictions . . . 2591
6.19.5 Related commands . . . 2591
6.19.6 Default . . . 2591
6.20 angle_style lepton command . . . 2591
6.20.1 Syntax . . . 2591
6.20.2 Examples . . . 2592

6.20.3 Description . . . 2592
6.20.4 Lepton expression syntax and features . . . 2592
6.20.5 Restrictions . . . 2594
6.20.6 Related commands . . . 2594
6.20.7 Default . . . 2594
6.21 angle_style mesocnt command . . . 2594
6.21.1 Syntax . . . 2594
6.21.2 Examples . . . 2594
6.21.3 Description . . . 2594
6.21.4 Restrictions . . . 2595
6.21.5 Related commands . . . 2596
6.21.6 Default . . . 2596
6.22 angle_style mm3 command . . . 2596
6.22.1 Syntax . . . 2596
6.22.2 Examples . . . 2596
6.22.3 Description . . . 2596
6.22.4 Restrictions . . . 2596
6.22.5 Related commands . . . 2596
6.22.6 Default . . . 2596
6.23 angle_style mwlc command . . . 2597
6.23.1 Syntax . . . 2597
6.23.2 Examples . . . 2597
6.23.3 Description . . . 2597
6.23.4 Restrictions . . . 2597
6.23.5 Related commands . . . 2597
6.23.6 Default . . . 2598
6.24 angle_style none command . . . 2598
6.24.1 Syntax . . . 2598
6.24.2 Examples . . . 2598
6.24.3 Description . . . 2598
6.24.4 Restrictions . . . 2598
6.24.5 Related commands . . . 2598
6.24.6 Default . . . 2598
6.25 angle_style quartic command . . . 2598
6.25.1 Syntax . . . 2598
6.25.2 Examples . . . 2598
6.25.3 Description . . . 2599
6.25.4 Restrictions . . . 2599
6.25.5 Related commands . . . 2599
6.25.6 Default . . . 2599
6.26 angle_style spica command . . . 2599
6.26.1 Syntax . . . 2599
6.26.2 Examples . . . 2600
6.26.3 Description . . . 2600
6.26.4 Restrictions . . . 2600
6.26.5 Related commands . . . 2600
6.26.6 Default . . . 2601
6.27 angle_style table command . . . 2601
6.27.1 Syntax . . . 2601
6.27.2 Examples . . . 2601
6.27.3 Description . . . 2601
6.27.4 Restart, fix_modify, output, run start/stop, minimize info . . . 2603
6.27.5 Restrictions . . . 2603
6.27.6 Related commands . . . 2603

6.27.7 Default . . . 2603
6.28 angle_style zero command . . . 2603
6.28.1 Syntax . . . 2603
6.28.2 Examples . . . 2603
6.28.3 Description . . . 2603
6.28.4 Restrictions . . . 2604
6.28.5 Related commands . . . 2604
6.28.6 Default . . . 2604

7 Dihedral Styles 2605
7.1 dihedral_style charmm command . . . 2605
7.2 dihedral_style charmmfsw command . . . 2605
7.2.1 Syntax . . . 2605
7.2.2 Examples . . . 2605
7.2.3 Description . . . 2605
7.2.4 Restrictions . . . 2607
7.2.5 Related commands . . . 2607
7.2.6 Default . . . 2607
7.3 dihedral_style class2 command . . . 2607
7.3.1 Syntax . . . 2607
7.3.2 Examples . . . 2607
7.3.3 Description . . . 2608
7.3.4 Restrictions . . . 2610
7.3.5 Related commands . . . 2610
7.3.6 Default . . . 2610
7.4 dihedral_style cosine/shift/exp command . . . 2610
7.4.1 Syntax . . . 2610
7.4.2 Examples . . . 2610
7.4.3 Description . . . 2610
7.4.4 Restrictions . . . 2611
7.4.5 Related commands . . . 2611
7.4.6 Default . . . 2611
7.5 dihedral_style cosine/squared/restricted command . . . 2611
7.5.1 Syntax . . . 2611
7.5.2 Examples . . . 2611
7.5.3 Description . . . 2611
7.5.4 Restrictions . . . 2612
7.5.5 Related commands . . . 2612
7.5.6 Default . . . 2612
7.6 dihedral_style fourier command . . . 2612
7.6.1 Syntax . . . 2612
7.6.2 Examples . . . 2612
7.6.3 Description . . . 2612
7.6.4 Restrictions . . . 2613
7.6.5 Related commands . . . 2613
7.6.6 Default . . . 2613
7.7 dihedral_style harmonic command . . . 2613
7.7.1 Syntax . . . 2613
7.7.2 Examples . . . 2613
7.7.3 Description . . . 2614
7.7.4 Restrictions . . . 2614
7.7.5 Related commands . . . 2614
7.7.6 Default . . . 2614
7.8 dihedral_style helix command . . . 2614

7.8.1 Syntax . . . 2615
7.8.2 Examples . . . 2615
7.8.3 Description . . . 2615
7.8.4 Restrictions . . . 2615
7.8.5 Related commands . . . 2615
7.8.6 Default . . . 2616
7.9 dihedral_style hybrid command . . . 2616
7.9.1 Syntax . . . 2616
7.9.2 Examples . . . 2616
7.9.3 Description . . . 2616
7.9.4 Restrictions . . . 2617
7.9.5 Related commands . . . 2617
7.9.6 Default . . . 2617
7.10 dihedral_style lepton command . . . 2617
7.10.1 Syntax . . . 2617
7.10.2 Examples . . . 2617
7.10.3 Description . . . 2618
7.10.4 Lepton expression syntax and features . . . 2618
7.10.5 Restrictions . . . 2619
7.10.6 Related commands . . . 2619
7.10.7 Default . . . 2619
7.11 dihedral_style multi/harmonic command . . . 2619
7.11.1 Syntax . . . 2620
7.11.2 Examples . . . 2620
7.11.3 Description . . . 2620
7.11.4 Restrictions . . . 2620
7.11.5 Related commands . . . 2620
7.11.6 Default . . . 2620
7.12 dihedral_style nharmonic command . . . 2621
7.12.1 Syntax . . . 2621
7.12.2 Examples . . . 2621
7.12.3 Description . . . 2621
7.12.4 Restrictions . . . 2621
7.12.5 Related commands . . . 2621
7.12.6 Default . . . 2622
7.13 dihedral_style none command . . . 2622
7.13.1 Syntax . . . 2622
7.13.2 Examples . . . 2622
7.13.3 Description . . . 2622
7.13.4 Restrictions . . . 2622
7.13.5 Related commands . . . 2622
7.13.6 Default . . . 2622
7.14 dihedral_style opls command . . . 2622
7.14.1 Syntax . . . 2622
7.14.2 Examples . . . 2622
7.14.3 Description . . . 2623
7.14.4 Restrictions . . . 2623
7.14.5 Related commands . . . 2623
7.14.6 Default . . . 2623
7.15 dihedral_style quadratic command . . . 2623
7.15.1 Syntax . . . 2624
7.15.2 Examples . . . 2624
7.15.3 Description . . . 2624
7.15.4 Restrictions . . . 2624

7.15.5 Related commands . . . 2624
7.15.6 Default . . . 2624
7.16 dihedral_style spherical command . . . 2625
7.16.1 Syntax . . . 2625
7.16.2 Examples . . . 2625
7.16.3 Description . . . 2625
7.16.4 Restrictions . . . 2626
7.16.5 Related commands . . . 2626
7.16.6 Default . . . 2626
7.17 dihedral_style table command . . . 2626
7.18 dihedral_style table/cut command . . . 2626
7.18.1 Syntax . . . 2626
7.18.2 Examples . . . 2627
7.18.3 Description . . . 2627
7.18.4 Restart, fix_modify, output, run start/stop, minimize info . . . 2629
7.18.5 Restrictions . . . 2630
7.18.6 Related commands . . . 2630
7.18.7 Default . . . 2630
7.19 dihedral_style zero command . . . 2630
7.19.1 Syntax . . . 2630
7.19.2 Examples . . . 2630
7.19.3 Description . . . 2630
7.19.4 Restrictions . . . 2630
7.19.5 Related commands . . . 2630
7.19.6 Default . . . 2631

8 Improper Styles 2633
8.1 improper_style amoeba command . . . 2633
8.1.1 Syntax . . . 2633
8.1.2 Examples . . . 2633
8.1.3 Description . . . 2633
8.1.4 Restrictions . . . 2633
8.1.5 Related commands . . . 2634
8.1.6 Default . . . 2634
8.2 improper_style class2 command . . . 2634
8.2.1 Syntax . . . 2634
8.2.2 Examples . . . 2634
8.2.3 Description . . . 2634
8.2.4 Restrictions . . . 2635
8.2.5 Related commands . . . 2635
8.2.6 Default . . . 2635
8.3 improper_style cossq command . . . 2636
8.3.1 Syntax . . . 2636
8.3.2 Examples . . . 2636
8.3.3 Description . . . 2636
8.3.4 Restrictions . . . 2636
8.3.5 Related commands . . . 2637
8.3.6 Default . . . 2637
8.4 improper_style cvff command . . . 2637
8.4.1 Syntax . . . 2637
8.4.2 Examples . . . 2637
8.4.3 Description . . . 2637
8.4.4 Restrictions . . . 2638
8.4.5 Related commands . . . 2638

8.4.6 Default . . . 2638
8.5 improper_style distance command . . . 2638
8.5.1 Syntax . . . 2638
8.5.2 Examples . . . 2638
8.5.3 Description . . . 2638
8.5.4 Restrictions . . . 2639
8.5.5 Related commands . . . 2639
8.5.6 Default . . . 2639
8.6 improper_style distharm command . . . 2639
8.6.1 Syntax . . . 2639
8.6.2 Examples . . . 2640
8.6.3 Description . . . 2640
8.6.4 Restrictions . . . 2640
8.6.5 Related commands . . . 2640
8.6.6 Default . . . 2640
8.7 improper_style fourier command . . . 2640
8.7.1 Syntax . . . 2640
8.7.2 Examples . . . 2640
8.7.3 Description . . . 2641
8.7.4 Restrictions . . . 2642
8.7.5 Related commands . . . 2642
8.7.6 Default . . . 2642
8.8 improper_style harmonic command . . . 2642
8.8.1 Syntax . . . 2642
8.8.2 Examples . . . 2642
8.8.3 Description . . . 2642
8.8.4 Restrictions . . . 2643
8.8.5 Related commands . . . 2643
8.8.6 Default . . . 2643
8.9 improper_style hybrid command . . . 2643
8.9.1 Syntax . . . 2643
8.9.2 Examples . . . 2643
8.9.3 Description . . . 2643
8.9.4 Restrictions . . . 2644
8.9.5 Related commands . . . 2644
8.9.6 Default . . . 2644
8.10 improper_style inversion/harmonic command . . . 2645
8.10.1 Syntax . . . 2645
8.10.2 Examples . . . 2645
8.10.3 Description . . . 2645
8.10.4 Restrictions . . . 2646
8.10.5 Related commands . . . 2646
8.10.6 Default . . . 2646
8.11 improper_style none command . . . 2646
8.11.1 Syntax . . . 2646
8.11.2 Examples . . . 2646
8.11.3 Description . . . 2646
8.11.4 Restrictions . . . 2646
8.11.5 Related commands . . . 2646
8.11.6 Default . . . 2646
8.12 improper_style ring command . . . 2646
8.12.1 Syntax . . . 2646
8.12.2 Examples . . . 2647
8.12.3 Description . . . 2647

8.12.4 Restrictions . . . 2647
8.12.5 Related commands . . . 2648
8.13 improper_style sqdistharm command . . . 2648
8.13.1 Syntax . . . 2648
8.13.2 Examples . . . 2648
8.13.3 Description . . . 2648
8.13.4 Restrictions . . . 2648
8.13.5 Related commands . . . 2648

About LAMMPS and this manual

LAMMPS stands for **L**arge-scale **A**tomic/**M**olecular **M**assively **P**arallel **S**imulator.

LAMMPS is a classical molecular dynamics simulation code focusing on materials modeling. It was designed to run efficiently on parallel computers and to be easy to extend and modify. Originally developed at Sandia National Laboratories, a US Department of Energy facility, LAMMPS now includes contributions from many research groups and individuals from many institutions. Most of the funding for LAMMPS has come from the US Department of Energy (DOE). LAMMPS is open-source software distributed under the terms of the GNU Public License Version 2 (GPLv2).

The LAMMPS website has a variety of information about the code. It includes links to an online version of this manual, an online forum where users can post questions and discuss LAMMPS, and a GitHub site where all LAMMPS development is coordinated.

The content for this manual is part of the LAMMPS distribution in its doc directory.

- The version of the manual on the LAMMPS website corresponds to the latest LAMMPS feature release. It is available at: https://docs.lammps.org/.
- A version of the manual corresponding to the latest LAMMPS stable release (state of the *stable* branch on GitHub) is available online at: https://docs.lammps.org/stable/
- A version of the manual with the features most recently added to LAMMPS (state of the *develop* branch on GitHub) is available at: https://docs.lammps.org/latest/

If needed, you can build a copy on your local machine of the manual (HTML pages or PDF file) for the version of LAMMPS you have downloaded. Follow the steps on the *Build the LAMMPS documentation* page.

The manual is organized into three parts:

1. The *User Guide* with information about how to obtain, configure, compile, install, and use LAMMPS,
2. the *Programmer Guide* with information about how to use the LAMMPS library interface from different programming languages, how to modify and extend LAMMPS, the program design, internal programming interfaces, and code design conventions,
3. the *Command Reference* with detailed descriptions of all input script commands available in LAMMPS.

Part I

User Guide

CHAPTER

ONE

INTRODUCTION

These pages provide a brief introduction to LAMMPS.

1.1 Overview of LAMMPS

LAMMPS is a classical molecular dynamics (MD) code that models ensembles of particles in a liquid, solid, or gaseous state. It can model atomic, polymeric, biological, solid-state (metals, ceramics, oxides), granular, coarse-grained, or macroscopic systems using a variety of interatomic potentials (force fields) and boundary conditions. It can model 2d or 3d systems with sizes ranging from only a few particles up to billions.

LAMMPS can be built and run on single laptop or desktop machines, but is designed for parallel computers. It will run in serial and on any parallel machine that supports the MPI message-passing library. This includes shared-memory multicore, multi-CPU servers and distributed-memory clusters and supercomputers. Parts of LAMMPS also support OpenMP multi-threading, vectorization, and GPU acceleration.

LAMMPS is written in C++ and currently requires a compiler that is at least compatible with the C++-11 standard. Earlier versions were written in F77, F90, and C++-98. See the History page of the website for details. All versions can be downloaded as source code from the LAMMPS website.

Through a *C language API* LAMMPS functionality can be accessed and managed from other programming languages rather than running the LAMMPS executable. Ready to use modules for *Python* and *Fortran* exist, and an example *SWIG interface file* as well as example C files for dynamically loading LAMMPS as a shared library into other executables are provided.

LAMMPS is designed to be easy to modify or extend with new capabilities, such as new force fields, atom types, boundary conditions, or diagnostics. See the *Modifying & extending LAMMPS* section of for more details.

In the most general sense, LAMMPS integrates Newton's equations of motion for a collection of interacting particles. A single particle can be an atom or molecule or electron, a coarse-grained cluster of atoms, or a mesoscopic or macroscopic clump of material. The interaction models that LAMMPS includes are mostly short-ranged in nature; some long-range models are included as well.

LAMMPS uses neighbor lists to keep track of nearby particles. The lists are optimized for systems with particles that are repulsive at short distances, so that the local density of particles never becomes too large. This is in contrast to methods used for modeling plasma or gravitational bodies (like galaxy formation).

On parallel machines, LAMMPS uses spatial-decomposition techniques with MPI parallelization to partition the simulation domain into subdomains of equal computational cost, one of which is assigned to each processor. Processors communicate and store "ghost" atom information for atoms that border their subdomain. Multi-threading parallelization and GPU acceleration with particle-decomposition can be used in addition.

1.2 What does a LAMMPS version mean

The LAMMPS "version" is the date when it was released, such as 1 May 2014. LAMMPS is updated continuously, and with the help of extensive automated testing (mostly applied *before* changes are included) we aim to keep it working correctly and reliably at all times, but there also are regular *feature releases* with new and expanded functionality, and there are designated *stable releases* that receive updates with bug fixes back-ported from the development branch.

In addition to automated testing, several variants of static code analysis are run regularly to maintain or improve the overall code quality, consistency, and compliance with programming standards, best practices and style conventions. You can follow its development in a public git repository on GitHub.

Each version of LAMMPS contains all the documented *features* up to and including its version date. For recently added features, we add markers to the documentation at which specific LAMMPS version a feature or keyword was added or significantly changed.

1.2.1 Identifying the Version

The version date is printed to the screen and log file every time you run LAMMPS. There also is an indication, if a LAMMPS binary was compiled from version with modifications **after** a release, either from the development version or the maintenance version of the last stable release. It is also visible in the file src/version.h and in the LAMMPS directory name created when you unpack a downloaded tarball. And it is on the first page of the *manual*.

- If you browse the HTML pages of the online version of the LAMMPS manual, they will by default describe the most current feature release version of LAMMPS. In the navigation bar on the bottom left, there is the option to view instead the documentation for the most recent *stable* version or the documentation corresponding to the state of the development branch *develop*.
- If you browse the HTML pages included in your downloaded tarball, they describe the version you have, which may be older than the online version.

1.2.2 LAMMPS releases, branches, and tags

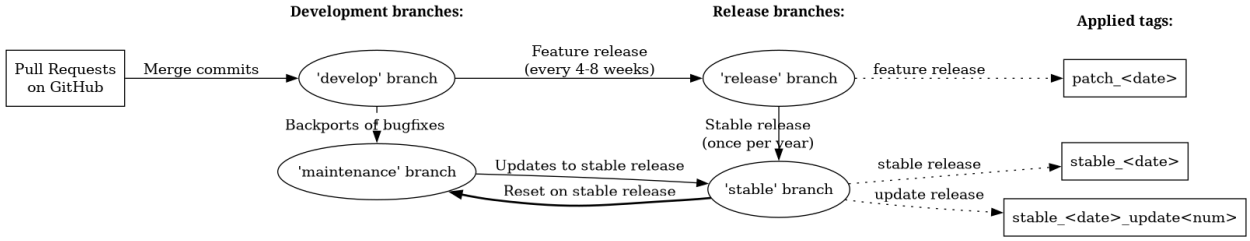

Fig. 1: Relations between releases, main branches, and tags in the LAMMPS git repository

Development

Modifications of the LAMMPS source code (like bug fixes, code refactoring, updates to existing features, or addition of new features) are organized into pull requests. Pull requests will be merged into the *develop* branch of the LAMMPS git repository on GitHub after they pass automated testing and code review by *core LAMMPS developers*.

Feature Releases

When a sufficient number of new features and updates have accumulated *and* the LAMMPS version on the *develop* branch passes an extended set of automated tests, we release it as a *feature release*, which are currently made every 4 to 8 weeks. The *release* branch of the git repository is updated with every such *feature release* and a tag in the format patch_1May2014 is added. A summary of the most important changes of these releases for the current year are posted on this website page. More detailed release notes are available on GitHub.

Stable Releases

About once a year, we release a *stable release* version of LAMMPS. This is done after a "stabilization period" where we apply only bug fixes and small, non-intrusive changes to the *develop* branch but no new features to the core code. At the same time, the code is subjected to more detailed and thorough manual testing than the default automated testing. After such a *stable release*, both the *release* and the *stable* branches are updated and two tags are applied, a patch_1May2014 format and a stable_1May2014 format tag.

Stable Release Updates

Between *stable releases*, we collect bug fixes and updates that are back-ported from the *develop* branch in a branch called *maintenance*. From the *maintenance* branch we make occasional *stable update releases* and update the *stable* branch accordingly. The first update to the stable_1May2014 release would be tagged as stable_1May2014_update1. These updates contain no new features.

1.3 LAMMPS features

LAMMPS is a classical molecular dynamics (MD) code with these general classes of functionality:

1. *General features*
2. *Particle and model types*
3. *Interatomic potentials (force fields)*
4. *Atom creation*
5. *Ensembles, constraints, and boundary conditions*
6. *Integrators*
7. *Diagnostics*
8. *Output*
9. *Multi-replica models*
10. *Pre- and post-processing*
11. *Specialized features (beyond MD itself)*

1.3.1 General features

- runs on a single processor or in parallel
- distributed memory message-passing parallelism (MPI)
- shared memory multi-threading parallelism (OpenMP)
- spatial decomposition of simulation domain for MPI parallelism
- particle decomposition inside spatial decomposition for OpenMP and GPU parallelism
- GPLv2 licensed open-source distribution
- highly portable C++-11 (optional packages may require C++17)
- modular code with most functionality in optional packages
- only depends on MPI library for basic parallel functionality, MPI stub for serial compilation
- other libraries are optional and only required for specific packages

- GPU (CUDA, OpenCL, HIP, SYCL), Intel Xeon Phi, and OpenMP support for many code features
- easy to extend with new features and functionality
- runs from an input script
- syntax for defining and using variables and formulas
- syntax for looping over runs and breaking out of loops
- run one or multiple simulations simultaneously (in parallel) from one script
- build as library, invoke LAMMPS through library interface (from C, C++, Fortran) or provided Python wrapper or SWIG based wrappers
- couple with other codes: LAMMPS calls other code, other code calls LAMMPS, umbrella code calls both, MDI coupling interface
- call out to Python for computing forces, time integration, or other tasks
- plugin interface for loading external features at runtime
- large integrated collection of tests

1.3.2 Particle and model types

(See *atom style* command)

- atoms
- coarse-grained particles (e.g. bead-spring polymers)
- united-atom polymers or organic molecules
- all-atom polymers, organic molecules, proteins, DNA
- metals
- metal oxides
- granular materials
- coarse-grained mesoscale models
- finite-size spherical and ellipsoidal particles
- finite-size line segment (2d) and triangle (3d) particles
- finite-size rounded polygons (2d) and polyhedra (3d) particles
- point dipole particles
- particles with magnetic spin
- rigid collections of n particles
- hybrid combinations of these

1.3.3 Interatomic potentials (force fields)

(See *pair style*, *bond style*, *angle style*, *dihedral style*, *improper style*, *kspace style* commands)

- pairwise potentials: Lennard-Jones, Buckingham, Morse, Born-Mayer-Huggins, Yukawa, soft, Class II (COMPASS), hydrogen bond, harmonic, gaussian, tabulated, scripted
- charged pairwise potentials: Coulombic, point-dipole

- many-body potentials: EAM, Finnis/Sinclair, MEAM, MEAM+SW, EIM, EDIP, ADP, Stillinger-Weber, Tersoff, REBO, AIREBO, ReaxFF, COMB, Streitz-Mintmire, 3-body polymorphic, BOP, Vashishta
- machine learning potentials: ACE, AGNI, GAP, Behler-Parrinello (N2P2), POD, RANN, SNAP
- interfaces to ML potentials distributed by external groups: ANI, ChIMES, DeepPot, HIPNN, MTP
- long-range interactions for charge, point-dipoles, and LJ dispersion: Ewald, Wolf, PPPM (similar to particle-mesh Ewald), MSM, ScaFaCoS
- polarization models: *QEq*, *core/shell model*, *Drude dipole model*
- charge equilibration (QEq via dynamic, point, shielded, Slater methods)
- coarse-grained potentials: DPD, GayBerne, REsquared, colloidal, DLVO, oxDNA / oxRNA, SPICA
- mesoscopic potentials: granular, Peridynamics, SPH, mesoscopic tubular potential (MESONT)
- semi-empirical potentials: multi-ion generalized pseudopotential theory (MGPT), second moment tight binding + QEq (SMTB-Q)
- electron force field (eFF)
- bond potentials: harmonic, FENE, Morse, nonlinear, Class II (COMPASS), quartic (breakable), tabulated, scripted
- angle potentials: harmonic, CHARMM, cosine, cosine/squared, cosine/periodic, Class II (COMPASS), tabulated, scripted
- dihedral potentials: harmonic, CHARMM, multi-harmonic, helix, Class II (COMPASS), OPLS, tabulated, scripted
- improper potentials: harmonic, cvff, umbrella, Class II (COMPASS), tabulated
- polymer potentials: all-atom, united-atom, bead-spring, breakable
- water potentials: TIP3P, TIP4P, SPC, SPC/E and variants
- interlayer potentials for graphene and analogues, hetero-junctions
- metal-organic framework potentials (QuickFF, MO-FF)
- implicit solvent potentials: hydrodynamic lubrication, Debye
- force-field compatibility with CHARMM, AMBER, DREIDING, OPLS, GROMACS, Class II (COMPASS), UFF, ClayFF, DREIDING, AMOEBA, INTERFACE
- access to the OpenKIM Repository of potentials via the *kim command*
- hybrid potentials: multiple pair, bond, angle, dihedral, improper potentials can be used in one simulation
- overlaid potentials: superposition of multiple pair potentials (including many-body) with optional scale factor

1.3.4 Atom creation

(See *read_data*, *lattice*, *create_atoms*, *delete_atoms*, *displace_atoms*, *replicate* commands)

- read in atom coordinates from files
- create atoms on one or more lattices (e.g. grain boundaries)
- delete geometric or logical groups of atoms (e.g. voids)
- replicate existing atoms multiple times
- displace atoms

1.3.5 Ensembles, constraints, and boundary conditions

(See *fix* command)

- 2d or 3d systems
- orthogonal or non-orthogonal (triclinic symmetry) simulation domains
- constant NVE, NVT, NPT, NPH, Parrinello/Rahman integrators
- thermostatting options for groups and geometric regions of atoms
- pressure control via Nose/Hoover or Berendsen barostatting in 1 to 3 dimensions
- simulation box deformation (tensile and shear)
- harmonic (umbrella) constraint forces
- rigid body constraints
- SHAKE / RATTLE bond and angle constraints
- motion constraints to manifold surfaces
- Monte Carlo bond breaking, formation, swapping, template based reaction modeling
- atom/molecule insertion and deletion
- walls of various kinds, static and moving
- non-equilibrium molecular dynamics (NEMD)
- variety of additional boundary conditions and constraints

1.3.6 Integrators

(See *run*, *run_style*, *minimize* commands)

- velocity-Verlet integrator
- Brownian dynamics
- rigid body integration
- energy minimization via conjugate gradient, steepest descent relaxation, or damped dynamics (FIRE, Quickmin)
- rRESPA hierarchical timestepping
- fixed or adaptive time step
- rerun command for post-processing of dump files

1.3.7 Diagnostics

- see various flavors of the *fix* and *compute* commands
- introspection command for system, simulation, and compile time settings and configurations

1.3.8 Output

(*dump*, *restart* commands)

- log file of thermodynamic info
- text dump files of atom coordinates, velocities, other per-atom quantities
- dump output on fixed and variable intervals, based timestep or simulated time

- binary restart files
- parallel I/O of dump and restart files
- per-atom quantities (energy, stress, centro-symmetry parameter, CNA, etc.)
- user-defined system-wide (log file) or per-atom (dump file) calculations
- custom partitioning (chunks) for binning, and static or dynamic grouping of atoms for analysis
- spatial, time, and per-chunk averaging of per-atom quantities
- time averaging and histogramming of system-wide quantities
- atom snapshots in native, XYZ, XTC, DCD, CFG, NetCDF, HDF5, ADIOS2, YAML formats
- on-the-fly compression of output and decompression of read in files

1.3.9 Multi-replica models

- *nudged elastic band*
- *hyperdynamics*
- *parallel replica dynamics*
- *temperature accelerated dynamics*
- *parallel tempering*
- path-integral MD: *first variant*, *second variant*
- multi-walker collective variables with *Colvars* and *Plumed*

1.3.10 Pre- and post-processing

- A handful of pre- and post-processing tools are packaged with LAMMPS, some of which can convert input and output files to/from formats used by other codes; see the *Tools* page.
- Our group has also written and released a separate toolkit called Pizza.py which provides tools for doing setup, analysis, plotting, and visualization for LAMMPS simulations. Pizza.py is written in Python and is available for download from the Pizza.py WWW site.

1.3.11 Specialized features

LAMMPS can be built with optional packages which implement a variety of additional capabilities. See the *Optional Packages* page for details.

These are LAMMPS capabilities which you may not think of as typical classical MD options:

- *static* and *dynamic load-balancing*, optional with recursive bisectioning decomposition
- *generalized aspherical particles*
- *stochastic rotation dynamics (SRD)*
- *real-time visualization and interactive MD*, *built-in renderer for images and movies*
- calculate *virtual diffraction patterns*
- calculate *finite temperature phonon dispersion* and the *dynamical matrix of minimized structures*
- *QM/MM coupling*
- Monte Carlo via *GCMC* and *tfMC* and *atom swapping*
- *path-integral molecular dynamics (PIMD)* and *this as well*

- *Direct Simulation Monte Carlo* for low-density fluids
- *Peridynamics modeling*
- *Lattice Boltzmann fluid*
- *targeted* and *steered* molecular dynamics
- *two-temperature electron model*

1.4 LAMMPS non-features

LAMMPS is designed to be a fast, parallel engine for molecular dynamics (MD) simulations. It provides only a modest amount of functionality for setting up simulations and analyzing their output.

Originally, LAMMPS was not conceived and designed for:

- being run through a GUI
- building molecular systems, or building molecular topologies
- assign force-field coefficients automagically
- perform sophisticated analysis of your MD simulation
- visualize your MD simulation interactively
- plot your output data

Over the years many of these limitations have been reduced or removed. In part through features added to LAMMPS and in part through external tools that either closely interface with LAMMPS or extend LAMMPS.

Here are suggestions on how to perform these tasks:

- **GUI:** LAMMPS can be built as a library and a Python module that wraps the library interface is provided. Thus, GUI interfaces can be written in Python or C/C++ that run LAMMPS and visualize or plot its output. Examples of this are provided in the python directory and described on the *Python* doc page. Since version 2 August 2023 the LAMMPS-GUI application is available and can be compiled together with LAMMPS and linked to the LAMMPS library for running and visualizing LAMMPS simulation inputs. As of August 2025, LAMMPS-GUI is maintained in its own repository on GitHub. Also, there are several external wrappers or GUI front ends that are mentioned on the Pre-/post-processing tools page of the LAMMPS homepage.
- **Builder:** Several pre-processing tools are packaged with LAMMPS. Some of them convert input files in formats produced by other MD codes such as CHARMM, AMBER, or Insight into LAMMPS input formats. Some of them are simple programs that will build simple molecular systems, such as linear bead-spring polymer chains. The moltemplate program is a true molecular builder that will generate complex molecular models. See the *Tools* page for details on tools packaged with LAMMPS. The Pre-/post-processing tools page of the LAMMPS homepage describes a variety of third party tools for this task. Furthermore, some internal LAMMPS commands allow reconstructing, or selectively adding topology information, as well as provide the option to insert molecule templates instead of atoms for building bulk molecular systems.
- **Force-field assignment:** The conversion tools described in the previous bullet for CHARMM, AMBER, and Insight will also assign force field coefficients in the LAMMPS format, assuming you provide CHARMM, AMBER, or BIOVIA (formerly Accelrys) force field files. The tools ParmEd and InterMol are particularly powerful and flexible in converting force field and topology data between various MD simulation programs.
- **Simulation analysis:** If you want to perform analysis on-the-fly as your simulation runs, see the *compute* and *fix* doc pages, which list commands that can be used in a LAMMPS input script. Also see the *Modify* page for info on how to add your own analysis code or algorithms to LAMMPS. For post-processing, LAMMPS output such as *dump file snapshots* can be converted into formats used by other MD or post-processing codes. To some degree, that conversion can be done directly inside LAMMPS by interfacing to the VMD molfile plugins. The *rerun* command also allows post-processing of existing trajectories, and through being able to read a variety of

file formats, this can also be used for analyzing trajectories from other MD codes. Some post-processing tools packaged with LAMMPS will do these conversions. Scripts provided in the tools/python directory can extract and massage data in dump files to make it easier to import into other programs. See the *Tools* page for details on these various options.

The Pre-/post-processing page on the LAMMPS homepage lists some external packages for analysis of MD simulation data, including data produced by LAMMPS.

- **Visualization:** LAMMPS can produce NETPBM, JPG, or PNG format snapshot images on-the-fly via its *dump image* command and pass them to an external program, FFmpeg, to generate movies from them. The *LAMMPS-GUI tool* has a *Snapshot Image Viewer* which uses *dump image* and allows to modify the visualization settings interactively. It also has a *Slide Show* feature where images created by *dump image* are collected during a simulation and can be animated interactively or exported to a movie with FFmpeg.

  For high-quality, interactive visualization, there are many excellent and free tools available. See the Visualization Tools page of the LAMMPS website for visualization packages that can process LAMMPS output data.

- **Plotting:** See the next bullet about Pizza.py as well as the *Python* page for examples of plotting LAMMPS output. Scripts provided with the *python* tool in the tools directory will extract and process data in log and dump files to make it easier to analyze and plot. See the *Tools* doc page for more discussion of the various tools.

  The *LAMMPS-GUI tool* has a *Chart Viewer* where *thermodynamic data* computed by LAMMPS is collected during the simulation and plotted immediately.

- **Pizza.py:** Our group has also written a separate toolkit called Pizza.py which can do certain kinds of setup, analysis, plotting, and visualization (via OpenGL) for LAMMPS simulations. It thus provides some functionality for several of the above bullets. Pizza.py is written in Python and is available for download from this page.

1.5 LAMMPS portability and compatibility

The primary form of distributing LAMMPS is through highly portable source code. But also several ways of obtaining LAMMPS as *precompiled packages or through automated build mechanisms* exist. Most of LAMMPS is written in C++, some support tools are written in Fortran or Python or MATLAB.

1.5.1 Programming language standards

Changed in version 10Sep2025.

The C++ code in LAMMPS currently requires a compiler that is compatible with the C++17 standard. The Kokkos library used for the KOKKOS package currently also requires at least C++17. If your compilers are not compatible and you cannot upgrade, please use LAMMPS version 22 July 2025, which requires only C++11 as the minimum C++ standard.

Most of the Python code in LAMMPS is written to be compatible with Python 3.6 and later.

Deprecated since version 2Apr2025.

Python 2.x is no longer supported and trying to use it, e.g. for the LAMMPS Python module should result in an error. If you come across some part of the LAMMPS distribution that is not (yet) compatible with Python 3, please notify the LAMMPS developers.

1.5.2 Build systems

LAMMPS can be compiled from source code using the cross-platform CMake system. CMake must be at least version 3.20. Alternatively, using a (traditional) build system based on shell scripts, a few shell utilities (grep, sed, cat, tr) and the GNU make program. This requires running within a Bourne shell (/bin/sh or /bin/bash).

Changed in version 10Sep2025.

The traditional GNU make based build system no longer supports all packages. Details can be found in the *package specific build instructions*.

1.5.3 Operating systems

The primary development platform for LAMMPS is Linux. Thus, the chances for LAMMPS to compile without problems are the best on Linux machines. Also, compilation and correct execution on macOS and Windows (using Microsoft Visual C++) is checked automatically for the largest part of the source code. Some (optional) features are not compatible with all operating systems, either through limitations of the corresponding LAMMPS source code or through incompatibilities or build system limitations of required external libraries or packages.

Executables for Windows may be created either natively using Cygwin, MinGW, Intel, Clang, or Microsoft Visual C++ compilers, or with a Linux to Windows MinGW cross-compiler. Native compilation is supported using Microsoft Visual Studio or a terminal window (using the CMake build system).

Executables for macOS may be created either using Xcode or GNU compilers installed with Homebrew. In the latter case, building of LAMMPS through Homebrew instead of a manual compile is also possible.

Additionally, FreeBSD and Solaris have been tested successfully to run LAMMPS and produce results consistent with those on Linux.

1.5.4 Compilers

The most commonly used compilers are the GNU compilers, but also Clang and the Intel compilers have been successfully used on Linux, macOS, and Windows. Also, the Nvidia HPC SDK (formerly PGI compilers) will compile LAMMPS (tested on Linux).

Changed in version 10Sep2025.

The GNU compilers *before* version 9.3 have known problems with supporting C++17 and thus are **not** recommended to build LAMMPS.

1.5.5 CPU architectures

The primary CPU architecture for running LAMMPS is 64-bit x86, but also 64-bit ARM is currently regularly tested. Further architectures are tested by Linux distributions that bundle LAMMPS.

1.5.6 Portability compliance

Only a subset of the LAMMPS source code is *fully* compliant to *all* of the above mentioned standards. This is rather typical for projects like LAMMPS that largely depend on contributions from the user community. Not all contributors are trained as programmers and not all of them have access to multiple platforms for testing. As part of the continuous integration process, however, all contributions are automatically tested to compile, link, and pass some runtime tests on a selection of Linux flavors, macOS, and Windows, and on Linux with different compilers. Thus portability issues are often found before a pull request is merged. Other platforms may be checked occasionally or when portability bugs are reported.

1.6 LAMMPS open-source license

1.6.1 GPL version of LAMMPS

LAMMPS is an open-source code, available free-of-charge, and distributed under the terms of the GNU Public License Version 2 (GPLv2), which means you can use or modify the code however you wish for your own purposes, but have to adhere to certain rules when redistributing it - specifically in binary form - or are distributing software derived from it or that includes parts of it.

LAMMPS comes with no warranty of any kind.

As each source file states in its header, it is a copyrighted code, and thus not in the public domain. For more information about open-source software and open-source distribution, see www.gnu.org or www.opensource.org. The legal text of the GPL as it applies to LAMMPS is in the LICENSE file included in the LAMMPS distribution.

Here is a more specific summary of what the GPL means for LAMMPS users:

(1) Anyone is free to use, copy, modify, or extend LAMMPS in any way they choose, including for commercial purposes.

(2) If you **distribute** a modified version of LAMMPS, it must remain open-source, meaning you are required to distribute **all** of it under the terms of the GPLv2. You should **clearly** annotate such a modified code as a derivative version of LAMMPS. This is best done by changing the name (example: LIGGGHTS is such a modified and extended version of LAMMPS).

(3) If you release any code that includes or uses LAMMPS source code, then it must also be open-sourced, meaning you distribute it under the terms of the GPLv2. You may write code that interfaces LAMMPS to a differently licensed library. In that case the code that provides the interface must be licensed GPLv2, but not necessarily that library unless you are distributing binaries that require the library to run.

(4) If you give LAMMPS files to someone else, the GPLv2 LICENSE file and source file headers (including the copyright and GPLv2 notices) should remain part of the code.

1.6.2 LGPL version of LAMMPS

We occasionally make stable LAMMPS releases available under the GNU Lesser Public License v2.1. This is on request only and with non-LGPL compliant files removed. This allows uses linking non-GPL compatible software with the (otherwise unmodified) LAMMPS library or loading it dynamically at runtime. Any **modifications** to the LAMMPS code however, even with the LGPL licensed version, must still be made available under the same open source terms as LAMMPS itself.

1.7 Authors of LAMMPS

The current core LAMMPS developers are listed here (grouped by seniority and sorted alphabetically by last name). You can email an individual developer with code related questions for their area of expertise, or send an email to all of them at this address: "developers at lammps.org". General questions about LAMMPS should be posted in the LAMMPS forum on MatSci.

Name	Affiliation	Email	Areas of expertise
Axel Kohlmeyer	Temple U	akohlmey at gmail.com	OpenMP, library interfaces, LAMMPS-GUI, GitHub, MatSci forum, code maintenance, testing, releases
Steve Plimpton	SNL (retired)	sjplimp at gmail.com	original author, MD kernels, parallel algorithms & scalability, code structure and design
Aidan Thompson	SNL	athomps at sandia.gov	manybody potentials, machine learned potentials, materials science, statistical mechanics
Richard Berger	LANL	richard.berger at outlook.com	Python, HPC, DevOps
Germain Clavier	U Caen	germain.clavier at unicaen.fr	organic molecules, polymers, mechanical properties, surfaces, integrators, coarse-graining
Joel Clemmer	SNL	jtclemm at sandia.gov	granular systems fluid/solid mechanics
Jacob R. Gissinger	Stevens Institute of Technology	jgissing at stevens.edu	reactive molecular dynamics, macro-molecular systems, type labels
James Goff	SNL	jmgoff at sandia.gov	machine learned potentials, QEq solvers, Python
Meg McCarthy	SNL	megmcca at sandia.gov	alloys, micro-structure, machine learned potentials
Stan Moore	SNL	stamoor at sandia.gov	Kokkos, KSpace solvers, ReaxFF
Trung Nguyen	U Chicago	ndactrung at gmail.com	soft matter, GPU package, DIELECTRIC package, regression testing

Past core developers include Paul Crozier and Mark Stevens, both at SNL, and Ray Shan while at SNL and later at Materials Design, now at Thermo Fisher Scientific.

The Authors page of the LAMMPS website has a comprehensive list of all the individuals who have contributed code for a new feature or command or tool to LAMMPS.

The following folks deserve special recognition. Many of the packages they have written are unique for an MD code and LAMMPS would not be as general-purpose as it is without their expertise and efforts.

- Metin Aktulga (MSU), REAXFF package for C/C++ version of ReaxFF
- Mike Brown (Intel), GPU and INTEL packages
- Colin Denniston (U Western Ontario), LATBOLTZ package
- Georg Ganzenmuller (EMI), MACHDYN and SPH packages
- Andres Jaramillo-Botero (Caltech), EFF package for electron force field
- Reese Jones (Sandia) and colleagues, ATC package for atom/continuum coupling
- Christoph Kloss (DCS Computing), LIGGGHTS code for granular materials, built on top of LAMMPS
- Rudra Mukherjee (JPL), POEMS package for articulated rigid body motion
- Trung Ngyuen (U Chicago), GPU, RIGID, BODY, and DIELECTRIC packages
- Mike Parks (Sandia), PERI package for Peridynamics
- Roy Pollock (LLNL), Ewald and PPPM solvers
- Julien Tranchida (CEA Cadarache), SPIN package
- Christian Trott (Sandia), CUDA and KOKKOS packages
- Ilya Valuev (JIHT), AWPMD package for wave packet MD
- Greg Wagner (Northwestern U), MEAM package for MEAM potential

---

As discussed on the History page of the website, LAMMPS originated as a cooperative project between DOE labs and industrial partners. Folks involved in the design and testing of the original version of LAMMPS were the following:

- John Carpenter (Mayo Clinic, formerly at Cray Research)
- Terry Stouch (Lexicon Pharmaceuticals, formerly at Bristol Myers Squibb)
- Steve Lustig (Dupont)
- Jim Belak and Roy Pollock (LLNL)

1.8 Citing LAMMPS

1.8.1 Core Algorithms

The paper mentioned below is the best overview of LAMMPS, but there are also publications describing particular models or algorithms implemented in LAMMPS or complementary software that is has interfaces to. Please see below for how to cite contributions to LAMMPS.

The latest canonical publication that describes the basic features, the source code design, the program structure, the spatial decomposition approach, the neighbor finding, basic communications algorithms, and how users and developers have contributed to LAMMPS is:

> LAMMPS - A flexible simulation tool for particle-based materials modeling at the atomic, meso, and continuum scales, Comp. Phys. Comm. 271, 108171 (2022)

So a project using LAMMPS or a derivative application that uses LAMMPS as a simulation engine should cite this paper. The paper is expected to be published in its final form under the same DOI in the first half of 2022. Please also give the URL of the LAMMPS website in your paper, namely https://www.lammps.org.

The original publication describing the parallel algorithms used in the initial versions of LAMMPS is:

> S. Plimpton, Fast Parallel Algorithms for Short-Range Molecular Dynamics, J Comp Phys, 117, 1-19 (1995).

1.8.2 DOI for the LAMMPS source code

The LAMMPS developers use the Zenodo service at CERN to create digital object identifiers (DOI) for stable releases of the LAMMPS source code. There are two types of DOIs for the LAMMPS source code.

The canonical DOI for **all** versions of LAMMPS, which will always point to the **latest** stable release version, is:

- DOI: 10.5281/zenodo.3726416

In addition there are DOIs generated for individual stable releases:

- 3 March 2020 version: DOI:10.5281/zenodo.3726417
- 29 October 2020 version: DOI:10.5281/zenodo.4157471
- 29 September 2021 version: DOI:10.5281/zenodo.6386596
- 23 June 2022 version: DOI:10.5281/zenodo.10806836
- 2 August 2023 version: DOI:10.5281/zenodo.10806852

1.8.3 Home page

The LAMMPS website at https://www.lammps.org/ is the canonical location for information about LAMMPS and its features.

1.8.4 Citing contributions

LAMMPS has many features that use either previously published methods and algorithms or novel features. It also includes potential parameter files for specific models. Where available, a reminder about references for optional features used in a specific run is printed to the screen and log file. Style and output location can be selected with the *-cite command-line switch*. Additional references are given in the documentation of the *corresponding commands* or in the *Howto tutorials*. Please make certain, that you provide the proper acknowledgments and citations in any published works using LAMMPS.

1.9 Additional website links

The LAMMPS website has a variety of additional info about LAMMPS, beyond what is in this manual. Some other useful resources available online are listed below.

- LAMMPS source code repository on GitHub
- LAMMPS plugins source code repository on GitHub
- LAMMPS forum on matsci.org
- Recent bug fixes and new features
- Download info

- Glossary of terms relevant to LAMMPS
- LAMMPS highlights with images
- LAMMPS highlights with movies

- Funding for LAMMPS

CHAPTER

TWO

INSTALL LAMMPS

You can download LAMMPS as an executable or as source code.

When downloading the LAMMPS source code, you also have to *build LAMMPS*. But you have more flexibility as to what features to include or exclude in the build. When you download and install pre-compiled LAMMPS executables, you are limited to install which version of LAMMPS is available and which features are included of these builds. If you plan to *modify or extend LAMMPS*, then you **must** build LAMMPS from the source code.

Note

If you have questions about the pre-compiled LAMMPS executables, you need to contact the people preparing those executables. The LAMMPS developers have no control over their choices of how they configure and build their packages and when they update them.

2.1 Download an executable for Linux

Binaries are available for different versions of Linux:

- *Pre-built static Linux x86_64 executables*
- *Pre-built Ubuntu and Debian Linux executables*
- *Pre-built Fedora Linux executables*
- *Pre-built EPEL Linux executables (RHEL, CentOS)*
- *Pre-built OpenSuse Linux executables*
- *Gentoo Linux executable*
- *Arch Linux build-script*

Note

If you have questions about these pre-compiled LAMMPS executables, you need to contact the people preparing those packages. The LAMMPS developers have no control over how they configure and build their packages and when they update them. They may only provide packages for stable release versions and not always update the packages in a timely fashion after a new LAMMPS release is made.

2.1.1 Pre-built static Linux x86_64 executables

Pre-built LAMMPS executables for Linux, that are statically linked and compiled for 64-bit x86 CPUs (x86_64 or AMD64) are available for download at https://download.lammps.org/static/. Because of that static linkage (and unlike the Linux distribution specific packages listed below), they do not depend on any installed software and thus should run on *any* 64-bit x86 machine with *any* Linux version.

These executable include most of the available packages and multi-thread parallelization (via INTEL, KOKKOS, or OPENMP package). They are **not** compatible with MPI. Several of the LAMMPS tools executables (e.g. msi2lmp) are included as well. Because of the static linkage, there is no liblammps.so library file and thus also the LAMMPS python module, which depends on it, is not included.

The compressed tar archives available for download have names following the pattern lammps-linux-x86_64-<version>.tar.gz and will all unpack into a lammps-static folder. The executables are then in the lammps-static/bin/ folder. Since they do not depend on any other software, they may be freely moved or copied around.

2.1.2 Pre-built Ubuntu and Debian Linux executables

A pre-built LAMMPS executable, suitable for running on the latest Ubuntu and Debian Linux versions, can be downloaded as a Debian package. This allows you to install LAMMPS with a single command, and stay (mostly) up-to-date with the current stable version of LAMMPS by simply updating your operating system.

To install LAMMPS do the following once:

```
sudo apt-get install lammps
```

This downloads an executable named lmp to your box and multiple packages with supporting data, examples and libraries as well as any missing dependencies. For example, the LAMMPS binary in this package is built with the *KIM package* enabled, which results in the above command also installing the kim-api binaries when LAMMPS is installed, unless they were installed already. In order to use potentials from openkim.org, you can also install the openkim-models package:

```
sudo apt-get install openkim-models
```

Or use the KIM-API commands to download and install individual models.

This LAMMPS executable can then be used in the usual way to run input scripts:

```
lmp -in in.lj
```

To update LAMMPS to the latest packaged version, do the following:

```
sudo apt-get update
```

This will also update other packages on your system.

To uninstall LAMMPS, do the following:

```
sudo apt-get remove lammps
```

Please use lmp -help to see which compilation options, packages, and styles are included in the binary.

Thanks to Anton Gladky (gladky.anton at gmail.com) for setting up this Ubuntu package capability.

2.1.3 Pre-built Fedora Linux executables

Pre-built LAMMPS packages for stable releases are available in the Fedora Linux distribution since Fedora version 28. The packages can be installed via the dnf package manager. There are 3 basic varieties (lammps = no MPI, lammps-mpich = MPICH MPI library, lammps-openmpi = OpenMPI MPI library) and for each support for linking to the C library interface (lammps-devel, lammps-mpich-devel, lammps-openmpi-devel), the header for compiling programs using the C library interface (lammps-headers), and the LAMMPS python module for Python 3. All packages can be installed at the same time and the name of the LAMMPS executable is lmp and lmp_openmpi or lmp_mpich respectively. By default, lmp will refer to the serial executable, unless one of the MPI environment modules is loaded (module load mpi/mpich-x86_64 or module load mpi/openmpi-x86_64). Then the corresponding parallel LAMMPS executable can be used. The same mechanism applies when loading the LAMMPS python module.

To install LAMMPS with OpenMPI and run an input in.lj with 2 CPUs do:

```
dnf install lammps-openmpi
module load mpi/openmpi-x86_64
mpirun -np 2 lmp -in in.lj
```

The dnf install command is needed only once. In case of a new LAMMPS stable release, dnf update will automatically update to the newer version as soon as the RPM files are built and uploaded to the download mirrors. The module load command is needed once per (shell) session or shell terminal instance, unless it is automatically loaded from the shell profile.

The LAMMPS binary is built with the *KIM package* which results in the above command also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from openkim.org, you can install the *openkim-models* package

```
dnf install openkim-models
```

Please use lmp -help to see which compilation options, packages, and styles are included in the binary.

Thanks to Christoph Junghans (LANL) for making LAMMPS available in Fedora.

2.1.4 Pre-built EPEL Linux executable

Pre-built LAMMPS (and KIM) packages for stable releases are available in the Extra Packages for Enterprise Linux (EPEL) repository for use with Red Hat Enterprise Linux (RHEL) or CentOS version 7.x and compatible Linux distributions. Names of packages, executable, and content are the same as described above for Fedora Linux. But RHEL/CentOS 7.x uses the yum package manager instead of dnf in Fedora 28.

Please use lmp -help to see which compilation options, packages, and styles are included in the binary.

Thanks to Christoph Junghans (LANL) for making LAMMPS available in EPEL.

2.1.5 Pre-built OpenSuse Linux executable

A pre-built LAMMPS package for stable releases is available in OpenSuse as of Leap 15.0. You can install the package with:

```
zypper install lammps
```

This includes support for OpenMPI. The name of the LAMMPS executable is lmp. To run an input in parallel on 2 CPUs you would do:

```
mpirun -np 2 lmp -in in.lj
```

Please use lmp -help to see which compilation options, packages, and styles are included in the binary.

The LAMMPS binary is built with the *KIM package* which results in the above command also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from openkim.org, you can install the *openkim-models* package

```
zypper install openkim-models
```

Thanks to Christoph Junghans (LANL) for making LAMMPS available in OpenSuse.

2.1.6 Gentoo Linux executable

LAMMPS is part of Gentoo's main package tree and can be installed by typing:

```
emerge --ask lammps
```

Note that in Gentoo the LAMMPS source code is downloaded and the package is then compiled and installed on your machine.

Certain LAMMPS packages can be enabled via USE flags, type

```
equery uses lammps
```

for details.

Thanks to Nicolas Bock and Christoph Junghans (LANL) for setting up this Gentoo capability.

2.1.7 Archlinux build-script

LAMMPS is available via Arch's unofficial Arch User repository (AUR). There are three scripts available, named lammps, lammps-beta and lammps-git. They respectively package the stable, feature, and git releases.

To install, you will need to have the git package installed. You may use any of the above names in-place of lammps.

```
git clone https://aur.archlinux.org/lammps.git
cd lammps
makepkg -s
makepkg -i
```

To update LAMMPS, you may repeat the above, or change into the cloned directory, and execute the following, after which, if there are any changes, you may use makepkg as above.

```
git pull
```

Alternatively, you may use an AUR helper to install these packages.

Note that the AUR provides build-scripts that download the source code and then build and install the package on your machine.

2.2 Download an executable for macOS

LAMMPS can be downloaded, built, and configured for macOS with Homebrew. (Alternatively, see the installation instructions for *downloading an executable via Conda*.) The following LAMMPS packages are unavailable at this time because of additional requirements not yet met: GPU, KOKKOS.

After installing Homebrew, you can install LAMMPS on your system with the following commands:

```
brew install lammps
```

This will install the executables "lammps_serial" and "lammps_mpi", as well as the LAMMPS "doc", "potentials", "tools", "bench", and "examples" directories.

Once LAMMPS is installed, you can test the installation with the Lennard-Jones benchmark file:

```
brew test lammps -v
```

The LAMMPS binary is built with the *KIM package*, which results in Homebrew also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from openkim.org, you can install the *openkim-models* package

```
brew install openkim-models
```

If you have problems with the installation, you can post issues to this link.

Thanks to Derek Thomas (derekt at cello.t.u-tokyo.ac.jp) for setting up the Homebrew capability.

2.3 Download an executable for Windows

Pre-compiled Windows installers which install LAMMPS executables on a Windows system can be downloaded from this site:

https://packages.lammps.org/windows.html

Note that each installer package has a date in its name, which corresponds to the LAMMPS version of the same date. Installers for current and older versions of LAMMPS are available. 32-bit and 64-bit installers are available, and each installer contains both a serial and parallel executable. The installer website also explains how to install the Windows MPI package (MPICH2 from Argonne National Labs), needed to run in parallel with MPI.

The LAMMPS binaries contain *all optional packages* included in the source distribution except: ADIOS, H5MD, KIM, ML-PACE, ML-QUIP, MSCG, NETCDF, QMMM, SCAFACOS, and VTK. The serial version also does not include the LATBOLTZ package. The PYTHON package is only available in the Python installers that bundle a Python runtime. The GPU package is compiled for OpenCL with mixed precision kernels.

The LAMMPS library is compiled as a shared library and the *LAMMPS Python module* is installed, so that it is possible to load LAMMPS into a Python interpreter.

The installer site also has instructions on how to run LAMMPS under Windows, once it is installed, in both serial and parallel.

When you download the installer package, you run it on your Windows machine. It will then prompt you with a dialog, where you can choose the installation directory, unpack and copy several executables, potential files, documentation PDFs, selected example files, etc. It will then update a few system settings (e.g. PATH, LAMMPS_POTENTIALS) and add an entry into the Start Menu (with references to the documentation, LAMMPS homepage and more). From that menu, there is also a link to an uninstaller that removes the files and undoes the environment manipulations.

Note that to update to a newer version of LAMMPS, you should typically uninstall the version you currently have, download a new installer, and go through the installation procedure described above. I.e. the same procedure for installing/updating most Windows programs. You can install multiple versions of LAMMPS (in different directories),

but only the executable for the last-installed package will be found automatically, so this should only be done for debugging purposes.

2.4 Download an executable for Linux or macOS via Conda

Pre-compiled LAMMPS binaries are available for macOS and Linux via the Conda package management system.

First, one must set up the Conda package manager on your system. Follow the instructions to install Miniconda, then create a conda environment (named *my-lammps-env* or whatever you prefer) for your LAMMPS install:

```
conda config --add channels conda-forge
conda create -n my-lammps-env
```

Then, you can install LAMMPS on your system with the following command:

```
conda activate my-lammps-env
conda install lammps
```

The LAMMPS binary is built with the *KIM package*, which results in Conda also installing the *kim-api* binaries when LAMMPS is installed. In order to use potentials from openkim.org, you can install the *openkim-models* package

```
conda install openkim-models
```

If you have problems with the installation, you can post issues to this link. Thanks to Jan Janssen (Max-Planck-Institut fuer Eisenforschung) for setting up the Conda capability.

Note

If you have questions about these pre-compiled LAMMPS executables, you need to contact the people preparing those packages. The LAMMPS developers have no control over their choices of how they configure and build their packages and when they update them.

2.5 Download source and documentation as a tarball

You can download a current LAMMPS tarball from the download page of the LAMMPS website or from GitHub (see below).

You have two choices of tarballs, either the most recent stable release or the most recent feature release. Stable releases occur a few times per year, and undergo more testing before release. Also, between stable releases bug fixes from the feature releases are back-ported and the tarball occasionally updated. Feature releases occur every 4 to 8 weeks. The new contents in all feature releases are listed on the bug and feature page of the LAMMPS homepage.

Tarballs of older LAMMPS versions can also be downloaded from this page.

Tarballs downloaded from the LAMMPS homepage include the pre-translated LAMMPS documentation (HTML and PDF files) corresponding to that version.

Once you have a tarball, uncompress and untar it with the following command:

```
tar -xzvf lammps*.tar.gz
```

This will create a LAMMPS directory with the version date in its name, e.g. lammps-28Mar23.

You can also download a compressed tar or zip archives from the "Assets" sections of the LAMMPS GitHub releases site. The file name will be lammps-<version>.zip which can be unzipped with the following command, to create a lammps-<version> directory:

```
unzip lammps*.zip
```

This version corresponds to the selected LAMMPS feature or stable release (as indicated by the matching git tag) and will only contain the source code and no pre-built documentation.

2.6 Download the LAMMPS source with git

LAMMPS development is coordinated through the "LAMMPS GitHub site". If you clone the LAMMPS repository onto your local machine, it has several advantages:

- You can stay current with changes to LAMMPS with a single git command.
- You can create your own development branches to add code to LAMMPS.
- You can submit your new features back to GitHub for inclusion in LAMMPS. For that, you should first create your own *fork on GitHub*, though.

You must have git installed on your system to use the commands explained below to communicate with the git servers on GitHub.

You can follow the LAMMPS development on 4 different git branches:

- **develop** : this branch follows the ongoing development and is updated with every merge commit of a pull request
- **release** : this branch is updated with every "feature release" and updates are always "fast-forward" merges from *develop*
- **maintenance** : this branch collects back-ported bug fixes from the *develop* branch to the *stable* branch. It is used to update the *stable* branch for "stable update releases".
- **stable** : this branch is updated from the *release* branch with every "stable release" version and also has selected bug fixes with every "update release" when the *maintenance* branch is merged into it

To access the git repository on your box, use the clone command to create a local copy of the LAMMPS repository with a command like:

```
git clone -b release https://github.com/lammps/lammps.git mylammps
```

where "mylammps" is the name of the directory you wish to create on your machine and "release" is one of the 3 branches listed above. (Note that you actually download all 3 branches; you can switch between them at any time using "git checkout <branch name>".)

Saving time and disk space when using git clone

The complete git history of the LAMMPS project is quite large because it contains the entire commit history of the project since fall 2006, which includes the time when LAMMPS was managed with subversion. This includes a few commits that have added and removed some large files (mostly by accident). If you do not need access to the entire commit history (most people don't), you can speed up the "cloning" process and reduce local disk space requirements by using the --depth git command-line flag. That will create a "shallow clone" of the repository, which contains only a subset of the git history. Using a depth of 1000 is usually sufficient to include the head commits of the *develop*, the *release*, and the *maintenance* branches. To include the head commit of the *stable* branch you may need a depth of up to 10000. If you later need more of the git history, you can always convert the shallow clone into a "full clone".

Once the command completes, your directory will contain the same files as if you unpacked a current LAMMPS tarball, with the exception, that the HTML documentation files are not included. They can be generated from the content provided in doc/src by typing make html from the doc directory.

After initial cloning, as bug fixes and new features are added to LAMMPS you can stay up-to-date by typing the following git commands from within the "mylammps" directory:

```
git checkout release      # not needed if you always stay in this branch
git checkout stable       # use one of these 4 checkout commands
git checkout develop      # to choose the branch to follow
git checkout maintenance
git pull
```

Doing a "pull" will not change any files you have added to the LAMMPS directory structure. It will also not change any existing LAMMPS files you have edited, unless those files have changed in the repository. In that case, git will attempt to merge the changes from the repository file with your version of the file and tell you if there are any conflicts. See the git documentation for details.

If you want to access a particular previous release version of LAMMPS, you can instead "check out" any version with a published tag. See the output of git tag -l for the list of tags. The git command to do this is as follows.

```
git checkout tagID
```

Stable versions and what tagID to use for a particular stable version are discussed on this page. Note that this command will print some warnings, because in order to get back to the latest revision and to be able to update with git pull again, you will need to do git checkout release (or check out any other desired branch) first.

Once you have updated your local files with a git pull (or git checkout), you still need to re-build LAMMPS if any source files have changed. How to do this depends on the build system you are using.

CMake build

Change to your build folder and type:

```
cmake --build .
```

CMake should auto-detect whether it needs to re-run the CMake configuration step and otherwise redo the build for all files that have been changed or files that depend on changed files. In case some build options have been changed or renamed, you may have to update those by running:

```
cmake .
```

and then rebuild.

Traditional make

Switch to the src directory and type:

```
make purge            # remove any deprecated src files
make package-update   # sync package files with src files
make foo              # re-build for your machine (mpi, serial, etc)
```

to enforce consistency of the source between the src folder and package directories. This is OK to do even if you don't use any packages. The make purge command removes any deprecated src files if they were removed by the update from a package subdirectory.

Warning

If you wish to edit/change a src file that is from a package, you should edit the version of the file inside the package subdirectory with src, then re-install the package. The version in the source directory is merely a copy and will be wiped out if you type "make package-update".

Git protocols

The servers at github.com support the "https" access protocol for anonymous, read-only access. If you have a suitably configured GitHub account, you may also use SSH protocol with the URL git@github.com:lammps/lammps.git.

The LAMMPS GitHub project is currently overseen by Axel Kohlmeyer (Temple U, akohlmey at gmail.com), contact him if you have any questions or concerns.

You can find additional LAMMPS features for dynamically loading with the *plugin command* in the LAMMPS plugins source code repository on GitHub

---

These are the files and subdirectories in the LAMMPS distribution:

README	Short description of the LAMMPS package
LICENSE	GNU General Public License (GPL)
SECURITY.md	Security policy for the LAMMPS package
bench	benchmark inputs
cmake	CMake build files
doc	documentation and tools to build the manual
examples	example input files
fortran	Fortran module for LAMMPS library interface
lib	additional provided or external libraries
potentials	selected interatomic potential files
python	Python module for LAMMPS library interface
src	LAMMPS source files
tools	pre- and post-processing tools
unittest	source code and inputs for testing LAMMPS

You will have all of these if you downloaded the LAMMPS source code. You will have only some of them if you downloaded executables, as explained on the pages listed above.

CHAPTER

THREE

BUILD LAMMPS

LAMMPS is built as a library and an executable from source code using a build environment generated by CMake (Unix Makefiles, Ninja, Xcode, Visual Studio, KDevelop, CodeBlocks and more depending on the platform). Using CMake is the preferred way to build LAMMPS. In addition, LAMMPS can be compiled using the legacy build system based on traditional makefiles for use with GNU make (which may require manual editing). Support for the legacy build system is slowly being phased out and may not be available for all optional features.

As an alternative, you can download a package with pre-built executables or automated build trees, as described in the *Install* section of the manual.

3.1 Prerequisites

Which software you need to compile and use LAMMPS strongly depends on which *features and settings* and which *optional packages* you are trying to include. Common to all is that you need a C++ and C compiler, where the C++ compiler has to support at least the C++17 standard (note that some compilers require a command-line flag to activate C++17 support). Furthermore, if you are building with CMake, you need at least CMake version 3.20 and a compatible build tool (make or ninja-build); if you are building the the legacy GNU make based build system you need GNU make (other make variants are not going to work since the build system uses features unique to GNU make) and a Unix-like build environment with a Bourne shell, and shell tools like "sed", "grep", "touch", "test", "tr", "cp", "mv", "rm", "ln", "diff" and so on. Parts of LAMMPS interface with or use Python version 3.6 or later.

The LAMMPS developers aim to keep LAMMPS very portable and usable - at least in parts - on most operating systems commonly used for running MD simulations. Please see the *section on portablility* for more details.

3.2 Build LAMMPS with CMake

This page describes how to use CMake in general to build LAMMPS. Details for specific compile time settings and options to enable and configure add-on packages are discussed with those packages. Links to those pages on the *Build overview* page.

The following text assumes some familiarity with CMake and focuses on using the command-line tool `cmake` and what settings are supported for building LAMMPS. A more detailed tutorial on how to use CMake itself, the text mode or graphical user interface, to change the generated output files for different build tools and development environments is on a *separate page*.

Note

LAMMPS currently requires that CMake version 3.20 or later is available.

Warning

You must not mix the *traditional make based* LAMMPS build procedure with using CMake. No packages may be installed or a build been previously attempted in the LAMMPS source directory by using make <machine>. CMake will detect if this is the case and generate an error. To remove conflicting files from the src you can use the command make no-all purge which will uninstall all packages and delete all auto-generated files.

3.2.1 Advantages of using CMake

CMake is the preferred way of compiling LAMMPS in contrast to the legacy build system based on GNU make and through *(manually customized) makefiles*. Using CMake has multiple advantages that are specifically helpful for people with limited experience in compiling software or for people that want to modify or extend LAMMPS.

- CMake can detect available hardware, tools, features, and libraries and adapt the LAMMPS default build configuration accordingly.
- CMake can generate files for different build tools and integrated development environments (IDE).
- CMake supports customization of settings with a command-line, text mode, or graphical user interface. No manual editing of files, knowledge of file formats or complex command-line syntax is required.
- All enabled components are compiled in a single build operation.
- Automated dependency tracking for all files and configuration options.
- Support for true out-of-source compilation. Multiple configurations and settings with different choices of LAMMPS packages, settings, or compilers can be configured and built concurrently from the same source tree.
- Simplified packaging of LAMMPS for Linux distributions, environment modules, or automated build tools like Spack or Homebrew.
- Integration of automated unit and regression testing.

3.2.2 Getting started

Building LAMMPS with CMake is a two-step process. In the first step, you use CMake to generate a build environment in a new directory. For that purpose you can use either the command-line utility cmake (or cmake3), the text-mode UI utility ccmake (or ccmake3) or the graphical utility cmake-gui, or use them interchangeably. The second step is then the compilation and linking of all objects, libraries, and executables using the selected build tool. Here is a minimal example using the command-line version of CMake to build LAMMPS with no add-on packages enabled and no customization:

```
cd lammps               # change to the LAMMPS distribution directory
mkdir build; cd build   # create and use a build directory
cmake ../cmake          # configuration reading CMake scripts from ../cmake
cmake --build .         # compilation (or type "make")
```

This will create and change into a folder called build, then run the configuration step to generate build files for the default build command and then launch that build command to compile LAMMPS. During the configuration step CMake will try to detect whether support for MPI, OpenMP, FFTW, gzip, JPEG, PNG, and ffmpeg are available and enable the corresponding configuration settings. The progress of this configuration can be followed on the screen and a summary of selected options and settings will be printed at the end. The cmake --build . command will launch the compilation, which, if successful, will ultimately produce a library liblammps.a and the LAMMPS executable lmp inside the build folder.

Compilation can take a long time, since LAMMPS is a large project with many features. If your machine has multiple CPU cores (most do these days), you can speed this up by compiling sources in parallel with make -j N (with N being the maximum number of concurrently executed tasks). Installation of the ccache (= Compiler Cache) software

may speed up repeated compilation even more, e.g. during code development, especially when repeatedly switching between branches.

After the initial build, whenever you edit LAMMPS source files, enable or disable packages, change compiler flags or build options, you must re-compile and relink the LAMMPS executable with cmake --build . (or make). If the compilation fails for some reason, try running cmake . and then compile again. The included dependency tracking should make certain that only the necessary subset of files is re-compiled. You can also delete compiled objects, libraries, and executables with cmake --build . --target clean (or make clean).

After compilation, you may optionally install the LAMMPS executable into your system with:

```
make install    # optional, copy compiled files into installation location
```

This will install the LAMMPS executable and library, some tools (if configured) and additional files like LAMMPS API headers, manpages, potential and force field files. The location of the installation tree defaults to ${HOME}/.local.

Note

If you have set *-D CMAKE_INSTALL_PREFIX* to install LAMMPS into a system location on a Linux machine , you may also have to run (as root) the *ldconfig* program to update the cache file for fast lookup of system shared libraries.

3.2.3 Configuration and build options

The CMake commands have one mandatory argument: a folder containing a file called CMakeLists.txt (for LAMMPS it is located in the cmake folder) or a build folder containing a file called CMakeCache.txt, which is generated at the end of the CMake configuration step. The cache file contains all current CMake settings.

To modify settings, enable or disable features, you need to set *variables* with either the -D command-line flag (-D VARIABLE1_NAME=value) or change them in the text mode of the graphical user interface. The -D flag can be used several times in one command.

For your convenience, we provide *CMake presets* that combine multiple settings to enable optional LAMMPS packages or use a different compiler tool chain. Those are loaded with the -C flag (-C ../cmake/presets/basic.cmake). This step would only be needed once, as the settings from the preset files are stored in the CMakeCache.txt file. It is also possible to customize the build by adding one or more -D flags to the CMake command.

Generating files for alternate build tools (e.g. Ninja) and project files for IDEs like Eclipse, CodeBlocks, or Kate can be selected using the -G command-line flag. A list of available generator settings for your specific CMake version is given when running cmake --help.

3.2.4 Multi-configuration build systems

Throughout this manual, it is mostly assumed that LAMMPS is being built on a Unix-like operating system with "make" as the underlying "builder", since this is the most common case. In this case the build "configuration" is chose using -D CMAKE_BUILD_TYPE=<configuration> with <configuration> being one of "Release", "Debug", "RelWithDebInfo", or "MinSizeRel". Some build tools, however, can also use or even require having a so-called multi-configuration build system setup. For a multi-configuration build, the built type (or configuration) is selected at compile time using the same build files. E.g. with:

```
cmake --build build-multi --config Release
```

In that case the resulting binaries are not in the build folder directly but in subdirectories corresponding to the build type (i.e. Release in the example from above). Similarly, for running unit tests the configuration is selected with the -C flag:

```
ctest -C Debug
```

The CMake scripts in LAMMPS have basic support for being compiled using a multi-config build system, but not all of it has been ported. This is in particular applicable to compiling packages that require additional libraries that would be downloaded and compiled by CMake. The windows.cmake preset file tries to keep track of which packages can be compiled natively with the MSVC compilers out-of-the box. Not all of the external libraries are portable to Windows, either.

3.2.5 Installing CMake

Check if your machine already has CMake installed:

```
which cmake          # do you have it?
which cmake3         # version 3 may have this name
cmake --version      # what specific version you have
```

On clusters or supercomputers which use environment modules to manage software packages, do this:

```
module list          # is a module for cmake already loaded?
module avail         # is a module for cmake available?
module load cmake    # load cmake module with appropriate name
```

Most Linux distributions offer pre-compiled cmake packages through their package management system. If you do not have CMake or a recent enough version (Note: for CentOS 7.x you need to enable the EPEL repository), you can download the latest version from https://cmake.org/download/. Links to more details on CMake can be found on this page.

3.3 Build LAMMPS with make

Building LAMMPS with traditional makefiles requires that you have a Makefile.<machine> file appropriate for your system in either the src/MAKE, src/MAKE/MACHINES, src/MAKE/OPTIONS, or src/MAKE/MINE directory (see below). It can include various options for customizing your LAMMPS build with a number of global compilation options and features.

This build system is slowly being phased out and may not support all optional features and packages in LAMMPS. It is recommended to switch to the *CMake based build system*.

3.3.1 Requirements

Those makefiles are written for and tested with GNU make and may not be compatible with other make programs. In most cases, if the "make" program is not GNU make, then there will be a GNU make program available under the name "gmake". If GNU make or a compatible make is not available, you may have to first install it or switch to building with *CMake*. The makefiles of the traditional make based build process and the scripts they are calling expect a few additional tools to be available and functioning.

- A working C/C++ compiler toolchain supporting the C++17 standard; on Linux, these are often the GNU compilers. Some older compiler versions require adding flags like -std=c++17 to enable C++17 mode.
- A Bourne shell compatible "Unix" shell program (frequently this is bash)
- A few shell utilities: ls, mv, ln, rm, grep, sed, tr, cat, touch, diff, dirname
- Python (optional, required for make lib-<pkg> in the src folder). Python scripts are currently tested with 3.6 to 3.11. The procedure for *building the documentation* *requires* Python 3.8 or later.

3.3.2 Getting started

To include LAMMPS packages (i.e. optional commands and styles) you must enable (or "install") them first, as discussed on the *Build package* page. If a package requires (provided or external) libraries, you must configure and build those libraries **before** building LAMMPS itself and especially **before** enabling such a package with make yes-<package>. *Building LAMMPS with CMake* can automate much of this for many types of machines, especially workstations, desktops, and laptops, so we suggest you try it first when building LAMMPS in those cases.

The commands below perform a default LAMMPS build, producing the LAMMPS executable lmp_serial and lmp_mpi in lammps/src:

```
cd lammps/src   # change to main LAMMPS source folder
make serial     # build a serial LAMMPS executable using GNU g++
make mpi        # build a parallel LAMMPS executable with MPI
make            # see a variety of make options
```

Compilation can take a long time, since LAMMPS is a large project with many features. If your machine has multiple CPU cores (most do these days), you can speed this up by compiling sources in parallel with make -j N (with N being the maximum number of concurrently executed tasks). Installation of the ccache (= Compiler Cache) software may speed up repeated compilation even more, e.g. during code development, especially when repeatedly switching between branches.

After the initial build, whenever you edit LAMMPS source files, or add or remove new files to the source directory (e.g. by installing or uninstalling packages), you must re-compile and relink the LAMMPS executable with the same make <machine> command. The makefile's dependency tracking should ensure that only the necessary subset of files is re-compiled. If you change settings in the makefile, you have to recompile *everything*. To delete all objects, you can use make clean-<machine>.

> **Note**
>
> Before the actual compilation starts, LAMMPS will perform several steps to collect information from the configuration and setup that is then embedded into the executable. When you build LAMMPS for the first time, it will also compile a tool to quickly determine a list of dependencies. Those are required for the make program to correctly detect, which files need to be recompiled or relinked after changes were made to the sources.

3.3.3 Customized builds and alternate makefiles

The src/MAKE directory tree contains the Makefile.<machine> files included in the LAMMPS distribution. Typing make example uses Makefile.example from one of those folders, if available. The make serial and make mpi lines above, for example, use src/MAKE/Makefile.serial and src/MAKE/Makefile.mpi, respectively. Other makefiles are in these directories:

```
OPTIONS     # Makefiles which enable specific options
MACHINES    # Makefiles for specific machines
MINE        # customized Makefiles you create (you may need to create this folder)
```

Simply typing make lists all the available Makefile.<machine> files with a single line description toward the end of the output. A file with the same name can appear in multiple folders (not a good idea). The order the directories are searched is as follows: src/MAKE/MINE, src/MAKE, src/MAKE/OPTIONS, src/MAKE/MACHINES. This gives preference to a customized file you put in src/MAKE/MINE. If you create your own custom makefile under a new name, please edit the first line with the description and machine name, so you will not confuse yourself, when looking at the machine summary.

Makefiles you may wish to try out, include those listed below (some require a package first be installed). Many of these include specific compiler flags for optimized performance. Please note, however, that some of these customized

machine Makefile are contributed by users, and thus may have modifications specific to the systems of those users. Since compilers, OS configurations, and LAMMPS itself keep changing, their settings may become outdated, too:

```
make mac            # build serial LAMMPS on macOS
make mac_mpi        # build parallel LAMMPS on macOS
make intel_cpu      # build with the INTEL package optimized for CPUs
make knl            # build with the INTEL package optimized for KNLs
make opt            # build with the OPT package optimized for CPUs
make omp            # build with the OPENMP package optimized for OpenMP
make kokkos_omp     # build with the KOKKOS package for OpenMP
make kokkos_cuda_mpi # build with the KOKKOS package for GPUs
make kokkos_phi     # build with the KOKKOS package for KNLs
```

3.4 Link LAMMPS as a library to another code

LAMMPS is designed as a library of C++ objects that can be integrated into other applications, including Python scripts. The files src/library.cpp and src/library.h define a C-style API for using LAMMPS as a library. See the *Library interface to LAMMPS* page for a description of the interface and how to use it for your needs.

The *Basic build options* page explains how to build LAMMPS as either a shared or static library. This results in a file in the compilation folder called liblammps.a or liblammps_<name>.a in case of building a static library. In case of a shared library, the name is the same only that the suffix is going to be either .so or .dylib or .dll instead of .a depending on the OS. In some cases, the .so file may be a symbolic link to a file with the suffix .so.0 (or some other number).

Note

Care should be taken to use the same MPI library for the calling code and the LAMMPS library, unless LAMMPS is to be compiled without (real) MPI support using the included STUBS MPI library.

3.4.1 Link with LAMMPS as a static library

The calling application can link to LAMMPS as a static library with compilation and link commands, as in the examples shown below. These are examples for a code written in C in the file caller.c. The benefit of linking to a static library is, that the resulting executable is independent of that library since all required executable code from the library is copied into the calling executable.

CMake build

This assumes that LAMMPS has been configured without setting a LAMMPS_MACHINE name, installed with make install, and the PKG_CONFIG_PATH environment variable has been updated to include the liblammps.pc file installed into the configured destination folder. The commands to compile and link a coupled executable are then:

```
mpicc -c -O $(pkg-config --cflags liblammps) caller.c
mpicxx -o caller caller.o -$(pkg-config --libs liblammps)
```

Traditional make

This assumes that LAMMPS has been compiled in the folder ${HOME}/lammps/src with "make mpi". The commands to compile and link a coupled executable are then:

```
mpicc -c -O -I${HOME}/lammps/src caller.c
mpicxx -o caller caller.o -L${HOME}/lammps/src -llammps_mpi
```

The -I argument is the path to the location of the library.h header file containing the interface to the LAMMPS C-style library interface. The -L argument is the path to where the liblammps_mpi.a file is located. The -llammps_mpi argument is shorthand for telling the compiler to link the file liblammps_mpi.a. If LAMMPS has been built as a shared library, then the linker will use liblammps_mpi.so instead. If both files are available, the linker will usually prefer the shared library. In case of a shared library, you may need to update the LD_LIBRARY_PATH environment variable or running the caller executable will fail since it cannot find the shared library at runtime.

However, it is only as simple as shown above for the case of a plain LAMMPS library without any optional packages that depend on libraries (bundled or external) or when using a shared library. Otherwise, you need to include all flags, libraries, and paths for the coupled executable, that are also required to link the LAMMPS executable.

CMake build

When using CMake, additional libraries with sources in the lib folder are built, but not included in liblammps.a and (currently) not installed with make install and not included in the pkgconfig configuration file. They can be found in the top level build folder, but you have to determine the necessary link flags manually. It is therefore recommended to either use the traditional make procedure to build and link with a static library or build and link with a shared library instead.

Traditional make

Changed in version 10Sep2025.

The traditional make build process no longer supports building packages that require extra build steps in the lib folder.

3.4.2 Link with LAMMPS as a shared library

When linking to LAMMPS built as a shared library, the situation becomes much simpler, as all dependent libraries and objects are either included in the shared library or registered as a dependent library in the shared library file. Thus, those libraries need not be specified when linking the calling executable. Only the -I flags are needed. So the example case from above of the serial version static LAMMPS library with the POEMS package installed becomes:

CMake build

The commands with a shared LAMMPS library compiled with the CMake build process are the same as for the static library.

```
mpicc -c -O $(pkg-config --cflags liblammps) caller.c
mpicxx -o caller caller.o -$(pkg-config --libs liblammps)
```

Traditional make

The commands with a shared LAMMPS library compiled with the traditional make build using make mode=shared serial becomes:

```
gcc -c -O -I${HOME}/lammps/src -caller.c
g++ -o caller caller.o -L${HOME}/lammps/src -llammps_serial
```

Locating liblammps.so at runtime

Unlike with a static link, now the liblammps.so file is required at runtime and needs to be in a folder, where the shared linker program of the operating system can find it. This would be either a folder like /usr/local/lib64 or ${HOME}/.local/lib64 or a folder pointed to by the LD_LIBRARY_PATH environment variable. You can type

```
printenv LD_LIBRARY_PATH
```

to see what directories are in that list.

Or you can add the LAMMPS src directory or the directory you performed a CMake style build in to your LD_LIBRARY_PATH environment variable, so that the current version of the shared library is always available to programs that use it.

For the Bourne or Korn shells (/bin/sh, /bin/ksh, /bin/bash etc.), you would add something like this to your ${HOME}/.profile file:

```
LD_LIBRARY_PATH ${LD_LIBRARY_PATH-/usr/lib64}:${HOME}/lammps/src
export LD_LIBRARY_PATH
```

For the csh or tcsh shells, you would equivalently add something like this to your ${HOME}/.cshrc file:

```
setenv LD_LIBRARY_PATH ${LD_LIBRARY_PATH}:${HOME}/lammps/src
```

You can verify whether all required shared libraries are found with the ldd tool. Example:

```
LD_LIBRARY_PATH=/home/user/lammps/src ldd caller
    linux-vdso.so.1 (0x00007ffe729e0000)
    liblammps.so => /home/user/lammps/src/liblammps.so (0x00007fc91bb9e000)
    libstdc++.so.6 => /lib64/libstdc++.so.6 (0x00007fc91b984000)
    libm.so.6 => /lib64/libm.so.6 (0x00007fc91b83e000)
    libgcc_s.so.1 => /lib64/libgcc_s.so.1 (0x00007fc91b824000)
    libc.so.6 => /lib64/libc.so.6 (0x00007fc91b65b000)
    /lib64/ld-linux-x86-64.so.2 (0x00007fc91c094000)
```

If a required library is missing, you would get a 'not found' entry:

```
ldd caller
    linux-vdso.so.1 (0x00007ffd672fe000)
    liblammps.so => not found
    libstdc++.so.6 => /usr/lib64/libstdc++.so.6 (0x00007fb7c7e86000)
    libm.so.6 => /usr/lib64/libm.so.6 (0x00007fb7c7d40000)
    libgcc_s.so.1 => /usr/lib64/libgcc_s.so.1 (0x00007fb7c7d26000)
    libc.so.6 => /usr/lib64/libc.so.6 (0x00007fb7c7b5d000)
    /lib64/ld-linux-x86-64.so.2 (0x00007fb7c80a2000)
```

3.5 Basic build options

The following topics are covered on this page, for building with both CMake and make:

- *Serial vs parallel build*

- *Choice of compiler and compile/link options*
- *Build the LAMMPS executable and library*
- *Including and removing debug support*
- *Install LAMMPS after a build*

3.5.1 Serial vs parallel build

LAMMPS is written to use the ubiquitous MPI (Message Passing Interface) library API for distributed memory parallel computation. You need to have such a library installed for building and running LAMMPS in parallel using a domain decomposition parallelization. It is compatible with the MPI standard version 2.x and later. LAMMPS can also be built into a "serial" executable for use with a single processor using the bundled MPI STUBS library.

Independent of the distributed memory MPI parallelization, parts of LAMMPS are also written with support for shared memory parallelization using the OpenMP threading standard. A more detailed discussion of that is below.

CMake build

```
-D BUILD_MPI=value       # yes or no, default is yes if CMake finds MPI
-D BUILD_OMP=value       # yes or no, default is yes if a compatible
                         # compiler is detected
-D LAMMPS_MACHINE=name   # name = mpi, serial, mybox, titan, laptop, etc
                         # no default value
```

The executable created by CMake (after running make) is named lmp unless the LAMMPS_MACHINE option is set. When setting LAMMPS_MACHINE=name, the executable will be called lmp_name. Using BUILD_MPI=no will enforce building a serial executable using the MPI STUBS library.

Traditional make

The build with traditional makefiles has to be done inside the source folder src.

```
make mpi      # parallel build, produces lmp_mpi using Makefile.mpi
make serial   # serial build, produces lmp_serial using Makefile/serial
make mybox    # uses Makefile.mybox to produce lmp_mybox
```

Any make machine command will look up the make settings from a file Makefile.machine in the folder src/MAKE or one of its subdirectories MINE, MACHINES, or OPTIONS, create a folder Obj_machine with all objects and generated files and an executable called lmp_machine. The standard parallel build with make mpi assumes a standard MPI installation with MPI compiler wrappers where all necessary compiler and linker flags to get access and link with the suitable MPI headers and libraries are set by the wrapper programs. For other cases or the serial build, you have to adjust the make file variables MPI_INC, MPI_PATH, MPI_LIB as well as CC and LINK. To enable OpenMP threading usually a compiler specific flag needs to be added to the compile and link commands. For the GNU compilers, this is -fopenmp, which can be added to the CC and LINK makefile variables.

For the serial build the following make variables are set (see src/MAKE/Makefile.serial):

```
CC =       g++
LINK =     g++
MPI_INC =  -I../STUBS
MPI_PATH = -L../STUBS
MPI_LIB =  -lmpi_stubs
```

You also need to build the STUBS library for your platform before making LAMMPS itself. A make serial build does this for you automatically, otherwise, type make mpi-stubs from the src directory, or make from the src/STUBS dir. If the build fails, you may need to edit the STUBS/Makefile for your platform. The stubs library does not provide MPI/IO functions required by some LAMMPS packages, e.g. LATBOLTZ, and thus is not compatible with those packages.

Note

The file src/STUBS/mpi.cpp provides a CPU timer function called MPI_Wtime() that calls gettimeofday(). If your operating system does not support gettimeofday(), you will need to insert code to call another timer. Note that the ANSI-standard function clock() rolls over after an hour or so, and is therefore insufficient for timing long LAMMPS simulations.

MPI and OpenMP support in LAMMPS

If you are installing MPI yourself to build a parallel LAMMPS executable, we recommend either MPICH or OpenMPI, which are regularly used and tested with LAMMPS by the LAMMPS developers. MPICH can be downloaded from the MPICH home page, and OpenMPI can be downloaded correspondingly from the OpenMPI home page. Other MPI packages should also work. No specific vendor provided and standard compliant MPI library is currently known to be incompatible with LAMMPS. If you are running on a large parallel machine, your system admins or the vendor should have already installed a version of MPI, which is likely to be faster than a self-installed MPICH or OpenMPI, so you should study the provided documentation to find out how to build and link with it.

The majority of OpenMP (threading) support in LAMMPS is provided by the OPENMP package; see the *OPENMP package* page for details. The INTEL package also includes OpenMP threading (it is compatible with OPENMP and will usually fall back on styles from that package, if a INTEL does not exist) and adds vectorization support when compiled with compatible compilers, in particular the Intel compilers on top of OpenMP. Also, the KOKKOS package can be compiled to include OpenMP threading.

In addition, there are a few commands in LAMMPS that have native OpenMP support included as well. These are commands in the ML-SNAP, DIFFRACTION, and DPD-REACT packages. Furthermore, some packages support OpenMP threading indirectly through the libraries they interface to: e.g. KSPACE, and COLVARS. See the *Packages details* page for more info on these packages, and the pages for their respective commands for OpenMP threading info.

For CMake, if you use BUILD_OMP=yes, you can use these packages and turn on their native OpenMP support and turn on their native OpenMP support at run time, by setting the OMP_NUM_THREADS environment variable before you launch LAMMPS.

For building via conventional make, the CCFLAGS and LINKFLAGS variables in Makefile.machine need to include the compiler flag that enables OpenMP. For the GNU compilers or Clang, it is -fopenmp. For (recent) Intel compilers, it is -qopenmp. If you are using a different compiler, please refer to its documentation.

OpenMP Compiler compatibility

Some compilers do not fully support the default(none) directive and others (e.g. GCC version 9 and beyond, Clang version 10 and later) may implement strict OpenMP 4.0 and later semantics, which are incompatible with the OpenMP 3.1 semantics used in LAMMPS for maximal compatibility with compiler versions in use. If compilation with OpenMP enabled fails because of your compiler requiring strict OpenMP 4.0 semantics, you can change the behavior by adding -D LAMMPS_OMP_COMPAT=4 to the LMP_INC variable in your makefile, or add it to the command-line flags while configuring with CMake. LAMMPS will auto-detect a suitable setting for most GNU, Clang, and Intel compilers.

3.5.2 Choice of compiler and compile/link options

The choice of compiler and compiler flags can be important for maximum performance. Vendor provided compilers for a specific hardware can produce faster code than open-source compilers like the GNU compilers. On the most common x86 hardware, the most popular C++ compilers are quite similar in their ability to optimize regular C/C++ source code at high optimization levels. When using the INTEL package, there is a distinct advantage in using the Intel C++ compiler due to much improved vectorization through SSE and AVX instructions on compatible hardware. The source code in that package conditionally includes compiler specific directives to enable these high degrees of vectorization. This may change over time as equivalent vectorization directives are included into the OpenMP standard and other compilers adopt them.

On parallel clusters or supercomputers which use "environment modules" for their compile/link environments, you can often access different compilers by simply loading the appropriate module before building LAMMPS.

CMake build

By default CMake will use the compiler it finds according to its internal preferences, and it will add optimization flags appropriate to that compiler and any *accelerator packages* you have included in the build. CMake will check if the detected or selected compiler is compatible with the C++ support requirements of LAMMPS and stop with an error, if this is not the case. A C++17 compatible compiler is required.

You can tell CMake to look for a specific compiler with setting CMake variables (listed below) during configuration. For a few common choices, there are also presets in the cmake/presets folder. You may also specify the corresponding CMAKE_*_FLAGS variables individually, if you want to experiment with alternate optimization flags. You should specify all 3 compilers, so that the (few) LAMMPS source files written in C or Fortran are built with a compiler consistent with the one used for the C++ files:

```
-D CMAKE_CXX_COMPILER=name          # name of C++ compiler
-D CMAKE_C_COMPILER=name            # name of C compiler
-D CMAKE_Fortran_COMPILER=name      # name of Fortran compiler

-D CMAKE_CXX_STANDARD=17            # put compiler in C++17 mode
-D CMAKE_CXX_FLAGS=string           # flags to use with C++ compiler
-D CMAKE_C_FLAGS=string             # flags to use with C compiler
-D CMAKE_Fortran_FLAGS=string       # flags to use with Fortran compiler
```

A few example command lines are:

```
# Building with GNU Compilers:
cmake -DCMAKE_C_COMPILER=gcc -DCMAKE_CXX_COMPILER=g++ \
    -DCMAKE_Fortran_COMPILER=gfortran ../cmake
# Building with Intel Classic Compilers:
cmake -DCMAKE_C_COMPILER=icc -DCMAKE_CXX_COMPILER=icpc \
    -DCMAKE_Fortran_COMPILER=ifort ../cmake
# Building with Intel oneAPI Compilers:
cmake -DCMAKE_C_COMPILER=icx -DCMAKE_CXX_COMPILER=icpx \
    -DCMAKE_Fortran_COMPILER=ifx ../cmake
# Building with LLVM/Clang Compilers:
cmake -DCMAKE_C_COMPILER=clang -DCMAKE_CXX_COMPILER=clang++ \
    -DCMAKE_Fortran_COMPILER=flang ../cmake
# Building with PGI/Nvidia Compilers:
cmake -DCMAKE_C_COMPILER=pgcc -DCMAKE_CXX_COMPILER=pgc++ \
    -DCMAKE_Fortran_COMPILER=pgfortran ../cmake
# Building with the NVHPC Compilers:
cmake -DCMAKE_C_COMPILER=nvc -DCMAKE_CXX_COMPILER=nvc++ \
    -DCMAKE_Fortran_COMPILER=nvfortran ../cmake
```

For compiling with the Clang/LLVM compilers a CMake preset is provided that can be loaded with -C ../cmake/presets/clang.cmake. Similarly, -C ../cmake/presets/intel.cmake should switch the compiler toolchain to the legacy Intel compilers, -C ../cmake/presets/oneapi.cmake will switch to the LLVM based oneAPI Intel compilers, -C ../cmake/presets/pgi.cmake will switch the compiler to the PGI compilers, and -C ../cmake/presets/nvhpc.cmake will switch to the NVHPC compilers.

Note

When the cmake command completes, it prints a summary to the screen which compilers it is using and what flags and settings will be used for the compilation. Note that if the top-level compiler is mpicxx, it is simply a wrapper on a real compiler. The underlying compiler info is what CMake will try to determine and report. You should check to confirm you are using the compiler and optimization flags you want.

Makefile.machine settings for traditional make

The "compiler/linker settings" section of a Makefile.machine lists compiler and linker settings for your C++ compiler, including optimization flags. For a parallel build it is recommended to use mpicxx or mpiCC, since these compiler wrappers will include a variety of settings appropriate for your MPI installation and thus avoiding the guesswork of finding the right flags.

Parallel build (see src/MAKE/Makefile.mpi):

```
CC =          mpicxx
CCFLAGS =     -g -O3
LINK =        mpicxx
LINKFLAGS =   -g -O
```

Serial build with GNU gcc (see src/MAKE/Makefile.serial):

```
CC =          g++
CCFLAGS =     -g -O3
LINK =        g++
LINKFLAGS =   -g -O
```

Note

If compilation stops with a message like the following:

```
g++ -g -O3  -DLAMMPS_GZIP -DLAMMPS_MEMALIGN=64    -I../STUBS     -c ..
↪/main.cpp
In file included from ../pointers.h:24:0,
                 from ../input.h:17,
                 from ../main.cpp:16:
../lmptype.h:34:2: error: #error LAMMPS requires a C++17 (or later) compliant␣
↪compiler. Enable C++17 compatibility or upgrade the compiler.
```

then you have either an unsupported (old) compiler or you have to turn on C++17 mode. For those compilers, you need to add the -std=c++17 flag. If there is no compiler that supports this flag (or equivalent), you would have to install a newer compiler that supports C++17; either as a binary package or through compiling from source.

If you build LAMMPS with any *Accelerator packages* included, there may be specific compiler or

linker flags that are either required or recommended to enable required features and to achieve optimal performance. You need to include these in the CCFLAGS and LINKFLAGS settings above. For details, see the documentation for the individual packages listed on the *Accelerator packages* page. Or examine these files in the src/MAKE/OPTIONS directory. They correspond to each of the 5 accelerator packages and their hardware variants:

```
Makefile.opt                # OPT package
Makefile.omp                # OPENMP package
Makefile.intel_cpu          # INTEL package for CPUs
Makefile.intel_coprocessor  # INTEL package for KNLs
Makefile.gpu                # GPU package
Makefile.kokkos_cuda_mpi    # KOKKOS package for GPUs
Makefile.kokkos_omp         # KOKKOS package for CPUs (OpenMP)
Makefile.kokkos_phi         # KOKKOS package for KNLs (OpenMP)
```

3.5.3 Build the LAMMPS executable and library

LAMMPS is always built as a library of C++ classes plus an executable. The executable is a simple main() function that sets up MPI and then creates a LAMMPS class instance from the LAMMPS library, which will then process commands provided via a file or from the console input. The LAMMPS library can also be called from another application or a scripting language. See the *Howto couple* doc page for more info on coupling LAMMPS to other codes. See the *Python* page for more info on wrapping and running LAMMPS from Python via its library interface.

CMake build

For CMake builds, you can select through setting CMake variables between building a shared or a static LAMMPS library and what kind of suffix is added to them (in case you want to concurrently install multiple variants of binaries with different settings). If none are set, defaults are applied.

```
-D BUILD_SHARED_LIBS=value   # yes or no (default)
-D LAMMPS_MACHINE=name       # name = mpi, serial, mybox, titan, laptop, etc
                             # no default value
```

The compilation will always produce a LAMMPS library and an executable linked to it. By default, this will be a static library named liblammps.a and an executable named lmp Setting BUILD_SHARED_LIBS=yes will instead produce a shared library called liblammps.so (or liblammps.dylib or liblammps.dll depending on the platform) If LAMMPS_MACHINE=name is set in addition, the name of the generated libraries will be changed to either liblammps_name.a or liblammps_name.so, respectively and the executable will be called lmp_name.

Traditional make

With the traditional makefile based build process, the choice of the generated executable or library depends on the "mode" setting. Several options are available and mode=static is the default.

```
make machine              # build LAMMPS executable lmp_machine
make mode=static machine  # same as "make machine"
make mode=shared machine  # build LAMMPS shared lib liblammps_machine.so
                          # instead
```

The "static" build will generate a static library called liblammps_machine.a and an executable named

lmp_machine, while the "shared" build will generate a shared library liblammps_machine.so instead and lmp_machine will be linked to it. The build step will also create generic soft links, named liblammps.a and liblammps.so, which point to the specific liblammps_machine.a/so files.

Additional information

Note that for creating a shared library, all the libraries it depends on must be compiled to be compatible with shared libraries. This should be the case for libraries included with LAMMPS, such as the dummy MPI library in src/STUBS or any package libraries in the lib directory, since they are always built in a shared library compatible way using the -fPIC compiler switch. However, if an auxiliary library (like MPI or FFTW) does not exist as a compatible format, the shared library linking step may generate an error. This means you will need to install a compatible version of the auxiliary library. The build instructions for that library should tell you how to do this.

As an example, here is how to build and install the MPICH library, a popular open-source version of MPI, as a shared library in the default /usr/local/lib location:

```
./configure --enable-shared
make
make install
```

You may need to use sudo make install in place of the last line if you do not have write privileges for /usr/local/lib or use the --prefix configuration option to select an installation folder, where you do have write access. The end result should be the file /usr/local/lib/libmpich.so. On many Linux installations, the folder ${HOME}/.local is an alternative to using /usr/local and does not require superuser or sudo access. In that case the configuration step becomes:

```
./configure --enable-shared --prefix=${HOME}/.local
```

Avoiding the use of "sudo" for custom software installation (i.e. from source and not through a package manager tool provided by the OS) is generally recommended to ensure the integrity of the system software installation.

3.5.4 Including or removing debug support

By default the compilation settings will include the -g flag which instructs the compiler to include debug information (e.g. which line of source code a particular instruction correspond to). This can be extremely useful in case LAMMPS crashes and can help to provide crucial information in *tracking down the origin of a crash* and help the LAMMPS developers fix bugs in the source code. However, this increases the storage requirements for object files, libraries, and the executable 3-5 fold.

If this is a concern, you can change the compilation settings or remove the debug information from the LAMMPS executable:

- **Traditional make**: edit your Makefile.<machine> to remove the -g flag from the CCFLAGS and LINKFLAGS definitions
- **CMake**: use -D CMAKE_BUILD_TYPE=Release or explicitly reset the applicable compiler flags (best done using the text mode or graphical user interface).
- **Remove debug info**: If you are only concerned about the executable being too large, you can use the strip tool (e.g. strip lmp_serial) to remove the debug information from the executable file. Do not strip libraries or object files, as that will render them unusable.

3.5.5 Build LAMMPS tools

Some tools described in *Auxiliary tools* can be built directly using CMake or Make.

CMake build

```
-D BUILD_TOOLS=value          # yes or no (default). Build binary2txt,
                              # chain.x, micelle2d.x, msi2lmp, phana,
                              # stl_bin2txt
-D BUILD_LAMMPS_GUI=value     # yes or no (default). Build LAMMPS-GUI
-D BUILD_WHAM=value           # yes (default). Download and build WHAM;
                              # only available for BUILD_LAMMPS_GUI=yes
```

The generated binaries will also become part of the LAMMPS installation (see below).

Traditional make

```
cd lammps/tools
make all              # build all binaries of tools
make binary2txt       # build only binary2txt tool
make chain            # build only chain tool
make micelle2d        # build only micelle2d tool
```

Note

Building LAMMPS-GUI *requires* building LAMMPS with CMake.

3.5.6 Install LAMMPS after a build

After building LAMMPS, you may wish to copy the LAMMPS executable or library, along with other LAMMPS files (library header, doc files), to a globally visible place on your system, for others to access. Note that you may need super-user privileges (e.g. sudo) if the directory you want to copy files to is protected.

CMake build

```
cmake -D CMAKE_INSTALL_PREFIX=path [options ...] ../cmake
make                        # perform make after CMake command
make install                # perform the installation into prefix
```

During the installation process CMake will by default remove any runtime path settings for loading shared libraries. Because of this you may have to set or modify the LD_LIBRARY_PATH (or DYLD_LIBRARY_PATH) environment variable, if you are installing LAMMPS into a non-system location and/or are linking to libraries in a non-system location that depend on such runtime path settings. As an alternative, you may set the CMake variable LAMMPS_INSTALL_RPATH to on and then the runtime paths for any linked shared libraries and the library installation folder for the LAMMPS library will be embedded and thus the requirement to set environment variables is avoided. The off setting is usually preferred for packaged binaries or when setting up environment modules, the on setting is more convenient for installing software into a non-system or personal folder.

Traditional make

There is no "install" option in the src/Makefile for LAMMPS. If you wish to do this you will need to first build LAMMPS, then manually copy the desired LAMMPS files to the appropriate system directories.

3.6 Optional build settings

LAMMPS can be built with several optional settings. Each subsection explains how to do this for building both with CMake and make.

- *C++17 standard compliance* when building all of LAMMPS
- *FFT library* for use with the *kspace_style pppm* command
- *Size of LAMMPS integer types and size limits*
- *Read or write compressed files*
- *Output of JPEG, PNG, and movie files* via the *dump image* or *dump movie* commands
- *Support for downloading files from the input*
- *Prevent download of large potential files*
- *Memory allocation alignment*
- *Workaround for long long integers*
- *Exception handling when using LAMMPS as a library* to capture errors

---

3.6.1 C++17 standard compliance

Changed in version 10Sep2025.

A C++17 standard compatible compiler is currently the minimum requirement for compiling LAMMPS. LAMMPS version 22 July 2025 is the last version compatible with the C++11 standard for the core code and most packages. Most currently used C++ compilers are compatible with C++17, but some older ones may need extra flags to enable C++17 compliance.

```
CCFLAGS = -g -O3 -std=c++17
```

Individual packages may require compliance with a later C++ standard like C++20. These requirements will be documented with the *individual packages*.

3.6.2 FFT library

When the KSPACE package is included in a LAMMPS build, the *kspace_style pppm* command performs 3d FFTs which require use of an FFT library to compute 1d FFTs. The KISS FFT library is included with LAMMPS, but other libraries can be faster. LAMMPS can use them if they are available on your system.

Added in version 7Feb2024.

Alternatively, LAMMPS can use the heFFTe library for the MPI communication algorithms, which comes with many optimizations for special cases, e.g. leveraging available 2D and 3D FFTs in the back end libraries and better pipelining for packing and communication.

CMake build

```
-D FFT=value              # FFTW3 or MKL or NVPL or KISS,
                          # default is FFTW3 if found, else KISS
-D FFT_KOKKOS=value       # FFTW3 or MKL or NVPL or KISS or CUFFT
                          # or HIPFFT or MKL_GPU, default is KISS
```

```
-D FFT_SINGLE=value       # yes or no (default), no = double precision
-D FFT_PACK=value         # array (default) or pointer or memcpy
-D FFT_USE_HEFFTE=value   # yes or no (default), yes links to heFFTe
```

Note

When the Kokkos variant of a package is compiled and selected at run time, the FFT library selected by the FFT_KOKKOS variable applies. Otherwise, the FFT library selected by the FFT variable applies. The same FFT settings apply to both. FFT_KOKKOS must be compatible with the Kokkos back end - for example, when using the CUDA back end of Kokkos, you must use either CUFFT or KISS.

Usually these settings are all that is needed. If FFTW3 is selected, then CMake will try to detect, if threaded FFTW libraries are available and enable them by default. This setting is independent of whether OpenMP threads are enabled and a package like KOKKOS or OPENMP is used. If CMake cannot detect the FFT library, you can set these variables to assist:

```
-D FFTW3_INCLUDE_DIR=path   # path to FFTW3 include files
-D FFTW3_LIBRARY=path       # path to FFTW3 libraries
-D FFTW3_OMP_LIBRARY=path   # path to FFTW3 OpenMP wrapper libraries
-D FFT_FFTW_THREADS=on      # enable using OpenMP threaded FFTW3 libraries
-D MKL_INCLUDE_DIR=path     # ditto for Intel MKL library
-D FFT_MKL_THREADS=on       # enable using threaded FFTs with MKL libraries
-D MKL_LIBRARY=path         # path to MKL libraries
-D FFT_HEFFTE_BACKEND=value # FFTW or MKL or empty/undefined for the stock
                            # heFFTe back end
-D Heffte_ROOT=path         # path to an existing heFFTe installation
-D nvpl_fft_INCLUDE_DIR=path # path to NVPL FFT include files
-D nvpl_fft_LIBRARY_DIR=path # path to NVPL FFT libraries
```

Note

heFFTe comes with a builtin (= stock) back end for FFTs, i.e. a default internal FFT implementation; however, this stock back end is intended for testing purposes only and is not optimized for production runs.

Traditional make

To change the FFT library to be used and its options, you have to edit your machine Makefile. Below are examples how the makefile variables could be changed.

```
FFT_INC = -DFFT_<NAME>        # where <NAME> is KISS (default), FFTW3,
                              # FFTW (same as FFTW3), NVPL, or MKL
FFT_INC = -DFFT_KOKKOS_<NAME> # where <NAME> is KISS (default), FFTW3,
                              # FFTW (same as FFTW3), NVPL, MKL, CUFFT,
                              # HIPFFT, or MKL_GPU
FFT_INC = -DFFT_SINGLE        # do not specify for double precision
FFT_INC = -DFFT_FFTW_THREADS # enable using threaded FFTW3 libraries
FFT_INC = -DFFT_MKL_THREADS  # enable using threaded FFTs with MKL libraries
```

```
FFT_INC = -DFFT_PACK_ARRAY   # or -DFFT_PACK_POINTER or -DFFT_
↪PACK_MEMCPY
                             # default is FFT_PACK_ARRAY if not specified
FFT_INC =  -I/usr/local/include
FFT_PATH = -L/usr/local/lib

# hipFFT either precision
FFT_LIB =  -lhipfft

# cuFFT either precision
FFT_LIB =  -lcufft

# MKL_GPU either precision
FFT_LIB = -lmkl_sycl_dft -lmkl_intel_ilp64 -lmkl_tbb_thread -lmkl_core -ltbb

# FFTW3 double precision
FFT_LIB =  -lfftw3

# FFTW3 double precision with threads (needs -DFFT_FFTW_THREADS)
FFT_LIB =  -lfftw3 -lfftw3_omp

# FFTW3 single precision
FFT_LIB =  -lfftw3 -lfftw3f

# serial MKL with Intel compiler
FFT_LIB =  -lmkl_intel_lp64 -lmkl_sequential -lmkl_core

# serial MKL with GNU compiler
FFT_LIB =  -lmkl_gf_lp64 -lmkl_sequential -lmkl_core

# threaded MKL with Intel compiler
FFT_LIB =  -lmkl_intel_lp64 -lmkl_intel_thread -lmkl_core

# threaded MKL with GNU compiler
FFT_LIB =  -lmkl_gf_lp64 -lmkl_gnu_thread -lmkl_core

# MKL with automatic runtime selection of interface libs
FFT_LIB =  -lmkl_rt

# threaded NVPL FFT
FFT_LIB =  -lnvpl_fftw
```

As with CMake, you do not need to set paths in FFT_INC or FFT_PATH, if the compiler can find the FFT header and library files in its default search path. You must specify FFT_LIB with the appropriate FFT libraries to include in the link.

Traditional make can also link to heFFTe using an existing installation

```
include <path-to-heffte-installation>/share/heffte/HeffteMakefile.in
FFT_INC = -DFFT_HEFFTE -DFFT_HEFFTE_FFTW $(heffte_include)
FFT_PATH =
FFT_LIB = $(heffte_link) $(heffte_libs)
```

The heFFTe install path will contain HeffteMakefile.in. which will define the heffte_

include variables needed to link to heFFTe from an external project using traditional make. The -DFFT_HEFFTE is required to switch to using heFFTe, while the optional -DFFT_HEFFTE_FFTW selects the desired heFFTe back end, e.g., -DFFT_HEFFTE_FFTW or -DFFT_HEFFTE_MKL, omitting the variable will default to the *stock* back end. The heFFTe *stock* back end is intended to be used for testing and debugging, but is not performance optimized for large scale production runs.

The KISS FFT library is included in the LAMMPS distribution. It is portable across all platforms. Depending on the size of the FFTs and the number of processors used, the other libraries listed here can be faster.

However, note that long-range Coulombics are only a portion of the per-timestep CPU cost, FFTs are only a portion of long-range Coulombics, and 1d FFTs are only a portion of the FFT cost (parallel communication can be costly). A breakdown of these timings is printed to the screen at the end of a run when using the *kspace_style pppm* command. The *Screen and logfile output* page gives more details. A more detailed (and time consuming) report of the FFT performance is generated with the *kspace_modify fftbench yes* command.

FFTW is a fast, portable FFT library that should also work on any platform and can be faster than the KISS FFT library. You can download it from www.fftw.org. LAMMPS requires version 3.X; the legacy version 2.1.X is no longer supported.

Building FFTW for your box should be as simple as ./configure; make; make install. The install command typically requires root privileges (e.g. invoke it via sudo), unless you specify a local directory with the --prefix option of configure. Type ./configure --help to see various options.

The Intel MKL math library is part of the Intel compiler suite. It can be used with the Intel or GNU compiler (see the FFT_LIB setting above).

The NVIDIA Performance Libraries (NVPL) FFT library is optimized for NVIDIA Grace Armv9.0 architecture. You can download it from https://docs.nvidia.com/nvpl/

The cuFFT and hipFFT FFT libraries are packaged with NVIDIA's CUDA and AMD's HIP installations, respectively. These FFT libraries require the Kokkos acceleration package to be enabled and the Kokkos back end to be GPU-resident (i.e., HIP or CUDA). Similarly, GPU offload of FFTs on Intel GPUs with oneMKL currently requires the Kokkos acceleration package to be enabled with the SYCL back end.

Performing 3d FFTs in parallel can be time-consuming due to data access and required communication. This cost can be reduced by performing single-precision FFTs instead of double precision. Single precision means the real and imaginary parts of a complex datum are 4-byte floats. Double precision means they are 8-byte doubles. Note that Fourier transform and related PPPM operations are somewhat less sensitive to floating point truncation errors, and thus the resulting error is generally less than the difference in precision. Using the -DFFT_SINGLE setting trades off a little accuracy for reduced memory use and parallel communication costs for transposing 3d FFT data.

When using -DFFT_SINGLE with FFTW3, you may need to ensure that the FFTW3 installation includes support for single-precision.

When compiler FFTW3 from source, you can do the following, which should produce the additional libraries libfftw3f.a and/or libfftw3f.so.

```
make clean
./configure --enable-single; make; make install
```

Performing 3d FFTs requires communication to transpose the 3d FFT grid. The data packing/unpacking for this can be done in one of 3 modes (ARRAY, POINTER, MEMCPY) as set by the FFT_PACK syntax above. Depending on the machine, the size of the FFT grid, the number of processors used, one option may be slightly faster. The default is ARRAY mode.

When using -DFFT_HEFFTE CMake will first look for an existing install with hints provided by -DHeffte_ROOT, as recommended by the CMake standard and note that the name is case sensitive. If CMake cannot find a heFFTe instal-

lation with the correct back end (e.g., FFTW or MKL), it will attempt to download and build the library automatically. In this case, LAMMPS CMake will also accept all heFFTe specific variables listed in the heFFTe documentation and those variables will be passed into the heFFTe build.

3.6.3 Size of LAMMPS integer types and size limits

LAMMPS uses a few custom integer data types, which can be defined as either 4-byte (= 32-bit) or 8-byte (= 64-bit) integers at compile time. This has an impact on the size of a system that can be simulated, or how large counters can become before "rolling over". The default setting of "smallbig" is almost always adequate.

CMake build

With CMake the choice of integer types is made via setting a variable during configuration.

```
-D LAMMPS_SIZES=value   # smallbig (default) or bigbig
```

If the variable is not set explicitly, "smallbig" is used.

Traditional build

If you want a setting different from the default, you need to edit the LMP_INC variable setting your machine Makefile.

```
LMP_INC = -DLAMMPS_SMALLBIG    # or -DLAMMPS_BIGBIG
```

The default setting is -DLAMMPS_SMALLBIG if nothing is specified

LAMMPS system size restrictions

	smallbig	bigbig
Total atom count	2^{63} atoms (= $9.223 \cdot 10^{18}$)	2^{63} atoms (= $9.223 \cdot 10^{18}$)
Total timesteps	2^{63} steps (= $9.223 \cdot 10^{18}$)	2^{63} steps (= $9.223 \cdot 10^{18}$)
Atom ID values	$1 \le i \le 2^{31}$(= $2.147 \cdot 10^{9}$)	$1 \le i \le 2^{63}$(= $9.223 \cdot 10^{18}$)
Image flag values	$-512 \le i \le 511$	$-1\,048\,576 \le i \le 1\,048\,575$

The "bigbig" setting increases the size of image flags and atom IDs over the default "smallbig" setting.

These are limits for the core of the LAMMPS code, specific features or some styles may impose additional limits. Also, there are limitations when using the library interface where some functions with known issues have been replaced by dummy calls printing a corresponding error message rather than crashing randomly or corrupting data.

Atom IDs are not required for atomic systems which do not store bond topology information, though IDs are enabled by default. The *atom_modify id no* command will turn them off. Atom IDs are required for molecular systems with bond topology (bonds, angles, dihedrals, etc). Similarly, some force or compute or fix styles require atom IDs. Thus, if you model a molecular system or use one of those styles with more than 2 billion atoms, you need the "bigbig" setting.

Regardless of the total system size limits, the maximum number of atoms per MPI rank (local + ghost atoms) is limited to 2 billion for atomic systems and 500 million for systems with bonds (the additional restriction is due to using the 2 upper bits of the local atom index in neighbor lists for storing special bonds info).

Image flags store 3 values per atom in a single integer, which count the number of times an atom has moved through the periodic box in each dimension. See the *dump* manual page for a discussion. If an atom moves through the periodic box more than this limit, the value will "roll over", e.g. from 511 to -512, which can cause diagnostics like the mean-squared displacement, as calculated by the *compute msd* command, to be faulty.

Also note that the GPU package requires its lib/gpu library to be compiled with the same size setting, or the link will fail. A CMake build does this automatically. When building with make, the setting in whichever lib/gpu/Makefile is used must be the same as above.

3.6.4 Output of JPEG, PNG, and movie files

The *dump image* command has options to output JPEG or PNG image files. Likewise, the *dump movie* command outputs movie files in a variety of movie formats. Using these options requires the following settings:

CMake build

```
-D WITH_JPEG=value    # yes or no
                      # default = yes if CMake finds JPEG development files, else no
-D WITH_PNG=value     # yes or no
                      # default = yes if CMake finds PNG and ZLIB development files,
                      # else no
-D WITH_FFMPEG=value  # yes or no
                      # default = yes if CMake can find ffmpeg, else no
```

Usually these settings are all that is needed. If CMake cannot find the graphics header, library, executable files, you can set these variables:

```
-D JPEG_INCLUDE_DIR=path    # path to jpeglib.h header file
-D JPEG_LIBRARY=path        # path to libjpeg.a (.so) file
-D PNG_INCLUDE_DIR=path     # path to png.h header file
-D PNG_LIBRARY=path         # path to libpng.a (.so) file
-D ZLIB_INCLUDE_DIR=path    # path to zlib.h header file
-D ZLIB_LIBRARY=path        # path to libz.a (.so) file
-D FFMPEG_EXECUTABLE=path   # path to ffmpeg executable
```

Traditional make

```
LMP_INC = -DLAMMPS_JPEG -DLAMMPS_PNG -DLAMMPS_FFMPEG  <other␣
↪LMP_INC settings>

JPG_INC = -I/usr/local/include   # path to jpeglib.h, png.h, zlib.h headers
                                 # if make cannot find them
JPG_PATH = -L/usr/lib            # paths to libjpeg.a, libpng.a, libz.a (.so)
                                 # files if make cannot find them
JPG_LIB = -ljpeg -lpng -lz       # library names
```

As with CMake, you do not need to set JPG_INC or JPG_PATH, if make can find the graphics header and library files in their default system locations. You must specify JPG_LIB with a list of graphics libraries to include in the link. You must make certain that the ffmpeg executable (or ffmpeg.exe on Windows) is in a directory where LAMMPS can find it at runtime; that is usually a directory list in your PATH environment variable.

Using ffmpeg to output movie files requires that your machine supports the "popen" function in the standard runtime library.

Note

On some clusters with high-speed networks, using the fork() library call (required by popen()) can interfere with the fast communication library and lead to simulations using ffmpeg to hang or crash.

3.6.5 Read or write compressed files

If this option is enabled, large files can be read or written with compression by gzip or similar tools by several LAMMPS commands, including *read_data*, *rerun*, and *dump*. Supported compression tools and algorithms are currently gzip, bzip2, zstd, xz, lz4, and lzma (via xz).

CMake build

```
-D WITH_GZIP=value  # yes or no
                    # default is yes if CMake can find the gzip program
```

Traditional make

```
LMP_INC = -DLAMMPS_GZIP   <other LMP_INC settings>
```

This option requires that your operating system fully supports the "popen()" function in the standard runtime library and that a gzip or other executable can be found by LAMMPS in the standard search path during a run.

Note

On clusters with high-speed networks, using the "fork()" library call (required by "popen()") can interfere with the fast communication library and lead to simulations using compressed output or input to hang or crash. For selected operations, compressed file I/O is also available using a compression library instead, which is what the *COMPRESS package* provides.

3.6.6 Support for downloading files from the input

Added in version 29Aug2024.

The *geturl command* command uses the the libcurl library to download files. This requires that LAMMPS is compiled accordingly which needs the following settings:

CMake build

```
-D WITH_CURL=value      # yes or no
                        # default = yes if CMake finds CURL development files, else no
```

Usually these settings are all that is needed. If CMake cannot find the graphics header, library, executable files, you can set these variables:

```
-D CURL_INCLUDE_DIR=path    # path to folder which contains curl.h header file
-D CURL_LIBRARY=path        # path to libcurls.a (.so) file
```

Traditional make

```
LMP_INC = -DLAMMPS_CURL  <other LMP_INC settings>
```

```
CURL_INC = -I/usr/local/include   # path to curl folder with curl.h
CURL_PATH = -L/usr/lib            # paths to libcurl.a(.so) if make cannot find it
CURL_LIB = -lcurl                 # library names
```

As with CMake, you do not need to set CURL_INC or CURL_PATH, if make can find the libcurl header and library files in their default system locations. You must specify CURL_LIB with a paths or linker flags to link to libcurl.

3.6.7 Prevent download of large potential files

Added in version 8Feb2023.

LAMMPS bundles a selection of potential files in the potentials folder as examples of how those kinds of potential files look like and for use with the provided input examples in the examples tree. To keep the size of the distributed LAMMPS source package small, very large potential files (> 5 MBytes) are not bundled, but only downloaded on demand when the *corresponding package* is installed. This automatic download can be prevented when *building LAMMPS with CMake* by adding the setting *-D DOWNLOAD_POTENTIALS=off* when configuring.

3.6.8 Memory allocation alignment

This setting enables the use of the posix_memalign() call instead of malloc() when LAMMPS allocates large chunks of memory. Vector instructions on CPUs may become more efficient, if dynamically allocated memory is aligned on larger-than-default byte boundaries. On most current operating systems, the malloc() implementation returns pointers that are aligned to 16-byte boundaries. Using SSE vector instructions efficiently, however, requires memory blocks being aligned on 64-byte boundaries.

CMake build

```
-D LAMMPS_MEMALIGN=value          # 0, 8, 16, 32, 64 (default)
```

Use a LAMMPS_MEMALIGN value of 0 to disable using posix_memalign() and revert to using the malloc() C-library function instead. When compiling LAMMPS for Windows systems, malloc() will always be used and this setting is ignored.

Traditional make

```
LMP_INC = -DLAMMPS_MEMALIGN=value   # 8, 16, 32, 64
```

Do not set -DLAMMPS_MEMALIGN, if you want to have memory allocated with the malloc() function call instead. -DLAMMPS_MEMALIGN **cannot** be used on Windows, as Windows different function calls with different semantics for allocating aligned memory, that are not compatible with how LAMMPS manages its dynamical memory.

3.6.9 Workaround for long long integers

If your system or MPI version does not recognize "long long" data types, the following setting will be needed. It converts "long long" to a "long" data type, which should be the desired 8-byte integer on those systems:

CMake build

```
-D LAMMPS_LONGLONG_TO_LONG=value      # yes or no (default)
```

Traditional make

```
LMP_INC = -DLAMMPS_LONGLONG_TO_LONG  <other LMP_INC settings>
```

3.6.10 Exception handling when using LAMMPS as a library

LAMMPS errors do not kill the calling code, but throw an exception. In the C-library interface, the call stack is unwound and control returns to the caller, e.g. to Python or a code that is coupled to LAMMPS. The error status can then be queried. When using C++ directly, the calling code has to be set up to *catch* exceptions thrown from within LAMMPS.

Note

When LAMMPS is running in parallel, it is not always possible to cleanly recover from an exception since not all parallel ranks may throw an exception and thus other MPI ranks may get stuck waiting for messages from the ones with errors.

3.7 Include packages in build

In LAMMPS, a package is a group of files that enable a specific set of features. For example, force fields for molecular systems or rigid-body constraints are in packages. In the src directory, each package is a subdirectory with the package name in capital letters.

An overview of packages is given on the *Packages* doc page. Brief overviews of each package are on the *Packages details* page.

When building LAMMPS, you can choose to include or exclude each package. Generally, there is no need to include a package if you never plan to use its features.

If you get a run-time error that a LAMMPS command or style is "unknown", it is often because the command is contained in a package, and your build did not include that package. If the command or style *is* available in a package included in the LAMMPS distribution, the error message will indicate which package would be needed. Running LAMMPS with the *-h command-line switch* will print *all* optional commands and packages that were enabled when building that executable.

For the majority of packages, if you follow the single step below to include it, you can then build LAMMPS exactly the same as you would without any packages installed. A few packages may require additional steps, as explained on the *Build extras* page.

These links take you to the extra instructions for those select packages:

ADIOS	*APIP*	*COLVARS*	*COMPRESS*	*ELECTRODE*	*GPU*
H5MD	*INTEL*	*KIM*	*KOKKOS*	*LEPTON*	*MACHDYN*
MDI	*MISC*	*ML-HDNNP*	*ML-IAP*	*ML-PACE*	*ML-POD*
ML-QUIP	*MOLFILE*	*NETCDF*	*OPENMP*	*OPT*	*PLUMED*
PYTHON	*QMMM*	*RHEO*	*SCAFACOS*	*VORONOI*	*VTK*

The mechanism for including packages is simple but different for the CMake build system in comparison to the traditional make build.

CMake build

```
-D PKG_NAME=value          # yes or no (default)
```

Examples:

```
-D PKG_MANYBODY=yes
-D PKG_INTEL=yes
```

All packages are included the same way. See the shortcut section below for how to install many packages at once with CMake.

Note

If you switch between building with CMake and make builds, no packages in the src directory can be installed when you invoke cmake. CMake will give an error if that is not the case, indicating how you can uninstall all packages in the src dir.

Traditional make

```
cd lammps/src
make ps          # check which packages are currently installed
make yes-name    # install a package with name
make no-name     # uninstall a package with name
make mpi         # build LAMMPS with whatever packages are now installed
```

Examples:

```
make no-rigid
make yes-intel
```

All packages are included the same way. See the shortcut section below for how to install many packages at once with make.

Note

You must always re-build LAMMPS (via make) after installing or uninstalling a package, for the action to take effect. The included dependency tracking will make certain only files that are required to be rebuilt are recompiled.

> **Note**
>
> You cannot install or uninstall packages and build LAMMPS in a single make command with multiple targets, e.g. `make yes-colloid mpi`. This is because the make procedure creates a list of source files that will be out-of-date for the build if the package configuration changes within the same command. You can include or exclude multiple packages in a single make command, e.g. `make yes-colloid no-manybody`.

3.7.1 Information for both build systems

Almost all packages can be included or excluded in a LAMMPS build, independent of the other packages. However, some packages include files derived from files in other packages. LAMMPS checks for this and does the right thing. Individual files are only included if their dependencies are already included. Likewise, if a package is excluded, other files dependent on that package are also excluded.

> **Note**
>
> By default **no** packages are installed. Prior to August 2018, however, if you downloaded a tarball, 3 packages (KSPACE, MANYBODY, MOLECULE) were pre-installed via the traditional make procedure in the `src` directory. That is no longer the case, so that CMake will build as-is without needing to first uninstall those packages. You can quickly include those packages (plus RIGID) by using the "basic" preset with CMake or `make yes-basic` with traditional make as discussed below.

3.7.2 CMake presets for installing many packages

Instead of specifying all the CMake options via the command-line, CMake allows initializing its settings cache using script files. These are regular CMake files which can manipulate and set CMake variables (which represent selected options), and can also contain control flow constructs for more complex operations.

LAMMPS includes several of these files to define configuration "presets", similar to the options that exist for the Make based system. Using these files, you can enable/disable portions of the available packages in LAMMPS. If you need a custom preset, you can make a copy of one of them and modify it to suit your needs.

```
# enable just a few core packages
cmake -C ../cmake/presets/basic.cmake    [OPTIONS] ../cmake

# enable most packages
cmake -C ../cmake/presets/most.cmake     [OPTIONS] ../cmake

# enable packages which download sources or potential files
cmake -C ../cmake/presets/download.cmake [OPTIONS] ../cmake

# disable packages that do require extra libraries or tools
cmake -C ../cmake/presets/nolib.cmake    [OPTIONS] ../cmake

# change settings to use the Clang compilers by default
cmake -C ../cmake/presets/clang.cmake    [OPTIONS] ../cmake

# change settings to use the GNU compilers by default
```

(continues on next page)

(continued from previous page)

```
cmake -C ../cmake/presets/gcc.cmake       [OPTIONS] ../cmake

# change settings to use the Intel compilers by default
cmake -C ../cmake/presets/intel.cmake     [OPTIONS] ../cmake

# change settings to use the PGI compilers by default
cmake -C ../cmake/presets/pgi.cmake       [OPTIONS] ../cmake

# enable all packages
cmake -C ../cmake/presets/all_on.cmake    [OPTIONS] ../cmake

# disable all packages
cmake -C ../cmake/presets/all_off.cmake   [OPTIONS] ../cmake

#  compile with MinGW cross-compilers
mingw64-cmake -C ../cmake/presets/mingw-cross.cmake [OPTIONS] ../cmake

# compile serial multi-arch binaries on macOS
cmake -C ../cmake/presets/macos-multiarch.cmake [OPTIONS] ../cmake
```

Presets that have names starting with "windows" are specifically for compiling LAMMPS *natively on Windows* and presets that have names starting with "kokkos" are specifically for selecting configurations for compiling LAMMPS with *KOKKOS*.

Note

Running cmake this way manipulates the CMake settings cache in your current build directory. You can combine multiple presets and options in a single cmake run, or change settings incrementally by running cmake with new flags. If you use a present for selecting a set of compilers, it will reset all settings from previous CMake runs.

Example

```
# build LAMMPS with most commonly used packages, but then remove
# those requiring additional library or tools, but still enable
# GPU package and configure it for using CUDA. You can run.
mkdir build
cd build
cmake -C ../cmake/presets/most.cmake -C ../cmake/presets/nolib.cmake \
      -D PKG_GPU=on -D GPU_API=cuda ../cmake

# to add another package, say BODY to the previous configuration you can run:
cmake -D PKG_BODY=on .

# to reset the package selection from above to the default of no packages
# but leaving all other settings untouched. You can run:
cmake -C ../cmake/presets/all_off.cmake .
```

3.7.3 Make shortcuts for installing many packages

The following commands are useful for managing package source files and their installation when building LAMMPS via traditional make. Just type make in lammps/src to see a one-line summary.

These commands install/uninstall sets of packages:

```
make yes-all          # install all packages
make no-all           # check for changes and uninstall all packages
make no-installed      # only check and uninstall installed packages
make yes-basic        # install a few commonly used packages'
make no-basic         # remove a few commonly used packages'
make yes-most         # install most packages w/o libs'
make no-most          # remove most packages w/o libs'
```

which install/uninstall various sets of packages. Typing make package will list all the these commands.

Note

Installing or uninstalling a package for the make based build process works by simply copying files back and forth between the main source directory src and the subdirectories with the package name (e.g. src/KSPACE, src/MANYBODY), so that the files are included or excluded when LAMMPS is built. Only source files in the src folder will be compiled.

The following make commands help manage files that exist in both the src directory and in package subdirectories. You do not normally need to use these commands unless you are editing LAMMPS files or are updating LAMMPS via git.

Type make package-status or make ps to show which packages are currently installed. For those that are installed, it will list any files that are different in the src directory and package subdirectory.

Type make package-installed or make pi to show which packages are currently installed, without listing the status of packages that are not installed.

Type make package-update or make pu to overwrite src files with files from the package subdirectories if the package is installed. It should be used after the checkout has been *updated or changed with git*, this will only update the files in the package subdirectories, but not the copies in the src folder.

Type make package-overwrite to overwrite files in the package subdirectories with src files.

Type make package-diff to list all differences between pairs of files in both the source directory and the package directory.

3.8 Packages with extra build options

When building with some packages, additional steps may be required, in addition to

CMake build	Traditional make
cmake -D PKG_NAME=yes	make yes-name

as described on the *Build_package* page.

For a CMake build there may be additional optional or required variables to set.

Changed in version 10Sep2025.

The traditional build system with GNU make no longer supports packages that require extra steps in the lammps/lib directory.

This is the list of packages that may require additional steps.

ADIOS	*APIP*	*COLVARS*	*COMPRESS*	*ELECTRODE*	*GPU*
H5MD	*INTEL*	*KIM*	*KOKKOS*	*LEPTON*	*MACHDYN*
MDI	*MISC*	*ML-HDNNP*	*ML-IAP*	*ML-PACE*	*ML-POD*
ML-QUIP	*MOLFILE*	*NETCDF*	*OPENMP*	*OPT*	*PLUMED*
PYTHON	*QMMM*	*RHEO*	*SCAFACOS*	*VORONOI*	*VTK*

3.8.1 COMPRESS package

To build with this package you must have the zlib compression library available on your system to build dump styles with a /gz suffix. There are also styles using the Zstandard library which have a '/zstd' suffix. The zstd library version must be at least 1.4. Older versions use an incompatible API and thus LAMMPS will fail to compile.

CMake build

If CMake cannot find the zlib library or include files, you can set these variables:

```
-D ZLIB_INCLUDE_DIR=path    # path to zlib.h header file
-D ZLIB_LIBRARY=path        # path to libz.a (.so) file
```

Support for Zstandard compression is auto-detected and for that CMake depends on the pkg-config tool to identify the necessary flags to compile with this library, so the corresponding libzstandard.pc file must be in a folder where pkg-config can find it, which may require adding it to the PKG_CONFIG_PATH environment variable.

Traditional make

Changed in version 10Sep2025.

The COMPRESS package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.2 GPU package

To build with this package, you must choose options for precision and which GPU hardware to build for. The GPU package currently supports three different types of back ends: OpenCL, CUDA and HIP.

CMake build

```
-D GPU_API=value            # value = opencl (default) or cuda or hip
-D GPU_PREC=value           # precision setting
                    # value = double or mixed (default) or single
```

(continues on next page)

(continued from previous page)

```
-D GPU_ARCH=value           # primary GPU hardware choice for GPU_API=cuda
                            # value = sm_XX (see below, default is sm_75)
-D GPU_DEBUG=value          # enable debug code in the GPU package library,
                            # mostly useful for developers
                            # value = yes or no (default)
-D HIP_PATH=value           # value = path to HIP installation. Must be set if
                            # GPU_API=HIP
-D HIP_ARCH=value           # primary GPU hardware choice for GPU_API=hip
                            # value depends on selected HIP_PLATFORM
                            # default is 'gfx906' for HIP_PLATFORM=amd and 'sm_75' for
                            # HIP_PLATFORM=nvcc
-D HIP_USE_DEVICE_SORT=value # enables GPU sorting
                            # value = yes (default) or no
-D CUDPP_OPT=value          # use GPU binning with CUDA (should be off for modern GPUs)
                            # enables CUDA Performance Primitives, must be "no" for
                            # CUDA_MPS_SUPPORT=yes
                            # value = yes or no (default)
-D CUDA_MPS_SUPPORT=value   # enables some tweaks required to run with active
                            # nvidia-cuda-mps daemon
                            # value = yes or no (default)
-D CUDA_BUILD_MULTIARCH=value  # enables building CUDA kernels for all supported GPU
                              # architectures
                              # value = yes (default) or no
-D USE_STATIC_OPENCL_LOADER=value  # downloads/includes OpenCL ICD loader library,
                                  # no local OpenCL headers/libs needed
                                  # value = yes (default) or no
```

The GPU package supports 3 precision modes: single, double, and mixed, with the latter being the default. In the double precision mode, atom positions, forces and energies are stored, computed and accumulated in double precision. In the mixed precision mode, forces and energies are accumulated in double precision while atom coordinates are stored and arithmetic operations are performed in single precision. In the single precision mode, all are stored, executed and accumulated in single precision.

To specify the precision mode (output to the screen before LAMMPS runs for verification), set GPU_PREC to one of single, double, or mixed.

Some accelerators or OpenCL implementations only support single precision. This mode should be used with care and appropriate validation as the errors can scale with system size in this implementation. This can be useful for accelerating test runs when setting up a simulation for production runs on another machine. In the case where only single precision is supported, either LAMMPS must be compiled with -DFFT_SINGLE to use PPPM with GPU acceleration or GPU acceleration should be disabled for PPPM (e.g. suffix off or pair/only as described in the LAMMPS documentation).

GPU_ARCH settings for different GPU hardware is as follows:

- sm_30 for Kepler (supported since CUDA 5 and until CUDA 10.x)
- sm_35 or sm_37 for Kepler (supported since CUDA 5 and until CUDA 11.x)
- sm_50 or sm_52 for Maxwell (supported since CUDA 6)
- sm_60 or sm_61 for Pascal (supported since CUDA 8)
- sm_70 for Volta (supported since CUDA 9)
- sm_75 for Turing (supported since CUDA 10)
- sm_80 or sm_86 for Ampere (supported since CUDA 11, sm_86 since CUDA 11.1)

- sm_89 for Lovelace (supported since CUDA 11.8)
- sm_90 or sm_90a for Hopper (supported since CUDA 12.0)
- sm_100 or sm_103 for Blackwell B100/B200/B300 (supported since CUDA 12.8)
- sm_120 for Blackwell B20x/B40 (supported since CUDA 12.8)
- sm_121 for Blackwell (supported since CUDA 12.9)

A more detailed list can be found, for example, at Wikipedia's CUDA article

CMake can detect which version of the CUDA toolkit is used and thus will try to include support for **all** major GPU architectures supported by this toolkit. Thus the GPU_ARCH setting is merely an optimization, to have code for the preferred GPU architecture directly included rather than having to wait for the JIT compiler of the CUDA driver to translate it. This behavior can be turned off (e.g. to speed up compilation) by setting CUDA_ENABLE_MULTIARCH to no.

When compiling for CUDA or HIP with CUDA, version 8.0 or later of the CUDA toolkit is required and a GPU architecture of Kepler or later, which must *also* be supported by the CUDA toolkit in use **and** the CUDA driver in use. When compiling for OpenCL, OpenCL version 1.2 or later is required and the GPU must be supported by the GPU driver and OpenCL runtime bundled with the driver.

Please note that the GPU library accesses the CUDA driver library directly, so it needs to be linked with the CUDA driver library (libcuda.so) that ships with the Nvidia driver. If you are compiling LAMMPS on the head node of a GPU cluster, this library may not be installed, so you may need to copy it over from one of the compute nodes (best into this directory). Recent versions of the CUDA toolkit starting from CUDA 9 provide a dummy libcuda.so library (typically under $(CUDA_HOME)/lib64/stubs), that can be used for linking.

To support the CUDA multi-process server (MPS) you can set the define -DCUDA_MPS_SUPPORT. Please note that in this case you must **not** use the CUDA performance primitives and thus set the variable CUDPP_OPT to empty.

If you are compiling for OpenCL, the default setting is to download, build, and link with a static OpenCL ICD loader library and standard OpenCL headers. This way no local OpenCL development headers or library needs to be present and only OpenCL compatible drivers need to be installed to use OpenCL. If this is not desired, you can set USE_STATIC_OPENCL_LOADER to no.

If GERYON_NUMA_FISSION is defined at build time (-DGPU_DEBUG=no), LAMMPS will consider separate NUMA nodes on GPUs or accelerators as separate devices. For example, a 2-socket CPU would appear as two separate devices for OpenCL (and LAMMPS would require two MPI processes to use both sockets with the GPU library - each with its own device ID as output by ocl_get_devices). OpenCL version 1.2 or later is required.

If you are compiling with HIP, note that before running CMake you will have to set appropriate environment variables. Some variables such as HCC_AMDGPU_TARGET (for ROCm <= 4.0) or CUDA_PATH are necessary for hipcc and the linker to work correctly.

When compiling for HIP ROCm, GPU sorting with -D HIP_USE_DEVICE_SORT=on requires installing the hipcub library (https://github.com/ROCmSoftwarePlatform/hipCUB). The HIP CUDA-backend additionally requires cub (https://nvlabs.github.io/cub). Setting -DDOWNLOAD_CUB=yes will download and compile CUB.

The GPU library has some multi-thread support using OpenMP. If LAMMPS is built with -D BUILD_OMP=on this will also be enabled.

For a debug build, set GPU_DEBUG to be yes.

Added in version 3Aug2022.

Using the CHIP-SPV implementation of HIP is supported. It allows one to run HIP code on Intel GPUs via the OpenCL or Level Zero back ends. To use CHIP-SPV, you must set -DHIP_USE_DEVICE_SORT=OFF in your CMake command-line as CHIP-SPV does not yet support hipCUB. As of Summer 2022, the use of HIP for Intel GPUs is experimental. You should only use this option in preparations to run on Aurora system at Argonne.

```
# AMDGPU target (ROCm <= 4.0)
export HIP_PLATFORM=hcc
export HIP_PATH=/path/to/HIP/install
export HCC_AMDGPU_TARGET=gfx906
cmake -D PKG_GPU=on -D GPU_API=HIP -D HIP_ARCH=gfx906 -D CMAKE_CXX_
↪COMPILER=hipcc ..
make -j 4
```

```
# AMDGPU target (ROCm >= 4.1)
export HIP_PLATFORM=amd
export HIP_PATH=/path/to/HIP/install
cmake -D PKG_GPU=on -D GPU_API=HIP -D HIP_ARCH=gfx906 -D CMAKE_CXX_
↪COMPILER=hipcc ..
make -j 4
```

```
# CUDA target (not recommended, use GPU_API=cuda)
# !!! DO NOT set CMAKE_CXX_COMPILER !!!
export HIP_PLATFORM=nvcc
export HIP_PATH=/path/to/HIP/install
export CUDA_PATH=/usr/local/cuda
cmake -D PKG_GPU=on -D GPU_API=HIP -D HIP_ARCH=sm_70 ..
make -j 4
```

```
# SPIR-V target (Intel GPUs)
export HIP_PLATFORM=spirv
export HIP_PATH=/path/to/HIP/install
export CMAKE_CXX_COMPILER=<hipcc/clang++>
cmake -D PKG_GPU=on -D GPU_API=HIP ..
make -j 4
```

3.8.3 KIM package

To build with this package, the KIM library with API v2 must be downloaded and built on your system. It must include the KIM models that you want to use with LAMMPS.

If you would like to use the *kim query* command, you also need to have libcurl installed with the matching development headers and the curl-config tool.

If you would like to use the *kim property* command, you need to build LAMMPS with the PYTHON package installed and linked to Python 3.6 or later. See the *PYTHON package build info* for more details on this. After successfully building LAMMPS with Python, you also need to install the kim-property Python package, which can be easily done using *pip* as `pip install kim-property`, or from the *conda-forge* channel as `conda install kim-property` if LAMMPS is built in Conda. More detailed information is available at: kim-property installation.

In addition to installing the KIM API, it is also necessary to install the library of KIM models (interatomic potentials). See Obtaining KIM Models to learn how to install a pre-build binary of the OpenKIM Repository of Models. See the list of all KIM models here: https://openkim.org/browse/models

(Also note that when downloading and installing from source the KIM API library with all its models, may take a long time (tens of minutes to hours) to build. Of course you only need to do that once.)

CMake build

```
-D DOWNLOAD_KIM=value          # download OpenKIM API v2 for build
                               # value = no (default) or yes
-D LMP_DEBUG_CURL=value        # set libcurl verbose mode on/off
                               # value = off (default) or on
-D LMP_NO_SSL_CHECK=value      # tell libcurl to not verify the peer
                               # value = no (default) or yes
-D KIM_EXTRA_UNITTESTS=value   # enables extra unit tests
                               # value = no (default) or yes
```

If DOWNLOAD_KIM is set to yes (or on), the KIM API library will be downloaded and built inside the CMake build directory. If the KIM library is already installed on your system (in a location where CMake cannot find it), you may need to set the PKG_CONFIG_PATH environment variable so that libkim-api can be found, or run the command source kim-api-activate.

Extra unit tests can only be available if they are explicitly requested (KIM_EXTRA_UNITTESTS is set to yes (or on)) and the prerequisites are met. See *KIM Extra unit tests* for more details on this.

Traditional make

Changed in version 10Sep2025.

The KIM package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

Debugging OpenKIM web queries in LAMMPS

If LMP_DEBUG_CURL is set, the libcurl verbose mode will be turned on, and any libcurl calls within the KIM web query display a lot of information about libcurl operations. You hardly ever want this set in production use, you will almost always want this when you debug or report problems.

The libcurl library performs peer SSL certificate verification by default. This verification is done using a CA certificate store that the SSL library can use to make sure the peer's server certificate is valid. If SSL reports an error ("certificate verify failed") during the handshake and thus refuses further communicate with that server, you can set LMP_NO_SSL_CHECK to override that behavior. When LAMMPS is compiled with LMP_NO_SSL_CHECK set, libcurl does not verify the peer and connection attempts will succeed regardless of the names in the certificate. This option is insecure. As an alternative, you can specify your own CA cert path by setting the environment variable CURL_CA_BUNDLE to the path of your choice. A call to the KIM web query would get this value from the environment variable.

KIM Extra unit tests (CMake only)

During development, testing, or debugging, if *unit testing* is enabled in LAMMPS, one can also enable extra tests on *KIM commands* by setting the KIM_EXTRA_UNITTESTS to yes (or on).

Enabling the extra unit tests have some requirements,

- It requires to have internet access.
- It requires to have libcurl installed with the matching development headers and the curl-config tool.
- It requires to build LAMMPS with the PYTHON package installed and linked to Python 3.6 or later. See the *PYTHON package build info* for more details on this.

- It requires to have kim-property Python package installed, which can be easily done using *pip* as pip install kim-property, or from the *conda-forge* channel as conda install kim-property if LAMMPS is built in Conda. More detailed information is available at: kim-property installation.
- It is also necessary to install the following KIM models:
  - EAM_Dynamo_MendelevAckland_2007v3_Zr__MO_004835508849_000
  - EAM_Dynamo_ErcolessiAdams_1994_Al__MO_123629422045_005
  - LennardJones612_UniversalShifted__MO_959249795837_003

  See Obtaining KIM Models to learn how to install a pre-built binary of the OpenKIM Repository of Models or see Installing KIM Models to learn how to install the specific KIM models.

3.8.4 KOKKOS package

Using the KOKKOS package requires choosing several settings. You have to select whether you want to compile with parallelization on the host and whether you want to include offloading of calculations to a device (e.g. a GPU). The default setting is to have no host parallelization and no device offloading. In addition, you can select the hardware architecture to select the instruction set. Since most hardware is backward compatible, you may choose settings for an older architecture to have an executable that will run on this and newer architectures.

Note

If you run Kokkos on a different GPU architecture than what LAMMPS was compiled with, there will be a delay during device initialization while the just-in-time compiler is recompiling all GPU kernels for the new hardware. This is, however, only supported for GPUs of the **same** major hardware version and different minor hardware versions, e.g. 5.0 and 5.2 but not 5.2 and 6.0. LAMMPS will abort with an error message indicating a mismatch, if the major version differs.

The settings discussed below have been tested with LAMMPS and are confirmed to work. Kokkos is an active project with ongoing improvements and projects working on including support for additional architectures. More information on Kokkos can be found on the Kokkos GitHub project.

Available Architecture settings

These are the possible choices for the Kokkos architecture ID. They must be specified in uppercase.

Arch-ID	HOST or GPU	Description
NATIVE	HOST	Local machine
AMDAVX	HOST	AMD chip
ARMV80	HOST	ARMv8.0 Compatible CPU
ARMV81	HOST	ARMv8.1 Compatible CPU
ARMV8_THUNDERX	HOST	ARMv8 Cavium ThunderX CPU
ARMV8_THUNDERX2	HOST	ARMv8 Cavium ThunderX2 CPU
A64FX	HOST	ARMv8.2 with SVE Support
ARMV9_GRACE	HOST	ARMv9 NVIDIA Grace CPU
SNB	HOST	Intel Sandy/Ivy Bridge CPUs
HSW	HOST	Intel Haswell CPUs
BDW	HOST	Intel Broadwell Xeon E-class CPUs
ICL	HOST	Intel Ice Lake Client CPUs (AVX512)
ICX	HOST	Intel Ice Lake Xeon Server CPUs (AVX512)

continues on next page

Table 1 – continued from previous page

SKL	HOST	Intel Skylake Client CPUs
SKX	HOST	Intel Skylake Xeon Server CPUs (AVX512)
KNC	HOST	Intel Knights Corner Xeon Phi
KNL	HOST	Intel Knights Landing Xeon Phi
SPR	HOST	Intel Sapphire Rapids Xeon Server CPUs (AVX512)
POWER8	HOST	IBM POWER8 CPUs
POWER9	HOST	IBM POWER9 CPUs
ZEN	HOST	AMD Zen architecture
ZEN2	HOST	AMD Zen2 architecture
ZEN3	HOST	AMD Zen3 architecture
ZEN4	HOST	AMD Zen4 architecture
ZEN5	HOST	AMD Zen5 architecture
RISCV_SG2042	HOST	SG2042 (RISC-V) CPUs
RISCV_RVA22V	HOST	RVA22V (RISC-V) CPUs
KEPLER30	GPU	NVIDIA Kepler generation CC 3.0
KEPLER32	GPU	NVIDIA Kepler generation CC 3.2
KEPLER35	GPU	NVIDIA Kepler generation CC 3.5
KEPLER37	GPU	NVIDIA Kepler generation CC 3.7
MAXWELL50	GPU	NVIDIA Maxwell generation CC 5.0
MAXWELL52	GPU	NVIDIA Maxwell generation CC 5.2
MAXWELL53	GPU	NVIDIA Maxwell generation CC 5.3
PASCAL60	GPU	NVIDIA Pascal generation CC 6.0
PASCAL61	GPU	NVIDIA Pascal generation CC 6.1
VOLTA70	GPU	NVIDIA Volta generation CC 7.0
VOLTA72	GPU	NVIDIA Volta generation CC 7.2
TURING75	GPU	NVIDIA Turing generation CC 7.5
AMPERE80	GPU	NVIDIA Ampere generation CC 8.0
AMPERE86	GPU	NVIDIA Ampere generation CC 8.6
ADA89	GPU	NVIDIA Ada generation CC 8.9
HOPPER90	GPU	NVIDIA Hopper generation CC 9.0
BLACKWELL100	GPU	NVIDIA Blackwell generation CC 10.0
BLACKWELL120	GPU	NVIDIA Blackwell generation CC 12.0
AMD_GFX906	GPU	AMD GPU MI50/60
AMD_GFX908	GPU	AMD GPU MI100
AMD_GFX90A	GPU	AMD GPU MI200
AMD_GFX940	GPU	AMD GPU MI300
AMD_GFX942	GPU	AMD GPU MI300
AMD_GFX942_APU	GPU	AMD APU MI300A
AMD_GFX1030	GPU	AMD GPU V620/W6800
AMD_GFX1100	GPU	AMD GPU RX7900XTX
AMD_GFX1103	GPU	AMD APU Phoenix
INTEL_GEN	GPU	SPIR64-based devices, e.g. Intel GPUs, using JIT
INTEL_DG1	GPU	Intel Iris XeMAX GPU
INTEL_GEN9	GPU	Intel GPU Gen9
INTEL_GEN11	GPU	Intel GPU Gen11
INTEL_GEN12LP	GPU	Intel GPU Gen12LP
INTEL_XEHP	GPU	Intel GPU Xe-HP
INTEL_PVC	GPU	Intel GPU Ponte Vecchio
INTEL_DG2	GPU	Intel GPU DG2

This list was last updated for version 4.6.2 of the Kokkos library.

Basic CMake build settings

For multicore CPUs using OpenMP, set these 2 variables.

```
-D Kokkos_ARCH_HOSTARCH=yes  # HOSTARCH = HOST from list above
-D Kokkos_ENABLE_OPENMP=yes
-D BUILD_OMP=yes
```

Please note that enabling OpenMP for KOKKOS requires that OpenMP is also *enabled for the rest of LAMMPS*.

For Intel KNLs using OpenMP, set these variables:

```
-D Kokkos_ARCH_KNL=yes
-D Kokkos_ENABLE_OPENMP=yes
```

For NVIDIA GPUs using CUDA, set these variables:

```
-D Kokkos_ARCH_HOSTARCH=yes   # HOSTARCH = HOST from list above
-D Kokkos_ARCH_GPUARCH=yes    # GPUARCH = GPU from list above
-D Kokkos_ENABLE_CUDA=yes
-D Kokkos_ENABLE_OPENMP=yes
```

This will also enable executing FFTs on the GPU, either via the internal KISSFFT library, or - by preference - with the cuFFT library bundled with the CUDA toolkit, depending on whether CMake can identify its location.

For AMD or NVIDIA GPUs using HIP, set these variables:

```
-D Kokkos_ARCH_HOSTARCH=yes   # HOSTARCH = HOST from list above
-D Kokkos_ARCH_GPUARCH=yes    # GPUARCH = GPU from list above
-D Kokkos_ENABLE_HIP=yes
-D Kokkos_ENABLE_OPENMP=yes
```

This will enable FFTs on the GPU, either by the internal KISSFFT library or with the hipFFT wrapper library, which will call out to the platform-appropriate vendor library: rocFFT on AMD GPUs or cuFFT on NVIDIA GPUs.

For Intel GPUs using SYCL, set these variables:

```
-D Kokkos_ARCH_HOSTARCH=yes   # HOSTARCH = HOST from list above
-D Kokkos_ARCH_GPUARCH=yes    # GPUARCH = GPU from list above
-D Kokkos_ENABLE_SYCL=yes
-D Kokkos_ENABLE_OPENMP=yes
-D FFT_KOKKOS=MKL_GPU
```

This will enable FFTs on the GPU using the oneMKL library.

To simplify compilation, seven preset files are included in the cmake/presets folder, kokkos-serial.cmake, kokkos-openmp.cmake, kokkos-cuda.cmake, kokkos-cuda-nowrapper.cmake, kokkos-hip.cmake, kokkos-sycl-nvidia.cmake, and kokkos-sycl-intel.cmake. They will enable the KOKKOS package and enable some hardware choices. For GPU support those preset files may need to be customized to match the hardware used. For some platforms, e.g. CUDA, the Kokkos library will try to auto-detect a suitable configuration. So to compile with CUDA device parallelization with some common packages enabled, you can do the following:

```
mkdir build-kokkos-cuda
cd build-kokkos-cuda
cmake -C ../cmake/presets/basic.cmake \
      -C ../cmake/presets/kokkos-cuda-nowrapper.cmake ../cmake
cmake --build .
```

The kokkos-openmp.cmake preset can be combined with any of the others, but it is not possible to combine multiple GPU acceleration settings (CUDA, HIP, SYCL) into a single executable.

Basic traditional make settings

Choose which hardware to support in Makefile.machine via KOKKOS_DEVICES and KOKKOS_ARCH settings. See the src/MAKE/OPTIONS/Makefile.kokkos* files for examples.

For multicore CPUs using OpenMP:

```
KOKKOS_DEVICES = OpenMP
KOKKOS_ARCH = HOSTARCH          # HOSTARCH = HOST from list above
```

For Intel KNLs using OpenMP:

```
KOKKOS_DEVICES = OpenMP
KOKKOS_ARCH = KNL
```

For NVIDIA GPUs using CUDA:

```
KOKKOS_DEVICES = Cuda
KOKKOS_ARCH = HOSTARCH,GPUARCH  # HOSTARCH = HOST from list above␣
↪that is
                                #           hosting the GPU
                                # GPUARCH = GPU from list above
KOKKOS_CUDA_OPTIONS = "enable_lambda"
FFT_INC = -DFFT_CUFFT           # enable use of cuFFT (optional)
FFT_LIB = -lcufft               # link to cuFFT library
```

For GPUs, you also need the following lines in your Makefile.machine before the CC line is defined. They tell mpicxx to use an nvcc compiler wrapper, which will use nvcc for compiling CUDA files and a C++ compiler for non-Kokkos, non-CUDA files.

```
# For OpenMPI
KOKKOS_ABSOLUTE_PATH = $(shell cd $(KOKKOS_PATH); pwd)
export OMPI_CXX = $(KOKKOS_ABSOLUTE_PATH)/config/nvcc_wrapper
CC = mpicxx
```

```
# For MPICH and derivatives
KOKKOS_ABSOLUTE_PATH = $(shell cd $(KOKKOS_PATH); pwd)
CC = mpicxx -cxx=$(KOKKOS_ABSOLUTE_PATH)/config/nvcc_wrapper
```

For AMD or NVIDIA GPUs using HIP:

```
KOKKOS_DEVICES = HIP
KOKKOS_ARCH = HOSTARCH,GPUARCH  # HOSTARCH = HOST from list above␣
↪that is
                                #           hosting the GPU
                                # GPUARCH = GPU from list above
FFT_INC = -DFFT_HIPFFT          # enable use of hipFFT (optional)
FFT_LIB = -lhipfft              # link to hipFFT library
```

For Intel GPUs using SYCL:

```
KOKKOS_DEVICES = SYCL
KOKKOS_ARCH = HOSTARCH,GPUARCH  # HOSTARCH = HOST from list above that is
                                #           hosting the GPU
                                # GPUARCH = GPU from list above
FFT_INC = -DFFT_KOKKOS_MKL_GPU  # enable use of oneMKL for Intel GPUs (optional)
                                # link to oneMKL FFT library
FFT_LIB = -lmkl_sycl_dft -lmkl_intel_ilp64 -lmkl_tbb_thread -mkl_core -ltbb
```

Advanced KOKKOS compilation settings

There are other allowed options when building with the KOKKOS package that can improve performance or assist in debugging or profiling. Below are some examples that may be useful in combination with LAMMPS. For the full list (which keeps changing as the Kokkos package itself evolves), please consult the Kokkos library documentation.

As alternative to using multi-threading via OpenMP (-DKokkos_ENABLE_OPENMP=on or KOKKOS_DEVICES=OpenMP) it is also possible to use Posix threads directly (-DKokkos_ENABLE_PTHREAD=on or KOKKOS_DEVICES=Pthread). While binding of threads to individual or groups of CPU cores is managed in OpenMP with environment variables, you need assistance from either the "hwloc" or "libnuma" library for the Pthread thread parallelization option. To enable use with CMake: -DKokkos_ENABLE_HWLOC=on or -DKokkos_ENABLE_LIBNUMA=on; and with conventional make: KOKKOS_USE_TPLS=hwloc or KOKKOS_USE_TPLS=libnuma.

The CMake option -DKokkos_ENABLE_LIBRT=on or the makefile setting KOKKOS_USE_TPLS=librt enables the use of a more accurate timer mechanism on many Unix-like platforms for internal profiling.

The CMake option -DKokkos_ENABLE_DEBUG=on or the makefile setting KOKKOS_DEBUG=yes enables printing of run-time debugging information that can be useful. It also enables runtime bounds checking on Kokkos data structures. As to be expected, enabling this option will negatively impact the performance and thus is only recommended when developing a Kokkos-enabled style in LAMMPS.

The CMake option -DKokkos_ENABLE_CUDA_UVM=on or the makefile setting KOKKOS_CUDA_OPTIONS=enable_lambda,force_uvm enables the use of CUDA "Unified Virtual Memory" (UVM) in Kokkos. UVM allows to transparently use RAM on the host to supplement the memory used on the GPU (with some performance penalty) and thus enables running larger problems that would otherwise not fit into the RAM on the GPU.

The CMake option -D KOKKOS_PREC=value sets the floating point precision of the calculations, where value can be one of: double (FP64, default) or mixed (FP64 for accumulation of forces, energy, and virial, FP32 otherwise) or single (FP32). Similarly the makefile settings -DLMP_KOKKOS_DOUBLE_DOUBLE (default), -DLMP_KOKKOS_SINGLE_DOUBLE, and -DLMP_KOKKOS_SINGLE_SINGLE set double, mixed, single precision respectively. When using reduced precision (single or mixed), the simulation should be carefully checked to ensure it is stable and that energy is acceptably conserved.

The CMake option -D KOKKOS_LAYOUT=value sets the array layout of Kokkos views (e.g. forces, velocities, etc.) on GPUs, where value can be one of: legacy (mostly LayoutRight, default) or default (mostly LayoutLeft). Similarly the makefile settings -DLMP_KOKKOS_LAYOUT_LEGACY (default) and -DLMP_KOKKOS_LAYOUT_DEFAULT set legacy or default layouts respectively. Using the default layout (LayoutLeft) can give speedup on GPUs for some models, but a slowdown for others. LayoutRight is always used for positions on GPUs since it has been found to be faster, and when compiling exclusively for CPUs.

3.8.5 LEPTON package

To build with this package, you must build the Lepton library which is included in the LAMMPS source distribution in the lib/lepton folder.

CMake build

This is the recommended build procedure for using Lepton in LAMMPS. No additional settings are normally needed besides -D PKG_LEPTON=yes.

On x86 hardware the Lepton library will also include a just-in-time compiler for faster execution. This is auto detected but can be explicitly disabled by setting -D LEPTON_ENABLE_JIT=no (or enabled by setting it to yes).

Traditional make

Changed in version 10Sep2025.

The LEPTON package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.6 MACHDYN package

To build with this package, you must download the Eigen3 library. Eigen3 is a template library, so you do not need to build it.

CMake build

```
-D DOWNLOAD_EIGEN3           # download Eigen3, value = no (default) or yes
-D EIGEN3_INCLUDE_DIR=path   # path to Eigen library (only needed if a
                             # custom location)
```

If DOWNLOAD_EIGEN3 is set, the Eigen3 library will be downloaded and inside the CMake build directory. If the Eigen3 library is already on your system (in a location where CMake cannot find it), set EIGEN3_INCLUDE_DIR to the directory the Eigen3 include file is in.

Traditional make

Changed in version 10Sep2025.

The MACHDYN package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.7 ML-IAP package

Building the ML-IAP package requires including the *ML-SNAP* package. There will be an error message if this requirement is not satisfied. Using the *mliappy* model also requires enabling Python support, which in turn requires to include

the *PYTHON* package **and** requires to have the cython software installed and with it a working cythonize command. This feature requires compiling LAMMPS with Python version 3.6 or later.

CMake build

```
-D MLIAP_ENABLE_PYTHON=value    # enable mliappy model (default is autodetect)
```

Without this setting, CMake will check whether it can find a suitable Python version and the cythonize command and choose the default accordingly. During the build procedure the provided .pyx file(s) will be automatically translated to C++ code and compiled. Please do **not** run cythonize manually in the src/ML-IAP folder, as that can lead to compilation errors if Python support is not enabled. If you did it by accident, please remove the generated .cpp and .h files.

Traditional make

The build uses the lib/python/Makefile.mliap_python file in the compile/link process to add a rule to update the files generated by the cythonize command in case the corresponding .pyx file(s) were modified. You may need to modify lib/python/Makefile.lammps if the LAMMPS build fails.

To enable building the ML-IAP package with Python support enabled, you need to add -DMLIAP_PYTHON to the LMP_INC variable in your machine makefile. You may have to manually run the cythonize command on .pyx file(s) in the src folder, if this is not automatically done during installing the ML-IAP package. Please do **not** run cythonize in the src/ML-IAP folder, as that can lead to compilation errors if Python support is not enabled. If you did this by accident, please remove the generated .cpp and .h files.

3.8.8 OPT package

CMake build

No additional settings are needed besides -D PKG_OPT=yes

Traditional make

The compiler flag -restrict must be used to build LAMMPS with the OPT package when using Intel compilers. It should be added to the CCFLAGS line of your Makefile.machine. See src/MAKE/OPTIONS/Makefile.opt for an example.

3.8.9 PYTHON package

Building with the PYTHON package requires you have a the Python development headers and library available on your system, which needs to be Python version 3.6 or later. See lib/python/README for additional details.

CMake build

```
-D Python_EXECUTABLE=path   # path to Python executable to use
```

Without this setting, CMake will guess the default Python version on your system. To use a different Python version, you can either create a virtualenv, activate it and then run cmake. Or you can set the Python_EXECUTABLE variable to specify which Python interpreter should be used. Note note that you will also need to have the development headers installed for this version, e.g. python3-devel.

Traditional make

Changed in version 10Sep2025.

The PYTHON package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.10 VORONOI package

To build with this package, you must download and build the Voro++ library or install a binary package provided by your operating system.

CMake build

```
-D DOWNLOAD_VORO=value    # download Voro++ for build
                          # value = no (default) or yes
-D VORO_LIBRARY=path      # Voro++ library file
                          # (only needed if at custom location)
-D VORO_INCLUDE_DIR=path  # Voro++ include directory
                          # (only needed if at custom location)
```

If DOWNLOAD_VORO is set, the Voro++ library will be downloaded and built inside the CMake build directory. If the Voro++ library is already on your system (in a location CMake cannot find it), VORO_LIBRARY is the filename (plus path) of the Voro++ library file, not the directory the library file is in. VORO_INCLUDE_DIR is the directory the Voro++ include file is in.

Traditional make

Changed in version 10Sep2025.

The VORONOI package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.11 ADIOS package

The ADIOS package requires the ADIOS I/O library, version 2.3.1 or newer. Make sure that you have ADIOS built either with or without MPI to match if you build LAMMPS with or without MPI. ADIOS compilation settings for LAMMPS are automatically detected, if the PATH and LD_LIBRARY_PATH environment variables have been updated for the local ADIOS installation and the instructions below are followed for the respective build systems.

CMake build

```
-D ADIOS2_DIR=path       # path is where ADIOS 2.x is installed
-D PKG_ADIOS=yes
```

Traditional make

Turn on the ADIOS package before building LAMMPS. If the ADIOS 2.x software is installed in PATH, there is nothing else to do:

```
make yes-adios
```

otherwise, set ADIOS2_DIR environment variable when turning on the package:

```
ADIOS2_DIR=path make yes-adios   # path is where ADIOS 2.x is installed
```

3.8.12 APIP package

The APIP package depends on the library of the *ML-PACE* package. The code for the library can be found at: https://github.com/ICAMS/lammps-user-pace/

CMake build

No additional settings are needed besides -D PKG_APIP=yes and -D PKG_ML-PACE=yes. One can use a local version of the ML-PACE library instead of automatically downloading the library as described *here*.

Traditional make

Changed in version 10Sep2025.

The APIP package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.13 COLVARS package

This package enables the use of the Colvars module included in the LAMMPS source distribution.

CMake build

This is the recommended build procedure for using Colvars in LAMMPS. No additional settings are normally needed besides -D PKG_COLVARS=yes. The following CMake variables are available.

```
-D PKG_COLVARS=yes         # enable the package itself
-D COLVARS_LEPTON=yes      # use the Lepton library for custom expression (on by
↪defaul)
-D COLVARS_DEBUG=no        # eneable debugging message (verbose, off by default)
```

Traditional make

Changed in version 10Sep2025.

The COLVARS package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.14 ELECTRODE package

This package depends on the KSPACE package.

CMake build

```
-D PKG_ELECTRODE=yes          # enable the package itself
-D PKG_KSPACE=yes             # the ELECTRODE package requires KSPACE
-D USE_INTERNAL_LINALG=value  #
```

Features in the ELECTRODE package are dependent on code in the KSPACE package so the latter one *must* be enabled.

The ELECTRODE package also requires LAPACK (and BLAS) and CMake can identify their locations and pass that info to the ELECTRODE build script. But on some systems this may cause problems when linking or the dependency is not desired. Try enabling USE_INTERNAL_LINALG in those cases to use the bundled linear algebra library and work around the limitation.

Traditional make

The ELECTRODE package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.15 ML-PACE package

This package requires a library that can be downloaded and built in lib/pace or somewhere else, which must be done before building LAMMPS with this package. The code for the library can be found at: https://github.com/ICAMS/lammps-user-pace/

Instead of including the ML-PACE package directly into LAMMPS, it is also possible to skip this step and build the ML-PACE package as a plugin using the CMake script files in the examples/PACKAGE/pace/plugin folder and then load this plugin at runtime with the *plugin command*.

CMake build

By default the library will be downloaded from the git repository and built automatically when the ML-PACE package is enabled with -D PKG_ML-PACE=yes. The location for the sources may be customized by setting the variable PACELIB_URL when configuring with CMake (e.g. to use a

local archive on machines without internet access). Since CMake checks the validity of the archive with md5sum you may also need to set PACELIB_MD5 if you provide a different library version than what is downloaded automatically.

Traditional make

Changed in version 10Sep2025.

The ML-PACE package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.16 ML-POD package

CMake build

No additional settings are needed besides -D PKG_ML-POD=yes.

Traditional make

Changed in version 10Sep2025.

The ML-POD package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.17 ML-QUIP package

To build with this package, you must download and build the QUIP library. It can be obtained from GitHub. For support of GAP potentials, additional files with specific licensing conditions need to be downloaded and configured. The automatic download will from within CMake will download the non-commercial use version.

CMake build

```
-D DOWNLOAD_QUIP=value       # download QUIP library for build
                             # value = no (default) or yes
-D QUIP_LIBRARY=path         # path to libquip.a
                             # (only needed if a custom location)
-D USE_INTERNAL_LINALG=value # Use the internal linear algebra library
                             # instead of LAPACK
                             # value = no (default) or yes
```

CMake will try to download and build the QUIP library from GitHub, if it is not found on the local machine. This requires to have git installed. It will use the same compilers and flags as used for compiling LAMMPS. Currently this is only supported for the GNU and the Intel compilers. Set the QUIP_LIBRARY variable if you want to use a previously compiled and installed QUIP library and CMake cannot find it.

The QUIP library requires LAPACK (and BLAS) and CMake can identify their locations and pass that info to the QUIP build script. But on some systems this triggers a (current) limitation of CMake and the configuration will fail. Try enabling USE_INTERNAL_LINALG in those cases to use the bundled linear algebra library and work around the limitation.

Traditional make

Changed in version 10Sep2025.

The ML-QUIP package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.18 PLUMED package

Before building LAMMPS with this package, you must first build PLUMED. PLUMED can be built as part of the LAMMPS build or installed separately from LAMMPS using the generic PLUMED installation instructions. The PLUMED package has been tested to work with Plumed versions 2.4.x, to 2.9.x and will error out, when trying to run calculations with a different version of the Plumed kernel.

PLUMED can be linked into MD codes in three different modes: static, shared, and runtime. With the "static" mode, all the code that PLUMED requires is linked statically into LAMMPS. LAMMPS is then fully independent from the PLUMED installation, but you have to rebuild/relink it in order to update the PLUMED code inside it. With the "shared" linkage mode, LAMMPS is linked to a shared library that contains the PLUMED code. This library should preferably be installed in a globally accessible location. When PLUMED is linked in this way the same library can be used by multiple MD packages. Furthermore, the PLUMED library LAMMPS uses can be updated without the need for a recompile of LAMMPS for as long as the shared PLUMED library is ABI-compatible.

The third linkage mode is "runtime" which allows the user to specify which PLUMED kernel should be used at runtime by using the PLUMED_KERNEL environment variable. This variable should point to the location of the libplumedKernel.so dynamical shared object, which is then loaded at runtime. This mode of linking is particularly convenient for doing PLUMED development and comparing multiple PLUMED versions as these sorts of comparisons can be done without recompiling the hosting MD code. All three linkage modes are supported by LAMMPS on selected operating systems (e.g. Linux) and using either CMake or traditional make build. The "static" mode should be the most portable, while the "runtime" mode support in LAMMPS makes the most assumptions about operating system and compiler environment. If one mode does not work, try a different one, switch to a different build system, consider a global PLUMED installation or consider downloading PLUMED during the LAMMPS build.

Instead of including the PLUMED package directly into LAMMPS, it is also possible to skip this step and build the PLUMED package as a plugin using the CMake script files in the examples/PACKAGE/plumed/plugin folder and then load this plugin at runtime with the *plugin command*.

CMake build

When the -D PKG_PLUMED=yes flag is included in the cmake command you must ensure that *the GNU Scientific Library (GSL) <https://www.gnu.org/software/gsl/>* is installed in locations that are accessible in your environment. There are then two additional variables that control the manner in which PLUMED is obtained and linked into LAMMPS.

```
-D DOWNLOAD_PLUMED=value   # download PLUMED for build
                           # value = no (default) or yes
-D PLUMED_MODE=value       # Linkage mode for PLUMED
                           # value = static (default), shared,
                           #         or runtime
```

If DOWNLOAD_PLUMED is set to yes, the PLUMED library will be downloaded (the version of PLUMED that will be downloaded is hard-coded to a vetted version of PLUMED, usually a recent stable release version) and built inside the CMake build directory. If DOWNLOAD_PLUMED is set to "no" (the default), CMake will try to detect and link to an installed version of PLUMED. For this to work, the PLUMED library has to be installed into a location where the pkg-config tool can find it or the PKG_CONFIG_PATH environment variable has to be set up accordingly. PLUMED should be installed in such a location if you compile it using the default make; make install commands.

The PLUMED_MODE setting determines the linkage mode for the PLUMED library. The allowed values for this flag are "static" (default), "shared", or "runtime". If you want to switch the linkage mode, just re-run CMake with a different setting. For a discussion of PLUMED linkage modes, please see above. When DOWNLOAD_PLUMED is enabled the static linkage mode is recommended.

Traditional make

Changed in version 10Sep2025.

The PLUMED package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.19 H5MD package

To build with this package you must have the HDF5 software package installed on your system, which should include the h5cc compiler and the HDF5 library.

CMake build

No additional settings are needed besides -D PKG_H5MD=yes.

This should auto-detect the H5MD library on your system. Several advanced CMake H5MD options exist if you need to specify where it is installed. Use the ccmake (terminal window) or cmake-gui (graphical) tools to see these options and set them interactively from their user interfaces.

Traditional make

Changed in version 10Sep2025.

The H5MD package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.20 ML-HDNNP package

To build with the ML-HDNNP package it is required to download and build the external n2p2 library v2.1.4 (or higher). The LAMMPS build process offers an automatic download and compilation of *n2p2* or allows you to choose the installation directory of *n2p2* manually. Please see the boxes below for the CMake and traditional build system for detailed information.

In case of a manual installation of *n2p2* you only need to build the *n2p2* core library libnnp and interface library libnnpif. When using GCC it should suffice to execute make libnnpif in the *n2p2* src directory. For more details please see lib/hdnnp/README and the n2p2 build documentation.

CMake build

```
-D DOWNLOAD_N2P2=value    # download n2p2 for build
                          # value = no (default) or yes
-D N2P2_DIR=path          # n2p2 base directory
                          # (only needed if a custom location)
```

If DOWNLOAD_N2P2 is set, the *n2p2* library will be downloaded and built inside the CMake build directory. If the *n2p2* library is already on your system (in a location CMake cannot find it), set the N2P2_DIR to path where *n2p2* is located. If *n2p2* is located directly in lib/hdnnp/n2p2 it will be automatically found by CMake.

Traditional make

Changed in version 10Sep2025.

The ML-HDNNP package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.21 INTEL package

To build with this package, you must choose which hardware you want to build for, either x86 CPUs or Intel KNLs in offload mode. You should also typically *install the OPENMP package*, as it can be used in tandem with the INTEL package to good effect, as explained on the *INTEL package* page.

When using Intel compilers version 16.0 or later is required. You can also use the GNU or Clang compilers and they will provide performance improvements over regular styles and OPENMP styles, but less so than with the Intel compilers. Please also note, that some compilers have been found to apply memory alignment constraints incompletely or incorrectly and thus can cause segmentation faults in otherwise correct code when using features from the INTEL package.

CMake build

```
-D INTEL_ARCH=value     # value = cpu (default) or knl
-D INTEL_LRT_MODE=value # value = threads, none, or c++17
```

Traditional make

Choose which hardware to compile for in Makefile.machine via the following settings. See src/MAKE/OPTIONS/Makefile.intel_cpu* and Makefile.knl files for examples. and src/INTEL/README for additional information.

For CPUs:

```
OPTFLAGS =  -xHost -O2 -fp-model fast=2 -no-prec-div -qoverride-limits -qopt-zmm-
↪usage=high
CCFLAGS =   -g -qopenmp -DLAMMPS_MEMALIGN=64 -no-offload -fno-alias -ansi-
↪alias -restrict $(OPTFLAGS)
LINKFLAGS = -g -qopenmp $(OPTFLAGS)
LIB =       -ltbbmalloc
```

For KNLs:

```
OPTFLAGS =  -xMIC-AVX512 -O2 -fp-model fast=2 -no-prec-div -qoverride-limits
CCFLAGS =   -g -qopenmp -DLAMMPS_MEMALIGN=64 -no-offload -fno-alias -ansi-
↪alias -restrict $(OPTFLAGS)
LINKFLAGS = -g -qopenmp $(OPTFLAGS)
LIB =       -ltbbmalloc
```

In Long-range thread mode (LRT) a modified verlet style is used, that operates the Kspace calculation in a separate thread concurrently to other calculations. This has to be enabled in the *package intel* command at runtime. With the setting "threads" it used the pthreads library, while "c++17" will use the built-in thread support of C++17 compilers. The option "none" skips compilation of this feature. The default is to use "threads" if pthreads is available and otherwise "none".

Best performance is achieved with Intel hardware, Intel compilers, as well as the Intel TBB and MKL libraries. However, the code also compiles, links, and runs with other compilers / hardware and without TBB and MKL.

3.8.22 MDI package

CMake build

```
-D DOWNLOAD_MDI=value    # download MDI Library for build
                         # value = no (default) or yes
```

Traditional make

Changed in version 10Sep2025.

The MDI package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.23 MISC package

The *fix imd* style in this package can be run either synchronously (communication with IMD clients is done in the main process) or asynchronously (the fix spawns a separate thread that can communicate with IMD clients concurrently to the LAMMPS execution).

CMake build

```
-D LAMMPS_ASYNC_IMD=value  # Run IMD server asynchronously
                           # value = no (default) or yes
```

Traditional make

To enable asynchronous mode the -DLAMMPS_ASYNC_IMD define needs to be added to the LMP_INC variable in the Makefile.machine you are using. For example:

```
LMP_INC = -DLAMMPS_ASYNC_IMD -DLAMMPS_MEMALIGN=64
```

3.8.24 MOLFILE package

CMake build

```
-D MOLFILE_INCLUDE_DIR=path   # (optional) path where VMD molfile
                              # plugin headers are installed
-D PKG_MOLFILE=yes
```

Using -D PKG_MOLFILE=yes enables the package, and setting -D MOLFILE_INCLUDE_DIR allows to provide a custom location for the molfile plugin header files. These should match the ABI of the plugin files used, and thus one typically sets them to include folder of the local VMD installation in use. LAMMPS ships with a couple of default header files that correspond to a popular VMD version, usually the latest release.

Traditional make

Changed in version 10Sep2025.

The MOLFILE package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.25 NETCDF package

To build with this package you must have the NetCDF library installed on your system.

CMake build

No additional settings are needed besides -D PKG_NETCDF=yes.

This should auto-detect the NETCDF library if it is installed on your system at standard locations. Several advanced CMake NETCDF options exist if you need to specify where it was installed. Use the ccmake (terminal window) or cmake-gui (graphical) tools to see these options and set them interactively from their user interfaces.

Traditional make

Changed in version 10Sep2025.

The NETCDF package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.26 OPENMP package

CMake build

No additional settings are required besides -D PKG_OPENMP=yes. If CMake detects OpenMP compiler support, the OPENMP code will be compiled with multi-threading support enabled, otherwise as optimized serial code.

Traditional make

To enable multi-threading support in the OPENMP package (and other styles supporting OpenMP) the following compile and link flags must be added to your Makefile.machine file. See src/MAKE/OPTIONS/Makefile.omp for an example.

```
CCFLAGS: -fopenmp              # for GNU and Clang Compilers
CCFLAGS: -qopenmp -restrict    # for Intel compilers on Linux
LINKFLAGS: -fopenmp            # for GNU and Clang Compilers
LINKFLAGS: -qopenmp            # for Intel compilers on Linux
```

For other platforms and compilers, please consult the documentation about OpenMP support for your compiler.

Adding OpenMP support on macOS

Apple offers the Xcode package and IDE for compiling software on macOS, so you have likely installed it to compile LAMMPS. Their compiler is based on Clang, but while it is capable of processing OpenMP directives, the necessary header files and OpenMP runtime library are missing. The R developers have figured out a way to build those in a compatible fashion. One can download them from https://mac.r-project.org/openmp/. Simply adding those files as instructed enables the Xcode C++ compiler to compile LAMMPS with -D BUILD_OMP=yes.

3.8.27 QMMM package

For using LAMMPS to do QM/MM simulations via the QMMM package you need to build LAMMPS as a library. A LAMMPS executable with *fix qmmm* included can be built, but will not be able to do a QM/MM simulation on as such. You must also build a QM code - currently only Quantum ESPRESSO (QE) is supported - and create a new executable which links LAMMPS and the QM code together. Details are given in the lib/qmmm/README file. It is also recommended to read the instructions for *linking with LAMMPS as a library* for background information. This requires compatible Quantum Espresso and LAMMPS versions. The current interface and makefiles have last been verified to work in February 2020 with Quantum Espresso versions 6.3 to 6.5.

CMake build

When using CMake, building a LAMMPS library is required and it is recommended to build a shared library, since any libraries built from the sources in the *lib* folder (including the essential libqmmm.a) are not included in the static LAMMPS library and are (currently) not installed, while their code is included in the shared LAMMPS library. Thus a typical command to configure building LAMMPS for QMMM would be:

```
cmake -C ../cmake/presets/basic.cmake -D PKG_QMMM=yes \
  -D BUILD_LIB=yes -DBUILD_SHARED_LIBS=yes ../cmake
```

After completing the LAMMPS build and also configuring and compiling Quantum ESPRESSO with external library support (via "make couple"), go back to the lib/qmmm folder and follow the instructions on the README file to build the combined LAMMPS/QE QM/MM executable (pwqmmm.x) in the lib/qmmm folder.

Traditional make

Changed in version 10Sep2025.

The QMMM package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.28 RHEO package

This package depends on the BPM package.

CMake build

```
-D PKG_RHEO=yes               # enable the package itself
-D PKG_BPM=yes                # the RHEO package requires BPM
-D USE_INTERNAL_LINALG=value  # prefer internal LAPACK if true
```

Some features in the RHEO package are dependent on code in the BPM package so the latter one *must* be enabled as well.

The RHEO package also requires LAPACK (and BLAS) and CMake can identify their locations and pass that info to the RHEO build script. But on some systems this may cause problems when linking or the dependency is not desired. By using the setting -D USE_INTERNAL_LINALG=yes when running the CMake configuration, you will select compiling and linking the bundled linear algebra library and work around the limitations.

Traditional make

Changed in version 10Sep2025.

The RHEO package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.29 SCAFACOS package

To build with this package, you must download and build the ScaFaCoS Coulomb solver library

CMake build

```
-D DOWNLOAD_SCAFACOS=value    # download ScaFaCoS for build, value = no
↪(default) or yes
-D SCAFACOS_LIBRARY=path      # ScaFaCos library file (only needed if at custom
↪location)
-D SCAFACOS_INCLUDE_DIR=path  # ScaFaCoS include directory (only needed if at
↪custom location)
```

If DOWNLOAD_SCAFACOS is set, the ScaFaCoS library will be downloaded and built inside the CMake build directory. If the ScaFaCoS library is already on your system (in a location CMake cannot find it), SCAFACOS_LIBRARY is the filename (plus path) of the ScaFaCoS library file, not the directory the library file is in. SCAFACOS_INCLUDE_DIR is the directory the ScaFaCoS include file is in.

Traditional make

Changed in version 10Sep2025.

The SCAFACOS package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.8.30 VTK package

To build with this package you must have the VTK library installed on your system.

CMake build

No additional settings are needed besides -D PKG_VTK=yes.

This should auto-detect the VTK library if it is installed on your system at standard locations. Several advanced VTK options exist if you need to specify where it was installed. Use the ccmake (terminal window) or cmake-gui (graphical) tools to see these options and set them interactively from their user interfaces.

Traditional make

Changed in version 10Sep2025.

The VTK package no longer supports the the traditional make build. You need to build LAMMPS with CMake.

3.9 Build the LAMMPS documentation

Depending on how you obtained LAMMPS and whether you have built the manual yourself, this directory has a number of subdirectories and files. Here is a list with descriptions:

```
README          # brief info about the documentation
src             # content files for LAMMPS documentation
html            # HTML version of the LAMMPS manual (see html/Manual.html)
utils           # tools and settings for building the documentation
lammps.1        # man page for the lammps command
msi2lmp.1       # man page for the msi2lmp command
Manual.pdf      # large PDF version of entire manual
LAMMPS.epub     # Manual in ePUB e-book format
LAMMPS.mobi     # Manual in MOBI e-book format
docenv          # virtualenv folder for processing the manual sources
doctrees        # temporary data from processing the manual
doxygen         # doxygen configuration and output
.gitignore      # list of files and folders to be ignored by git
doxygen-warn.log # logfile with warnings from running doxygen
github-development-workflow.md  # notes on the LAMMPS development workflow
```

If you downloaded LAMMPS as a tarball from the LAMMPS website, the html folder and the PDF files should be included.

If you downloaded LAMMPS from the public git repository, then the HTML and PDF files are not included. You can build the HTML or PDF files yourself, by typing make html or make pdf in the doc folder. This requires various tools and files. Some of them have to be installed (see below). For the rest the build process will attempt to download and install them into a python virtual environment and local folders.

A current version of the manual (latest feature release, that is the state of the *release* branch) is is available online at: https://docs.lammps.org/. A version of the manual corresponding to the ongoing development (that is the state of the *develop* branch) is available online at: https://docs.lammps.org/latest/ A version of the manual corresponding to the latest stable LAMMPS release (that is the state of the *stable* branch) is available online at: https://docs.lammps.org/stable/

3.9.1 Build using GNU make

The LAMMPS manual is written in reStructuredText format which can be translated to different output format using the Sphinx document generator tool. It also incorporates programmer documentation extracted from the LAMMPS C++ sources through the Doxygen program. Currently the translation to HTML, PDF (via LaTeX), ePUB (for many e-book readers) and MOBI (for Amazon Kindle readers) are supported. For that to work a Python interpreter version 3.8 or later, the doxygen tools and internet access to download additional files and tools are required. This download is usually only required once or after the documentation folder is returned to a pristine state with make clean-all. You can also upgrade those packages to their latest available versions with make upgrade.

For the documentation build a python virtual environment is set up in the folder doc/docenv and various python packages are installed into that virtual environment via the pip tool. For rendering embedded LaTeX code also the MathJax JavaScript engine needs to be downloaded. If you need to pass additional options to the pip commands to work (e.g. to use a web proxy or to point to additional SSL certificates) you can set them via the PIP_OPTIONS environment variable or uncomment and edit the PIP_OPTIONS setting at beginning of the makefile.

The actual translation is then done via make commands in the doc folder. The following make commands are available:

```
make html       # generate HTML in html dir using Sphinx
make pdf        # generate PDF  as Manual.pdf using Sphinx and PDFLaTeX
make epub       # generate LAMMPS.epub in ePUB format using Sphinx
```

(continues on next page)

(continued from previous page)

```
make mobi          # generate LAMMPS.mobi in MOBI format using ebook-convert

make fasthtml      # generate approximate HTML in fasthtml dir using pandoc

make upgrade       # upgrade sphinx, extensions, and dependencies to latest supported versions
make clean         # remove intermediate RST files created by HTML build
make clean-all     # remove entire build folder and any cached data
make upgrade       # upgrade the python packages in the virtual environment

make anchor_check  # check for duplicate anchor labels
make style_check   # check for complete and consistent style lists
make package_check # check for complete and consistent package lists
make char_check    # check for non-ASCII characters
make role_check    # check for misformatted role keywords

make link_check    # check for broken external URLs
make spelling      # spell-check the manual
```

3.9.2 Build using CMake

It is also possible to create the HTML version (and **only** the HTML version) of the manual within the *CMake build directory*. The reason for this option is to include the installation of the HTML manual pages into the "install" step when installing LAMMPS after the CMake build via cmake --build . --target install. The documentation build is included in the default build target, but can also be requested independently with cmake --build . --target doc. If you need to pass additional options to the pip commands to work (e.g. to use a web proxy or to point to additional SSL certificates) you can set them via the PIP_OPTIONS environment variable.

```
-D BUILD_DOC=value       # yes or no (default)
```

3.9.3 Prerequisites for HTML

To run the HTML documentation build toolchain, Python 3.8 or later, git, doxygen, and virtualenv have to be installed locally. Here are instructions for common setups:

Ubuntu

```
sudo apt-get install git doxygen
```

Fedora or RHEL/AlmaLinux/RockyLinux (8.x or later)

```
sudo dnf install git doxygen
```

macOS

Python 3

If Python 3 is not available on your macOS system, you can download the latest Python 3 macOS package from https://www.python.org and install it. This will install both Python 3 and pip3.

3.9.4 Prerequisites for PDF

In addition to the tools needed for building the HTML format manual, a working LaTeX installation with support for PDFLaTeX and a selection of LaTeX styles/packages are required. Apart from LaTeX packages that are usually installed by default, the following packages are required:

amsmath	anysize	babel	capt-of	cmap	dvipng	ellipse	fncychap	fontawesome	framed	geometry
gyre	hyperref	hyphcap	needspace	pict2e	times	tabulary	titlesec	upquote	wrapfig	xindy

To run the PDFLaTeX translation the `latexmk` script needs to be installed as well.

3.9.5 Prerequisites for ePUB and MOBI

In addition to the tools needed for building the HTML format manual, a working LaTeX installation with a few add-on LaTeX packages as well as the `dvipng` tool are required to convert embedded math expressions transparently into embedded images.

For converting the generated ePUB file to a MOBI format file (for e-book readers, like Kindle, that cannot read ePUB), you also need to have the `ebook-convert` tool from the "calibre" software installed. https://calibre-ebook.com/ Typing `make mobi` will first create the ePUB file and then convert it. On the Kindle readers in particular, you also have support for PDF files, so you could download and view the PDF version as an alternative.

3.9.6 Instructions for Developers

When adding new styles or options to the LAMMPS code, corresponding documentation is required and either existing files in the `src` folder need to be updated or new files added. These files are written in reStructuredText markup for translation with the Sphinx tool.

Testing your contribution

Before contributing any documentation, please check that both the HTML and the PDF format documentation can translate without errors and that there are no spelling issues. This is done with `make html`, `make pdf`, and `make spelling`, respectively.

Fast and approximate translation to HTML

Translating the full manual to HTML or PDF can take a long time. Thus there is a fast and approximate way to translate the reStructuredText to HTML as a quick-n-dirty way of checking your manual page.

This translation uses Pandoc instead of Sphinx and thus all special Sphinx features (cross-references, advanced tables, embedding of Python docstrings or doxygen documentation, and so on) will not render correctly. Most embedded math should render correctly. This is a **very fast** way to check the syntax and layout of a documentation file translated to HTML while writing or updating it.

To translate **all** manual pages, you can type `make fasthtml` at the command line. The translated HTML files are then in the `fasthtml` folder. All subsequent `make fasthtml` commands will only translate `.rst` files that have been changed.

The make fasthtml command can be parallelized with make using the *-j* flag. You can also directly translate only individual pages: e.g. to translate only the doc/src/pair_lj.rst page type make fasthtml/pair_lj.html

After writing the documentation is completed, you will still need to verify with make html and make pdf that it translates correctly in both formats.

Tests for consistency, completeness, and other known issues

Please also check the output to the console for any warnings or problems. There will be multiple tests run automatically:

- A test for correctness of all anchor labels and their references
- A test that all LAMMPS packages (= folders with sources in lammps/src) are documented and listed. A typical warning shows the name of the folder with the suspected new package code and the documentation files where they need to be listed:

```
Found 88 packages
Package NEWPACKAGE missing in Packages_list.rst
Package NEWPACKAGE missing in Packages_details.rst
```

- A test that only standard, printable ASCII text characters are used. This runs the command env LC_ALL=C grep -n '[^ -~]' src/*.rst and thus prints all offending lines with filename and line number prepended to the screen. Special characters like Greek letters (α σ ε), super- or subscripts (x^2 U_{LJ}), mathematical expressions ($\frac{1}{2}N$ $x \to \infty$), or the Angstrom symbol (Å) should be typeset with embedded LaTeX (like this :math:`\alpha \sigma \epsilon`, :math:`x^2 \mathrm{E}_{LJ}`, :math:`\frac{1}{2}\mathrm{N} x\to\infty`, or :math:`\AA`).
- Embedded LaTeX is rendered in HTML output with MathJax and in PDF output by passing the embedded text to LaTeX. Some care has to be taken, though, since there are limitations which macros and features can be used in either mode, so it is recommended to always check whether any new or changed documentation does translate and render correctly with either output.
- A test whether all styles are documented and listed in their respective overview pages. A typical output with warnings looks like this:

```
Parsed style names w/o suffixes from C++ tree in ../src:
  Angle styles:      21    Atom styles:       24
  Body styles:        3    Bond styles:       17
  Command styles:    41    Compute styles:   143
  Dihedral styles:   16    Dump styles:       26
  Fix styles:       223    Improper styles:   13
  Integrate styles:   4    Kspace styles:     15
  Minimize styles:    9    Pair styles:      234
  Reader styles:      4    Region styles:      8
Compute style entry newcomp is missing or incomplete in Commands_compute.rst
Compute style entry newcomp is missing or incomplete in compute.rst
Fix style entry newfix is missing or incomplete in Commands_fix.rst
Fix style entry newfix is missing or incomplete in fix.rst
Pair style entry new is missing or incomplete in Commands_pair.rst
Pair style entry new is missing or incomplete in pair_style.rst
Found 6 issue(s) with style lists
```

In addition, there is the option to run a spellcheck on the entire manual with make spelling. This requires a library called enchant. To avoid printing out *false positives* (e.g. keywords, names, abbreviations) those can be added to the file lammps/doc/utils/sphinx-config/false_positives.txt.

3.10 Notes for building LAMMPS on Windows

- *General remarks*
- *Running Linux on Windows*
- *Using GNU GCC ported to Windows*
- *Using Visual Studio*
- *Using Intel oneAPI compilers and libraries*
- *Using a cross-compiler*

3.10.1 General remarks

LAMMPS is developed and tested primarily on Linux machines. The vast majority of HPC clusters and supercomputers today run on Linux as well. While portability to other platforms is desired, it is not always achieved. That is sometimes due to non-portable code in LAMMPS itself, but more often due to portability limitations of external libraries and tools required to build a specific feature or package. The LAMMPS developers are dependent on LAMMPS users giving feedback and providing assistance in resolving portability issues. This is particularly true for compiling LAMMPS on Windows, since this platform has significant differences in some low-level functionality. As of LAMMPS version 14 December 2021, large parts of LAMMPS can be compiled natively with the Microsoft Visual C++ Compilers. As of LAMMPS version 31 May 2022, also the Intel oneAPI compilers can compile large parts of LAMMPS natively on Windows. This is mostly facilitated by using the *Platform abstraction functions* in the platform namespace and CMake.

Before trying to build LAMMPS on Windows yourself, please consider the pre-compiled Windows installer packages and see if they are sufficient for your needs.

3.10.2 Running Linux on Windows

If it is necessary for you to compile LAMMPS on a Windows machine (e.g. because it is your main desktop), please also consider using a virtual machine software and compile and run LAMMPS in a Linux virtual machine, or - if you have a sufficiently up-to-date Windows 10 or Windows 11 installation - consider using the Windows subsystem for Linux. This optional Windows feature allows you to run the bash shell of a Linux system (Ubuntu by default) from within Windows and from there on, you can pretty much use that shell like you are running on a regular Ubuntu Linux machine (e.g. installing software via apt-get and more). For more details on that, please see *this tutorial*.

3.10.3 Using a GNU GCC ported to Windows

One option for compiling LAMMPS on Windows natively is to install a Bash shell, Unix shell utilities, Perl, Python, GNU make, and a GNU compiler ported to Windows. The Cygwin package provides a unix/linux interface to low-level Windows functions, so LAMMPS can be compiled on Windows. The necessary (minor) modifications to LAMMPS are included, but may not always up-to-date for recently added functionality and the corresponding new code. A machine makefile for using cygwin for the old build system is provided. Using CMake for this mode of compilation is untested and not likely to work.

When compiling for Windows do **not** set the -DLAMMPS_MEMALIGN define in the LMP_INC makefile variable and add -lwsock32 -lpsapi to the linker flags in LIB makefile variable. Try adding -static-libgcc or -static or both to the linker flags when your resulting LAMMPS Windows executable complains about missing .dll files. The CMake configuration should set this up automatically, but is untested.

In case of problems, you are recommended to contact somebody with experience in using Cygwin. If you do come across portability problems requiring changes to the LAMMPS source code, or figure out corrections yourself, please report them on the LAMMPS forum at MatSci, or file them as an issue or pull request on the LAMMPS GitHub project.

3.10.4 Using Microsoft Visual Studio

Following the integration of the *platform namespace* into the LAMMPS code base, portability of LAMMPS for native compilation on Windows using Visual Studio has been significantly improved. This has been tested with Visual Studio 2019 (aka version 16) and Visual Studio 2022 (aka version 17). We strongly recommend using Visual Studio 2022 version 17.1 or later. Not all features and packages in LAMMPS are currently supported out of the box, but a preset cmake/presets/windows.cmake is provided that contains the packages that have been compiled successfully so far. You **must** use the CMake based build procedure, since there is no support for GNU make or the Unix shell utilities required for the GNU make build procedure.

It is possible to use both the integrated CMake support of the Visual Studio IDE or use an external CMake installation (e.g. downloaded from cmake.org) to create build files and compile LAMMPS from the command-line.

Compilation via command-line and unit tests are checked automatically for the LAMMPS development branch through GitHub Actions.

Note

Versions of Visual Studio before version 17.1 may scan the entire LAMMPS source tree and likely miss the correct master CMakeLists.txt and get confused since there are multiple files of that name in different folders but none in top level folder.

Please note, that for either approach CMake will create a so-called *"multi-configuration" build environment*, and the commands for building and testing LAMMPS must be adjusted accordingly.

The LAMMPS cmake folder contains a CMakeSettings.json file with build configurations for MSVC compilers and the MS provided Clang compiler package in Debug and Release mode.

To support running in parallel you can compile with OpenMP enabled using the OPENMP package or install Microsoft MPI (including the SDK) and compile LAMMPS with MPI enabled.

Note

This is work in progress and you should contact the LAMMPS developers via GitHub or the LAMMPS forum at MatSci, if you have questions or LAMMPS specific problems.

3.10.5 Using Intel oneAPI Compilers and Libraries

Added in version 31May2022.

After installing the Intel oneAPI base toolkit and the HPC toolkit, it is also possible to compile large parts of LAMMPS natively on Windows using Intel compilers. The HPC toolkit provides two sets of C/C++ and Fortran compilers: the so-called "classic" compilers (icl.exe and ifort.exe) and newer, LLVM based compilers (icx.exe and ifx.exe). In addition to the compilers and their dependent modules, also the thread building blocks (TBB) and the math kernel library (MKL) need to be installed. Two presets (cmake/presets/windows-intel-llvm.cmake and cmake/presets/windows-intel-classic.cmake) are provided for selecting the LLVM based or classic compilers, respectively. The preset cmake/presets/windows.cmake enables compatible packages that are not dependent on additional features or libraries. You **must** use the CMake based build procedure and use Ninja as build tool. For compiling from the command prompt, thus both CMake and Ninja-build binaries must be installed. It is also possible to use Visual Studio, if it is started (devenv.exe) from a command prompt that has the Intel oneAPI compilers enabled. The Visual Studio settings file in the cmake folder contains configurations for both compiler variants in debug and release settings. Those will use the CMake and Ninja binaries bundled with Visual Studio, thus a separate installation is not required.

Known Limitations

In addition to portability issues with several packages and external libraries, the classic Intel compilers are currently not able to compile the googletest libraries and thus enabling the -DENABLE_TESTING option will result in compilation failure. The LLVM based compilers are compatible.

Note

This is work in progress and you should contact the LAMMPS developers via GitHub or the LAMMPS forum at MatSci, if you have questions or LAMMPS specific problems.

3.10.6 Using a cross-compiler

If you need to provide custom LAMMPS binaries for Windows, but do not need to do the compilation on Windows, please consider using a Linux to Windows cross-compiler. This is how currently the Windows binary packages are created by the LAMMPS developers. Because of that, this is probably the currently best tested and supported way to build LAMMPS executables for Windows. A CMake preset selecting all packages compatible with this cross-compilation build is provided. The GPU package can only be compiled with OpenCL support. To compile with MPI support, a pre-compiled library and the corresponding header files are required. When building with CMake the matching package will be downloaded automatically, but MPI support has to be explicitly enabled with -DBUILD_MPI=on.

Please keep in mind, though, that this only applies to **compiling** LAMMPS. Whether the resulting binaries do work correctly is rarely tested by the LAMMPS developers. We instead rely on the feedback of the users of these pre-compiled LAMMPS packages for Windows. We will try to resolve issues to the best of our abilities if we become aware of them. However this is subject to time constraints and focus on HPC platforms.

3.11 Notes for saving disk space when building LAMMPS from source

LAMMPS is a large software project with a large number of source files, extensive documentation, and a large collection of example files. When downloading LAMMPS by cloning the git repository from GitHub this will by default also download the entire commit history since September 2006. Compiling LAMMPS will add the storage requirements of the compiled object files and libraries to the tally.

In a user account on an HPC cluster with filesystem quotas or in other environments with restricted disk space capacity it may be needed to reduce the storage requirements. Here are some suggestions:

- Create a so-called shallow repository by cloning only the last commit instead of the full project history by using git clone git@github.com:lammps/lammps --depth=1 --branch=develop. This reduces the downloaded size to about half. With --depth=1 it is not possible to check out different versions/branches of LAMMPS, using --depth=1000 will make multiple recent versions available at little extra storage needs (the entire git history had nearly 30,000 commits in fall 2021).
- Download a tar archive from either the download section on the LAMMPS homepage or from the LAMMPS releases page on GitHub these will not contain the git history at all.
- Build LAMMPS without the debug flag (remove -g from the machine makefile or use -DCMAKE_BUILD_TYPE=Release) or use the strip command on the LAMMPS executable when no more debugging would be needed. The strip command may also be applied to the LAMMPS shared library. The static library may be deleted entirely.
- Delete compiled object files and libraries after copying the LAMMPS executable to a permanent location. When using the traditional build process, one may use make clean-<machine> or make clean-all to delete object

files in the src folder. For CMake based builds, one may use make clean or just delete the entire build folder.

- The folders containing the documentation tree (doc), the examples (examples) are not needed to build and run LAMMPS and can be safely deleted. Some files in the potentials folder are large and may be deleted, if not needed. The largest of those files (occupying about 120 MBytes combined) will only be downloaded on demand, when the corresponding package is installed.
- When using the CMake build procedure, the compilation can be done on a (local) scratch storage that will not count toward the quota. A local scratch file system may offer the additional benefit of speeding up creating object files and linking with libraries compared to a networked file system. Also with CMake (and unlike with the traditional make) it is possible to compile LAMMPS executables with different settings and packages included from the same source tree since all the configuration information is stored in the build folder. So it is not necessary to have multiple copies of LAMMPS.

3.12 Development build options

The build procedures in LAMMPS offers a few extra options which are useful during development, testing or debugging.

3.12.1 Monitor compilation flags (CMake only)

Sometimes it is necessary to verify the complete sequence of compilation flags generated by the CMake build. To enable a more verbose output during compilation you can use the following option.

```
-D CMAKE_VERBOSE_MAKEFILE=value    # value = no (default) or yes
```

Another way of doing this without reconfiguration is calling make with variable VERBOSE set to 1:

```
make VERBOSE=1
```

3.12.2 Report missing and unneeded '#include' statements (CMake only)

The conventions for how and when to use and order include statements in LAMMPS are documented in *LAMMPS programming style*. To assist with following these conventions one can use the Include What You Use tool. This tool is still under development and for large and complex projects like LAMMPS there are some false positives, so suggested changes need to be verified manually. It is recommended to use at least version 0.16, which has much fewer incorrect reports than earlier versions. To install the IWYU toolkit, you need to have the clang compiler **and** its development package installed. Download the IWYU version that matches the version of the clang compiler, configure, build, and install it.

The necessary steps to generate the report can be enabled via a CMake variable during CMake configuration.

```
-D ENABLE_IWYU=value    # value = no (default) or yes
```

This will check if the required binary (include-what-you-use or iwyu) and python script script (iwyu-tool or iwyu_tool or iwyu_tool.py) can be found in the path. The analysis can then be started with:

```
make iwyu
```

This may first run some compilation, as the analysis is dependent on recording all commands required to do the compilation.

3.12.3 Address, Leak, Undefined Behavior, and Thread Sanitizer Support (CMake only)

Compilers such as GCC and Clang support generating instrumented binaries which use different sanitizer libraries to detect problems in the code during run-time. They can detect issues like:

- memory leaks
- undefined behavior
- data races

Please note that this kind of instrumentation usually comes with a performance hit (but much less than using tools like Valgrind with a more low level approach). To enable these features, additional compiler flags need to be added to the compilation and linking stages. This is done through setting the ENABLE_SANITIZER variable during configuration. Examples:

```
-D ENABLE_SANITIZER=none       # no sanitizer active (default)
-D ENABLE_SANITIZER=address    # enable address sanitizer / memory leak checker
-D ENABLE_SANITIZER=hwaddress  # enable hardware assisted address sanitizer / memory leak␣
↪checker
-D ENABLE_SANITIZER=leak       # enable memory leak checker (only)
-D ENABLE_SANITIZER=undefined  # enable undefined behavior sanitizer
-D ENABLE_SANITIZER=thread     # enable thread sanitizer
```

3.12.4 Code Coverage and Unit Testing (CMake only)

The LAMMPS code is subject to multiple levels of automated testing during development:

- Integration testing (i.e. whether the code compiles on various platforms and with a variety of compilers and settings),
- Unit testing (i.e. whether certain functions or classes of the code produce the expected results for given inputs),
- Run testing (i.e. whether selected input decks can run to completion without crashing for multiple configurations),
- Regression testing (i.e. whether selected input examples reproduce the same results over a given number of steps and operations within a given error margin).

The status of this automated testing can be viewed on https://ci.lammps.org.

The scripts and inputs for integration, run, and legacy regression testing are maintained in a separate repository of the LAMMPS project on GitHub. A few tests are also run as GitHub Actions and their configuration files are in the .github/workflows/ folder of the LAMMPS git tree.

Regression tests can also be performed locally with the *regression tester tool*. The tool checks if a given LAMMPS binary run with selected input examples produces thermo output that is consistent with the provided log files. The script can be run in one pass over all available input files, but it can also first create multiple lists of inputs or folders that can then be run with multiple workers concurrently to speed things up. Another mode allows to do a quick check of inputs that contain commands that have changes in the current checkout branch relative to a git branch. This works similar to the two pass mode, but will select only shorter runs and no more than 100 inputs that are chosen randomly. This ensures that this test runs significantly faster compared to the full test run. These test runs can also be performed with instrumented LAMMPS binaries (see previous section).

The unit testing facility is integrated into the CMake build process of the LAMMPS source code distribution itself. It can be enabled by setting -D ENABLE_TESTING=on during the CMake configuration step. It requires the YAML library and matching development headers to compile (if those are not found locally a recent version of that library will be downloaded and compiled along with LAMMPS and the test programs) and will download and compile a

specific version of the GoogleTest C++ test framework that is used to implement the tests. Those unit tests may be combined with memory access and leak checking with valgrind (see below for how to enable it). In that case, running so-called death tests will create a lot of false positives and thus they can be disabled by configuring compilation with the additional setting -D SKIP_DEATH_TESTS=on.

Software version and LAMMPS configuration requirements

The compiler and library version requirements for the testing framework are more strict than for the main part of LAMMPS. For example the default GNU C++ and Fortran compilers of RHEL/CentOS 7.x (version 4.8.x) are not sufficient. The CMake configuration will try to detect incompatible versions and either skip incompatible tests or stop with an error. Also the number of available tests will depend on installed LAMMPS packages, development environment, operating system, and configuration settings.

After compilation is complete, the unit testing is started in the build folder using the ctest command, which is part of the CMake software. The output of this command will be looking something like this:

```
$ ctest
Test project /home/akohlmey/compile/lammps/build-testing
      Start  1: RunLammps
 1/563 Test  #1: RunLammps ..................................   Passed    0.28 sec
      Start  2: HelpMessage
 2/563 Test  #2: HelpMessage ................................   Passed    0.06 sec
      Start  3: InvalidFlag
 3/563 Test  #3: InvalidFlag ................................   Passed    0.06 sec
      Start  4: Tokenizer
 4/563 Test  #4: Tokenizer ..................................   Passed    0.05 sec
      Start  5: MemPool
 5/563 Test  #5: MemPool ....................................   Passed    0.05 sec
      Start  6: ArgUtils
 6/563 Test  #6: ArgUtils ...................................   Passed    0.05 sec
    [...]
      Start 561: ImproperStyle:zero
561/563 Test #561: ImproperStyle:zero .......................   Passed    0.07 sec
      Start 562: TestMliapPyUnified
562/563 Test #562: TestMliapPyUnified .......................   Passed    0.16 sec
      Start 563: TestPairList
563/563 Test #563: TestPairList .............................   Passed    0.06 sec

100% tests passed, 0 tests failed out of 563

Label Time Summary:
generated    =   0.85 sec*proc (3 tests)
noWindows    =   4.16 sec*proc (2 tests)
slow         =  78.33 sec*proc (67 tests)
unstable     =  28.23 sec*proc (34 tests)

Total Test time (real) = 132.34 sec
```

The ctest command has many options, the most important ones are:

Option	Function
-V	verbose output: display output of individual test runs
-j <num>	parallel run: run <num> tests in parallel
-R <regex>	run subset of tests matching the regular expression <regex>
-E <regex>	exclude subset of tests matching the regular expression <regex>
-L <regex>	run subset of tests with a label matching the regular expression <regex>
-LE <regex>	exclude subset of tests with a label matching the regular expression <regex>
-N	dry-run: display list of tests without running them
-T memcheck	run tests with valgrind memory checker (if available)

In its full implementation, the unit test framework will consist of multiple kinds of tests implemented in different programming languages (C++, C, Python, Fortran) and testing different aspects of the LAMMPS software and its features. The tests will adapt to the compilation settings of LAMMPS, so that tests will be skipped if prerequisite features are not available in LAMMPS.

Work in Progress

The unit test framework was added in spring 2020 and is under active development. The coverage is not complete and will be expanded over time. Preference is given to parts of the code base that are easy to test or commonly used.

Tests as shown by the ctest program are commands defined in the CMakeLists.txt files in the unittest directory tree. A few tests simply execute LAMMPS with specific command-line flags and check the output to the screen for expected content. A large number of unit tests are special tests programs using the GoogleTest framework and linked to the LAMMPS library that test individual functions or create a LAMMPS class instance, execute one or more commands and check data inside the LAMMPS class hierarchy. There are also tests for the C-library, Fortran, and Python module interfaces to LAMMPS. The Python tests use the Python "unittest" module in a similar fashion than the others use *GoogleTest*. These special test programs are structured to perform multiple individual tests internally and each of those contains several checks (aka assertions) for internal data being changed as expected.

Tests for force computing or modifying styles (e.g. styles for non-bonded and bonded interactions and selected fixes) are run by using a more generic test program that reads its input from files in YAML format. The YAML file provides the information on how to customized the test program to test a specific style and - if needed - with specific settings. To add a test for another, similar style (e.g. a new pair style) it is usually sufficient to add a suitable YAML file. *Detailed instructions for adding tests* are provided in the Programmer Guide part of the manual. A description of what happens during the tests is given below.

Unit tests for force styles

A large part of LAMMPS are different "styles" for computing non-bonded and bonded interactions selected through the *pair_style command*, *bond_style command*, *angle_style command*, *dihedral_style command*, *improper_style command*, and *kspace_style command*. Since these all share common interfaces, it is possible to write generic test programs that will call those common interfaces for small test systems with less than 100 atoms and compare the results with pre-recorded reference results. A test run is then a a collection multiple individual test runs each with many comparisons to reference results based on template input files, individual command settings, relative error margins, and reference data stored in a YAML format file with .yaml suffix. Currently the programs test_pair_style, test_bond_style, test_angle_style, test_dihedral_style, and test_improper_style are implemented. They will compare forces, energies and (global) stress for all atoms after a run 0 calculation and after a few steps of MD with *fix nve*, each in multiple variants with different settings and also for multiple accelerated styles. If a prerequisite style or package is missing, the individual tests are skipped. All force style tests will be executed on a single MPI process, so using the CMake option -D BUILD_MPI=off can significantly speed up testing, since this will skip the MPI initialization for each test run. Below is an example command and output:

```
$ test_pair_style mol-pair-lj_cut.yaml
[==========] Running 6 tests from 1 test suite.
[----------] Global test environment set-up.
[----------] 6 tests from PairStyle
[ RUN      ] PairStyle.plain
[       OK ] PairStyle.plain (24 ms)
[ RUN      ] PairStyle.omp
[       OK ] PairStyle.omp (18 ms)
[ RUN      ] PairStyle.intel
[       OK ] PairStyle.intel (6 ms)
[ RUN      ] PairStyle.opt
[  SKIPPED ] PairStyle.opt (0 ms)
[ RUN      ] PairStyle.single
[       OK ] PairStyle.single (7 ms)
[ RUN      ] PairStyle.extract
[       OK ] PairStyle.extract (6 ms)
[----------] 6 tests from PairStyle (62 ms total)

[----------] Global test environment tear-down
[==========] 6 tests from 1 test suite ran. (63 ms total)
[  PASSED  ] 5 tests.
[  SKIPPED ] 1 test, listed below:
[  SKIPPED ] PairStyle.opt
```

In this particular case, 5 out of 6 sets of tests were conducted, the tests for the lj/cut/opt pair style was skipped, since the tests executable did not include it. To learn what individual tests are performed, you (currently) need to read the source code. You can use code coverage recording (see next section) to confirm how well the tests cover the code paths in the individual source files.

The force style test programs have a common set of options:

Option	Function
-g <newfile>	regenerate reference data in new YAML file
-u	update reference data in the original YAML file
-s	print error statistics for each group of comparisons
-v	verbose output: also print the executed LAMMPS commands

The ctest tool has no mechanism to directly pass flags to the individual test programs, but a workaround has been implemented where these flags can be set in an environment variable TEST_ARGS. Example:

```
env TEST_ARGS=-s ctest -V -R BondStyle
```

To add a test for a style that is not yet covered, it is usually best to copy a YAML file for a similar style to a new file, edit the details of the style (how to call it, how to set its coefficients) and then run test command with either the -g and the replace the initial test file with the regenerated one or the -u option. The -u option will destroy the original file, if the generation run does not complete, so using -g is recommended unless the YAML file is fully tested and working.

Some of the force style tests are rather slow to run and some are very sensitive to small differences like CPU architecture, compiler toolchain, compiler optimization. Those tests are flagged with a "slow" and/or "unstable" label, and thus those tests can be selectively excluded with the -LE flag or selected with the -L flag.

Recommendations and notes for YAML files

- The reference results should be recorded without any code optimization or related compiler flags enabled.
- The epsilon parameter defines the relative precision with which the reference results must be met. The test geometries often have high and low energy parts and thus a significant impact from floating-point math truncation errors is to be expected. Some functional forms and potentials are more noisy than others, so this parameter needs to be adjusted. Typically a value around 1.0e-13 can be used, but it may need to be as large as 1.0e-8 in some cases.
- The tests for pair styles from OPT, OPENMP and INTEL are performed with automatically rescaled epsilon to account for additional loss of precision from code optimizations and different summation orders.
- When compiling with (aggressive) compiler optimization, some tests are likely to fail. It is recommended to inspect the individual tests in detail to decide, whether the specific error for a specific property is acceptable (it often is), or this may be an indication of mis-compiled code (or an undesired large loss of precision due to significant reordering of operations and thus less error cancellation).

Unit tests for timestepping related fixes

A substantial subset of *fix styles* are invoked regularly during MD timestepping and manipulate per-atom properties like positions, velocities, and forces. For those fix styles, testing can be done in a very similar fashion as for force fields and thus there is a test program *test_fix_timestep* that shares a lot of code, properties, and command-line flags with the force field style testers described in the previous section.

This tester will set up a small molecular system run with verlet run style for 4 MD steps, then write a binary restart and continue for another 4 MD steps. At this point coordinates and velocities are recorded and compared to reference data. Then the system is cleared, restarted and running the second 4 MD steps again and the data is compared to the same reference. That is followed by another restart after which per atom type masses are replaced with per-atom masses and the second 4 MD steps are repeated again and compared to the same reference. Also global scalar and vector data of the fix is recorded and compared. If the fix is a thermostat and thus the internal property t_target can be extracted, then this is compared to the reference data. The tests are repeated with the respa run style.

If the fix has a multi-threaded version in the OPENMP package, then the entire set of tests is repeated for that version as well.

For this to work, some additional conditions have to be met by the YAML format test inputs.

- The fix to be tested (and only this fix), should be listed in the prerequisites: section
- The fix to be tested must be specified in the post_commands: section with the fix-ID test. This section may contain other commands and other fixes (e.g. an instance of fix nve for testing a thermostat or force manipulation fix)
- For fixes that can tally contributions to the global virial, the line fix_modify test virial yes should be included in the post_commands: section of the test input.
- For thermostat fixes the target temperature should be ramped from an arbitrary value (e.g. 50K) to a pre-defined target temperature entered as ${t_target}.
- For fixes that have thermostatting support included, but do not have it enabled in the input (e.g. fix rigid with default settings), the post_commands: section should contain the line variable t_target delete to disable the target temperature ramp check to avoid false positives.

Use custom linker for faster link times when ENABLE_TESTING is active

When compiling LAMMPS with enabled tests, most test executables will need to be linked against the LAMMPS library. Since this can be a very large library with many C++ objects when many packages are enabled, link times can become very long on machines that use the GNU BFD linker (e.g. Linux systems). Alternatives like the mold linker, the lld linker of the LLVM project, or the gold linker available with GNU binutils can speed up this step substantially (in this order). CMake will by default test if any of the three can be enabled and use it when ENABLE_TESTING is active. It can also be selected manually through the CMAKE_CUSTOM_LINKER CMake variable. Allowed values are mold, lld, gold, bfd, or default. The default option will use the system default linker otherwise, the linker is chosen explicitly. This option is only available for the GNU or Clang C++ compilers.

Tests for other components and utility functions

Additional tests that validate utility functions or specific components of LAMMPS are implemented as standalone executable which may, or may not require creating a suitable LAMMPS instance. These tests are more specific and do not require YAML format input files. To add a test, either an existing source file needs to be extended or a new file added, which in turn requires additions to the CMakeLists.txt file in the source folder.

Collect and visualize code coverage metrics

You can also collect code coverage metrics while running LAMMPS or the tests by enabling code coverage support during the CMake configuration:

```
-D ENABLE_COVERAGE=on  # enable coverage measurements (off by default)
```

This will instrument all object files to write information about which lines of code were accessed during execution in files next to the corresponding object files. These can be post-processed to visually show the degree of coverage and which code paths are accessed and which are not taken. When working on unit tests (see above), this can be extremely helpful to determine which parts of the code are not executed and thus what kind of tests are still missing. The coverage data is cumulative, i.e. new data is added with each new run.

Enabling code coverage will also add the following build targets to generate coverage reports after running the LAMMPS executable or the unit tests:

```
make gen_coverage_html   # generate coverage report in HTML format
make gen_coverage_xml    # generate coverage report in XML format
make clean_coverage_html # delete folder with HTML format coverage report
make reset_coverage      # delete all collected coverage data and HTML output
```

These reports require GCOVR to be installed. The easiest way to do this to install it via pip:

```
python3 -m pip install gcovr
```

After post-processing with gen_coverage_html the results are in a folder coverage_html and can be viewed with a web browser. The images below illustrate how the data is presented.

3.12.5 Coding style utilities

To aid with enforcing some of the coding style conventions in LAMMPS some additional build targets have been added. These require Python 3.5 or later and will only work properly on Unix-like operating and file systems.

The following options are available.

```
make check-whitespace    # search for files with whitespace issues
make fix-whitespace      # correct whitespace issues in files
make check-homepage      # search for files with old LAMMPS homepage URLs
```

Fig. 4: Source page with branches

(continued from previous page)

```
make fix-homepage        # correct LAMMPS homepage URLs in files
make check-errordocs     # search for deprecated error docs in header files
make fix-errordocs       # remove error docs in header files
make check-permissions   # search for files with permissions issues
make fix-permissions     # correct permissions issues in files
make check-docs          # search for several issues in the manual
make check-version       # list files with pending release version tags
make check               # run all check targets from above
```

These should help to make source and documentation files conforming to some the coding style preferences of the LAMMPS developers.

3.12.6 Clang-format support

For the code in the unittest and src trees we are transitioning to use the *clang-format* tool to assist with having a consistent source code formatting style. The *clang-format* command bundled with Clang version 8.0 or later is required. The configuration is in files called .clang-format in the respective folders. Since the modifications from *clang-format* can be significant and - especially for "legacy style code" - they are not always improving readability, a large number of files currently have a // clang-format off at the top, which will disable the processing. As of fall 2021 all files have been either "protected" this way or are enabled for full or partial *clang-format* processing. Over time, the "protected" files will be refactored and updated so that *clang-format* may be applied to them as well.

It is recommended for all newly contributed files to use the clang-format processing while writing the code or do the coding style processing (including the scripts mentioned in the previous paragraph)

If *clang-format* is available, files can be updated individually with commands like the following:

```
clang-format -i some_file.cpp
```

The following target are available for both, GNU make and CMake:

```
make format-src      # apply clang-format to all files in src and the package folders
make format-tests    # apply clang-format to all files in the unittest tree
```

3.12.7 GitHub command-line interface

GitHub has developed a command-line tool to interact with the GitHub website via a command called gh. This is extremely convenient when working with a Git repository hosted on GitHub (like LAMMPS). It is thus highly recommended to install it when doing LAMMPS development. To use gh you must be within a git checkout of a repository and you must obtain an authentication token to connect your checkout with a GitHub user. This is done with the command: gh auth login where you then have to follow the prompts. Here are some examples:

Command	Description
gh pr list	List currently open pull requests
gh pr checks 404	Shows the status of all checks for pull request #404
gh pr view 404	Shows the description and recent comments for pull request #404
gh co 404	Check out the branch from pull request #404; set up for pushing changes
gh issue list	List currently open issues
gh issue view 430 --comments	Shows the description and all comments for issue #430

The capabilities of the gh command are continually expanding, so for more details please see the documentation at https://cli.github.com/manual/ or use gh --help or gh <command> --help for embedded help.

CHAPTER

FOUR

AVAILABLE OPTIONAL PACKAGES

This section gives an overview of the optional packages that extend LAMMPS' functionality. Packages are groups of files that enable a specific set of features. For example, force fields for molecular systems or rigid-body constraints are in packages. You can see the list of all packages and "make" commands to manage them by typing "make package" from within the src directory of the LAMMPS distribution. The list of packages that are included in a specific LAMMPS executable can be displayed by *running LAMMPS with the "-h" flag.*

The *Build package* page gives general info on how to install and uninstall packages as part of the LAMMPS build process.

Below is the list of packages that are included in the LAMMPS distribution. The link for each package name gives more details.

Packages are supported by either the LAMMPS developers or the contributing authors. They should all be written in a syntax and style consistent with the rest of LAMMPS.

The "Examples" column is a subdirectory in the examples directory of the distribution which has one or more input scripts that use the package. E.g. peptide refers to the examples/peptide directory; PACKAGES/atc refers to the examples/PACKAGES/atc directory. The "Lib" column indicates`` whether an extra library is needed to build and use the package:

- no = no library
- sys = system library: you likely have it on your machine
- int = internal library: provided with LAMMPS, but you may need to build it
- ext = external library: you will need to download and install it on your machine

Package	Description	Doc page	Examples	Lib
ADIOS	dump output via ADIOS	*dump adios*	PACKAGES/adios	ext
AMOEBA	AMOEBA and HIPPO force fields	*AMOEBA and HIPPO howto*	amoeba	no
APIP	adaptive-precision interatomic potentials	*Howto APIP*	PACKAGES/apip	ext
ASPHERE	aspherical particle models	*Howto spherical*	ellipse	no
BOCS	BOCS bottom up coarse graining	*fix bocs*	PACKAGES/bocs	no
BODY	body-style particles	*Howto body*	body	no
BPM	bonded particle models	*Howto bpm*	bpm	no

Table 1 – continued from previous page

Package	Description	Doc page	Examples	Lib
INTEL	optimized Intel CPU and KNL styles	*Speed intel*	Benchmarks	no
INTERLAYER	Inter-layer pair potentials	*several pair styles*	PACKAGES/interlayer	no
KIM	OpenKIM wrapper	*pair_style kim*	kim	ext
KOKKOS	Kokkos-enabled styles	*Speed kokkos*	Benchmarks	no
KSPACE	long-range Coulombic solvers	*kspace_style*	peptide	no
LATBOLTZ	Lattice Boltzmann fluid	*fix lb/fluid*	PACKAGES/latboltz	no
LEPTON	evaluate strings as potential function	*pair_style lepton*	PACKAGES/lepton	int
MACHDYN	smoothed Mach dynamics	SMD User Guide	PACKAGES/machdyn	ext
MANIFOLD	motion on 2d surfaces	*fix manifoldforce*	PACKAGES/manifold	no
MANYBODY	many-body potentials	*pair_style tersoff*	shear	no
MC	Monte Carlo options	*fix gcmc*	n/a	no
MDI	client-server code coupling	*MDI Howto*	PACKAGES/mdi	ext
MEAM	modified EAM potential (C++)	*pair_style meam*	meam	no
MESONT	mesoscopic tubular potential model	pair styles *mesocnt*	PACKAGES/mesont	no
MGPT	fast MGPT multi-ion potentials	*pair_style mgpt*	PACKAGES/mgpt	no
MISC	miscellaneous single-file commands	n/a	no	no
ML-HDNNP	High-dimensional neural network potentials	*pair_style hdnnp*	PACKAGES/hdnnp	ext
ML-IAP	multiple machine learning potentials	*pair_style mliap*	mliap	no
ML-PACE	Atomic Cluster Expansion potential	*pair pace*	PACKAGES/pace	ext
ML-POD	Proper orthogonal decomposition potentials	*pair pod*	pod	ext
ML-QUIP	QUIP/libatoms interface	*pair_style quip*	PACKAGES/quip	ext
ML-RANN	Pair style for RANN potentials	*pair rann*	PACKAGES/rann	no
ML-SNAP	quantum-fitted potential	*pair_style snap*	snap	no
ML-UF3	quantum-fitted ultra fast potentials	*pair_style uf3*	PACKAGES/uf3	no

Table 1 – continued from previous page

Package	Description	Doc page	Examples	Lib
MOFFF	styles for MOF-FF force field	*pair_style buck6d/coul/gauss*	PACKAGES/mofff	no
MOLECULE	molecular system force fields	*Howto bioFF*	peptide	no
MOLFILE	VMD molfile plugins	*dump molfile*	n/a	ext
NETCDF	dump output via NetCDF	*dump netcdf*	n/a	ext
OPENMP	OpenMP-enabled styles	*Speed omp*	Benchmarks	no
OPT	optimized pair styles	*Speed opt*	Benchmarks	no
ORIENT	fixes for orientation depended forces	*fix orient/**	PACKAGES/orient_eco	no
PERI	Peridynamics models	*pair_style peri*	peri	no
PHONON	phonon dynamical matrix	*fix phonon*	PACKAGES/phonon	no
PLUGIN	Plugin loader command	*plugin*	plugins	no
PLUMED	PLUMED free energy library	*fix plumed*	PACKAGES/plumed	ext
PTM	Polyhedral Template Matching	*compute ptm/atom*	n/a	no
PYTHON	embed Python code in an input script	*python*	python	sys
QEQ	QEq charge equilibration	*fix qeq*	qeq	no
QMMM	QM/MM coupling	*fix qmmm*	PACKAGES/qmmm	ext
QTB	quantum nuclear effects	*fix qtb fix qbmsst*	qtb	no
RHEO	reproducing hydrodynamics and elastic objects	*Howto rheo*	rheo	no
REACTION	chemical reactions in classical MD	*fix bond/react*	PACKAGES/reaction	no
REAXFF	ReaxFF potential (C/C++)	*pair_style reaxff*	reax	no
REPLICA	multi-replica methods	*Howto replica*	tad	no
RIGID	rigid bodies and constraints	*fix rigid*	rigid	no
SCAFACOS	wrapper for ScaFaCoS Kspace solver	*kspace_style scafacos*	PACKAGES/scafacos	ext
SHOCK	shock loading methods	*fix msst*	n/a	no
SMTBQ	second moment tight binding potentials	pair styles *smtbq*, *smatb*	PACKAGES/smtbq	no
SPH	smoothed particle hydrodynamics	SPH User Guide	PACKAGES/sph	no

SPIN	magnetic atomic spin dynamics	*Howto spins*	SPIN	no
SRD	stochastic rotation dynamics	*fix srd*	srd	no
TALLY	pairwise tally computes	*compute XXX/tally*	PACKAGES/tally	no
UEF	extensional flow	*fix nvt/uef*	PACKAGES/uef	no
VORONOI	Voronoi tesselation	*compute voronoi/atom*	n/a	ext
VTK	dump output via VTK	*compute vtk*	n/a	ext
YAFF	additional styles implemented in YAFF	*angle_style cross*	PACKAGES/yaff	no

4.1 Package details

Here is a brief description of all packages in LAMMPS. It lists authors (if applicable) and summarizes the package contents. It has specific instructions on how to install the package, including, if necessary, info on how to download or build any extra library it requires. It also gives links to documentation, example scripts, and pictures/movies (if available) that illustrate use of the package.

The majority of packages can be included in a LAMMPS build with a single setting (-D PKG_<NAME>=on for CMake) or command (make yes-<name> for make). See the *Build package* page for more info. A few packages may require additional steps; this is indicated in the descriptions below. The *Build extras* page gives those details.

Note

To see the complete list of commands a package adds to LAMMPS, you can examine the files in its src directory, e.g. ls src/GRANULAR. Files with names that start with fix, compute, atom, pair, bond, angle, etc correspond to commands with the same style name as contained in the file name.

ADIOS	*AMOEBA*	*APIP*	*ASPHERE*	*BOCS*	*BODY*
BPM	*BROWNIAN*	*CG-DNA*	*CG-SPICA*	*CLASS2*	*COLLOID*
COLVARS	*COMPRESS*	*CORESHELL*	*DIELECTRIC*	*DIFFRACTION*	*DIPOLE*
DPD-BASIC	*DPD-MESO*	*DPD-REACT*	*DPD-SMOOTH*	*DRUDE*	*EFF*
ELECTRODE	*EXTRA-COMMAND*	*EXTRA-COMPUTE*	*EXTRA-DUMP*	*EXTRA-FIX*	*EXTRA-MOLECULE*
EXTRA-PAIR	*FEP*	*GPU*	*GRANULAR*	*H5MD*	*INTEL*
INTERLAYER	*KIM*	*KOKKOS*	*KSPACE*	*LATBOLTZ*	*LEPTON*
MACHDYN	*MANIFOLD*	*MANYBODY*	*MC*	*MDI*	*MEAM*

YAFF					

4.1.1 ADIOS package

Contents:

ADIOS is a high-performance I/O library. This package implements the *dump atom/adios*, *dump custom/adios* and *read_dump ... format adios* commands to write and read data using the ADIOS library.

Authors: Norbert Podhorszki (ORNL) from the ADIOS developer team.

Added in version 28Feb2019.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/ADIOS: filenames -> commands
- src/ADIOS/README
- examples/PACKAGES/adios
- https://github.com/ornladios/ADIOS2
- *dump atom/adios*
- *dump custom/adios*
- *read_dump*

4.1.2 AMOEBA package

Contents:

Implementation of the AMOEBA and HIPPO polarized force fields originally developed by Jay Ponder's group at the U Washington at St Louis. The LAMMPS implementation is based on Fortran 90 code provided by the Ponder group in their Tinker MD software.

Authors: Josh Rackers and Steve Plimpton (Sandia), Trung Nguyen (U Chicago)

Supporting info:

- src/AMOEBA: filenames -> commands
- *AMOEBA and HIPPO howto*
- *pair_style amoeba*
- *pair_style hippo*
- *atom_style amoeba*
- *angle_style amoeba*
- *improper_style amoeba*
- *fix amoeba/bitorsion*
- *fix amoeba/pitorsion*
- tools/tinker/tinker2lmp.py
- examples/amoeba

4.1.3 APIP package

Contents:

This package provides adaptive-precision interatomic potentials (APIP) as described in:

D. Immel, R. Drautz and G. Sutmann, "Adaptive-precision potentials for large-scale atomistic simulations", J. Chem. Phys. 162, 114119 (2025) link

Adaptive-precision means, that a fast interatomic potential, such as EAM, is coupled to a precise interatomic potential, such as ACE. This package provides the required pair_styles and fixes to run an efficient, energy-conserving adaptive-precision simulation.

In the context of this package, precision refers to the accuracy of an interatomic potential.

Authors:

This package was written by David Immel^1, Ralf Drautz^2 and Godehard Sutmann^1^2.

^1: Forschungszentrum Juelich, Juelich, Germany

^2: Ruhr-University Bochum, Bochum, Germany

Install:

The APIP package requires also the installation of ML-PACE, which has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/APIP: filenames -> commands

- *Howto APIP*
- examples/PACKAGES/apip
- *fix atom_weight/apip*
- *fix lambda/apip*
- *fix lambda_thermostat/apip*
- *pair_style eam/apip*
- *pair_style lambda/zone/apip*
- *pair_style lambda/input/apip*
- *pair_style pace/apip*

4.1.4 ASPHERE package

Contents:

Computes, time-integration fixes, and pair styles for aspherical particle models including ellipsoids, 2d lines, and 3d triangles.

Supporting info:

- src/ASPHERE: filenames -> commands
- *Howto spherical*
- *pair_style gayberne*
- *pair_style resquared*
- *pair_style ylz*
- doc/PDF/pair_gayberne_extra.pdf
- doc/PDF/pair_resquared_extra.pdf
- examples/ASPHERE
- examples/ellipse
- https://www.lammps.org/movies.html#line
- https://www.lammps.org/movies.html#tri

4.1.5 BOCS package

Contents:

This package provides *fix bocs*, a modified version of *fix npt* which includes the pressure correction to the barostat as outlined in:

N. J. H. Dunn and W. G. Noid, "Bottom-up coarse-grained models that accurately describe the structure, pressure, and compressibility of molecular liquids", J. Chem. Phys. 143, 243148 (2015).

Authors: Nicholas J. H. Dunn and Michael R. DeLyser (The Pennsylvania State University)

Supporting info:

The BOCS package for LAMMPS is part of the BOCS software package: https://github.com/noid-group/BOCS

See the following reference for information about the entire package:

Dunn, NJH; Lebold, KM; DeLyser, MR; Rudzinski, JF; Noid, WG. "BOCS: Bottom-Up Open-Source Coarse-Graining Software." J. Phys. Chem. B. 122, 13, 3363-3377 (2018).

Example inputs are in the examples/PACKAGES/bocs folder.

4.1.6 BODY package

Contents:

Body-style particles with internal structure. Computes, time-integration fixes, pair styles, as well as the body styles themselves. See the *Howto body* page for an overview.

Supporting info:

- src/BODY filenames -> commands
- *Howto_body*
- *atom_style body*
- *fix nve/body*
- *pair_style body/nparticle*
- examples/body

4.1.7 BPM package

Contents:

Pair styles, bond styles, fixes, and computes for bonded particle models for mesoscale simulations of solids and fracture. See the *Howto bpm* page for an overview.

Authors: Joel T. Clemmer (Sandia National Labs)

Added in version 4May2022.

Supporting info:

- src/BPM: filenames -> commands
- *Howto_bpm*
- *atom_style bpm/sphere*
- *bond_style bpm/rotational*
- *bond_style bpm/spring*
- *compute nbond/atom*
- *fix nve/bpm/sphere*
- *pair_style bpm/spring*
- https://www.lammps.org/movies.html#bpmpackage
- examples/bpm

4.1.8 BROWNIAN package

Contents:

This package provides *fix brownian, fix brownian/sphere, and fix brownian/asphere* as well as *fix propel/self* which allow to do Brownian Dynamics time integration of point, spherical and aspherical particles and also support self-propelled particles.

Authors: Sam Cameron (University of Bristol), Stefan Paquay (while at Brandeis University) (initial version of fix propel/self)

Added in version 14May2021.

Example inputs are in the examples/PACKAGES/brownian folder.

4.1.9 CG-DNA package

Contents:

Several pair styles, bond styles, and integration fixes for coarse-grained modelling of single- and double-stranded DNA and RNA based on the oxDNA and oxRNA model of Doye, Louis and Ouldridge. The package includes Langevin-type rigid-body integrators with improved stability.

Author: Oliver Henrich (University of Strathclyde, Glasgow).

Install:

The CG-DNA package requires that also the *MOLECULE* and *ASPHERE* packages are installed.

Supporting info:

- src/CG-DNA: filenames -> commands
- src/CG-DNA/README
- *pair_style oxdna/**
- *pair_style oxdna2/**
- *pair_style oxrna2/**
- *bond_style oxdna/**
- *bond_style oxdna2/**
- *bond_style oxrna2/**
- *fix nve/dotc/langevin*
- examples/PACKAGES/cgdna

4.1.10 CG-SPICA package

Contents:

Several pair styles and an angle style which implement the coarse-grained SPICA (formerly called SDK) model which enables simulation of biological or soft material systems.

Original Author: Axel Kohlmeyer (Temple U).

Maintainers: Yusuke Miyazaki and Wataru Shinoda (Okayama U).

Supporting info:

- src/CG-SPICA: filenames -> commands
- src/CG-SPICA/README
- *pair_style lj/spica/**
- *angle_style spica*
- examples/PACKAGES/cgspica
- https://www.lammps.org/pictures.html#cg
- https://www.spica-ff.org/

4.1.11 CLASS2 package

Contents:

Bond, angle, dihedral, improper, and pair styles for the COMPASS CLASS2 molecular force field.

Supporting info:

- src/CLASS2: filenames -> commands
- *bond_style class2*
- *angle_style class2*
- *dihedral_style class2*
- *improper_style class2*
- *pair_style lj/class2*

4.1.12 COLLOID package

Contents:

Coarse-grained finite-size colloidal particles. Pair styles and fix wall styles for colloidal interactions. Includes the Fast Lubrication Dynamics (FLD) method for hydrodynamic interactions, which is a simplified approximation to Stokesian dynamics.

Authors: This package includes Fast Lubrication Dynamics pair styles which were created by Amit Kumar and Michael Bybee from Jonathan Higdon's group at UIUC.

Supporting info:

- src/COLLOID: filenames -> commands
- *fix wall/colloid*
- *pair_style colloid*
- *pair_style yukawa/colloid*
- *pair_style brownian*
- *pair_style lubricate*
- *pair_style lubricateU*
- examples/colloid
- examples/srd

4.1.13 COLVARS package

Contents:

Colvars stands for collective variables, which can be used to implement various enhanced sampling methods, including Adaptive Biasing Force, Metadynamics, Steered MD, Umbrella Sampling and Restraints. A *fix colvars* command is implemented which wraps a COLVARS library, which implements these methods. simulations.

Authors: The COLVARS library is written and maintained by Giacomo Fiorin (NIH, Bethesda, MD, USA) and Jerome Henin (CNRS, Paris, France), originally for the NAMD MD code, but with portability in mind. Axel Kohlmeyer (Temple U) provided the interface to LAMMPS.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/COLVARS: filenames -> commands
- doc/PDF/colvars-refman-lammps.pdf
- src/COLVARS/README
- lib/colvars/README
- *fix colvars*
- *group2ndx*
- *ndx2group*
- examples/PACKAGES/colvars

4.1.14 COMPRESS package

Contents:

Compressed output of dump files via the zlib compression library, using dump styles with a "gz" in their style name.

To use this package you must have the zlib compression library available on your system.

Author: Axel Kohlmeyer (Temple U).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/COMPRESS: filenames -> commands
- src/COMPRESS/README
- lib/compress/README
- *dump atom/gz*
- *dump cfg/gz*
- *dump custom/gz*
- *dump xyz/gz*

4.1.15 CORESHELL package

Contents:

Compute and pair styles that implement the adiabatic core/shell model for polarizability. The pair styles augment Born, Buckingham, and Lennard-Jones styles with core/shell capabilities. The *compute temp/cs* command calculates the temperature of a system with core/shell particles. See the *Howto coreshell* page for an overview of how to use this package.

Author: Hendrik Heenen (Technical U of Munich).

Supporting info:

- src/CORESHELL: filenames -> commands
- *Howto coreshell*
- *Howto polarizable*
- *compute temp/cs*
- *pair_style born/coul/long/cs*
- *pair_style buck/coul/long/cs*
- *pair_style lj/cut/coul/long/cs*
- examples/coreshell

4.1.16 DIELECTRIC package

Contents:

An atom style, multiple pair styles, several fixes, Kspace styles and a compute for simulating systems using boundary element solvers for computing the induced charges at the interface between two media with different dielectric constants.

Install:

To use this package, also the *KSPACE* and *EXTRA-PAIR* packages need to be installed.

Author: Trung Nguyen and Monica Olvera de la Cruz (Northwestern U)

Added in version 2Jul2021.

Supporting info:

- src/DIELECTRIC: filenames -> commands
- *atom_style dielectric*
- *pair_style coul/cut/dielectric*
- *pair_style coul/long/dielectric*
- *pair_style lj/cut/coul/cut/dielectric*
- *pair_style lj/cut/coul/debye/dielectric*
- *pair_style lj/cut/coul/long/dielectric*
- *pair_style lj/cut/coul/msm/dielectric*
- *pair_style pppm/dielectric*

- *pair_style pppm/disp/dielectric*
- *pair_style msm/dielectric*
- *fix_style polarize/bem/icc*
- *fix_style polarize/bem/gmres*
- *fix_style polarize/functional*
- *compute efield/atom*
- examples/PACKAGES/dielectric

4.1.17 DIFFRACTION package

Contents:

Two computes and a fix for calculating x-ray and electron diffraction intensities based on kinematic diffraction theory.

Author: Shawn Coleman while at the U Arkansas.

Supporting info:

- src/DIFFRACTION: filenames -> commands
- *compute saed*
- *compute xrd*
- *fix saed/vtk*
- examples/PACKAGES/diffraction

4.1.18 DIPOLE package

Contents:

An atom style and several pair styles for point dipole models with short-range or long-range interactions.

Supporting info:

- src/DIPOLE: filenames -> commands
- *atom_style dipole*
- *pair_style lj/cut/dipole/cut*
- *pair_style lj/cut/dipole/long*
- *pair_style lj/long/dipole/long*
- *angle_style dipole*
- examples/dipole

4.1.19 DPD-BASIC package

Contents:

Pair styles for the basic dissipative particle dynamics (DPD) method and DPD thermostatting.

Pair style *dpd/coul/slater/long* also includes smeared charges for coulomb interactions and thus requires the *KSPACE* package to be installed to handle the long-range Coulomb part of the interactions.

Authors: Kurt Smith (U Pittsburgh), Martin Svoboda, Martin Lisal (ICPF and UJEP), Eddy Barraud (IFPEN)

Supporting info:

- src/DPD-BASIC: filenames -> commands
- *pair_style dpd*
- *pair_style dpd/tstat*
- *pair_style dpd/ext*
- *pair_style dpd/ext/tstat*
- *pair_style dpd/coul/slater/long*
- examples/PACKAGES/dpd-basic

4.1.20 DPD-MESO package

Contents:

Several extensions of the dissipative particle dynamics (DPD) method. Specifically, energy-conserving DPD (eDPD) that can model non-isothermal processes, many-body DPD (mDPD) for simulating vapor-liquid coexistence, and transport DPD (tDPD) for modeling advection-diffusion-reaction systems. The equations of motion of these DPD extensions are integrated through a modified velocity-Verlet (MVV) algorithm.

Author: Zhen Li (Department of Mechanical Engineering, Clemson University)

Supporting info:

- src/DPD-MESO: filenames -> commands
- src/DPD-MESO/README
- *atom_style edpd*
- *pair_style edpd*
- *pair_style mdpd*
- *pair_style tdpd*
- *fix mvv/dpd*
- examples/PACKAGES/mesodpd

4.1.21 DPD-REACT package

Contents:

DPD stands for dissipative particle dynamics. This package implements coarse-grained DPD-based models for energetic, reactive molecular crystalline materials. It includes many pair styles specific to these systems, including for reactive DPD, where each particle has internal state for multiple species and a coupled set of chemical reaction ODEs are integrated each timestep. Highly accurate time integrators for isothermal, isoenergetic, isobaric and isenthalpic conditions are included. These enable long timesteps via the Shardlow splitting algorithm.

Authors: Jim Larentzos (ARL), Tim Mattox (Engility Corp), and John Brennan (ARL).

Supporting info:

- src/DPD-REACT: filenames -> commands
- src/DPD-REACT/README
- *compute dpd*
- *compute dpd/atom*
- *fix eos/cv*
- *fix eos/table*
- *fix eos/table/rx*
- *fix shardlow*
- *fix rx*
- *pair_style table/rx*
- *pair_style dpd/fdt*
- *pair_style dpd/fdt/energy*
- *pair_style exp6/rx*
- *pair_style multi/lucy*
- *pair_style multi/lucy/rx*
- examples/PACKAGES/dpd-react

4.1.22 DPD-SMOOTH package

Contents:

A pair style for smoothed dissipative particle dynamics (SDPD), which is an extension of smoothed particle hydrodynamics (SPH) to mesoscale where thermal fluctuations are important (see the *SPH package*). Also two fixes for moving and rigid body integration of SPH/SDPD particles (particles of atom_style meso).

Author: Morteza Jalalvand (Institute for Advanced Studies in Basic Sciences, Iran).

Supporting info:

- src/DPD-SMOOTH: filenames -> commands
- src/DPD-SMOOTH/README
- *pair_style sdpd/taitwater/isothermal*
- *fix meso/move*

- *fix rigid/meso*
- examples/PACKAGES/dpd-smooth

4.1.23 DRUDE package

Contents:

Fixes, pair styles, and a compute to simulate thermalized Drude oscillators as a model of polarization. See the *Howto drude* and *Howto drude2* pages for an overview of how to use the package. There are auxiliary tools for using this package in tools/drude.

Authors: Alain Dequidt (U Clermont Auvergne), Julien Devemy (CNRS), and Agilio Padua (ENS de Lyon).

Supporting info:

- src/DRUDE: filenames -> commands
- *Howto drude*
- *Howto drude2*
- *Howto polarizable*
- src/DRUDE/README
- *fix drude*
- *fix drude/transform/**
- *compute temp/drude*
- *pair_style thole*
- *pair_style lj/cut/thole/long*
- examples/PACKAGES/drude
- tools/drude

4.1.24 EFF package

Contents:

EFF stands for electron force field which allows a classical MD code to model electrons as particles of variable radius. This package contains atom, pair, fix and compute styles which implement the eFF as described in A. Jaramillo-Botero, J. Su, Q. An, and W.A. Goddard III, JCC, 2010. The eFF potential was first introduced by Su and Goddard, in 2007. There are auxiliary tools for using this package in tools/eff; see its README file.

Author: Andres Jaramillo-Botero (CalTech).

Supporting info:

- src/EFF: filenames -> commands
- src/EFF/README
- *atom_style electron*
- *fix nve/eff*
- *fix nvt/eff*

- *fix npt/eff*
- *fix langevin/eff*
- *compute temp/eff*
- *pair_style eff/cut*
- *pair_style eff/inline*
- examples/PACKAGES/eff
- tools/eff/README
- tools/eff
- https://www.lammps.org/movies.html#eff

4.1.25 ELECTRODE package

Contents:

The ELECTRODE package allows the user to enforce a constant potential method for groups of atoms that interact with the remaining atoms as electrolyte.

Authors: The ELECTRODE package is written and maintained by Ludwig Ahrens-Iwers (TUHH, Hamburg, Germany), Shern Tee (UQ, Brisbane, Australia) and Robert Meissner (Helmholtz-Zentrum Hereon, Geesthacht and TUHH, Hamburg, Germany).

Added in version 4May2022.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- *fix electrode/conp*
- *fix electrode/conq*
- *fix electrode/thermo*

4.1.26 EXTRA-COMMAND package

Contents:

Additional command styles that are less commonly used.

Supporting info:

- src/EXTRA-COMMAND: filenames -> commands
- *general commands*

4.1.27 EXTRA-COMPUTE package

Contents:

Additional compute styles that are less commonly used.

Supporting info:

- src/EXTRA-COMPUTE: filenames -> commands
- *compute*

4.1.28 EXTRA-DUMP package

Contents:

Additional dump styles that are less commonly used.

Supporting info:

- src/EXTRA-DUMP: filenames -> commands
- *dump*

4.1.29 EXTRA-FIX package

Contents:

Additional fix styles that are less commonly used.

Supporting info:

- src/EXTRA-FIX: filenames -> commands
- *fix*

4.1.30 EXTRA-MOLECULE package

Contents:

Additional bond, angle, dihedral, and improper styles that are less commonly used.

Install:

To use this package, also the *MOLECULE* package needs to be installed.

Supporting info:

- src/EXTRA-MOLECULE: filenames -> commands
- *molecular styles*

4.1.31 EXTRA-PAIR package

Contents:

Additional pair styles that are less commonly used.

Supporting info:

- src/EXTRA-PAIR: filenames -> commands
- *pair_style*
- examples/PACKAGES/dispersion

4.1.32 FEP package

Contents:

FEP stands for free energy perturbation. This package provides methods for performing FEP simulations by using a *fix adapt/fep* command with soft-core pair potentials, which have a "soft" in their style name. There are auxiliary tools for using this package in tools/fep; see its README file.

Author: Agilio Padua (ENS de Lyon)

Supporting info:

- src/FEP: filenames -> commands
- src/FEP/README
- *fix adapt/fep*
- *compute fep*
- *pair_style */soft*
- examples/PACKAGES/fep
- tools/fep/README
- tools/fep

4.1.33 GPU package

Contents:

Dozens of pair styles and a version of the PPPM long-range Coulombic solver optimized for GPUs. All such styles have a "gpu" as a suffix in their style name. The GPU code can be compiled with either CUDA or OpenCL, however the OpenCL variants are no longer actively maintained and only the CUDA versions are regularly tested. The *GPU package* page gives details of what hardware and GPU software is required on your system, and details on how to build and use this package. Its styles can be invoked at run time via the -sf gpu or -suffix gpu *command-line switches*. See also the *KOKKOS* package, which has GPU-enabled styles.

Authors: Mike Brown (Intel) while at Sandia and ORNL and Trung Nguyen (Northwestern U) while at ORNL and later. AMD HIP support by Evgeny Kuznetsov, Vladimir Stegailov, and Vsevolod Nikolskiy (HSE University).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/GPU: filenames -> commands
- src/GPU/README
- lib/gpu/README
- *Accelerator packages*
- *GPU package*
- *Section 2.6 -sf gpu*
- *Section 2.6 -pk gpu*
- *package gpu*
- *Commands* pages (*pair*, *kspace*) for styles followed by (g)
- Benchmarks page of website

4.1.34 GRANULAR package

Contents:

Pair styles and fixes for finite-size granular particles, which interact with each other and boundaries via frictional and dissipative potentials.

Supporting info:

- src/GRANULAR: filenames -> commands
- *Howto granular*
- *fix pour*
- *fix wall/gran*
- *pair_style gran/hooke*
- *pair_style gran/hertz/history*
- examples/granregion
- examples/pour
- bench/in.chute
- https://www.lammps.org/pictures.html#jamming
- https://www.lammps.org/movies.html#hopper
- https://www.lammps.org/movies.html#dem
- https://www.lammps.org/movies.html#brazil
- https://www.lammps.org/movies.html#granregion

4.1.35 H5MD package

Contents:

H5MD stands for HDF5 for MD. HDF5 is a portable, binary, self-describing file format, used by many scientific simulations. H5MD is a format for molecular simulations, built on top of HDF5. This package implements a *dump h5md* command to output LAMMPS snapshots in this format.

To use this package you must have the HDF5 library available on your system.

Author: Pierre de Buyl (KU Leuven) created both the package and the H5MD format.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/H5MD: filenames -> commands
- src/H5MD/README
- lib/h5md/README
- *dump h5md*

4.1.36 INTEL package

Contents:

Dozens of pair, fix, bond, angle, dihedral, improper, and kspace styles which are optimized for Intel CPUs and KNLs (Knights Landing). All of them have an "intel" in their style name. The *INTEL package* page gives details of what hardware and compilers are required on your system, and how to build and use this package. Its styles can be invoked at run time via the -sf intel or -suffix intel *command-line switches*. Also see the *KOKKOS*, *OPT*, and *OPENMP* packages, which have styles optimized for CPUs and KNLs.

You need to have an Intel compiler, version 14 or higher to take full advantage of this package. While compilation with GNU compilers is supported, performance will be sub-optimal.

> **Note**
>
> the INTEL package contains styles that require using the -restrict flag, when compiling with Intel compilers.

Author: Mike Brown (Intel).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/INTEL: filenames -> commands
- src/INTEL/README
- *Accelerator packages*
- *INTEL package*
- *Section 2.6 -sf intel*
- *Section 2.6 -pk intel*

- *package intel*
- Search the *commands* pages (*fix*, *compute*, *pair*, *bond, angle, dihedral, improper*, *kspace*) for styles followed by (i)
- src/INTEL/TEST
- Benchmarks page of website

4.1.37 INTERLAYER package

Contents:

A collection of pair styles specifically to be used for modeling layered materials, most commonly graphene sheets (or equivalents).

Supporting info:

- src/INTERLAYER: filenames -> commands
- *Pair style* page
- examples/PACKAGES/interlayer

4.1.38 KIM package

Contents:

This package contains a command with a set of sub-commands that serve as a wrapper on the Open Knowledgebase of Interatomic Models (OpenKIM) repository of interatomic models (IMs) enabling compatible ones to be used in LAMMPS simulations.

This includes *kim init*, and *kim interactions* commands to select, initialize and instantiate the IM, a *kim query* command to perform web queries for material property predictions of OpenKIM IMs, a *kim param* command to access KIM Model Parameters from LAMMPS, and a *kim property* command to write material properties computed in LAMMPS to standard KIM property instance format.

Support for KIM IMs that conform to the KIM Application Programming Interface (API) is provided by the *pair_style kim* command.

> **Note**
>
> The command *pair_style kim* is called by *kim interactions* and is not recommended to be directly used in input scripts.

To use this package you must have the KIM API library available on your system. The KIM API is available for download on the OpenKIM website. When installing LAMMPS from binary, the kim-api package is a dependency that is automatically downloaded and installed.

Information about the KIM project can be found at its website: https://openkim.org. The KIM project is led by Ellad Tadmor and Ryan Elliott (U Minnesota) and is funded by the National Science Foundation.

Authors: Ryan Elliott (U Minnesota) is the main developer for the KIM API and the *pair_style kim* command. Yaser Afshar (U Minnesota), Axel Kohlmeyer (Temple U), Ellad Tadmor (U Minnesota), and Daniel Karls (U Minnesota) contributed to the *kim command* interface in close collaboration with Ryan Elliott.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- *kim command*
- *pair_style kim*
- src/KIM: filenames -> commands
- src/KIM/README
- lib/kim/README
- examples/kim

4.1.39 KOKKOS package

Contents:

Dozens of atom, pair, bond, angle, dihedral, improper, fix, compute styles adapted to compile using the Kokkos library which can convert them to OpenMP or CUDA code so that they run efficiently on multicore CPUs, KNLs, or GPUs. All the styles have a "kk" as a suffix in their style name. The *KOKKOS package* page gives details of what hardware and software is required on your system, and how to build and use this package. Its styles can be invoked at run time via the -sf kk or -suffix kk *command-line switches*. Also see the *GPU*, *OPT*, *INTEL*, and *OPENMP* packages, which have styles optimized for CPUs, KNLs, and GPUs.

You must have a C++17 compatible compiler to use this package. KOKKOS makes extensive use of advanced C++ features, which can expose compiler bugs, especially when compiling for maximum performance at high optimization levels. Please see the file lib/kokkos/README for a list of compilers and their respective platforms, that are known to work.

Authors: The KOKKOS package was created primarily by Christian Trott and Stan Moore (Sandia), with contributions from other folks as well. It uses the open-source Kokkos library which was developed by Carter Edwards, Christian Trott, and others at Sandia, and which is included in the LAMMPS distribution in lib/kokkos.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/KOKKOS: filenames -> commands
- src/KOKKOS/README
- lib/kokkos/README
- *Accelerator packages*
- *KOKKOS package*
- *Section 2.6 -k on ...*
- *Section 2.6 -sf kk*
- *Section 2.6 -pk kokkos*
- *package kokkos*
- Search the *commands* pages (*fix*, *compute*, *pair*, *bond, angle, dihedral, improper*, *kspace*) for styles followed by (k)
- Benchmarks page of website

4.1.40 KSPACE package

Contents:

A variety of long-range Coulombic solvers, as well as pair styles which compute the corresponding short-range pairwise Coulombic interactions. These include Ewald, particle-particle particle-mesh (PPPM), and multilevel summation method (MSM) solvers.

Install:

Building with this package requires a 1d FFT library be present on your system for use by the PPPM solvers. This can be the KISS FFT library provided with LAMMPS, third party libraries like FFTW, or a vendor-supplied FFT library. See the *Build settings* page for details on how to select different FFT options for your LAMMPS build.

Supporting info:

- src/KSPACE: filenames -> commands
- *kspace_style*
- doc/PDF/kspace.pdf
- *Howto tip3p*
- *Howto tip4p*
- *Howto spc*
- *pair_style coul*
- Search the *pair style* page for styles with "long" or "msm" in name
- examples/peptide
- bench/in.rhodo

4.1.41 LATBOLTZ package

Contents:

Fixes which implement a background Lattice-Boltzmann (LB) fluid, which can be used to model MD particles influenced by hydrodynamic forces.

Authors: Frances Mackay and Colin Denniston (University of Western Ontario).

Install:

The LATBOLTZ package requires that LAMMPS is build in *MPI parallel mode*.

Supporting info:

- src/LATBOLTZ: filenames -> commands
- src/LATBOLTZ/README
- *fix lb/fluid*
- *fix lb/momentum*
- *fix lb/viscous*
- examples/PACKAGES/latboltz

4.1.42 LEPTON package

Contents:

Styles for pair, bond, and angle forces that evaluate the potential function from a string using the Lepton mathematical expression parser. Lepton is a C++ library that is bundled with OpenMM and can be used for parsing, evaluating, differentiating, and analyzing mathematical expressions. This is a more lightweight and efficient alternative for evaluating custom potential function to an embedded Python interpreter as used in the *PYTHON package*. On the other hand, since the potentials are evaluated form analytical expressions, they are more precise than what can be done with *tabulated potentials*.

Authors: Axel Kohlmeyer (Temple U). Lepton itself is developed by Peter Eastman at Stanford University.

Added in version 8Feb2023.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/LEPTON: filenames -> commands
- lib/lepton/README.md
- *pair_style lepton*
- *bond_style lepton*
- *angle_style lepton*
- *dihedral_style lepton*

4.1.43 MACHDYN package

Contents:

An atom style, fixes, computes, and several pair styles which implements smoothed Mach dynamics (SMD) for solids, which is a model related to smoothed particle hydrodynamics (SPH) for liquids (see the *SPH package*).

This package solves solids mechanics problems via a state of the art stabilized meshless method with hourglass control. It can specify hydrostatic interactions independently from material strength models, i.e. pressure and deviatoric stresses are separated. It provides many material models (Johnson-Cook, plasticity with hardening, Mie-Grueneisen, Polynomial EOS) and allows new material models to be added. It implements rigid boundary conditions (walls) which can be specified as surface geometries from *.STL files.

Author: Georg Ganzenmuller (Fraunhofer-Institute for High-Speed Dynamics, Ernst Mach Institute, Germany).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/MACHDYN: filenames -> commands
- src/MACHDYN/README
- doc/PDF/MACHDYN_LAMMPS_userguide.pdf
- examples/PACKAGES/machdyn

4.1.44 MANIFOLD package

Contents:

Several fixes and a "manifold" class which enable simulations of particles constrained to a manifold (a 2D surface within the 3D simulation box). This is done by applying the RATTLE constraint algorithm to formulate single-particle constraint functions g(xi,yi,zi) = 0 and their derivative (i.e. the normal of the manifold) n = grad(g).

Author: Stefan Paquay (until 2017: Eindhoven University of Technology (TU/e), The Netherlands; since 2017: Brandeis University, Waltham, MA, USA)

Supporting info:

- src/MANIFOLD: filenames -> commands
- src/MANIFOLD/README
- *Howto manifold*
- *fix manifoldforce*
- *fix nve/manifold/rattle*
- *fix nvt/manifold/rattle*
- examples/PACKAGES/manifold
- https://www.lammps.org/movies.html#manifold

4.1.45 MANYBODY package

Contents:

A variety of many-body and bond-order potentials. These include (AI)REBO, BOP, EAM, EIM, Stillinger-Weber, and Tersoff potentials.

Supporting info:

- src/MANYBODY: filenames -> commands
- *Pair style* page
- examples/comb
- examples/eim
- examples/nb3d
- examples/shear
- examples/streitz
- examples/vashishta
- bench/in.eam

4.1.46 MC package

Contents:

Several fixes and a pair style that have Monte Carlo (MC) or MC-like attributes. These include fixes for creating, breaking, and swapping bonds, for performing atomic swaps, and performing grand canonical MC (GCMC), semi-grand canonical MC (SGCMC), or similar processes in conjunction with molecular dynamics (MD).

Supporting info:

- src/MC: filenames -> commands
- *fix atom/swap*
- *fix bond/break*
- *fix bond/create*
- *fix bond/create/angle*
- *fix bond/swap*
- *fix charge/regulation*
- *fix gcmc*
- *fix sgcmc*
- *fix tfmc*
- *fix widom*
- *pair_style dsmc*
- https://www.lammps.org/movies.html#gcmc

4.1.47 MDI package

Contents:

A LAMMPS command and fixes to allow client-server coupling of LAMMPS to other atomic or molecular simulation codes or materials modeling workflows via the MolSSI Driver Interface (MDI) library.

Author: Taylor Barnes - MolSSI, taylor.a.barnes at gmail.com

Added in version 14May2021.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/MDI/README
- lib/mdi/README
- *Howto MDI*
- *mdi*
- *fix mdi/qm*
- examples/PACKAGES/mdi

4.1.48 MEAM package

Contents:

A pair style for the modified embedded atom (MEAM) potential translated from the Fortran version in the (obsolete) MEAM package to plain C++. The MEAM fully replaces the MEAM package, which has been removed from LAMMPS after the 12 December 2018 version.

Author: Sebastian Huetter, (Otto-von-Guericke University Magdeburg) based on the Fortran version of Greg Wagner (Northwestern U) while at Sandia.

Supporting info:

- src/MEAM: filenames -> commands
- src/MEAM/README
- *pair_style meam*
- examples/meam

4.1.49 MESONT package

Contents:

MESONT is a LAMMPS package for simulation of nanomechanics of nanotubes (NTs). The model is based on a coarse-grained representation of NTs as "flexible cylinders" consisting of a variable number of segments. Internal interactions within a NT and the van der Waals interaction between the tubes are described by a mesoscopic force field designed and parameterized based on the results of atomic-level molecular dynamics simulations. The description of the force field is provided in the papers listed in src/MESONT/README.

This package used to have two independent implementations of this model: the original implementation using a Fortran library written by the developers of the model and a second implementation written in C++ by Philipp Kloza (U Cambridge). Since the C++ implementation offers the same features as the original implementation with the addition of friction, is typically faster, and easier to compile/install, the Fortran library based implementation has since been obsoleted and removed from the distribution. You have to download and compile an older version of LAMMPS if you want to use those.

Download of potential files:

The potential files for these pair styles are *very* large and thus are not included in the regular downloaded packages of LAMMPS or the git repositories. Instead, they will be automatically downloaded from a web server when the package is installed for the first time.

Authors of the obsoleted *mesont* styles:

Maxim V. Shugaev (University of Virginia), Alexey N. Volkov (University of Alabama), Leonid V. Zhigilei (University of Virginia)

Deprecated since version 8Feb2023.

Author of the C++ styles: Philipp Kloza (U Cambridge)

Added in version 15Jun2020.

Supporting info:

- src/MESONT: filenames -> commands
- src/MESONT/README
- *bond_style mesocnt*

- *angle_style mesocnt*
- *pair_style mesocnt*
- examples/PACKAGES/mesont

4.1.50 MGPT package

Contents:

A pair style which provides a fast implementation of the quantum-based MGPT multi-ion potentials. The MGPT or model GPT method derives from first-principles DFT-based generalized pseudopotential theory (GPT) through a series of systematic approximations valid for mid-period transition metals with nearly half-filled d bands. The MGPT method was originally developed by John Moriarty at LLNL. The pair style in this package calculates forces and energies using an optimized matrix-MGPT algorithm due to Tomas Oppelstrup at LLNL.

Authors: Tomas Oppelstrup and John Moriarty (LLNL).

Supporting info:

- src/MGPT: filenames -> commands
- src/MGPT/README
- *pair_style mgpt*
- examples/PACKAGES/mgpt

4.1.51 MISC package

Contents:

A variety of compute, fix, pair, bond styles with specialized capabilities that don't align with other packages. Do a directory listing, ls src/MISC, to see the list of commands.

> **Note**
>
> the MISC package contains styles that require using the -restrict flag, when compiling with Intel compilers.

Supporting info:

- src/MISC: filenames -> commands
- *bond_style special*
- *compute viscosity/cos*
- *fix accelerate/cos*
- *fix imd*
- *fix ipi*
- *pair_style agni*
- *pair_style list*
- *pair_style srp*
- *pair_style tracker*

4.1.52 ML-HDNNP package

Contents:

A *pair_style hdnnp* command which allows to use high-dimensional neural network potentials (HDNNPs), a form of machine learning potentials. HDNNPs must be carefully trained prior to their application in a molecular dynamics simulation.

To use this package you must have the n2p2 library installed and compiled on your system.

Author: Andreas Singraber

Added in version 27May2021.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/ML-HDNNP: filenames -> commands
- src/ML-HDNNP/README
- lib/hdnnp/README
- *pair_style hdnnp*
- examples/PACKAGES/hdnnp

4.1.53 ML-IAP package

Contents:

A general interface for machine-learning interatomic potentials, including PyTorch.

Install:

To use this package, also the *ML-SNAP* package needs to be installed. To make the *mliappy* model available, also the *PYTHON* package needs to be installed, the version of Python must be 3.6 or later, and the cython software must be installed.

Author: Aidan Thompson (Sandia), Nicholas Lubbers (LANL).

Added in version 30Jun2020.

Supporting info:

- src/ML-IAP: filenames -> commands
- src/ML-IAP/README.md
- *pair_style mliap*
- *compute_style mliap*
- examples/mliap (see README)

When built with the *mliappy* model this package includes an extension for coupling with Python models, including PyTorch. In this case, the Python interpreter linked to LAMMPS will need the cython and numpy modules installed. The provided examples build models with PyTorch, which would therefore also needs to be installed to run those examples.

4.1.54 ML-PACE package

Contents:

A pair style for the Atomic Cluster Expansion potential (ACE). ACE is a methodology for deriving a highly accurate classical potential fit to a large archive of quantum mechanical (DFT) data. The ML-PACE package provides an efficient implementation for running simulations with ACE potentials.

Authors:

This package was written by Yury Lysogorskiy^1, Cas van der Oord^2, Anton Bochkarev^1, Sarath Menon^1, Matteo Rinaldi^1, Thomas Hammerschmidt^1, Matous Mrovec^1, Aidan Thompson^3, Gabor Csanyi^2, Christoph Ortner^4, Ralf Drautz^1.

^1: Ruhr-University Bochum, Bochum, Germany

^2: University of Cambridge, Cambridge, United Kingdom

^3: Sandia National Laboratories, Albuquerque, New Mexico, USA

^4: University of British Columbia, Vancouver, BC, Canada

Added in version 14May2021.

Install:

This package has *specific installation instructions* on the *Build extras* page. This package may also be compiled as a plugin to avoid licensing conflicts when distributing binaries.

Supporting info:

- src/ML-PACE: filenames -> commands
- *pair_style pace*
- examples/PACKAGES/pace

4.1.55 ML-POD package

Contents:

A pair style and fitpod style for Proper Orthogonal Descriptors (POD). POD is a methodology for deriving descriptors based on the proper orthogonal decomposition. The ML-POD package provides an efficient implementation for running simulations with POD potentials, along with fitting the potentials natively in LAMMPS.

Authors:

Ngoc Cuong Nguyen (MIT), Andrew Rohskopf (Sandia)

Added in version 22Dec2022.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/ML-POD: filenames -> commands
- *pair_style pod*
- *command_style fitpod*

- examples/PACKAGES/pod

4.1.56 ML-QUIP package

Contents:

A *pair_style quip* command which wraps the QUIP libAtoms library, which includes a variety of interatomic potentials, including Gaussian Approximation Potential (GAP) models developed by the Cambridge University group.

To use this package you must have the QUIP libAtoms library available on your system.

Author: Albert Bartok (Cambridge University)

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/ML-QUIP: filenames -> commands
- src/ML-QUIP/README
- *pair_style quip*
- examples/PACKAGES/quip

4.1.57 ML-RANN package

Contents:

A pair style for using rapid atomistic neural network (RANN) potentials. These neural network potentials work by first generating a series of symmetry functions from the neighbor list and then using these values as the input layer of a neural network.

Authors:

This package was written by Christopher Barrett with contributions by Doyl Dickel, Mississippi State University.

Added in version 27May2021.

Supporting info:

- src/ML-RANN: filenames -> commands
- *pair_style rann*
- examples/PACKAGES/rann

4.1.58 ML-SNAP package

Contents:

A pair style for the spectral neighbor analysis potential (SNAP). SNAP is methodology for deriving a highly accurate classical potential fit to a large archive of quantum mechanical (DFT) data. Also several computes which analyze attributes of the potential.

Author: Aidan Thompson (Sandia).

Supporting info:

- src/ML-SNAP: filenames -> commands
- *pair_style snap*
- *compute sna/atom*
- *compute sna/grid*
- *compute sna/grid/local*
- *compute snad/atom*
- *compute snav/atom*
- examples/snap

4.1.59 ML-UF3 package

Contents:

A pair style for the ultra-fast force field potentials (UF3). UF3 is a methodology for deriving a highly accurate classical potential which is fast to evaluate and is fitted to a large archives of quantum mechanical (DFT) data. The use of b-spline basis set in UF3 enables the rapid evaluation of 2-body and 3-body interactions.

Authors: Ajinkya C Hire (University of Florida), Hendrik Krass (University of Constance), Matthias Rupp (Luxembourg Institute of Science and Technology), Richard Hennig (University of Florida)

Supporting info:

- src/ML-UF3: filenames -> commands
- *pair_style uf3*
- examples/uf3
- https://github.com/uf3/uf3

4.1.60 MOFFF package

Contents:

Pair, angle and improper styles needed to employ the MOF-FF force field by Schmid and coworkers with LAMMPS. MOF-FF is a first principles derived force field with the primary aim to simulate MOFs and related porous framework materials, using spherical Gaussian charges. It is described in S. Bureekaew et al., Phys. Stat. Sol. B 2013, 250, 1128-1141. For the usage of MOF-FF see the example in the example directory as well as the MOF+ website.

Author: Hendrik Heenen (Technical U of Munich), Rochus Schmid (Ruhr-University Bochum).

Supporting info:

- src/MOFFF: filenames -> commands
- src/MOFFF/README
- *pair_style buck6d/coul/gauss*
- *angle_style class2*
- *angle_style cosine/buck6d*
- *improper_style inversion/harmonic*
- examples/PACKAGES/mofff

4.1.61 MOLECULE package

Contents:

A large number of atom, pair, bond, angle, dihedral, improper styles that are used to model molecular systems with fixed covalent bonds. The pair styles include the Dreiding (hydrogen-bonding) and CHARMM force fields, and a TIP4P water model.

Supporting info:

- src/MOLECULE: filenames -> commands
- *atom_style*
- *bond_style*
- *angle_style*
- *dihedral_style*
- *improper_style*
- *pair_style hbond/dreiding/lj*
- *pair_style lj/charmm/coul/charmm*
- *Howto bioFF*
- examples/cmap
- examples/dreiding
- examples/micelle,
- examples/peptide
- bench/in.chain
- bench/in.rhodo

4.1.62 MOLFILE package

Contents:

A *dump molfile* command which uses molfile plugins that are bundled with the VMD molecular visualization and analysis program, to enable LAMMPS to dump snapshots in formats compatible with various molecular simulation tools.

To use this package you must have the desired VMD plugins available on your system.

Note that this package only provides the interface code, not the plugins themselves, which will be accessed when requesting a specific plugin via the *dump molfile* command. Plugins can be obtained from a VMD installation which has to match the platform that you are using to compile LAMMPS for. By adding plugins to VMD, support for new file formats can be added to LAMMPS (or VMD or other programs that use them) without having to re-compile the application itself. More information about the VMD molfile plugins can be found at https://www.ks.uiuc.edu/Research/vmd/plugins/molfile.

Author: Axel Kohlmeyer (Temple U).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/MOLFILE: filenames -> commands
- src/MOLFILE/README
- lib/molfile/README
- *dump molfile*

4.1.63 NETCDF package

Contents:

Dump styles for writing NetCDF formatted dump files. NetCDF is a portable, binary, self-describing file format developed on top of HDF5. The file contents follow the AMBER NetCDF trajectory conventions (https://ambermd.org/netcdf/nctraj.xhtml), but include extensions.

To use this package you must have the NetCDF library available on your system.

Note that NetCDF files can be directly visualized with the following tools:

- Ovito (Ovito supports the AMBER convention and the extensions mentioned above)
- VMD

Author: Lars Pastewka (Karlsruhe Institute of Technology).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/NETCDF: filenames -> commands
- src/NETCDF/README
- lib/netcdf/README
- *dump netcdf*

4.1.64 OPENMP package

Contents:

Hundreds of pair, fix, compute, bond, angle, dihedral, improper, and kspace styles which are altered to enable threading on many-core CPUs via OpenMP directives. All of them have an "omp" in their style name. The *OPENMP package* page gives details of what hardware and compilers are required on your system, and how to build and use this package. Its styles can be invoked at run time via the -sf omp or -suffix omp *command-line switches*. Also see the *KOKKOS*, *OPT*, and *INTEL* packages, which have styles optimized for CPUs.

Author: Axel Kohlmeyer (Temple U).

> **Note**
>
> To enable multi-threading support the compile flag -fopenmp and the link flag -fopenmp (for GNU compilers, you have to look up the equivalent flags for other compilers) must be used to build LAMMPS. When using Intel compilers, also the -restrict flag is required. The OPENMP package can be compiled without enabling OpenMP; then all code will be compiled as serial and the only improvement over the regular styles are some data access optimization. These flags should be added to the CCFLAGS and LINKFLAGS lines of your Makefile.machine. See src/MAKE/OPTIONS/Makefile.omp for an example.

Once you have an appropriate Makefile.machine, you can install/uninstall the package and build LAMMPS in the usual manner:

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/OPENMP: filenames -> commands
- src/OPENMP/README
- *Accelerator packages*
- *OPENMP package*
- *Command-line option -suffix/-sf omp*
- *Command-line option -package/-pk omp*
- *package omp*
- Search the *commands* pages (*fix*, *compute*, *pair*, *bond, angle, dihedral, improper*, *kspace*) for styles followed by (o)
- Benchmarks page of website

4.1.65 OPT package

Contents:

A handful of pair styles which are optimized for improved CPU performance on single or multiple cores. These include EAM, LJ, CHARMM, and Morse potentials. The styles have an "opt" suffix in their style name. The *OPT package* page gives details of how to build and use this package. Its styles can be invoked at run time via the -sf opt or -suffix opt *command-line switches*. See also the *KOKKOS*, *INTEL*, and *OPENMP* packages, which have styles optimized for CPU performance.

Authors: James Fischer (High Performance Technologies), David Richie, and Vincent Natoli (Stone Ridge Technology).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/OPT: filenames -> commands
- *Accelerator packages*
- *OPT package*
- *Section 2.6 -sf opt*
- Search the *pair style* page for styles followed by (t)
- Benchmarks page of website

4.1.66 ORIENT package

Contents:

A few fixes that apply orientation dependent forces for studying grain boundary migration.

Supporting info:

- src/ORIENT: filenames -> commands
- *fix orient/bcc*
- *fix orient/fcc*
- *fix orient/eco*

4.1.67 PERI package

Contents:

An atom style, several pair styles which implement different Peridynamics materials models, and several computes which calculate diagnostics. Peridynamics is a particle-based meshless continuum model.

Authors: The original package was created by Mike Parks (Sandia). Additional Peridynamics models were added by Rezwanur Rahman and John Foster (UTSA).

Supporting info:

- src/PERI: filenames -> commands
- *Peridynamics Howto*
- doc/PDF/PDLammps_overview.pdf
- doc/PDF/PDLammps_EPS.pdf
- doc/PDF/PDLammps_VES.pdf
- *atom_style peri*
- *pair_style peri/**
- *compute damage/atom*
- *compute plasticity/atom*
- examples/peri
- https://www.lammps.org/movies.html#impact

4.1.68 PHONON package

Contents:

A *fix phonon* command that calculates dynamical matrices, which can then be used to compute phonon dispersion relations, directly from molecular dynamics simulations. And a *dynamical_matrix* as well as a *third_order* command to compute the dynamical matrix and third order tensor from finite differences.

Install:

The fix phonon command also requires that the *KSPACE* package is installed.

Authors: Ling-Ti Kong (Shanghai Jiao Tong University) for "fix phonon" and Charlie Sievers (UC Davis) for "dynamical_matrix" and "third_order"

Supporting info:

- src/PHONON: filenames -> commands
- src/PHONON/README
- *fix phonon*
- *dynamical_matrix*
- *third_order*
- examples/PACKAGES/phonon

4.1.69 PLUGIN package

Contents:

A *plugin* command that can load and unload several kind of styles in LAMMPS from shared object files at runtime without having to recompile and relink LAMMPS.

When the environment variable LAMMPS_PLUGIN_PATH is set, then LAMMPS will search the directory (or directories) listed in this path for files with names that end in plugin.so (e.g. helloplugin.so) and will try to load the contained plugins automatically at start-up.

Authors: Axel Kohlmeyer (Temple U)

Added in version 8Apr2021.

Supporting info:

- src/PLUGIN: filenames -> commands
- *plugin command*
- *Information on writing plugins*
- examples/plugin

4.1.70 PLUMED package

Contents:

The fix plumed command allows you to use the PLUMED free energy plugin for molecular dynamics to analyze and bias your LAMMPS trajectory on the fly. The PLUMED library is called from within the LAMMPS input script by using the *fix plumed* command.

Authors: The PLUMED library is written and maintained by Massimilliano Bonomi, Giovanni Bussi, Carlo Camiloni, and Gareth Tribello.

Install:

This package has *specific installation instructions* on the *Build extras* page. This package may also be compiled as a plugin to avoid licensing conflicts when distributing binaries.

Supporting info:

- src/PLUMED/README

- lib/plumed/README
- *fix plumed*
- examples/PACKAGES/plumed

4.1.71 PTM package

Contents:

A *compute ptm/atom* command that calculates local structure characterization using the Polyhedral Template Matching methodology.

Author: Peter Mahler Larsen (MIT).

Supporting info:

- src/PTM: filenames not starting with ptm_ -> commands
- src/PTM: filenames starting with ptm_ -> supporting code
- src/PTM/LICENSE
- *compute ptm/atom*

4.1.72 PYTHON package

Contents:

A *python* command which allow you to execute Python code from a LAMMPS input script. The code can be in a separate file or embedded in the input script itself. See the *Python call* page for an overview of using Python from LAMMPS in this manner and all the *Python* manual pages for other ways to use LAMMPS and Python together.

> **Note**
>
> Building with the PYTHON package assumes you have a Python development environment (headers and libraries) available on your system, which needs to be Python version 3.6 or later.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/PYTHON: filenames -> commands
- *Python call*
- lib/python/README
- examples/python

4.1.73 QEQ package

Contents:

Several fixes for performing charge equilibration (QEq) via different algorithms. These can be used with pair styles that perform QEq as part of their formulation.

Supporting info:

- src/QEQ: filenames -> commands
- *fix qeq/**
- examples/qeq
- examples/streitz

4.1.74 QMMM package

Contents:

A *fix qmmm* command which allows LAMMPS to be used as the MM code in a QM/MM simulation. This is currently only available in combination with the Quantum ESPRESSO package.

To use this package you must have Quantum ESPRESSO (QE) available on your system and include its coupling library in the compilation and then compile LAMMPS as a library. For QM/MM calculations you then build a custom binary with MPI support, that sets up 3 partitions with MPI sub-communicators (for inter- and intra-partition communication) and then calls the corresponding library interfaces on each partition (2x LAMMPS and 1x QE).

The current implementation supports an ONIOM style mechanical coupling and a multi-pole based electrostatic coupling to the Quantum ESPRESSO plane wave DFT package. The QM/MM interface has been written in a manner that coupling to other QM codes should be possible without changes to LAMMPS itself.

Authors: Axel Kohlmeyer (Temple U). Mariella Ippolito and Carlo Cavazzoni (CINECA, Italy)

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/QMMM: filenames -> commands
- src/QMMM/README
- lib/qmmm/README
- *fix phonon*
- lib/qmmm/example-ec/README
- lib/qmmm/example-mc/README

4.1.75 QTB package

Contents:

Two fixes which provide a self-consistent quantum treatment of vibrational modes in a classical molecular dynamics simulation. By coupling the MD simulation to a colored thermostat, it introduces zero point energy into the system, altering the energy power spectrum and the heat capacity to account for their quantum nature. This is useful when

modeling systems at temperatures lower than their classical limits or when temperatures ramp across the classical limits in a simulation.

Author: Yuan Shen (Stanford U).

Supporting info:

- src/QTB: filenames -> commands
- src/QTB/README
- *fix qtb*
- *fix qbmsst*
- examples/PACKAGES/qtb

4.1.76 REACTION package

Contents:

This package implements the REACTER protocol, which allows for complex bond topology changes (reactions) during a running MD simulation when using classical force fields. Topology changes are defined in pre- and post-reaction molecule templates and can include creation and deletion of bonds, angles, dihedrals, impropers, atom types, bond types, angle types, dihedral types, improper types, and/or atomic charges. Other options currently available include reaction constraints (e.g., angle and Arrhenius constraints), deletion of reaction byproducts or other small molecules, creation of new atoms or molecules bonded to existing atoms, and using LAMMPS variables for input parameters.

Author: Jacob R. Gissinger (NASA Langley Research Center).

Supporting info:

- src/REACTION/README
- *fix bond/react*
- examples/PACKAGES/reaction
- 2017 LAMMPS Workshop
- 2019 LAMMPS Workshop
- 2021 LAMMPS Workshop
- REACTER website (reacter.org)

4.1.77 REAXFF package

Contents:

A pair style which implements the ReaxFF potential in C/C++. ReaxFF is a universal reactive force field. See the src/REAXFF/README file for more info on differences between the two packages. Also two fixes for monitoring molecules as bonds are created and destroyed.

Author: Hasan Metin Aktulga (MSU) while at Purdue University.

Supporting info:

- src/REAXFF: filenames -> commands

- src/REAXFF/README
- *pair_style reaxff*
- *fix reaxff/bonds*
- *fix reaxff/species*
- examples/reaxff

4.1.78 REPLICA package

Contents:

A collection of multi-replica methods which can be used when running multiple LAMMPS simulations (replicas). See the *Howto replica* page for an overview of how to run multi-replica simulations in LAMMPS. Methods in the package include nudged elastic band (NEB), parallel replica dynamics (PRD), temperature accelerated dynamics (TAD), parallel tempering, and a verlet/split algorithm for performing long-range Coulombics on one set of processors, and the remainder of the force field calculation on another set.

Supporting info:

- src/REPLICA: filenames -> commands
- *Howto replica*
- *neb*
- *prd*
- *tad*
- *temper*,
- *temper/npt*,
- *temper/grem*,

- examples/prd
- examples/tad
- examples/PACKAGES/grem

4.1.79 RHEO package

Contents:

Pair styles, bond styles, fixes, and computes for reproducing hydrodynamics and elastic objects. See the *Howto rheo* page for an overview.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Authors: Joel T. Clemmer (Sandia National Labs), Thomas C. O'Connor (Carnegie Mellon University)

Added in version 29Aug2024.

Supporting info:

- src/RHEO filenames -> commands
- *Howto_rheo*
- *atom_style rheo*
- *atom_style rheo/thermal*
- *bond_style rheo/shell*
- *compute rheo/property/atom*
- *fix rheo*
- *fix rheo/oxidation*
- *fix rheo/pressure*
- *fix rheo/thermal*
- *fix rheo/viscosity*
- *pair_style rheo*
- *pair_style rheo/solid*
- https://www.lammps.org/movies.html#rheopackage
- examples/rheo

4.1.80 RIGID package

Contents:

Fixes which enforce rigid constraints on collections of atoms or particles. This includes SHAKE and RATTLE, as well as various rigid-body integrators for a few large bodies or many small bodies. Also several computes which calculate properties of rigid bodies.

Supporting info:

- src/RIGID: filenames -> commands
- *compute erotate/rigid*
- *fix shake*
- *fix rattle*
- *fix rigid/**
- examples/ASPHERE
- examples/rigid
- bench/in.rhodo
- https://www.lammps.org/movies.html#box
- https://www.lammps.org/movies.html#star

4.1.81 SCAFACOS package

Contents:

A KSpace style which wraps the ScaFaCoS Coulomb solver library to compute long-range Coulombic interactions.

To use this package you must have the ScaFaCoS library available on your system.

Author: Rene Halver (JSC) wrote the scafacos LAMMPS command.

ScaFaCoS itself was developed by a consortium of German research facilities with a BMBF (German Ministry of Science and Education) funded project in 2009-2012. Participants of the consortium were the Universities of Bonn, Chemnitz, Stuttgart, and Wuppertal as well as the Forschungszentrum Juelich.

Install:

This package has *specific installation instructions* on the *Build extras* page. The SCAFACOS package requires that LAMMPS is build in *MPI parallel mode*.

Supporting info:

- src/SCAFACOS: filenames -> commands
- src/SCAFACOS/README
- *kspace_style scafacos*
- *kspace_modify*
- examples/PACKAGES/scafacos

4.1.82 SHOCK package

Contents:

Fixes for running impact simulations where a shock-wave passes through a material.

Supporting info:

- src/SHOCK: filenames -> commands
- *fix append/atoms*
- *fix msst*
- *fix nphug*
- *fix wall/piston*
- examples/hugoniostat
- examples/msst

4.1.83 SMTBQ package

Contents:

Pair styles which implement Second Moment Tight Binding models. One with QEq charge equilibration (SMTBQ) for the description of ionocovalent bonds in oxides, and two more as plain SMATB models.

Authors: SMTBQ: Nicolas Salles, Emile Maras, Olivier Politano, and Robert Tetot (LAAS-CNRS, France); SMATB: Daniele Rapetti (Politecnico di Torino)

Supporting info:

- src/SMTBQ: filenames -> commands
- src/SMTBQ/README
- *pair_style smtbq*
- *pair_style smatb*, *pair_style smatb/single*
- examples/PACKAGES/smtbq

4.1.84 SPH package

Contents:

An atom style, fixes, computes, and several pair styles which implements smoothed particle hydrodynamics (SPH) for liquids. See the related *MACHDYN package* package for smooth Mach dynamics (SMD) for solids.

This package contains ideal gas, Lennard-Jones equation of states, Tait, and full support for complete (i.e. internal-energy dependent) equations of state. It allows for plain or Monaghans XSPH integration of the equations of motion. It has options for density continuity or density summation to propagate the density field. It has *set* command options to set the internal energy and density of particles from the input script and allows the same quantities to be output with thermodynamic output or to dump files via the *compute property/atom* command.

Author: Georg Ganzenmuller (Fraunhofer-Institute for High-Speed Dynamics, Ernst Mach Institute, Germany).

Supporting info:

- src/SPH: filenames -> commands
- src/SPH/README
- doc/PDF/SPH_LAMMPS_userguide.pdf
- examples/PACKAGES/sph
- https://www.lammps.org/movies.html#sph

> **Note**
>
> Please note that the SPH PDF guide file has not been updated for many years and thus does not reflect the current *syntax* of the SPH package commands. For that please refer to the LAMMPS manual.

> **Note**
>
> Please also note, that the *RHEO package* offers similar functionality in a more modern and flexible implementation.

4.1.85 SPIN package

Contents:

Model atomic magnetic spins classically, coupled to atoms moving in the usual manner via MD. Various pair, fix, and compute styles.

Author: Julien Tranchida (Sandia).

Supporting info:

- src/SPIN: filenames -> commands
- *Howto spins*
- *pair_style spin/dipole/cut*
- *pair_style spin/dipole/long*
- *pair_style spin/dmi*
- *pair_style spin/exchange*
- *pair_style spin/exchange/biquadratic*
- *pair_style spin/magelec*
- *pair_style spin/neel*
- *fix nve/spin*
- *fix langevin/spin*
- *fix precession/spin*
- *compute spin*
- *neb/spin*
- examples/SPIN

4.1.86 SRD package

Contents:

A pair of fixes which implement the Stochastic Rotation Dynamics (SRD) method for coarse-graining of a solvent, typically around large colloidal particles.

Supporting info:

- src/SRD: filenames -> commands
- *fix srd*
- *fix wall/srd*
- examples/srd
- examples/ASPHERE
- https://www.lammps.org/movies.html#tri
- https://www.lammps.org/movies.html#line
- https://www.lammps.org/movies.html#poly

4.1.87 TALLY package

Contents:

Several compute styles that can be called when pairwise interactions are calculated to tally information (forces, heat flux, energy, stress, etc) about individual interactions.

Author: Axel Kohlmeyer (Temple U).

Supporting info:

- src/TALLY: filenames -> commands
- src/TALLY/README
- *compute */tally*
- examples/PACKAGES/tally

4.1.88 UEF package

Contents:

A fix style for the integration of the equations of motion under extensional flow with proper boundary conditions, as well as several supporting compute styles and an output option.

Author: David Nicholson (MIT).

Supporting info:

- src/UEF: filenames -> commands
- src/UEF/README
- *fix nvt/uef*
- *fix npt/uef*
- *compute pressure/uef*
- *compute temp/uef*
- *dump cfg/uef*
- examples/uef

4.1.89 VORONOI package

Contents:

A compute command which calculates the Voronoi tesselation of a collection of atoms by wrapping the Voro++ library. This can be used to calculate the local volume or each atoms or its near neighbors.

To use this package you must have the Voro++ library available on your system.

Author: Daniel Schwen (INL) while at LANL. The open-source Voro++ library was written by Chris Rycroft (Harvard U) while at UC Berkeley and LBNL.

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/VORONOI: filenames -> commands
- src/VORONOI/README
- lib/voronoi/README
- *compute voronoi/atom*
- examples/voronoi

4.1.90 VTK package

Contents:

A *dump vtk* command which outputs snapshot info in the VTK format, enabling visualization by Paraview or other visualization packages.

To use this package you must have VTK library available on your system.

Authors: Richard Berger (JKU) and Daniel Queteschiner (DCS Computing).

Install:

This package has *specific installation instructions* on the *Build extras* page.

Supporting info:

- src/VTK: filenames -> commands
- src/VTK/README
- lib/vtk/README
- *dump vtk*

4.1.91 YAFF package

Contents:

Some potentials that are also implemented in the Yet Another Force Field (YAFF) code. The expressions and their use are discussed in the following papers

- Vanduyfhuys et al., J. Comput. Chem., 36 (13), 1015-1027 (2015) link
- Vanduyfhuys et al., J. Comput. Chem., 39 (16), 999-1011 (2018) link

which discuss the QuickFF methodology.

Author: Steven Vandenbrande.

Added in version 1Feb2019.

Supporting info:

- src/YAFF/README
- *angle_style cross*
- *angle_style mm3*
- *bond_style mm3*
- *improper_style distharm*
- *improper_style sqdistharm*
- *pair_style mm3/switch3/coulgauss/long*
- *pair_style lj/switch3/coulgauss/long*
- examples/PACKAGES/yaff

CHAPTER

FIVE

AUXILIARY TOOLS

LAMMPS is designed to be a computational kernel for performing molecular dynamics computations. Additional pre- and post-processing steps are often necessary to setup and analyze a simulation. A list of such tools can be found on the LAMMPS webpage at these links:

- Pre/Post processing
- External LAMMPS packages & tools
- Pizza.py toolkit

The last link for Pizza.py is a Python-based tool developed at Sandia which provides tools for doing setup, analysis, plotting, and visualization for LAMMPS simulations.

Additional tools included in the LAMMPS distribution are described on this page.

Note that many users write their own setup or analysis tools or use other existing codes and convert their output to a LAMMPS input format or vice versa. The tools listed here are included in the LAMMPS distribution as examples of auxiliary tools. Some of them are not actively supported by the LAMMPS developers, as they were contributed by LAMMPS users. If you have problems using them, we can direct you to the authors.

The source code for each of these codes is in the tools subdirectory of the LAMMPS distribution. There is a Makefile (which you may need to edit for your platform) which will build several of the tools which reside in that directory. Most of them are larger packages in their own subdirectories with their own Makefiles and/or README files.

5.1 Pre-processing tools

5.4 Tool descriptions

5.4.1 amber2lmp tool

The amber2lmp subdirectory contains three Python scripts for converting files back-and-forth between the AMBER MD code and LAMMPS. See the README file in amber2lmp for more information.

These tools were written by Keir Novik while he was at Queen Mary University of London. Keir is no longer there and cannot support these tools which are out-of-date with respect to the current LAMMPS version (and maybe with respect to AMBER as well). Since we don't use these tools at Sandia, you will need to experiment with them and make necessary modifications yourself.

5.4.2 binary2txt tool

The file binary2txt.cpp converts one or more binary LAMMPS dump file into ASCII text files. The syntax for running the tool is

```
binary2txt file1 file2 ...
```

which creates file1.txt, file2.txt, etc. This tool must be compiled on a platform that can read the binary file created by a LAMMPS run, since binary files are not compatible across all platforms.

5.4.3 ch2lmp tool

The ch2lmp subdirectory contains tools for converting files back-and-forth between the CHARMM MD code and LAMMPS.

They are intended to make it easy to use CHARMM as a builder and as a post-processor for LAMMPS. Using charmm2lammps.pl, you can convert a PDB file with associated CHARMM info, including CHARMM force field data, into its LAMMPS equivalent. Support for the CMAP correction of CHARMM22 and later is available as an option. This tool can also add solvent water molecules and Na+ or Cl- ions to the system. Using lammps2pdb.pl you can convert LAMMPS atom dumps into PDB files.

See the README file in the ch2lmp subdirectory for more information.

These tools were created by Pieter in't Veld (pjintve at sandia.gov) and Paul Crozier (pscrozi at sandia.gov) at Sandia.

CMAP support added and tested by Xiaohu Hu (hux2 at ornl.gov) and Robert A. Latour (latourr at clemson.edu), David Hyde-Volpe, and Tigran Abramyan, (Clemson University) and Chris Lorenz (chris.lorenz at kcl.ac.uk), King's College London.

5.4.4 chain tool

The file chain.f90 creates a LAMMPS data file containing bead-spring polymer chains and/or monomer solvent atoms. It uses a text file containing chain definition parameters as an input. The created chains and solvent atoms can strongly overlap, so LAMMPS needs to run the system initially with a "soft" pair potential to un-overlap it. The syntax for running the tool is

```
chain < def.chain > data.file
```

See the def.chain or def.chain.ab files in the tools directory for examples of definition files. This tool was used to create the system for the *chain benchmark*.

5.4.5 LAMMPS coding standard

The coding_standard folder contains multiple python scripts to check for and apply some LAMMPS coding conventions. The following scripts are available:

```
permissions.py   # detects if sources have executable permissions and scripts have not
whitespace.py    # detects TAB characters and trailing whitespace
homepage.py      # detects outdated LAMMPS homepage URLs (pointing to sandia.gov instead of
↪lammps.org)
errordocs.py     # detects deprecated error docs in header files
versiontags.py   # detects .. versionadded:: or .. versionchanged:: with pending version date
```

The tools need to be given the main folder of the LAMMPS distribution or individual file names as argument and will by default check them and report any non-compliance. With the optional -f argument the corresponding script will try to change the non-compliant file(s) to match the conventions.

For convenience this scripts can also be invoked by the make file in the src folder with, *make check-whitespace* or *make fix-whitespace* to either detect or edit the files. Correspondingly for the other python scripts. *make check* will run all checks.

5.4.6 colvars tools

The colvars directory contains a collection of tools for post-processing data produced by the colvars collective variable library. To compile the tools, edit the makefile for your system and run "make".

Please report problems and issues the colvars library and its tools at: https://github.com/colvars/colvars/issues

abf_integrate:

MC-based integration of multidimensional free energy gradient Version 20110511

./abf_integrate < filename > [-n < nsteps >] [-t < temp >] [-m [0|1] (metadynamics)] [-h < hill_height >
↪] [-f < variable_hill_factor >]

The LAMMPS interface to the colvars collective variable library, as well as these tools, were created by Axel Kohlmeyer (akohlmey at gmail.com) while at ICTP, Italy.

5.4.7 createatoms tool

The tools/createatoms directory contains a Fortran program called createAtoms.f which can generate a variety of interesting crystal structures and geometries and output the resulting list of atom coordinates in LAMMPS or other formats.

See the included Manual.pdf for details.

The tool is authored by Xiaowang Zhou (Sandia), xzhou at sandia.gov.

5.4.8 drude tool

The tools/drude directory contains a Python script called polarizer.py which can add Drude oscillators to a LAMMPS data file in the required format.

See the header of the polarizer.py file for details.

The tool is authored by Agilio Padua and Alain Dequidt: agilio.padua at ens-lyon.fr, alain.dequidt at uca.fr

---

5.4.9 eam database tool

The tools/eam_database directory contains a Fortran and a Python program that will generate EAM alloy setfl potential files for any combination of the 17 elements: Cu, Ag, Au, Ni, Pd, Pt, Al, Pb, Fe, Mo, Ta, W, Mg, Co, Ti, Zr, Cr. The files can then be used with the *pair_style eam/alloy* command.

The Fortran version of the tool was authored by Xiaowang Zhou (Sandia), xzhou at sandia.gov, with updates from Lucas Hale (NIST) lucas.hale at nist.gov and is based on his paper:

X. W. Zhou, R. A. Johnson, and H. N. G. Wadley, Phys. Rev. B, 69, 144113 (2004).

The parameters for Cr were taken from:

Lin Z B, Johnson R A and Zhigilei L V, Phys. Rev. B 77 214108 (2008).

The Python version of the tool was authored by Germain Clavier (Unicaen) germain.clavier at unicaen.fr

> **Note**
>
> The parameters in the database are only optimized for individual elements. The mixed parameters for interactions between different elements generated by this tool are derived from simple mixing rules and are thus inferior to parameterizations that are specifically optimized for specific mixtures and combinations of elements.

5.4.10 eam generate tool

The tools/eam_generate directory contains several one-file C programs that convert an analytic formula into a tabulated *embedded atom method (EAM)* setfl potential file. The potentials they produce are in the potentials directory, and can be used with the *pair_style eam/alloy* command.

The source files and potentials were provided by Gerolf Ziegenhain (gerolf at ziegenhain.com).

5.4.11 eff tool

The tools/eff directory contains various scripts for generating structures and post-processing output for simulations using the electron force field (eFF).

These tools were provided by Andres Jaramillo-Botero at CalTech (ajaramil at wag.caltech.edu).

5.4.12 emacs tool

The tools/emacs directory contains an Emacs Lisp add-on file for GNU Emacs that enables a lammps-mode for editing input scripts when using GNU Emacs, with various highlighting options set up.

These tools were provided by Aidan Thompson at Sandia (athomps at sandia.gov).

5.4.13 fep tool

The tools/fep directory contains Python scripts useful for post-processing results from performing free-energy perturbation simulations using the FEP package.

The scripts were contributed by Agilio Padua (ENS de Lyon), agilio.padua at ens-lyon.fr.

See README file in the tools/fep directory.

5.4.14 i-PI tool

Changed in version 27June2024.

The tools/i-pi directory used to contain a bundled version of the i-PI software package for use with LAMMPS. This version, however, was removed in 06/2024.

The i-PI package was created and is maintained by Michele Ceriotti, michele.ceriotti at gmail.com, to interface to a variety of molecular dynamics codes.

i-PI is now available via PyPI using the pip package manager at: https://pypi.org/project/ipi/

Here are the commands to set up a virtual environment and install i-PI into it with all its dependencies.

```
python -m venv ipienv
source ipienv/bin/activate
pip install --upgrade pip
pip install ipi
```

To install the development version from GitHub, please use:

```
pip install git+https://github.com/i-pi/i-pi.git
```

For further information, please consult the [i-PI home page](https://ipi-code.org).

5.4.15 ipp tool

The tools/ipp directory contains a Perl script ipp which can be used to facilitate the creation of a complicated file (say, a LAMMPS input script or tools/createatoms input file) using a template file.

ipp was created and is maintained by Reese Jones (Sandia), rjones at sandia.gov.

See two examples in the tools/ipp directory. One of them is for the tools/createatoms tool's input file.

5.4.16 JSON support files

Added in version 12June2025.

The tools/json directory contains files and tools to support using JSON format files in LAMMPS. Currently only the *molecule command* supports files in JSON format directly, but this is planned to be expanded in the future.

JSON file validation

The JSON syntax is independent of its content, and thus the data in the file must follow suitable conventions to be correctly parsed during input. This can be done in a portable fashion using a JSON schema file (which is in JSON format as well) to define those conventions. A suitable JSON validator software can then validate JSON files against the requirements. Validating a particular JSON file against a schema ensures that both, the syntax *and* the conventions are followed. This is useful when writing or editing JSON files in a text editor or when writing a pre-processing script or tool to create JSON files for a specific purpose in LAMMPS. It **cannot** check whether the file contents are physically meaningful, though.

One such validator tool is check-jsonschema which is written in Python and can be installed using the pip Python package manager, best in a virtual environment as shown below (for a Bourne Shell command line):

```
python -m venv validate-json
source validate-json/bin/activate
pip install --upgrade pip
pip install check-jsonschema
```

To validate a specific JSON file against a provided schema (here for a *molecule command file* you would then run for example:

```
check-jsonschema --schemafile molecule-schema.json tip3p.json
```

The latest schema files are also maintained and available for download at https://download.lammps.org/json/ . This enables validation of JSON files even if the LAMMPS sources are not locally available. Example:

```
check-jsonschema --schemafile https://download.lammps.org/json/molecule-schema.json tip3p.json
```

JSON file format normalization

There are extensions to the strict JSON format that allow for comments or ignore additional (dangling) commas. The reformat-json.cpp tool will read JSON files in relaxed format, but write it out in strict format. It is also possible to change the level of indentation from -1 (all data one long line) to any positive integer value. The original file will be backed up (.bak added to file name) and then overwritten.

Manual compilation (it will be automatically included in the CMake build if building tools is requested during CMake configuration):

```
g++ -I <path/to/lammps/src> -o reformat-json reformat-json.cpp
```

Usage:

```
reformat-json <indent-width> <json-file-1> [<json-file-2> ...]
```

5.4.17 kate tool

The file in the tools/kate directory is an add-on to the Kate editor in the KDE suite that allow syntax highlighting of LAMMPS input scripts. See the README.txt file for details.

The file was provided by Alessandro Luigi Sellerio (alessandro.sellerio at ieni.cnr.it).

5.4.18 LAMMPS-GUI

Changed in version 10Sep2025.

LAMMPS-GUI is a graphical text editor customized for editing LAMMPS input files that is linked to the *LAMMPS C-library*. It used to be included with LAMMPS in the tools/lammps-gui folder, but it is now hosted in its own git repository at https://github.com/akohlmey/lammps-gui/ and the online documentation is at https://lammps-gui.lammps.org/

It is still possible to compile *LAMMPS-GUI together with LAMMPS*.

5.4.19 lmp2arc tool

The lmp2arc subdirectory contains a tool for converting LAMMPS output files to the format for Accelrys' Insight MD code (formerly MSI/Biosym and its Discover MD code). See the README file for more information.

This tool was written by John Carpenter (Cray), Michael Peachey (Cray), and Steve Lustig (Dupont). John is now at the Mayo Clinic (jec at mayo.edu), but still fields questions about the tool.

This tool was updated for the current LAMMPS C++ version by Jeff Greathouse at Sandia (jagreat at sandia.gov).

5.4.20 lmp2cfg tool

The lmp2cfg subdirectory contains a tool for converting LAMMPS output files into a series of *.cfg files which can be read into the AtomEye visualizer. See the README file for more information.

This tool was written by Ara Kooser at Sandia (askoose at sandia.gov).

5.4.21 Magic patterns for the "file" command

Added in version 10Mar2021.

The file magic contains patterns that are used by the file program available on most Unix-like operating systems which enables it to detect various LAMMPS files and print some useful information about them. To enable these patterns, append or copy the contents of the file to either the file .magic in your home directory or (as administrator) to /etc/magic (for a system-wide installation). Afterwards the file command should be able to detect most LAMMPS restarts, dump, data and log files. Examples:

```
$ file *.*
dihedral-quadratic.restart:   LAMMPS binary restart file (rev 2), Version 10 Mar 2021, Little Endian
mol-pair-wf_cut.restart:      LAMMPS binary restart file (rev 2), Version 24 Dec 2020, Little Endian
atom.bin:                     LAMMPS atom style binary dump (rev 2), Little Endian, First time step: 445570
custom.bin:                   LAMMPS custom style binary dump (rev 2), Little Endian, First time step: 100
bn1.lammpstrj:                LAMMPS text mode dump, First time step: 5000
data.fourmol:                 LAMMPS data file written by LAMMPS
pnc.data:                     LAMMPS data file written by msi2lmp
data.spce:                    LAMMPS data file written by TopoTools
B.data:                       LAMMPS data file written by OVITO
log.lammps:                   LAMMPS log file written by version 10 Feb 2021
```

5.4.22 matlab tool

The matlab subdirectory contains several MATLAB scripts for post-processing LAMMPS output. The scripts include readers for log and dump files, a reader for EAM potential files, and a converter that reads LAMMPS dump files and produces CFG files that can be visualized with the AtomEye visualizer.

See the README.pdf file for more information.

These scripts were written by Arun Subramaniyan at Purdue Univ (asubrama at purdue.edu).

5.4.23 micelle2d tool

The file micelle2d.f creates a LAMMPS data file containing short lipid chains in a monomer solution. It uses a text file containing lipid definition parameters as an input. The created molecules and solvent atoms can strongly overlap, so LAMMPS needs to run the system initially with a "soft" pair potential to un-overlap it. The syntax for running the tool is

```
micelle2d < def.micelle2d > data.file
```

See the def.micelle2d file in the tools directory for an example of a definition file. This tool was used to create the system for the *micelle example*.

5.4.24 moltemplate tool

The moltemplate subdirectory contains instructions for installing moltemplate, a Python-based tool for building molecular systems based on a text-file description, and creating LAMMPS data files that encode their molecular topology as lists of bonds, angles, dihedrals, etc. See the README.txt file for more information.

This tool was written by Andrew Jewett (jewett.aij at gmail.com), who supports it. It has its own WWW page at https://moltemplate.org. The latest sources can be found on its GitHub page

5.4.25 msi2lmp tool

The msi2lmp subdirectory contains a tool for creating LAMMPS template input and data files from BIOVIA's Materias Studio files (formerly Accelrys' Insight MD code, formerly MSI/Biosym and its Discover MD code).

This tool was written by John Carpenter (Cray), Michael Peachey (Cray), and Steve Lustig (Dupont). Several people contributed changes to remove bugs and adapt its output to changes in LAMMPS.

This tool has several known limitations and is no longer under active development, so there are no changes except for the occasional bug fix.

See the README file in the tools/msi2lmp folder for more information.

5.4.26 Scripts for building LAMMPS when offline

In some situations it might be necessary to build LAMMPS on a system without direct internet access. The scripts in tools/offline folder allow you to pre-load external dependencies for both the documentation build and for building LAMMPS with CMake.

It does so by

1. downloading necessary pip packages,
2. cloning git repositories
3. downloading tarballs

to a designated cache folder.

As of April 2021, all of these downloads make up around 600MB. By default, the offline scripts will download everything into the $HOME/.cache/lammps folder, but this can be changed by setting the LAMMPS_CACHING_DIR environment variable.

Once the caches have been initialized, they can be used for building the LAMMPS documentation or compiling LAMMPS using CMake on an offline system.

The use_caches.sh script must be sourced into the current shell to initialize the offline build environment. Note that it must use the same LAMMPS_CACHING_DIR. This script does the following:

1. Set up environment variables that modify the behavior of both, pip and git
2. Start a simple local HTTP server using Python to host files for CMake

Afterwards, it will print out instruction on how to modify the CMake commands to make sure it uses the local HTTP server.

To undo the environment changes and shutdown the local HTTP server, run the deactivate_caches command.

Examples

For all of the examples below, you first need to create the cache, which requires an internet connection.

```
./tools/offline/init_caches.sh
```

Afterwards, you can disconnect or copy the contents of the LAMMPS_CACHING_DIR folder to an offline system.

Documentation Build

The documentation build will create a new virtual environment that typically first installs dependencies from pip. With the offline environment loaded, these installations will instead grab the necessary packages from your local cache.

```
# if LAMMPS_CACHING_DIR is different from default, make sure to set it first
# export LAMMPS_CACHING_DIR=path/to/folder
source tools/offline/use_caches.sh
cd doc/
make html

deactivate_caches
```

CMake Build

When compiling certain packages with external dependencies, the CMake build system will download necessary files or sources from the web. For more flexibility the CMake configuration allows users to specify the URL of each of these dependencies. What the init_caches.sh script does is create a CMake "preset" file, which sets the URLs for all of the known dependencies and redirects the download to the local cache.

```
# if LAMMPS_CACHING_DIR is different from default, make sure to set it first
# export LAMMPS_CACHING_DIR=path/to/folder
source tools/offline/use_caches.sh

mkdir build
cd build
cmake -D LAMMPS_DOWNLOADS_URL=${HTTP_CACHE_URL} -C "${LAMMPS_HTTP_
↪CACHE_CONFIG}" -C ../cmake/presets/most.cmake -D DOWNLOAD_POTENTIALS=off ../cmake
make -j 8

deactivate_caches
```

5.4.27 phonon tool

The phonon subdirectory contains a post-processing tool, *phana*, useful for analyzing the output of the *fix phonon* command in the PHONON package.

See the README file for instruction on building the tool and what library it needs. And see the examples/PACKAGES/phonon directory for example problems that can be post-processed with this tool.

This tool was written by Ling-Ti Kong at Shanghai Jiao Tong University.

5.4.28 polybond tool

The polybond subdirectory contains a Python-based tool useful for performing "programmable polymer bonding". The Python file lmpsdata.py provides a "Lmpsdata" class with various methods which can be invoked by a user-written Python script to create data files with complex bonding topologies.

See the Manual.pdf for details and example scripts.

This tool was written by Zachary Kraus at Georgia Tech.

5.4.29 pymol_asphere tool

The pymol_asphere subdirectory contains a tool for converting a LAMMPS dump file that contains orientation info for ellipsoidal particles into an input file for the PyMol visualization package or its open source variant.

Specifically, the tool triangulates the ellipsoids so they can be viewed as true ellipsoidal particles within PyMol. See the README and examples directory within pymol_asphere for more information.

This tool was written by Mike Brown at Sandia.

5.4.30 python tool

The python subdirectory contains several Python scripts that perform common LAMMPS post-processing tasks, such as:

- extract thermodynamic info from a log file as columns of numbers
- plot two columns of thermodynamic info from a log file using GnuPlot
- sort the snapshots in a dump file by atom ID
- convert multiple *NEB* dump files into one dump file for viz
- convert dump files into XYZ, CFG, or PDB format for viz by other packages

These are simple scripts built on Pizza.py modules. See the README for more info on Pizza.py and how to use these scripts.

5.4.31 Regression tester tool

The regression-tests subdirectory contains a tool for performing regression tests with a given LAMMPS binary. The tool launches the LAMMPS binary with any given input script under one of the *examples* subdirectories, and compares the thermo output in the generated log file with those in the provided log file with the same number of processors in the same subdirectory. If the differences between the actual and reference values are within specified tolerances, the test is considered passed. For each test batch, that is, a set of example input scripts, the mpirun command, the LAMMPS command-line arguments, and the tolerances for individual thermo quantities can be specified in a configuration file in YAML format.

The tool also reports if and how the run fails, and if a reference log file is missing. See the README file for more information.

This tool was written by Trung Nguyen at U of Chicago (ndactrung at gmail.com).

5.4.32 replica tool

The tools/replica directory contains the reorder_remd_traj python script which can be used to reorder the replica trajectories (resulting from the use of the temper command) according to temperature. This will produce discontinuous trajectories with all frames at the same temperature in each trajectory. Additional options can be used to calculate the canonical configurational log-weight for each frame at each temperature using the pymbar package. See the README.md file for further details. Try out the peptide example provided.

This tool was written by (and is maintained by) Tanmoy Sanyal, while at the Shell lab at UC Santa Barbara. (tanmoy dot 7989 at gmail.com)

5.4.33 smd tool

The smd subdirectory contains a C++ file dump2vtk_tris.cpp and Makefile which can be compiled and used to convert triangle output files created by the Smooth-Mach Dynamics (MACHDYN) package into a VTK-compatible unstructured grid file. It could then be read in and visualized by VTK.

See the header of dump2vtk.cpp for more details.

This tool was written by the MACHDYN package author, Georg Ganzenmuller at the Fraunhofer-Institute for High-Speed Dynamics, Ernst Mach Institute in Germany (georg.ganzenmueller at emi.fhg.de).

5.4.34 spin tool

The spin subdirectory contains a C file interpolate.c which can be compiled and used to perform a cubic polynomial interpolation of the MEP following a GNEB calculation.

See the README file in tools/spin/interpolate_gneb for more details.

This tool was written by the SPIN package author, Julien Tranchida at Sandia National Labs (jtranch at sandia.gov, and by Aleksei Ivanov, at University of Iceland (ali5 at hi.is).

5.4.35 singularity/apptainer tool

The singularity subdirectory contains container definitions files that can be used to build container images for building and testing LAMMPS on specific OS variants using the Apptainer or Singularity container software. Contributions for additional variants are welcome. For more details please see the README.md file in that folder.

5.4.36 stl_bin2txt tool

The file stl_bin2txt.cpp converts binary STL files - like they are frequently offered for download on the web - into ASCII format STL files that LAMMPS can read with the *create_atoms mesh* or the *fix smd/wall_surface* commands. The syntax for running the tool is

```
stl_bin2txt infile.stl outfile.stl
```

which creates outfile.stl from infile.stl. This tool must be compiled on a platform compatible with the byte-ordering that was used to create the binary file. This usually is a so-called little endian hardware (like x86).

5.4.37 SWIG interface

The SWIG tool offers a mostly automated way to incorporate compiled code modules into scripting languages. It processes the function prototypes in C and generates wrappers for a wide variety of scripting languages from it. Thus it can also be applied to the *C language library interface* of LAMMPS so that build a wrapper that allows to call LAMMPS from programming languages like: C#/Mono, Lua, Java, JavaScript, Perl, Python, R, Ruby, Tcl, and more.

What is included

We provide here an "interface file", lammps.i, that has the content of the library.h file adapted so SWIG can process it. That will create wrappers for all the functions that are present in the LAMMPS C library interface. Please note that not all kinds of C functions can be automatically translated, so you would have to add custom functions to be able to utilize those where the automatic translation does not work. A few functions for converting pointers and accessing arrays are predefined. We provide the file here on an "as is" basis to help people getting started, but not as a fully tested and supported feature of the LAMMPS distribution. Any contributions to complete this are, of course, welcome. Please also note, that for the case of creating a Python wrapper, a fully supported *Ctypes based lammps module* already exists. That module is designed to be object-oriented while SWIG will generate a 1:1 translation of the functions in the interface file.

Building the wrapper

When using CMake, the build steps for building a wrapper module are integrated for the languages: Java, Lua, Perl5, Python, Ruby, and Tcl. These require that the LAMMPS library is build as a shared library and all necessary development headers and libraries are present.

```
-D WITH_SWIG=on          # to enable building any SWIG wrapper
-D BUILD_SWIG_JAVA=on    # to enable building the Java wrapper
-D BUILD_SWIG_LUA=on     # to enable building the Lua wrapper
-D BUILD_SWIG_PERL5=on   # to enable building the Perl 5.x wrapper
-D BUILD_SWIG_PYTHON=on  # to enable building the Python wrapper
-D BUILD_SWIG_RUBY=on    # to enable building the Ruby wrapper
-D BUILD_SWIG_TCL=on     # to enable building the Tcl wrapper
```

Manual building allows a little more flexibility. E.g. one can choose the name of the module and build and use a dynamically loaded object for Tcl with:

```
swig -tcl -module tcllammps lammps.i
gcc -fPIC -shared $(pkg-config tcl --cflags) -o tcllammps.so \
          lammps_wrap.c -L ../src/ -llammps
tclsh
```

Or one can build an extended Tcl shell command with the wrapped functions included with:

```
swig -tcl -module tcllmps lammps_shell.i
gcc -o tcllmpsh lammps_wrap.c -Xlinker -export-dynamic \
        -DHAVE_CONFIG_H $(pkg-config tcl --cflags) \
        $(pkg-config tcl --libs) -L ../src -llammps
```

In both cases it is assumed that the LAMMPS library was compiled as a shared library in the src folder. Otherwise the last part of the commands needs to be adjusted.

Utility functions

Definitions for several utility functions required to manage and access data passed or returned as pointers are included in the lammps.i file. So most of the functionality of the library interface should be accessible. What works and what does not depends a bit on the individual language for which the wrappers are built and how well SWIG supports those. The SWIG documentation has very detailed instructions and recommendations.

Usage examples

The tools/swig folder has multiple shell scripts, run_<name>_example.sh that will create a small example script and demonstrate how to load the wrapper and run LAMMPS through it in the corresponding programming language.

For illustration purposes below is a part of the Tcl example script.

```
load ./tcllammps.so
set lmp [lammps_open_no_mpi 0 NULL NULL]
lammps_command $lmp "units real"
lammps_command $lmp "lattice fcc 2.5"
lammps_command $lmp "region box block -5 5 -5 5 -5 5"
lammps_command $lmp "create_box 1 box"
lammps_command $lmp "create_atoms 1 box"

set dt [doublep_value [voidp_to_doublep [lammps_extract_global $lmp dt]]]
puts "LAMMPS version $ver"
puts [format "Number of created atoms: %g" [lammps_get_natoms $lmp]]
puts "Current size of timestep: $dt"
puts "LAMMPS version: [lammps_version $lmp]"
lammps_close $lmp
```

5.4.38 tabulate tool

Added in version 22Dec2022.

The tabulate folder contains Python scripts scripts to generate and visualize tabulated potential files for LAMMPS. The bulk of the code is in the tabulate module in the tabulate.py file. Some example files demonstrating its use are included. See the README file for more information.

5.4.39 tinker tool

The tinker folder contains Python scripts scripts to convert Tinker input files to LAMMPS.

See the README file for more information.

Those scripts were written by Steve Plimpton sjplimp at gmail.com

---

5.4.40 valgrind tool

The valgrind folder contains additional suppressions for LAMMPS when using valgrind's ` memcheck tool to search for memory access violation and memory leaks. These suppressions are automatically invoked when running tests through CMake "ctest -T memcheck". See the instruction in the README file to add these suppressions when using valgrind with LAMMPS or other programs.

5.4.41 vim tool

The files in the tools/vim directory are add-ons to the VIM editor that allow easier editing of LAMMPS input scripts. See the README.txt file for details.

These files were provided by Gerolf Ziegenhain (gerolf at ziegenhain.com)

5.4.42 xmgrace tool

The files in the tools/xmgrace directory can be used to plot the thermodynamic data in LAMMPS log files via the xmgrace plotting package. There are several tools in the directory that can be used in post-processing mode. The lammpsplot.cpp file can be compiled and used to create plots from the current state of a running LAMMPS simulation.

See the README file for details.

These files were provided by Vikas Varshney (vv0210 at gmail.com)

CHAPTER

SIX

RUN LAMMPS

These pages explain how to run LAMMPS once you have *installed an executable* or *downloaded the source code* and *built an executable*. The *Commands* doc page describes how input scripts are structured and the commands they can contain.

6.1 Basics of running LAMMPS

LAMMPS is run from the command-line, reading commands from a file via the -in command-line flag, or from standard input. Using the -in in.file variant is recommended (see note below). The name of the LAMMPS executable is either lmp or lmp_<machine> with *<machine>* being the machine string used when compiling LAMMPS. This is required when compiling LAMMPS with the traditional build system (e.g. with make mpi), but optional when using CMake to configure and build LAMMPS:

```
lmp_serial -in in.file
lmp_serial < in.file
lmp -in in.file
lmp < in.file
/path/to/lammps/src/lmp_serial -i in.file
mpirun -np 4 lmp_mpi -in in.file
mpiexec -np 4 lmp -in in.file
mpirun -np 8 /path/to/lammps/src/lmp_mpi -in in.file
mpiexec -n 6 /usr/local/bin/lmp -in in.file
```

You normally run the LAMMPS command in the directory where your input script is located. That is also where output files are produced by default, unless you provide specific other paths in your input script or on the command-line. As in some of the examples above, the LAMMPS executable itself can be placed elsewhere.

Note

The redirection operator "<" will not always work when running in parallel with mpirun or mpiexec; for those systems the -in form is required.

As LAMMPS runs it prints info to the screen and a logfile named log.lammps. More info about output is given on the *screen and logfile output* page.

If LAMMPS encounters errors in the input script or while running a simulation it will print an ERROR message and stop or a WARNING message and continue. See the *Common Problems* page for a discussion of the various kinds of errors LAMMPS can or can't detect, a list of all ERROR and WARNING messages, and what to do about them.

LAMMPS can run the same problem on any number of processors, including a single processor. In theory you should get identical answers on any number of processors and on any machine. In practice, numerical round-off due to using floating-point math can cause slight differences and an eventual divergence of molecular dynamics trajectories. See the *Errors common* page for discussion of this.

LAMMPS can run as large a problem as will fit in the physical memory of one or more processors. If you run out of memory, you must run on more processors or define a smaller problem. The amount of memory needed and how well it can be distributed across processors may vary based on the models and settings and commands used.

If you run LAMMPS in parallel via mpirun, you should be aware of the *processors* command, which controls how MPI tasks are mapped to the simulation box, as well as mpirun options that control how MPI tasks are assigned to physical cores of the node(s) of the machine you are running on. These settings can improve performance, though the defaults are often adequate.

For example, it is often important to bind MPI tasks (processes) to physical cores (processor affinity), so that the operating system does not migrate them during a simulation. If this is not the default behavior on your machine, the mpirun option --bind-to core (OpenMPI) or -bind-to core (MPICH) can be used.

If the LAMMPS command(s) you are using support multi-threading, you can set the number of threads per MPI task via the environment variable OMP_NUM_THREADS, before you launch LAMMPS:

```
export OMP_NUM_THREADS=2    # bash
setenv OMP_NUM_THREADS 2    # csh or tcsh
```

This can also be done via the *package* command or via the *-pk command-line switch* which invokes the package command. See the *package* command or *Speed* doc pages for more details about which accelerator packages and which commands support multi-threading.

You can experiment with running LAMMPS using any of the input scripts provided in the examples or bench directory. Input scripts are named in.* and sample outputs are named log.*.P where P is the number of processors it was run on.

Some of the examples or benchmarks require LAMMPS to be built with optional packages.

6.2 Command-line options

At run time, LAMMPS recognizes several optional command-line switches which may be used in any order. Either the full word or a one or two letter abbreviation can be used:

- *-e or -echo*
- *-h or -help*
- *-i or -in*
- *-k or -kokkos*
- *-l or -log*
- *-mdi*
- *-m or -mpicolor*
- *-c or -cite*
- *-nc or -nocite*
- *-nb or -nonbuf*
- *-pk or -package*
- *-p or -partition*

- *-pl or -plog*
- *-ps or -pscreen*
- *-ro or -reorder*
- *-r2data or -restart2data*
- *-r2dump or -restart2dump*
- *-r2info or -restart2info*
- *-sc or -screen*
- *-sr or skiprun*
- *-sf or -suffix*
- *-v or -var*

For example, the lmp_mpi executable might be launched as follows:

```
mpirun -np 16 lmp_mpi -v f tmp.out -l my.log -sc none -i in.alloy
mpirun -np 16 lmp_mpi -var f tmp.out -log my.log -screen none -in in.alloy
```

-echo style

Set the style of command echoing. The style can be *none* or *screen* or *log* or *both*. Depending on the style, each command read from the input script will be echoed to the screen and/or logfile. This can be useful to figure out which line of your script is causing an input error. The default value is *log*. The echo style can also be set by using the *echo* command in the input script itself.

-help

Print a brief help summary and a list of options compiled into this executable for each LAMMPS style (atom_style, fix, compute, pair_style, bond_style, etc). This can tell you if the command you want to use was included via the appropriate package at compile time. LAMMPS will print the info and immediately exit if this switch is used.

-in file

Specify a file to use as an input script. This is an optional but recommended switch when running LAMMPS in one-partition mode. If it is not specified, LAMMPS reads its script from standard input, typically from a script via I/O redirection; e.g. lmp_linux < in.run. With many MPI implementations I/O redirection also works in parallel, but using the -in flag will always work.

Note that this is a required switch when running LAMMPS in multi-partition mode, since multiple processors cannot all read from stdin concurrently. The file name may be "none" for starting multi-partition calculations without reading an initial input file from the library interface.

-kokkos on/off keyword/value ...

Explicitly enable or disable KOKKOS support, as provided by the KOKKOS package. Even if LAMMPS is built with this package, as described in the *the KOKKOS package page*, this switch must be set to enable running with KOKKOS-enabled styles the package provides. If the switch is not set (the default), LAMMPS will operate as if the KOKKOS package were not installed; i.e. you can run standard LAMMPS or with the GPU or OPENMP packages, for testing or benchmarking purposes.

Additional optional keyword/value pairs can be specified which determine how Kokkos will use the underlying hardware on your platform. These settings apply to each MPI task you launch via the mpirun or mpiexec command. You may choose to run one or more MPI tasks per physical node. Note that if you are running on a desktop machine, you typically have one physical node. On a cluster or supercomputer there may be dozens or 1000s of physical nodes.

Either the full word or an abbreviation can be used for the keywords. Note that the keywords do not use a leading minus sign. I.e. the keyword is "t", not "-t". Also note that each of the keywords has a default setting. Examples of when to use these options and what settings to use on different platforms is given on the *KOKKOS package* doc page.

- d or device
- g or gpus
- t or threads

```
device Nd
```

This option is only relevant if you built LAMMPS with CUDA=yes, you have more than one GPU per node, and if you are running with only one MPI task per node. The Nd setting is the ID of the GPU on the node to run on. By default Nd = 0. If you have multiple GPUs per node, they have consecutive IDs numbered as 0,1,2,etc. This setting allows you to launch multiple independent jobs on the node, each with a single MPI task per node, and assign each job to run on a different GPU.

```
gpus Ng Ns
```

This option is only relevant if you built LAMMPS with CUDA=yes, you have more than one GPU per node, and you are running with multiple MPI tasks per node (up to one per GPU). The Ng setting is how many GPUs you will use. The Ns setting is optional. If set, it is the ID of a GPU to skip when assigning MPI tasks to GPUs. This may be useful if your desktop system reserves one GPU to drive the screen and the rest are intended for computational work like running LAMMPS. By default Ng = 1 and Ns is not set.

Depending on which flavor of MPI you are running, LAMMPS will look for one of these 4 environment variables

```
SLURM_LOCALID (various MPI variants compiled with SLURM support)
MPT_LRANK (HPE MPI)
MV2_COMM_WORLD_LOCAL_RANK (Mvapich)
OMPI_COMM_WORLD_LOCAL_RANK (OpenMPI)
```

which are initialized by the srun, mpirun, or mpiexec commands. The environment variable setting for each MPI rank is used to assign a unique GPU ID to the MPI task.

```
threads Nt
```

This option assigns Nt number of threads to each MPI task for performing work when Kokkos is executing in OpenMP or pthreads mode. The default is Nt = 1, which essentially runs in MPI-only mode. If there are Np MPI tasks per physical node, you generally want Np*Nt = the number of physical cores per node, to use your available hardware optimally. This also sets the number of threads used by the host when LAMMPS is compiled with CUDA=yes.

Deprecated since version 22Dec2022.

Support for the "numa" or "n" option was removed as its functionality was ignored in Kokkos for some time already.

-log file

Specify a log file for LAMMPS to write status information to. In one-partition mode, if the switch is not used, LAMMPS writes to the file log.lammps. If this switch is used, LAMMPS writes to the specified file. In multi-partition mode, if the switch is not used, a log.lammps file is created with high-level status information. Each partition also writes to a log.lammps.N file where N is the partition ID. If the switch is specified in multi-partition mode, the high-level logfile

is named "file" and each partition also logs information to a file.N. For both one-partition and multi-partition mode, if the specified file is "none", then no log files are created. Using a *log* command in the input script will override this setting. Option -plog will override the name of the partition log files file.N.

-mdi 'multiple flags'

This flag is only recognized and used when LAMMPS has support for the MolSSI Driver Interface (MDI) included as part of the *MDI* package. This flag is specific to the MDI library and controls how LAMMPS interacts with MDI. There are usually multiple flags that have to follow it and those have to be placed in quotation marks. For more information about how to launch LAMMPS in MDI client/server mode please refer to the *MDI Howto*.

-mpicolor color

If used, this must be the first command-line argument after the LAMMPS executable name. It is only used when LAMMPS is launched by an mpirun command which also launches another executable(s) at the same time. (The other executable could be LAMMPS as well.) The color is an integer value which should be different for each executable (another application may set this value in a different way). LAMMPS and the other executable(s) perform an MPI_Comm_split() with their own colors to shrink the MPI_COMM_WORLD communication to be the subset of processors they are actually running on.

-cite style or **file name**

Select how and where to output a reminder about citing contributions to the LAMMPS code that were used during the run. Available keywords for styles are "both", "none", "screen", or "log". Any other keyword will be considered a file name to write the detailed citation info to instead of logfile or screen. Default is the "log" style where there is a short summary in the screen output and detailed citations in BibTeX format in the logfile. The option "both" selects the detailed output for both, "none", the short output for both, and "screen" will write the detailed info to the screen and the short version to the log file. If a dedicated citation info file is requested, the screen and log file output will be in the short format (same as with "none").

See the *citation page* for more details on how to correctly reference and cite LAMMPS.

-nocite

Disable generating a citation reminder (see above) at all.

-nonbuf

Added in version 15Sep2022.

Turn off buffering for screen and logfile output. For performance reasons, output to the screen and logfile is usually buffered, i.e. output is only written to a file if its buffer - typically 4096 bytes - has been filled. When LAMMPS crashes for some reason, however, that can mean that there is important output missing. With this flag the buffering can be turned off (only for screen and logfile output) and any output will be committed immediately. Note that when running in parallel with MPI, the screen output may still be buffered by the MPI library and this cannot be changed by LAMMPS. This flag should only be used for debugging and not for production simulations as the performance impact can be significant, especially for large parallel runs.

-package style args ....

Invoke the *package* command with style and args. The syntax is the same as if the command appeared at the top of the input script. For example -package gpu 2 or -pk gpu 2 is the same as *package gpu 2* in the input script. The possible styles and args are documented on the *package* doc page. This switch can be used multiple times, e.g. to set options for the INTEL and OPENMP packages which can be used together.

Along with the -suffix command-line switch, this is a convenient mechanism for invoking accelerator packages and their options without having to edit an input script.

-partition 8x2 4 5 ...

Invoke LAMMPS in multi-partition mode. When LAMMPS is run on P processors and this switch is not used, LAMMPS runs in one partition, i.e. all P processors run a single simulation. If this switch is used, the P processors are split into separate partitions and each partition runs its own simulation. The arguments to the switch specify the number of processors in each partition. Arguments of the form MxN mean M partitions, each with N processors. Arguments of the form N mean a single partition with N processors. The sum of processors in all partitions must equal P. Thus the command -partition 8x2 4 5 has 10 partitions and runs on a total of 25 processors.

Running with multiple partitions can be useful for running *multi-replica simulations*, where each replica runs on one or a few processors. Note that with MPI installed on a machine (e.g. your desktop), you can run on more (virtual) processors than you have physical processors.

To run multiple independent simulations from one input script, using multiple partitions, see the *Howto multiple* page. World- and universe-style *variables* are useful in this context.

-plog file

Specify the base name for the partition log files, so partition N writes log information to file.N. If file is none, then no partition log files are created. This overrides the filename specified in the -log command-line option. This option is useful when working with large numbers of partitions, allowing the partition log files to be suppressed (-plog none) or placed in a subdirectory (-plog replica_files/log.lammps) If this option is not used the log file for partition N is log.lammps.N or whatever is specified by the -log command-line option.

-pscreen file

Specify the base name for the partition screen file, so partition N writes screen information to file.N. If file is "none", then no partition screen files are created. This overrides the filename specified in the -screen command-line option. This option is useful when working with large numbers of partitions, allowing the partition screen files to be suppressed (-pscreen none) or placed in a subdirectory (-pscreen replica_files/screen). If this option is not used the screen file for partition N is screen.N or whatever is specified by the -screen command-line option.

-reorder

This option has 2 forms:

```
-reorder nth N
-reorder custom filename
```

Reorder the processors in the MPI communicator used to instantiate LAMMPS, in one of several ways. The original MPI communicator ranks all P processors from 0 to P-1. The mapping of these ranks to physical processors is done by MPI before LAMMPS begins. It may be useful in some cases to alter the rank order. E.g. to ensure that cores within each node are ranked in a desired order. Or when using the *run_style verlet/split* command with 2 partitions to ensure that a specific Kspace processor (in the second partition) is matched up with a specific set of processors in the first partition. See the *General tips* page for more details.

If the keyword *nth* is used with a setting *N*, then it means every Nth processor will be moved to the end of the ranking. This is useful when using the *run_style verlet/split* command with 2 partitions via the -partition command-line switch. The first set of processors will be in the first partition, the second set in the second partition. The -reorder command-line switch can alter this so that the first N procs in the first partition and one proc in the second partition will be ordered consecutively, e.g. as the cores on one physical node. This can boost performance. For example, if you use -reorder nth 4 and -partition 9 3 and you are running on 12 processors, the processors will be reordered from

```
0 1 2 3 4 5 6 7 8 9 10 11
```

to

```
0 1 2 4 5 6 8 9 10 3 7 11
```

so that the processors in each partition will be

```
0 1 2 4 5 6 8 9 10
3 7 11
```

See the "processors" command for how to ensure processors from each partition could then be grouped optimally for quad-core nodes.

If the keyword is *custom*, then a file that specifies a permutation of the processor ranks is also specified. The format of the reorder file is as follows. Any number of initial blank or comment lines (starting with a "#" character) can be present. These should be followed by P lines of the form:

```
I J
```

where P is the number of processors LAMMPS was launched with. Note that if running in multi-partition mode (see the -partition switch above) P is the total number of processors in all partitions. The I and J values describe a permutation of the P processors. Every I and J should be values from 0 to P-1 inclusive. In the set of P I values, every proc ID should appear exactly once. Ditto for the set of P J values. A single I,J pairing means that the physical processor with rank I in the original MPI communicator will have rank J in the reordered communicator.

Note that rank ordering can also be specified by many MPI implementations, either by environment variables that specify how to order physical processors, or by config files that specify what physical processors to assign to each MPI rank. The -reorder switch simply gives you a portable way to do this without relying on MPI itself. See the *processors file* command for how to output info on the final assignment of physical processors to the LAMMPS simulation domain.

-restart2data restartfile datafile keyword value ...

Convert the restart file into a data file and immediately exit. This is the same operation as if the following 2-line input script were run:

```
read_restart restartfile
write_data datafile keyword value ...
```

The specified restartfile and/or datafile name may contain the wild-card character "*". The restartfile name may also contain the wild-card character "%". The meaning of these characters is explained on the *read_restart* and *write_data* doc pages. The use of "%" means that a parallel restart file can be read. Note that a filename such as file.* may need to be enclosed in quotes or the "*" character prefixed with a backslash ("") to avoid shell expansion of the "*" character.

The syntax following restartfile, namely

```
datafile keyword value ...
```

is identical to the arguments of the *write_data* command. See its documentation page for details. This includes its optional keyword/value settings.

-restart2dump restartfile group-ID dumpstyle dumpfile arg1 arg2 ...

Convert the restart file into a dump file and immediately exit. This is the same operation as if the following 2-line input script were run:

```
read_restart restartfile
write_dump group-ID dumpstyle dumpfile arg1 arg2 ...
```

Note that the specified restartfile and dumpfile names may contain wild-card characters ("*" or "%") as explained on the *read_restart* and *write_dump* doc pages. The use of "%" means that a parallel restart file and/or parallel dump file can be read and/or written. Note that a filename such as file.* may need to be enclosed in quotes or the "*" character prefixed with a backslash ("") to avoid shell expansion of the "*" character.

The syntax following restartfile, namely

```
group-ID dumpstyle dumpfile arg1 arg2 ...
```

is identical to the arguments of the *write_dump* command. See its documentation page for details. This includes what per-atom fields are written to the dump file and optional dump_modify settings, including ones that affect how parallel dump files are written, e.g. the *nfile* and *fileper* keywords. See the *dump_modify* page for details.

-restart2info restartfile keyword ...

Added in version 29Aug2024.

Write out some info about the restart file and and immediately exit. This is the same operation as if the following 2-line input script were run:

```
read_restart restartfile
info system group computes fixes
```

The specified restartfile name may contain the wild-card character "*". The restartfile name may also contain the wild-card character "%". The meaning of these characters is explained on the *read_restart* documentation. The use of "%" means that a parallel restart file can be read. Note that a filename such as file.* may need to be enclosed in quotes or the "*" character prefixed with a backslash ("") to avoid shell expansion of the "*" character.

Optional keywords may follow the restartfile argument. These must be valid keywords for the *info command*. The most useful ones - *system*, *group*, *computes*, and *fixes* - are already applied. Appending keywords like *coeffs* or *communication* may provide additional useful information stored in the restart file.

-screen file

Specify a file for LAMMPS to write its screen information to. In one-partition mode, if the switch is not used, LAMMPS writes to the screen. If this switch is used, LAMMPS writes to the specified file instead and you will see no screen output. In multi-partition mode, if the switch is not used, high-level status information is written to the screen. Each partition also writes to a screen.N file where N is the partition ID. If the switch is specified in multi-partition mode, the high-level screen dump is named "file" and each partition also writes screen information to a file.N. For both one-partition and multi-partition mode, if the specified file is "none", then no screen output is performed. Option -pscreen will override the name of the partition screen files file.N.

-skiprun

Insert the command *timer timeout 0 every 1* at the beginning of an input file or after a *clear* command. This has the effect that the entire LAMMPS input script is processed without executing actual *run* or *minimize* and similar commands (their main loops are skipped). This can be helpful and convenient to test input scripts of long running calculations for correctness to avoid having them crash after a long time due to a typo or syntax error in the middle or at the end.

-suffix style args

Use variants of various styles if they exist. The specified style can be *gpu*, *intel*, *kk*, *omp*, *opt*, or *hybrid*. These refer to optional packages that LAMMPS can be built with, as described in *Accelerate performance*. The "gpu" style corresponds to the GPU package, the "intel" style to the INTEL package, the "kk" style to the KOKKOS package, the "opt" style to the OPT package, and the "omp" style to the OPENMP package. The hybrid style is the only style that accepts arguments. It allows for two packages to be specified. The first package specified is the default and will be used if it is available. If no style is available for the first package, the style for the second package will be used if available. For example, -suffix hybrid intel omp will use styles from the INTEL package if they are installed and available, but styles for the OPENMP package otherwise.

Along with the -package command-line switch, this is a convenient mechanism for invoking accelerator packages and their options without having to edit an input script.

As an example, all of the packages provide a *pair_style lj/cut* variant, with style names lj/cut/gpu, lj/cut/intel, lj/cut/kk, lj/cut/omp, and lj/cut/opt. A variant style can be specified explicitly in your input script, e.g. pair_style lj/cut/gpu. If the -suffix switch is used the specified suffix (gpu,intel,kk,omp,opt) is automatically appended whenever your input script command creates a new *atom style*, *pair style*, *fix*, *compute*, or *run style*. If the variant version does not exist, the standard version is created.

For the GPU package, using this command-line switch also invokes the default GPU settings, as if the command "package gpu 1" were used at the top of your input script. These settings can be changed by using the -package gpu command-line switch or the *package gpu* command in your script.

For the INTEL package, using this command-line switch also invokes the default INTEL settings, as if the command "package intel 1" were used at the top of your input script. These settings can be changed by using the -package intel command-line switch or the *package intel* command in your script. If the OPENMP package is also installed, the hybrid style with "intel omp" arguments can be used to make the omp suffix a second choice, if a requested style is not available in the INTEL package. It will also invoke the default OPENMP settings, as if the command "package omp 0" were used at the top of your input script. These settings can be changed by using the -package omp command-line switch or the *package omp* command in your script.

For the KOKKOS package, using this command-line switch also invokes the default KOKKOS settings, as if the command "package kokkos" were used at the top of your input script. These settings can be changed by using the -package kokkos command-line switch or the *package kokkos* command in your script.

For the OMP package, using this command-line switch also invokes the default OMP settings, as if the command "package omp 0" were used at the top of your input script. These settings can be changed by using the -package omp command-line switch or the *package omp* command in your script.

The *suffix* command can also be used within an input script to set a suffix, or to turn off or back on any suffix setting made via the command-line.

-var name value1 value2 ...

Specify a variable that will be defined for substitution purposes when the input script is read. This switch can be used multiple times to define multiple variables. "Name" is the variable name which can be a single character (referenced as $x in the input script) or a full string (referenced as ${abc}). An *index-style variable* will be created and populated with the subsequent values, e.g. a set of filenames. Using this command-line option is equivalent to putting the line

"variable name index value1 value2 ..." at the beginning of the input script. Defining an index variable as a command-line argument overrides any setting for the same index variable in the input script, since index variables cannot be re-defined.

See the *variable* command for more info on defining index and other kinds of variables and the *Parsing rules* page for more info on using variables in input scripts.

Note

Currently, the command-line parser looks for arguments that start with "-" to indicate new switches. Thus you cannot specify multiple variable values if any of them start with a "-", e.g. a negative numeric value. It is OK if the first value1 starts with a "-", since it is automatically skipped.

6.3 Screen and logfile output

As LAMMPS reads an input script, it prints information to both the screen and a log file about significant actions it takes to setup a simulation. When the simulation is ready to begin, LAMMPS performs various initializations, and prints info about the run it is about to perform, including the amount of memory (in MBytes per processor) that the simulation requires. It also prints details of the initial thermodynamic state of the system. During the run itself, thermodynamic information is printed periodically, every few timesteps. When the run concludes, LAMMPS prints the final thermodynamic state and a total run time for the simulation. It also appends statistics about the CPU time and storage requirements for the simulation. An example set of statistics is shown here:

```
Loop time of 0.942801 on 4 procs for 300 steps with 2004 atoms

Performance: 54.985 ns/day, 0.436 hours/ns, 318.201 timesteps/s, 637.674 katom-step/s
195.2% CPU use with 2 MPI tasks x 2 OpenMP threads

MPI task timing breakdown:
Section |  min time  |  avg time  |  max time  |%varavg| %total
---------------------------------------------------------------
Pair    | 0.61419    | 0.62872    | 0.64325    |   1.8 | 66.69
Bond    | 0.0028608  | 0.0028899  | 0.002919   |   0.1 |  0.31
Kspace  | 0.12652    | 0.14048    | 0.15444    |   3.7 | 14.90
Neigh   | 0.10242    | 0.10242    | 0.10242    |   0.0 | 10.86

Output  | 0.00018341 | 0.00030942 | 0.00043542 |   0.0 |  0.03
Modify  | 0.039117   | 0.039348   | 0.039579   |   0.1 |  4.17
Other   |            | 0.001041   |            |       |  0.11

Nlocal:          1002 ave         1006 max          998 min
Histogram: 1 0 0 0 0 0 0 0 0 1
Nghost:          8670.5 ave         8691 max         8650 min
Histogram: 1 0 0 0 0 0 0 0 0 1
Neighs:          354010 ave       357257 max       350763 min
Histogram: 1 0 0 0 0 0 0 0 0 1

Total # of neighbors = 708020
Ave neighs/atom = 353.30339
Ave special neighs/atom = 2.3403194
Neighbor list builds = 26
Dangerous builds = 0
```

The first section provides a global loop timing summary. The *loop time* is the total wall-clock time for the MD steps of the simulation run, excluding the time for initialization and setup (i.e. the parts that may be skipped with *run N pre no*). The *Performance* line is provided for convenience to help predict how long it will take to run a desired physical simulation and to have numbers useful for performance comparison between different simulation settings or system sizes. The *CPU use* line provides the CPU utilization per MPI task; it should be close to 100% times the number of OpenMP threads (or 1 if not using OpenMP). Lower numbers correspond to delays due to file I/O or insufficient thread utilization from parts of the code that have not been multi-threaded.

The *MPI task* section gives the breakdown of the CPU run time (in seconds) into major categories:

- *Pair* = non-bonded force computations
- *Bond* = bonded interactions: bonds, angles, dihedrals, impropers
- *Kspace* = long-range interactions: Ewald, PPPM, MSM
- *Neigh* = neighbor list construction
- *Comm* = inter-processor communication of atoms and their properties
- *Output* = output of thermodynamic info and dump files
- *Modify* = fixes and computes invoked by fixes
- *Other* = all the remaining time

For each category, there is a breakdown of the least, average and most amount of wall time any processor spent on this category of computation. The "%varavg" is the percentage by which the max or min varies from the average. This is an indication of load imbalance. A percentage close to 0 is perfect load balance. A large percentage is imbalance. The final "%total" column is the percentage of the total loop time is spent in this category.

When using the *timer full* setting, an additional column is added that also prints the CPU utilization in percent. In addition, when using *timer full* and the *package omp* command are active, a similar timing summary of time spent in threaded regions to monitor thread utilization and load balance is provided. A new *Thread timings* section is also added, which lists the time spent in reducing the per-thread data elements to the storage for non-threaded computation. These thread timings are measured for the first MPI rank only and thus, because the breakdown for MPI tasks can change from MPI rank to MPI rank, this breakdown can be very different for individual ranks. Here is an example output for this section:

```
Thread timings breakdown (MPI rank 0):
Total threaded time 0.6846 / 90.6%
Section |  min time  |  avg time  |  max time  |%varavg| %total
---------------------------------------------------------------
Pair    | 0.5127     | 0.5147     | 0.5167     |   0.3 | 75.18
Bond    | 0.0043139  | 0.0046779  | 0.0050418  |   0.5 |  0.68
Kspace  | 0.070572   | 0.074541   | 0.07851    |   1.5 | 10.89
Neigh   | 0.084778   | 0.086969   | 0.089161   |   0.7 | 12.70
Reduce  | 0.0036485  | 0.003737   | 0.0038254  |   0.1 |  0.55
```

The third section above lists the number of owned atoms (Nlocal), ghost atoms (Nghost), and pairwise neighbors stored per processor. The max and min values give the spread of these values across processors with a 10-bin histogram showing the distribution. The total number of histogram counts is equal to the number of processors.

The last section gives aggregate statistics (across all processors) for pairwise neighbors and special neighbors that LAMMPS keeps track of (see the *special_bonds* command). This section will not always contain data, for example

when there has not been a neighbor rebuild, or the neighbor list was constructed on the GPU or when a hybrid pair style was used and LAMMPS cannot determine a suitable (base) neighbor list to draw the statistics from.

The number of times neighbor lists were rebuilt is tallied, as is the number of potentially *dangerous* rebuilds. If atom movement triggered neighbor list rebuilding (see the *neigh_modify* command), then dangerous reneighborings are those that were triggered on the first timestep atom movement was checked for. If this count is non-zero you may wish to reduce the delay factor to ensure no force interactions are missed by atoms moving beyond the neighbor skin distance before a rebuild takes place.

If an energy minimization was performed via the *minimize* command, additional information is printed, e.g.

```
Minimization stats:
  Stopping criterion = linesearch alpha is zero
  Energy initial, next-to-last, final =
        -6372.3765206     -8328.46998942     -8328.46998942
  Force two-norm initial, final = 1059.36 5.36874
  Force max component initial, final = 58.6026 1.46872
  Final line search alpha, max atom move = 2.7842e-10 4.0892e-10
  Iterations, force evaluations = 701 1516
```

The first line prints the criterion that determined minimization was converged. The next line lists the initial and final energy, as well as the energy on the next-to-last iteration. The next 2 lines give a measure of the gradient of the energy (force on all atoms). The 2-norm is the "length" of this 3N-component force vector; the largest component (x, y, or z) of force (infinity-norm) is also given. Then information is provided about the line search and statistics on how many iterations and force-evaluations the minimizer required. Multiple force evaluations are typically done at each iteration to perform a 1d line minimization in the search direction. See the *minimize* page for more details.

If a *kspace_style* long-range Coulombics solver that performs FFTs was used during the run (PPPM, Ewald), then additional information is printed, e.g.

```
FFT time (% of Kspce) = 0.200313 (8.34477)
FFT Gflps 3d 1d-only = 2.31074 9.19989
```

The first line is the time spent doing 3d FFTs (several per timestep) and the fraction it represents of the total KSpace time (listed above). Each 3d FFT requires computation (3 sets of 1d FFTs) and communication (transposes). The total flops performed is 5Nlog_2(N), where N is the number of points in the 3d grid. The FFTs are timed with and without the communication and a Gflop rate is computed. The 3d rate is with communication; the 1d rate is without (just the 1d FFTs). Thus you can estimate what fraction of your FFT time was spent in communication, roughly 75% in the example above.

6.4 Error message output

Depending on the error function arguments when it is called in the source code, there will be one to four lines of error output.

6.4.1 A single line

The line starts with "ERROR: ", followed by the error message and information about the location in the source where the error function was called in parenthesis on the right (here: line 131 of the file src/fix_print.cpp). Example:

```
ERROR: Fix print timestep variable nevery returned a bad timestep: 9900 (src/fix_print.cpp:131)
```

6.4.2 Two lines

In addition to the single line output, also the last line of the input will be repeated. If a command is spread over multiple lines in the input using the continuation character '&', then the error will print the entire concatenated line. For readability all whitespace is compressed to single blanks. Example:

```
ERROR: Unrecognized fix style 'printf' (src/modify.cpp:924)
Last input line: fix 0 all printf v_nevery "Step: $(step) ${step}"
```

6.4.3 Three lines

In addition to the two line output from above, a third line is added that uses caret character markers '^' to indicate which "word" in the input failed. Example:

```
ERROR: Illegal fix print nevery value -100; must be > 0 (src/fix_print.cpp:41)
Last input line: fix 0 all print -100 "Step: $(step) ${stepx}"
                                 ^^^^
```

6.4.4 Four lines

The three line output is expanded to four lines, if the the input is modified through input pre-processing, e.g. when substituting variables. Now the last command is printed once in the original form and a second time after substitutions are applied. The caret character markers '^' are applied to the second version. Example:

```
ERROR: Illegal fix print nevery value -100; must be > 0 (src/fix_print.cpp:41)
Last input line: fix 0 all print ${nevery} 'Step: $(step) ${step}'
--> parsed line: fix 0 all print -100 "Step: $(step) ${step}"
                                 ^^^^
```

6.5 File formats used by LAMMPS

This page provides a general overview of the kinds of files and file formats that LAMMPS is reading and writing.

On this page

- *File formats used by LAMMPS*
  - *Character Encoding*
  - *Number Formatting*
  - *Input file*
  - *Data file*
  - *Molecule file*
  - *Restart file*

6.5.1 Character Encoding

For processing text files, the LAMMPS source code assumes ASCII character encoding which represents the digits 0 to 9, the lower and upper case letters a to z, some common punctuation and other symbols and a few whitespace characters including a regular "space character", "line feed", "carriage return", "tabulator". These characters are all represented by single bytes with a value smaller than 128 and only 95 of those 128 values represent printable characters. This list is sufficient to represent most English text, but misses accented characters or umlauts or Greek symbols and more.

Modern text often uses UTF-8 character encoding instead. This encoding is a way to represent many more different characters as defined by the Unicode standard. UFT-8 is compatible with ASCII, since the first 128 values are identical with the ASCII encoding. It is important to note, however, that there are Unicode characters that *look* similar to ASCII characters, but have a different binary representation. As a general rule, these characters may not be correctly recognized by LAMMPS. For some parts of LAMMPS' text processing, translation tables with known "lookalike" characters are used. The tables are used to substitute non-ASCII characters with their ASCII equivalents. Non-ASCII lookalike characters are often used by web browsers or PDF viewers to improve the readability of text. Thus, when using copy and paste to transfer text from such an application to your input file, you may unintentionally create text that is not exclusively using ASCII encoding and may cause errors when LAMMPS is trying to read it.

Lines with non-printable and non-ASCII characters in text files can be detected for example with a (Linux) command like the following:

```
env LC_ALL=C grep -n '[^ -~]' some_file.txt
```

6.5.2 Number Formatting

Different countries and languages have different conventions to format numbers. While in some regions commas are used for fractions and points to indicate thousand, million and so on, this is reversed in other regions. Modern operating systems have facilities to adjust input and output accordingly that are collectively referred to as "native language support" (NLS). The exact rules are often applied according to the value of the $LANG environment variable (e.g. "en_US.utf8" for English text in UTF-8 encoding).

For the sake of simplicity of the implementation and transferability of results, LAMMPS does not support this and instead expects numbers being formatted in the generic or "C" locale. The "C" locale has no punctuation for thousand, million and so on and uses a decimal point for fractions. One thousand would be represented as "1000.0" and not as "1,000.0" nor as "1.000,0". Having native language support enabled for a locale other than "C" will result in different behavior when converting or formatting numbers that can trigger unexpected errors.

LAMMPS also only accepts integer numbers when an integer is required, so using floating point equivalents like "1.0" are not accepted; you *must* use "1" instead.

For floating point numbers in scientific notation, the Fortran double precision notation "1.1d3" is not accepted; you have to use "1100", "1100.0" or "1.1e3".

6.5.3 Input file

A LAMMPS input file is a text file with commands. It is read line-by-line and each line is processed *immediately*. Before looking for commands and executing them, there is a pre-processing step where comments (non-quoted text starting with a pound sign '#') are removed, ${variable} and $(expression) constructs are expanded or evaluated, and lines that end in the ampersand character '&' are combined with the next line (similar to Fortran 90 free-format source code). After the pre-processing, lines are split into "words" and evaluated. The first word must be a *command* and all following words are arguments. Below are some example lines:

```
# full line comment

# some global settings
units           lj
```

(continues on next page)

(continued from previous page)

```
atom_style      atomic
# ^^ command    ^^ argument(s)

variable        x index 1       # may be overridden from command line with -var x <value>
variable        xx equal 20*$x  # variable "xx" is always 20 times "x"

lattice         fcc 0.8442

# example of a command written across multiple lines
# the "region" command uses spacing from "lattice" command, unless "units box" is specified
region          box block 0.0 ${xx} &
                          0.0 40.0  &
                          0.0 30.0
# create simulation box and fill with atoms according to lattice setting
create_box      1 box
create_atoms    1 box

# set force field and parameters
mass            1 1.0
pair_style      lj/cut 2.5
pair_coeff      1 1 1.0 1.0 2.5

# run simulation
fix             1 all nve
run             1000
```

The pivotal command in this example input is the *create_box command*. It defines the simulation system and many parameters that go with it: units, atom style, number of atom types (and other types) and more. Those settings are *locked in* after the box is created. Commands that change these kind of settings are only allowed **before** a simulation box is created and many other commands are only allowed **after** the simulation box is defined (e.g. *pair_coeff*). Very few commands (e.g. *pair_style*) may be used in either part of the input. The *read_data* and *read_restart* commands also create the system box and thus have a similar pivotal function.

The LAMMPS input syntax has minimal support for conditionals and loops, but if more complex operations are required, it is recommended to use the library interface, e.g. *from Python using the LAMMPS Python module*.

There is a frequent misconception about the *if command*: this is a command for conditional execution **outside** a run or minimization. To trigger actions on specific conditions **during** a run is a non-trivial operation that usually requires adopting one of the available "fix" commands or creating a new "fix" command.

LAMMPS commands change the internal state and thus the order of commands matters and reordering them can produce different results. For example, the region defined by the *region command* in the example above depends on the *lattice setting* and thus its dimensions will be different depending on the order of the two commands.

Each line must have an "end-of-line" character (line feed or carriage return plus line feed). Some text editors do not automatically insert one which may cause LAMMPS to ignore the last command. It is thus recommended to always have an empty line at the end of an input file.

The specific details describing how LAMMPS input is processed and parsed are explained in *Parsing rules for input scripts*.

6.5.4 Data file

A LAMMPS data file contains a description of a system suitable for reading with the *read_data command*. Data files are commonly used for setting up complex molecular systems that can be difficult to achieve with the commands *create_box* and *create_atoms* alone. Also, data files can be used as a portable alternatives to a *binary restart file*. A restart file can be converted into a data file from the *command line*.

Data files have a header section at the very beginning of the file and multiple titled sections such as "Atoms", Masses", "Pair Coeffs", and so on. Header keywords can only be used *before* the first title section.

The data file **always** starts with a "title" line, which will be **ignored** by LAMMPS. Omitting the title line can lead to unexpected behavior because a line of the header with an actual setting may be ignored. In this case, the mistakenly ignored line often contains the "atoms" keyword, which results in LAMMPS assuming that there are no atoms in the data file and thus throwing an error on the contents of the "Atoms" section. The title line may contain some keywords that can be used by external programs to convey information about the system (included as comments), that is not required and not read by LAMMPS.

The line following a section title is also **ignored**. An error will occur if an empty line is not placed after a section title. The number of lines in titled sections depends on header keywords, like the number of atom types, the number of atoms, the number of bond types, the number of bonds, and so on. The data in those sections has to be complete. A special case are the "Pair Coeffs" and "PairIJ Coeffs" sections; the former is for force fields and pair styles that use mixing of non-bonded potential parameters, the latter for pair styles and force fields requiring explicit coefficients. Thus with N being the number of atom types, the "Pair Coeffs" section has N entries while "PairIJ Coeffs" has $N \cdot (N-1)$ entries. Internally, these sections will be converted to *pair_coeff* commands. Thus the corresponding *pair style* must have been set *before* the *read_data command* reads the data file.

Data files may contain comments, which start with the pound sign '#'. There must be at least one blank between a valid keyword and the pound sign. Below is a simple example case of a data file for *atom style full*.

```
LAMMPS Title line (ignored)
# full line comment

      10  atoms # comment
       4  atom types

 -36.840194 64.211560 xlo xhi

#  ^^atomID ^^molID ^^type  ^^charge ^^xcoord  ^^ycoord  ^^ycoord  ^^image^^flags (optional)

Velocities # this section is optional

     1  0.0050731  -0.00398928  0.00391473
     2 -0.0175184   0.0173484  -0.00489207
     3  0.00597225 -0.00202006  0.00166454
     4 -0.010395   -0.0082582   0.00316419
     5 -0.00390877  0.00470331 -0.00226911
     6 -0.00111157 -0.00374545 -0.0169374
     7  0.00209054 -0.00594936 -0.000124563
     8  0.00635002 -0.0120093  -0.0110999
     9 -0.004955   -0.0123375   0.000403422
    10  0.00265028 -0.00189329 -0.00293198
```

The common problem is processing the "Atoms" section, since its format depends on the *atom style* used, and that setting must be done in the input file *before* reading the data file. To assist with detecting incompatible data files, a comment is appended to the "Atoms" title indicating the atom style used (or intended) when *writing* the data file. For example, below is an "Atoms" section for *atom style charge*, which omits the molecule ID column.

```
Atoms # charge

     1     1     0.560   43.99993  58.52678  36.78550
     2     2    -0.270   45.10395  58.23499  35.86693
     3     3    -0.510   43.81519  59.54928  37.43995
     4     4     0.090   45.71714  57.34797  36.13434
     5     4     0.090   45.72261  59.13657  35.67007
     6     4     0.090   44.66624  58.09539  34.85538
     7     3    -0.470   43.28193  57.47427  36.91953
     8     4     0.070   42.07157  57.45486  37.62418
     9     1     0.510   42.19985  57.57789  39.12163
    10     1     0.510   41.88641  58.62251  39.70398
#  ^^atomID ^^type  ^^charge ^^xcoord  ^^ycoord  ^^ycoord
```

Another source of confusion about the "Atoms" section format is the ordering of columns. The three atom style variants *atom_style full*, *atom_style hybrid charge molecular*, and *atom_style hybrid molecular charge* all carry the same per-atom information. However, in data files, the Atoms section has the columns 'Atom-ID Molecule-ID Atom-type Charge X Y Z' for atom style full, but for hybrid atom styles the first columns are always 'Atom-ID Atom-type X Y Z' followed by any *additional* data added by the hybrid styles, for example, 'Charge Molecule-ID' for the first hybrid style and 'Molecule-ID Charge' in the second hybrid style variant. Finally, an alternative to a hybrid atom style is to use fix property/atom, e.g. to add molecule IDs to atom style charge. In this case the "Atoms" section is formatted according to atom style charge and a new section, "Molecules" is added that contains lines with 'Atom-ID Molecule-ID', one for each atom in the system. For adding charges to atom style molecular with fix property/atom, the "Atoms" section is now formatted according to the atom style and a "Charges" section is added.

6.5.5 Molecule file

Molecule files for use with the *molecule command* look quite similar to data files but they do not have a compatible format, i.e., one cannot use a data file as molecule file and vice versa. Below is a simple example for a water molecule (SPC/E model). Same as a data file, there is an ignored title line and you can use comments. However, there is no information about the number of types or the box dimensions. These parameters are set when the simulation box is created. Thus the header only has the count of atoms, bonds, and so on.

Molecule files have a header followed by sections (just as in data files), but the section names are different than those of a data file. There is no "Atoms" section and the section formats in molecule files is independent of the atom style. Its information is split across multiple sections, like "Coords", "Types", and "Charges". Note that no "Masses" section is needed here. The atom masses are by default tied to the atom type and set with a data file or the *mass command*. A "Masses" section would only be required for atom styles with per-atom masses, e.g. atom style sphere, where in data files you would provide the density and the diameter instead of the mass.

Since the entire file is a 'molecule', LAMMPS will assign a new molecule-ID (if supported by the atom style) when atoms are instantiated from a molecule file, e.g. with the *create_atoms command*. It is possible to include a "Molecules" section to indicate that the atoms belong to multiple 'molecules'. Atom-IDs and molecule-IDs in the molecule file are relative for the file (i.e. starting from 1) and will be translated into actual atom-IDs also when the atoms from the molecule are created.

```
# Water molecule. SPC/E model.

3 atoms
2 bonds
1 angles

Coords

1    1.12456   0.09298   1.27452
2    1.53683   0.75606   1.89928
3    0.49482   0.56390   0.65678

Types

1        1
2        2
3        2

Charges

1       -0.8472
2        0.4236
3        0.4236

Bonds

1   1      1      2
2   1      1      3

Angles

1   1      2      1      3
```

There are also optional sections, e.g. about *SHAKE* and *special bonds*. Those sections are only needed if the molecule command is issued *before* the simulation box is defined. Otherwise, the molecule command can derive the required

settings internally.

6.5.6 Restart file

LAMMPS restart files are binary files and not available in text format. They can be identified by the first few bytes that contain the (C-style) string LammpS RestartT as magic string. This string is followed by a 16-bit integer of the number 1 used for detecting whether the computer writing the restart has the same endianness as the computer reading it. If not, the file cannot be read correctly. This integer is followed by a 32-bit integer indicating the file format revision (currently 3), which can be used to implement backward compatibility for reading older revisions.

This information has been added to the *Unix "file" command's <https://www.darwinsys.com/file/>* "magic" file so that restart files can be identified without opening them. If you have a fairly recent version, it should already be included. If you have an older version, the LAMMPS source package *contains a file with the necessary additions*.

The rest of the file is organized in sections of a 32-bit signed integer constant indicating the kind of content and the corresponding value (or values). If those values are arrays (including C-style strings), then the integer constant is followed by a 32-bit integer indicating the length of the array. This mechanism will read the data regardless of the ordering of the sections. Symbolic names of the section constants are in the lmprestart.h header file.

LAMMPS restart files are not expected to be portable between platforms or LAMMPS versions, but changes to the file format are rare.

6.6 Running LAMMPS on Windows

To run a serial (non-MPI) executable, follow these steps:

- Install a LAMMPS installer package from https://packages.lammps.org/windows.html
- Open the "Command Prompt" or "Terminal" app.
- Change to the directory where you have your input script, (e.g. by typing: cd "Documents").
- At the command prompt, type "lmp -in in.file.lmp", where in.file.lmp is the name of your LAMMPS input script.

Note that the serial executable includes support for multi-threading parallelization from the styles in the OPENMP and KOKKOS packages. To run with 4 threads, you can type this:

```
lmp -in in.lj.lmp -pk omp 4 -sf omp
lmp -in in.lj.lmp -k on t 4 -sf kk
```

Alternately, you can also install a package with LAMMPS-GUI included and open the LAMMPS-GUI app (the package includes the command-line version of LAMMPS as well) and open the input file in the GUI and run it from there. For details on LAMMPS-GUI, see https://lammps-gui.lammps.org/

For the MS-MPI executables, which allow you to run LAMMPS under Windows in parallel using MPI rather than multi-threading, follow these steps.

Download and install the MS-MPI runtime package msmpisetup.exe from https://www.microsoft.com/en-us/download/details.aspx?id=105289 (Note that the msmpisdk.msi is **only** required for **compilation** of LAMMPS from source on Windows using Microsoft Visual Studio). After installation of MS-MPI perform a reboot.

Then you can run the executable in serial like in the example above or in parallel using MPI with one of the following commands:

```
mpiexec -localonly 4 lmp -in in.file.lmp
mpiexec -np 4 lmp -in in.file.lmp
```

where in.file.lmp is the name of your LAMMPS input script. For the latter case, you may be prompted to enter the password that you set during installation of the MPI library software.

In this mode, output may not immediately show up on the screen, so if your input script takes a long time to execute, you may need to be patient before the output shows up.

Note that the parallel executable also includes OpenMP multi-threading through both the OPENMP and the KOKKOS package, which can be combined with MPI using something like:

```
mpiexec -localonly 2 lmp -in in.lj.lmp -pk omp 2 -sf omp
mpiexec -localonly 2 lmp -in in.lj.lmp -kokkos on t 2 -sf kk
```

MPI parallelization will work for *all* functionality in LAMMPS and in many cases the MPI parallelization is more efficient than multi-threading since LAMMPS was designed from ground up for MPI parallelization using domain decomposition. Multi-threading is only available for selected styles and implemented on top of the MPI parallelization. Multi-threading is most useful for systems with large load imbalances when using domain decomposition and a smaller number of threads (<= 8).

CHAPTER

SEVEN

ERRORS

These doc pages describe many of the error and warning message you can encounter when using LAMMPS. The common problems include conceptual issues. The messages and warnings doc pages give complete lists of all the messages the code may generate, with additional details for many of them.

7.1 Common issues that are often regarded as bugs

The list below are some random notes on behavior of LAMMPS that is sometimes unexpected or even considered a bug. Most of the time, these are just issues of understanding how LAMMPS is implemented and parallelized. Please also have a look at the *Error details discussions page* that contains recommendations for tracking down issues and explanations for error messages that may sometimes be confusing or need additional explanations.

- A LAMMPS simulation typically has two stages, 1) issuing commands and 2) run or minimize. Most LAMMPS errors are detected in stage 1), others at the beginning of stage 2), and finally others like a bond stretching too far may or lost atoms or bonds may not occur until the middle of a run.
- If two LAMMPS runs do not produce the exact same answer on different machines or different numbers of processors, this is typically not a bug. In theory you should get identical answers on any number of processors and on any machine. In practice, numerical round-off can cause slight differences and eventual divergence of molecular dynamics phase space trajectories within a few 100s or few 1000s of timesteps. This can be triggered by different ordering of atoms due to different domain decompositions, but also through different CPU architectures, different operating systems, different compilers or compiler versions, different compiler optimization levels, different FFT libraries. However, the statistical properties of the two runs (e.g. average energy or temperature) should still be the same.
- If the *velocity* command is used to set initial atom velocities, a particular atom can be assigned a different velocity when the problem is run on a different number of processors or on different machines. If this happens, the phase space trajectories of the two simulations will rapidly diverge. See the discussion of the *loop* option in the *velocity* command for details and options that avoid this issue.
- Similarly, the *create_atoms* command generates a lattice of atoms. For the same physical system, the ordering and numbering of atoms by atom ID may be different depending on the number of processors.
- Some commands use random number generators which may be setup to produce different random number streams on each processor and hence will produce different effects when run on different numbers of processors. A commonly-used example is the *fix langevin* command for thermostatting.
- LAMMPS tries to flag errors and print informative error messages so you can fix the problem. For most errors it will also print the last input script command that it was processing or even point to the keyword that is causing troubles. Of course, LAMMPS cannot figure out your physics or numerical mistakes, like choosing too big a timestep, specifying erroneous force field coefficients, or putting 2 atoms on top of each other! Also, LAMMPS does not know what you *intend* to do, but very strictly applies the syntax as described in the documentation. If you run into errors that LAMMPS does not catch that you think it should flag, please send an email to the developers or create an new topic on the dedicated MatSci forum section.

- If you get an error message about an invalid command in your input script, you can determine what command is causing the problem by looking in the log.lammps file or using the *echo command* to see it on the screen. If you get an error like "Invalid ... style", with ... being fix, compute, pair, etc, it means that you mistyped the style name or that the command is part of an optional package which was not compiled into your executable. The list of available styles in your executable can be listed by using *the -h command-line switch*. The installation and compilation of optional packages is explained on the *Build packages* doc page.
- For a given command, LAMMPS expects certain arguments in a specified order. If you mess this up, LAMMPS will often flag the error, but it may also simply read a bogus argument and assign a value that is valid, but not what you wanted. E.g. trying to read the string "abc" as an integer value of 0. Careful reading of the associated doc page for the command should allow you to fix these problems. In most cases, where LAMMPS expects to read a number, either integer or floating point, it performs a stringent test on whether the provided input actually is an integer or floating-point number, respectively, and reject the input with an error message (for instance, when an integer is required, but a floating-point number 1.0 is provided):

```
ERROR: Expected integer parameter instead of '1.0' in input script or data file
```

- Some commands allow for using variable references in place of numeric constants so that the value can be evaluated and may change over the course of a run. This is typically done with the syntax *v_name* for a parameter, where name is the name of the variable. On the other hand, immediate variable expansion with the syntax ${name} is performed while reading the input and before parsing commands,

> **Note**
>
> Using a variable reference (i.e. *v_name*) is only allowed if the documentation of the corresponding command explicitly says it is. Otherwise, you will receive an error message of this kind:

```
ERROR: Expected floating point parameter instead of 'v_name' in input script or data file
```

- Generally, LAMMPS will print a message to the screen and logfile and exit gracefully when it encounters a fatal error. When running in parallel this message may be stuck in an I/O buffer and LAMMPS will be terminated before that buffer is printed. In that case you can try adding the -nonblock or -nb command-line flag to turn off that buffering. Please note that this should not be used for production runs, since turning off buffering usually has a significant negative impact on performance (even worse than *thermo_modify flush yes*). Sometimes LAMMPS will print a WARNING to the screen and logfile and continue on; you can decide if the WARNING is important or not, but as a general rule do not ignore warnings that you not understand. A WARNING message that is generated in the middle of a run is only printed to the screen, not to the logfile, to avoid cluttering up thermodynamic output. If LAMMPS crashes or hangs without generating an error message first then it could be a bug (see *this section*).
- LAMMPS runs in the available memory a processor allows to be allocated. Most reasonable MD runs are compute limited, not memory limited, so this should not be a bottleneck on most platforms. Almost all large memory allocations in the code are done via C-style malloc's which will generate an error message if you run out of memory. Smaller chunks of memory are allocated via C++ "new" statements. If you are unlucky you could run out of memory just when one of these small requests is made, in which case the code will crash or hang (in parallel).
- Illegal arithmetic can cause LAMMPS to run slow or crash. This is typically due to invalid physics and numerics that your simulation is computing. If you see wild thermodynamic values or NaN values in your LAMMPS output, something is wrong with your simulation. If you suspect this is happening, it is a good idea to print out thermodynamic info frequently (e.g. every timestep) via the *thermo* so you can monitor what is happening. Visualizing the atom movement is also a good idea to ensure your model is behaving as you expect.
- When running in parallel with MPI, one way LAMMPS can hang is because LAMMPS has come across an error condition, but only on one or a few MPI processes and not all of them. LAMMPS has two different "stop with an error message" functions and the correct one has to be called or else it will hang.

7.2 Errors and warnings details

Many errors and warnings that LAMMPS outputs are self-explanatory and thus straightforward to resolve. However, there are also cases where there is no single cause or simple explanation that can be provided in a short message printed by LAMMPS. Therefore, more detailed discussions of such scenarios are provided here; first on a more general level and then for specific errors. In the latter cases, LAMMPS will output a short message and then provide a URL that links to a specific section on this page.

7.2.1 General troubleshooting advice

Below are suggestions that can help to understand the causes of problems with simulations leading to errors or unexpected results.

Create a small test system

Debugging problems often requires running a simulation many times with small modifications, thus it can be a huge time saver to first assemble a small test system input that has the same issue, but will take much time until it triggers the error condition. Also, it will be easier to see what happens.

Visualize your trajectory

To better understand what is causing problems, it is often very useful to visualize the system close to the point of failure. It may be necessary to have LAMMPS output trajectory frames rather frequently. To avoid gigantic files, you can use *dump_modify delay* to delay output until the critical section is reached, and you can use a smaller test system (see above).

Parallel versus serial

Issues where something is "lost" or "missing" often exhibit that issue *only* when running in parallel. That doesn't mean there is no problem when running in serial, only the symptoms are not triggering an error. This may be because there is no domain decomposition with just one processor and thus all atoms are accessible, or it may be because the problem will manifest faster with smaller subdomains. Correspondingly, errors may be triggered faster with more processors and thus smaller sub-domains.

Segmentation Fault

A segmentation fault is an error reported by the **operating system** and not LAMMPS itself. It happens when a process tries to access a memory address that is not available. This can have **many** reasons: memory has not been allocated, a memory buffer is not large enough, a memory address is computed from an incorrect index, a memory buffer is used after it has been freed, some general memory corruption. When investigating a segmentation fault (aka segfault), it is important to determine which process is causing it; it may not always be LAMMPS. For example, some MPI library implementations report a segmentation fault from their "mpirun" or "mpiexec" command when the application has been terminated unexpectedly.

While a segmentation fault is likely an indication of a bug in LAMMPS, it need not always be; it can also be the consequence of too aggressive simulation settings. For time critical code paths, LAMMPS will assume the user has chosen the settings carefully and will not make any checks to avoid to avoid performance penalties.

A crucial step in resolving a segmentation fault is to identify the exact location in the code where it happens. Please see *Errors_debug* for a couple of examples showing how to do this on a Linux machine. With this information – a simple way to reproduce the segmentation fault and the exact *LAMMPS version* and platform you are running on – you can contact the LAMMPS developers or post in the LAMMPS forum to get assistance.

Fast moving atoms

Fast moving atoms may be "lost" or "missing" when their velocity becomes so large that they can cross a sub-domain within one timestep. This often happens when atoms are too close, but atoms may also "move" too fast from sub-domain to sub-domain if the box changes rapidly. E.g. when setting a large an initial box with *shrink-wrap boundary conditions* that collapses on the first step (in this case the solution is often using 'm' instead of 's' as a boundary condition).

To reduce the impact of "close contacts", one can remove those atoms or molecules with something like *delete_atoms overlap 0.1 all all*. With periodic boundaries, a close contact pair of atoms may be on opposite sides of the simulation box. Another option would be to first run a minimization (aka quench) before starting the MD. Reducing the time step can also help. Many times, one just needs to "ease" the system into a balanced state and can then switch to more aggressive settings.

The speed of atoms during an MD run depends on the steepness of the potential function and their mass. Since the positions and velocities of atoms are computed with finite timesteps, the timestep needs to be small enough for stable numeric integration of the trajectory. If the timestep is too large during initialization (or other instances of extreme dynamics), using *fix nve/limit* or *fix dt/reset* temporarily can help to avoid too large updates or adapt the timestep according to the displacements.

Ignoring lost atoms

It is tempting to use the *thermo_modify lost ignore* to avoid LAMMPS aborting with an error on lost atoms. This setting should, however, *only* be used when atoms *should* leave the system. In general, ignoring a problem does not solve it.

Pressure, forces, positions becoming NaN or Inf

Some potentials can overflow or have a division by zero with close contacts or bad geometries (for the given force styles in use) leading to forces that can no longer be represented as numbers. Those will show as "NaN" or "Inf". On most machines, the program will continue, but there is no way to recover from it and those NaN or Inf values will propagate. So-called *"soft-core" potentials* or the *"soft" repulsive-only pair style* are less prone for this behavior (depending on the settings in use) and can be used at the beginning of a simulation. Also, single precision numbers can overflow much faster, so for the GPU or INTEL package it may be beneficial to run with double precision initially before switching to mixed or single precision for faster execution when the system has relaxed.

Communication cutoff

The communication cutoff determines the "overlap" between sub-domains and atoms in these regions are referred to in LAMMPS as "ghost atoms". This region has to be large enough to contain all atoms of a bond, angle, dihedral, or improper with just one atom in the actual sub-domain. Typically, this cutoff is set to the largest cutoff from the *pair style(s)* plus the *neighbor list skin distance* and will typically be sufficient for all bonded interactions. But if the pair style cutoff is small (e.g. with a repulsive-only Lennard-Jones potential) this may not be enough. It is even worse if there is no pair style defined (or the pair style is set to "none"), since then there will be no ghost atoms created at all.

The communication cutoff can be set or adjusted with *comm_modify cutoff <value>*, but setting this too large will waste CPU time and memory. LAMMPS will print warnings in these cases. For bonds it uses some heuristic based on the equilibrium bond length, but that still may not be sufficient for cases where the force constants are small and thus bonds may be stretched very far.

Neighbor list settings

Every time LAMMPS rebuilds the neighbor lists, LAMMPS will also check for "lost" or "missing" atoms. Thus it can help to use very conservative *neighbor list settings* and then examine the neighbor list statistics if the neighbor list rebuild can be safely delayed. Rebuilding the neighbor list less frequently (i.e. through increasing the *delay* or *every*) setting has diminishing returns and increasing risks.

Units

A frequent cause for a variety of problems is due to using the wrong *units* settings for a particular potentials, especially when reading them from a potential file. Most of the (example) potentials bundled with LAMMPS have a "UNITS:" tag that allows LAMMPS to check of the units are consistent with what is intended, but potential files from publications or potential parameter databases may lack this metadata information and thus will not error out or warn when using the wrong setting. Most potential files usually use "metal" units, but some are parameterized for other settings, most notably *ReaxFF potentials* that use "real" units.

Also, individual parameters for *pair_coeff* commands taken from publications or other MD software may need to be converted and sometimes in unexpected ways. Thus some careful checking is recommended.

No error message printed

In some cases – especially when running in parallel with MPI – LAMMPS may stop without displaying an error. But the fact that nothing was displayed does not mean there was not an error message. Instead it is highly likely that the message was written to a buffer and LAMMPS was aborted before the buffer was output. Usually, output buffers are output for every line of output, but sometimes this is delayed until 4096 or 8192 bytes of output have been accumulated. This buffering for screen and logfile output can be disabled by using the *-nb or -nonbuf* command-line flag. This is most often needed when debugging crashing multi-replica calculations.

Errors before or after the simulation box is created

As critical step in a LAMMPS input is when the simulation box is defined, either with a *create_box command*, a *read_data command*, or a *read_restart command*. After this step, certain settings are locked in (e.g. units, or number of atom, bond, angle, dihedral, improper types) and cannot be changed after that. Consequently, commands that change such settings (e.g. *units*) are only allowed before the box is defined. Very few commands can be used before and after, like *pair_style* (but not *pair_coeff*). Most LAMMPS commands must be used after the simulation box is created.

Consequently, LAMMPS will stop with an error, if a command is used in the wrong place. This is not always obvious. So index or string style *variables* can be expanded anywhere in the input, but equal style (or similar) variables can only be expanded before the box is defined if they do not reference anything that cannot be defined before the box (e.g. a compute or fix reference or a thermo keyword).

Illegal ... command

These are a catchall error messages that used to be used a lot in LAMMPS (also programmers are sometimes lazy). They usually include the name of the source file and the line where the error happened. This can be used to track down what caused the error (most often some form of syntax error) by looking at the source code. However, this has two disadvantages: 1. one has to check the source file from the exact same LAMMPS version, or else the line number would be different or the core may have been rewritten and that specific error does not exist anymore.

The LAMMPS developers are committed to replace these too generic error messages with more descriptive errors, e.g. listing *which* keyword was causing the error, so that it will be much simpler to look up the correct syntax in the manual (and without referring to the source code).

7.2.2 Unknown identifier in data file

This error happens when LAMMPS encounters a line of text with an unexpected keyword while *reading a data file*. This would be either header keywords or section header keywords. This is most commonly due to a mistyped keyword or due to a keyword that is inconsistent with the *atom style* used.

The header section informs LAMMPS how many entries or lines are expected in the various sections (like Atoms, Masses, Pair Coeffs, *etc.*) of the data file. If there is a mismatch, LAMMPS will either keep reading beyond the end of a section or stop reading before the section has ended. In that case the next line will not contain a recognized keyword.

Such a mismatch can also happen when the first line of the data is *not* a comment as required by the format, but a line with a valid header keyword. That would result in LAMMPS expecting, for instance, 0 atoms because the "atoms" header line is the first line and thus treated as a comment.

Another possibility to trigger this error is to have a keyword in the data file that corresponds to a fix (e.g. *fix cmap*) but the *read_data* command is missing the (optional) arguments that identify the fix and its header and section keywords. Alternatively, those arguments are inconsistent with the keywords in the data file.

7.2.3 Incorrect format in ... section of data file

This error happens when LAMMPS reads the contents of a section of a *data file* and the number of parameters in the line differs from what is expected. This most commonly happens when the atom style is different from what is expected for a specific data file since changing the atom style usually changes the format of the line.

This error can also occur when the number of entries indicated in the header of a data file (e.g. the number of atoms) is larger than the number of lines provided (e.g. in the corresponding Atoms section) causing LAMMPS to continue reading into the next section which has a completely different format.

7.2.4 Illegal variable command: expected X arguments but found Y

This error indicates that a variable command has either incorrectly formatted arguments or the wrong number of arguments. A common reason for this is that a variable expression contains whitespace, but is not enclosed in single or double quotes.

To explain, the LAMMPS input parser reads and processes lines. The resulting line is broken down into "words". Those are usually individual commands, labels, names, and values separated by whitespace (a space or tab character). For "words" that may contain whitespace, they have to be enclosed in single (') or double (") quotes. The parser will then remove the outermost pair of quotes and pass that string as single argument to the variable command.

Thus missing quotes or accidental extra whitespace will trigger this error because the unquoted whitespace will result in the text being broken into more "words" than expected, i.e. the variable expression being split.

7.2.5 Out of range atoms - cannot compute ...

The PPPM (and also PPPMDisp and MSM) methods need to assemble a grid of electron density data derived from the (partial) charges assigned to the atoms. These charges are smeared out across multiple grid points (see *kspace_modify order*). When running in parallel with MPI, LAMMPS uses a *domain decomposition scheme* where each processor manages a subset of atoms and thus also a grid representing the density. The processor's grid covers the actual volume of the sub-domain and some extra space corresponding to the *neighbor list skin*. These are then *combined and redistributed* for parallel processing of the long-range component of the Coulomb interaction.

The `Out of range atoms` error can happen when atoms move too fast, the neighbor list skin is too small, or the neighbor lists are not updated frequently enough. The smeared charges cannot then be fully assigned to the density grid for all atoms. LAMMPS checks for this condition and stops with an error. Most of the time, this is an indication of a system with very high forces, often at the beginning of a simulation or when boundary conditions are changed. The error becomes more likely with more MPI processes.

There are multiple options to explore for avoiding the error. The best choice depends strongly on the individual system, and often a combination of changes is required. For example, more conservative MD parameter settings can be used (larger neighbor skin, shorter time step, more frequent neighbor list updates). Sometimes, it helps to revisit the system generation and avoid close contacts when building it. Otherwise one can use the *delete_atoms overlap* command to delete those close contact atoms or run a minimization before the MD. It can also help to temporarily use a cutoff-Coulomb pair style and no kspace style until the system has somewhat equilibrated and then switch to the long-range solver.

7.2.6 Bond (or angle, dihedral, improper, cmap, or shake) atoms missing

The second atom needed to compute a particular bond (or the third or fourth atom for angle, dihedral, or improper) is missing on the indicated timestep and processor. Typically, this is because the two bonded atoms have become too far apart relative to the communication cutoff distance for ghost atoms. By default, the communication cutoff is set by the pair cutoff. However, to accommodate larger distances between topologically connected atoms, it can be manually adjusted using *comm_modify* at the cost of increased communication and more ghost atoms. However, missing bond atoms may also indicate that there are unstable dynamics which caused the atoms to blow apart. In this scenario, increasing the communication distance will not solve the underlying issue. Rather, see *Fast moving atoms* and *Neighbor list settings* in the general troubleshooting section above for ideas to fix unstable dynamics.

If atoms are intended to be lost during a simulation (e.g. due to open boundary conditions or *fix evaporate*) such that two bonded atoms may be lost at different times from each other, this error can be converted to a warning or turned off using the *lost/bond* keyword in the *thermo_modify* command.

7.2.7 Non-numeric atom coords or pressure or box dimensions - simulation unstable

This error usually occurs due to overly aggressive simulation settings or issues with the system geometry or the potential. See *Pressure, forces, positions becoming NaN or Inf* above in the general troubleshooting section. This error is more likely to happen during equilibration, so it can help to do a minimization before or even add a second or third minimization after running a few equilibration MD steps. It also is more likely when directly using a Nose-Hoover (or other) barostat, and thus it may be advisable to run with only a thermostat for a bit until the potential energy has stabilized.

7.2.8 Fix used in . . . not computed at compatible time

Many fix styles are invoked only every *nevery* timesteps, which means their data is only valid on those steps. When data from a fix is used as input for a compute, a dump, another fix, or thermo output, it must read that data at timesteps when the fix in question was invoked, i.e. on timesteps that are multiples of its *nevery* setting. If this is not the case, LAMMPS will stop with an error. To remedy this, it may be required to change the output frequency or the *nevery* setting of the fix.

7.2.9 Lost atoms . . .

A simulation stopping with an error due to lost atoms can have multiple causes. By default, LAMMPS checks for whether the total number of atoms is consistent with the sum of atoms "owned" by MPI processors every time that thermodynamic output is written. In the majority of cases, lost atoms are unexpected and a result of extremely high velocities causing instabilities in the system. Such velocities can result from a variety of issues. For ideas on how to track down issues with unexpected lost atoms, see *Fast moving atoms* and *Neighbor list settings* in the general troubleshooting section above. In specific situations however, losing atoms is expected material behavior (e.g. with sputtering and surface evaporation simulations), and an unwanted crash can be avoided by changing the *thermo_modify lost* keyword from the default 'error' to 'warn' or 'ignore' (though heed the advice in *Ignoring lost atoms* above!).

7.2.10 Too many neighbor bins

The simulation box is or has become too large relative to the size of a neighbor bin (which in turn depends on the largest pair-wise cutoff by default) such that LAMMPS is unable to store the needed number of bins. This typically implies the simulation box has expanded too far. That can occur when some atoms move rapidly apart with shrink-wrap boundaries or when a fix (like fix deform or a barostat) excessively grows the simulation box. This can also happen if the largest pair-wise cutoff is small. In this case, the error can be avoided by using the *neigh_modify command* to set the bin width to a suitably large value.

7.2.11 Unrecognized . . . style . . . is part of . . . package which is not enabled in this LAMMPS binary

The LAMMPS executable (binary) being used was not compiled with a package containing the specified style. This indicates that the executable needs to be re-built after enabling the correct package in the relevant Makefile or CMake build directory. See *Section 3. Build LAMMPS* for more details. One can check if the expected package and pair style is present in the executable by running it with the -help (or -h) flag on the command line. One common oversight, especially for beginner LAMMPS users, is enabling the package but forgetting to run commands to rebuild (e.g., to run the final make or cmake command).

If this error occurs with an executable that the user does not control (e.g., through a module on HPC clusters), the user will need to get in contact with the relevant person or people who can update the executable.

7.2.12 Energy or stress was not tallied by pair style

This warning can be printed by computes from the *TALLY package*. Those use a callback mechanism that only work for regular pair-wise additive pair styles like *Lennard-Jones*, *Morse*, *Born-Meyer-Huggins*, and similar. Such required callbacks have not been implemented for many-body potentials so one would have to implement them to add compatibility with these computes (which may be difficult to do in a generic fashion). Whether this warning indicates that contributions to the computed properties are missing depends on the groups used. At any rate, careful testing of the results is advised when this warning appears.

7.2.13 fmt::format_error

LAMMPS uses the {fmt} library for advanced string formatting tasks. This is similar to the printf() family of functions from the standard C library, but more flexible. If there is a bug in the LAMMPS code and the format string does not match the list of arguments or has some other error, this error message will be shown. You should contact the LAMMPS developers and report the bug as a GitHub Bug Report Issue along with sufficient information to easily reproduce it.

7.2.14 Substitution for illegal variable

A variable in an input script or a variable expression was not found in the list of valid variables. The most common reason for this is a typo somewhere in the input file such that the expression uses an invalid variable name. The second most common reason is omitting the curly braces for a direct variable with a name that is not a single letter. For example:

```
variable cutoff index 10.0
pair_style lj/cut ${cutoff}  # this is correct
pair_style lj/cut $cutoff    # this is incorrect, LAMMPS looks for 'c' instead of 'cutoff'
variable c      index 5.0    # if $c is defined, LAMMPS subsitutes only '$c' and reads: 5utoff
```

Another potential source of this error may be invalid command line variables (-var or -v argument) used when launching LAMMPS from an interactive shell or shell scripts. An uncommon source for this error is using the *next command* to advance through a list of values provided by an index style variable. If there is no remaining element in the list, LAMMPS will delete the variable and any following expansion or reference attempt will trigger the error.

Users with harder-to-track variable errors might also find reading the *Parsing rules for input scripts* helpful.

7.2.15 Bond atom missing in image check or box size check

This can be either an error or a warning depending on your *thermo_modify settings*. It is flagged in a part of the LAMMPS code where it updates the domain decomposition and before it builds the neighbor lists. It checks that both atoms of a bond are within the communication cutoff of a subdomain. It is usually caused by atoms moving too fast (see the *paragraph on fast moving atoms*), or by the *communication cutoff being too small*, or by waiting too long between *sub-domain and neighbor list updates*.

7.2.16 Cannot use neighbor bins - box size << cutoff

LAMMPS is unable to build neighbor bins since the size of the box is much smaller than an interaction cutoff in at least one of its dimensions. Typically, this error is triggered when the simulation box has one very thin dimension. If a cubic neighbor bin had to fit exactly within the thin dimension, then an inordinate amount of bins would be created to fill space. This error can be avoided using the generally slower *nsq neighbor style* or by increasing the size of the smallest box lengths.

7.2.17 Did not assign all atoms correctly

This error happens most commonly when *reading a data file* under *non-periodic boundary conditions*. Only atoms with positions **inside** the simulation box will be read and thus any atoms outside the box will be skipped and the total atom count will not match, which triggers the error. This does not happen with periodic boundary conditions where atoms outside the principal box will be "wrapped" into the principal box and their image flags set accordingly.

Similar errors can happen with the *replicate command* or the *read_restart command*. In these cases the cause may be a problematic geometry, an insufficient communication cutoff, or a bug in the LAMMPS source code. In these cases it is advisable to set up *small test case* for testing and debugging. This will be required in case you need to get help from a LAMMPS developer.

7.2.18 Domain too large for neighbor bins

The domain has become extremely large so that neighbor bins cannot be used. Too many neighbor bins would need to be created to fill space. Most likely, one or more atoms have been blown a great distance out of the simulation box or a fix (like fix deform or a barostat) has excessively grown the simulation box.

7.2.19 Step X: (h)bondchk failed

This error is a consequence of the heuristic memory allocations for buffers of the regular ReaxFF version. In ReaxFF simulations, the lists of bonds and hydrogen bonds can change due to chemical reactions. The default approach, however, assumes that these changes are not very large, so it allocates buffers for the current system setup plus a safety margin. This can be adjusted with the *safezone, mincap, and minhbonds settings of the pair style*, but only to some extent. When equilibrating a new system, or simulating a sparse system in parallel, this can be difficult to control and become wasteful. A simple workaround is often to break a simulation down in multiple chunks. A better approach, however, is to compile and use the KOKKOS package version of ReaxFF (you do not need a GPU for that, but can also compile it in serial or OpenMP mode), which uses a more robust memory allocation approach.

7.2.20 Numeric index X is out of bounds

This error most commonly happens when setting force field coefficients with either the *pair_coeff*, the *bond_coeff*, the *angle_coeff*, the *dihedral_coeff*, or the *improper_coeff* command. These commands accept type labels, explicit numbers, and wildcards for ranges of numbers. If the numeric value of any of these is outside the valid range (defined by the number of corresponding types), LAMMPS will stop with this error. A few other commands and styles also allow ranges of numbers and check using the same method and thus print the same kind of error.

The cause is almost always a typo in the input or a logic error when defining the values or ranges. So one needs to carefully review the input. Along with the error, LAMMPS will print the valid range as a hint.

7.2.21 Compute, fix, or variable vector or array is accessed out-of-range

When accessing an individual element of a global vector or array or a per-atom vector or array provided by a compute or fix or atom-style or vector-style variable or data from a specific atom, an index in square brackets ("[ ]") (or two indices) must be provided to determine which element to access and it must be in a valid range or else LAMMPS would access invalid data or crash with a segmentation fault. In the two most common cases, where this data is accessed, *variable expressions* and *thermodynamic output*, LAMMPS will check for valid indices and stop with an error otherwise.

While LAMMPS is written in C++ (which uses 0 based indexing) these indices start at 1 (i.e. similar to Fortran). Any index smaller than 1 or larger than the maximum allowed value should trigger this error. Since this kind of error frequently happens with rather complex expressions, it is recommended to test these with small test systems, where the values can be tracked with output files for all relevant properties at every step.

7.2.22 Incorrect args for pair coefficients (also bond/angle/dihedral/improper coefficients)

The parameters in the *pair_coeff* command for a specified *pair_style* have a missing or erroneous argument. The same applies when seeing this error for *bond_coeff*, *angle_coeff*, *dihedral_coeff*, or *improper_coeff* and their respective style commands when using the MOLECULE or EXTRA-MOLECULE packages. The cases below describe some ways to approach pair coefficient errors, but the same strategies apply to bonded systems as well.

Outside of normal typos, this error can have several sources. In all cases, the first step is to compare the command arguments to the expected format found in the corresponding *pair_style* page. This can reveal cases where, for exam-

ple, a pair style was changed, but the pair coefficients were not updated. This can happen especially with pair style variants such as *pair_style eam* vs. *pair_style eam/alloy* that look very similar but accept different parameters (the latter 'eam/alloy' variant takes element type names while 'eam' does not).

Another common source of coefficient errors is when using multiple pair styles with commands such as *pair_style hybrid*. Using hybrid pair styles requires adding an extra "label" argument in the coefficient commands that designates which pair style the command line refers to. Moreover, if the same pair style is used multiple times, this label must be followed by an additional numeric argument. Also, different pair styles may require different arguments.

This error message might also require a close look at other LAMMPS input files that are read in by the input script, such as data files or restart files.

7.2.23 Energy was not tallied on needed timestep (also virial, per-atom energy, per-atom virial)

This error is generated when LAMMPS attempts to access an out-of-date or non-existent energy, pressure, or virial. For efficiency reasons, LAMMPS does *not* calculate these quantities when the forces are calculated on every timestep or iteration. Global quantities are only calculated when they are needed for *thermo* output (at the beginning, end, and at regular intervals specified by the *thermo* command). Similarly, per-atom quantities are only calculated if they are needed to write per-atom energy or virial to a dump file. This system works fine for simple input scripts. However, the many user-specified *variable*, *fix*, and *compute* commands that LAMMPS provides make it difficult to anticipate when a quantity will be requested. In some use cases, LAMMPS will figure out that a quantity is needed and arrange for it to be calculated on that timestep e.g. if it is requested by *fix ave/time* or similar commands. If that fails, it can be detected by a mismatch between the current timestep and when a quantity was last calculated, in which case an error message of this type is generated.

The most common cause of this type of error is requesting a quantity before the start of the simulation.

```
# run 0 post no              # this will fix the error
variable e equal pe          # requesting energy compute
print "Potential energy = $e" # this will generate the error
run 1000                     # start of simulation
```

This situation can be avoided by adding in a "run 0" command, as explained in more detail in the "Variable Accuracy" section of the *variable* doc page.

Another cause is requesting a quantity on a timestep that is not a thermo or dump output timestep. This can often be remedied by increasing the frequency of thermo or dump output.

7.2.24 Molecule auto special bond generation overflow

In order to correctly apply the *special_bonds* settings (also known as "exclusions"), LAMMPS needs to maintain for each atom a list of atoms that are connected to this atom, either directly with a bond or indirectly through bonding with an intermediate atom(s). The purpose is to either remove or tag those pairs of atoms in the neighbor list. This information is stored with individual atoms and thus the maximum number of such "special" neighbors is set when the simulation box is created. When reading (relative) geometry and topology of a 'molecule' from a *molecule file*, LAMMPS will build the list of such "special" neighbors for the molecule atom (if not given in the molecule file explicitly). The error is triggered when the resulting list is too long for the space reserved when creating the simulation box. The solution is to increase the corresponding setting. Overestimating this value will only consume more memory, and is thus a safe choice.

7.2.25 Molecule topology/atom exceeds system topology/atom

LAMMPS uses *domain decomposition* to distribute data (i.e. atoms) across the MPI processes in parallel runs. This includes topology data about bonds, angles, dihedrals, impropers and *"special" neighbors*. This information is stored with either one or all atoms involved in such a topology entry (which of the two option applies depends on the *newton*

setting for bonds). When reading a data file, LAMMPS analyzes the requirements for this file and then the values are "locked in" and cannot be extended.

So loading a molecule file that requires more of the topology per atom storage or adding a data file with such needs will lead to an error. To avoid the error, one or more of the *extra/XXX/per/atom* keywords are required to extend the corresponding storage. It is no problem to choose those numbers generously and have more storage reserved than actually needed, but having these numbers set too small will lead to an error.

7.2.26 Molecule topology type exceeds system topology type

The total number of atom, bond, angle, dihedral, and improper types is "locked in" when LAMMPS creates the simulation box. This can happen through either the *create_box*, the *read_data*, or the *read_restart* command. After this it is not possible to refer to an additional type. So loading a molecule file that uses additional types or adding a data file that would require additional types will lead to an error. To avoid the error, one or more of the *extra/XXX/types* keywords are required to extend the maximum number of the individual types.

7.2.27 Molecule attributes do not match system attributes

Choosing an *atom_style* in LAMMPS determines which per-atom properties are available. In a *molecule file*, however, it is possible to add sections (for example Masses or Charges) that are not supported by the atom style. Masses for example, are usually not a per-atom property, but defined through the atom type. Thus it would not be required to have a Masses section and the included data would be ignored. LAMMPS prints this warning to inform about this case.

7.2.28 Inconsistent image flags

This warning happens when the distance between the *unwrapped* x-, y-, or z-components of the coordinates of a bond is larger than half the box with periodic boundaries or larger than the box with non-periodic boundaries. It means that the positions and image flags have become inconsistent. LAMMPS will still compute bonded interactions based on the closest periodic images of the atoms and thus in most cases the results will be correct. However they can cause problems when such atoms are used with the fix rigid or replicate commands. Thus, it is good practice to update the system so that the message does not appear. It will help with future manipulations of the system.

There is one case where this warning *must* appear: when you have a chain of connected bonds that pass through the entire box and connect back to the first atom in the chain through periodic boundaries, i.e. some kind of "infinite polymer". In that case, the bond image flags *must* be inconsistent for the one bond that reaches back to the beginning of the chain.

7.2.29 No fixes with time integration, atoms won't move

This warning will be issued if LAMMPS encounters a *run* command that does not have a preceding *fix* command that updates atom/object positions and velocities per step. In other words, there are no fixes detected that perform velocity-Verlet time integration, such as *fix nve*. Note that this alert does not mean that there are no active fixes. LAMMPS has a very wide variety of fixes, many of which do not move objects but also operate through steps, such as printing outputs (e.g. *fix print*), performing calculations (e.g. *fix ave/time*), or changing other system parameters (e.g. *fix dt/reset*). It is up to the user to determine whether the lack of a time-integrating fix is intentional or not.

7.2.30 System is not charge neutral, net charge = ...

the sum of charges in the system is not zero. When a system is not charge-neutral, methods that evolve/manipulate per-atom charges, evaluate Coulomb interactions, evaluate Coulomb forces, or evaluate/manipulate other properties relying on per-atom charges may raise this warning. A non-zero net charge most commonly arises after setting per-atom charges *set* such that the sum is non-zero or by reading in a system through *read_data* where the per-atom charges do not sum to zero. However, a loss of charge neutrality may occur in other less common ways, like when charge equilibration methods (e.g., *fix qeq*) fail.

A similar warning/error may be raised when using certain charge equilibration methods: *fix qeq*, *fix qeq/comb*, *fix qeq/reaxff*, and *fix qtpie/reaxff*. In such cases, this warning/error will be raised for the fix *group* when the group has a non-zero net charge.

When the system is expected to be charge-neutral, this warning often arises due to an error in the lammps input (e.g., an incorrect *set* command, error in the data file read by *read_data*, incorrectly grouping atoms with charge, etc.). If the system is NOT expected to be charge-neutral, the user should make sure that the method(s) used are appropriate for systems with a non-zero net charge. Some commonly used fixes for charge equilibration *fix qeq*, pair styles that include charge interactions *pair_style coul/XXX*, and kspace methods *kspace_style* can, in theory, support systems with non-zero net charge. However, non-zero net charge can lead to spurious artifacts. The severity of these artifacts depends on the magnitude of total charge, system size, and methods used. Before running simulations or calculations for systems with non-zero net charge, users should test for artifacts and convergence of properties.

7.2.31 Variable evaluation before simulation box is defined

This error happens, when trying to expand or use an equal- or atom-style variable (or an equivalent style), where the expression contains a reference to something (e.g. a compute reference, a property of an atom, or a thermo keyword) that is not allowed to be used before the simulation box is defined. See the paragraph on *errors before or after the simulation box is created* for additional information.

7.2.32 Invalid thermo keyword 'X' in variable formula

This error message is often misleading. It is caused when evaluating a *variable command* expression and LAMMPS comes across a string that it does not recognize. LAMMPS first checks if a string is a reference to a compute, fix, custom property, or another variable by looking at the first 2-3 characters (and if it is, it checks whether the referenced item exists). Next LAMMPS checks if the string matches one of the available functions or constants. If that fails, LAMMPS will assume that this string is a *thermo keyword* and let the code for printing thermodynamic output return the corresponding value. However, if this fails too, since the string is not a thermo keyword, LAMMPS stops with the 'Invalid thermo keyword' error. But it is also possible, that there is just a typo in the name of a valid variable function. Thus it is recommended to check the failing variable expression very carefully.

7.2.33 One or more atoms are time integrated more than once

This is probably an error since you typically do not want to advance the positions or velocities of an atom more than once per timestep. This typically happens when there are multiple fix commands that advance atom positions with overlapping groups. Also, for some fix styles it is not immediately obvious that they include time integration. Please check the documentation carefully.

7.2.34 XXX command before simulation box is defined

This error occurs when trying to execute a LAMMPS command that requires information about the system dimensions, or the number atom, bond, angle, dihedral, or improper types, or the number of atoms or similar data that is only available *after* the simulation box has been created. See the paragraph on *errors before or after the simulation box is created* for additional information.

7.2.35 XXX command after simulation box is defined

This error occurs when trying to execute a LAMMPS command that changes a global setting *after* it is locked in when the simulation box is created (for instance defining the *atom style*, *dimension*, *newton*, or *units* setting). These settings may only be changed *before* the simulation box has been created. See the paragraph on *errors before or after the simulation box is created* for additional information.

7.2.36 Error messages ending in 'Please contact the LAMMPS developers'

Such error messages indicate that something unexpected has happened and that it will require a good understanding of the details of the design of LAMMPS to resolve this. This can be due to some bug in contributed code, and oversight when updating functionality, a feature that is scheduled to be removed or reaching a combination of flags and settings that should not be possible or similar.

Even if you find a way to work around this error or warning, you should contact the LAMMPS developers and prepare a minimal set of inputs that can be used to reproduce this error or warning. By providing the input, the LAMMPS developers can then assess whether additional action is needed and who else to contact about this, if needed.

There are multiple ways to get into contact and report your issue. In order of preference there are:

- Submit a bug report issue in the LAMMPS GitHub repository
- Post a message in the "LAMMPS Development" forum in the MatSci Community Discourse
- Send an email to developers@lammps.org
- Send an email to an *individual LAMMPS developer* that you know and trust

7.2.37 Neighbor list overflow, boost neigh_modify one

The neighbor list code in LAMMPS uses a special memory allocation strategy to speed up building and accessing neighbor lists.

Instead of making a memory allocation for each list of neighbors of the atoms LAMMPS allocates "pages" that have room for several neighbor lists. This has two main advantages:

1. It is not needed to first count how many neighbors there are for an atom to determine the storage required. Since the pages are much larger than individual lists, LAMMPS just "fills up" the page until there is not enough space left and then allocates a new page.
2. There are fewer calls to the memory allocator functions (which can be time consuming for long-running jobs and fragmented memory space) and the resulting neighbor lists are close to each other physically which improves cache efficiency.

This is controlled by the two parameters "one" and "page", respectively, that can be set via the *neigh_modify command*. The parameter "one" is the maximum number of entries in a list of neighbors for a single atom. If an atom has more neighbors as the "one" parameter allows, the "overflow" error message is triggered. The parameter "page" sets the size of the page. The neighbor list code checks, if there are "one" entries left in the current page. If not, a new page is allocated.

The default settings are suitable for most systems. They need to be changed, for instance, when simulating a system with a very high density or when setting a very long cutoff (e.g. $\gtrapprox$ 15Å with *units real*). The value of "page" **must** be at least 10x the value of "one", but 50x to 100x are recommended to avoid wasting memory. The neighbor list storage is typically the largest amount of RAM required by a LAMMPS calculation.

Even though the LAMMPS error message recommends to increase the "one" parameter, this may not always be the correct solution. The neighbor list overflow can also be a symptom for some other error that cannot be easily detected. For example, a frequent reason for an (unexpected) high density are incorrect box dimensions (since LAMMPS wraps atoms back into the principal box with periodic boundaries) or coordinates provided as fractional coordinates (LAMMPS does not support this for data files). In both cases, LAMMPS cannot easily know whether the input geometry has such a high density (and thus requiring more neighbor list storage per atom) on purpose or by accident. Rather than blindly increasing the "one" parameter, it is thus worth checking if this is justified by the combination of density and cutoff. This is particularly recommended when using some tool(s) to convert input or data files.

When boosting (= increasing) the "one" parameter, it is recommended to also increase the value for the "page" parameter to maintain the ratio between "one" and "page" to reduce waste of memory. For some more details, please check out the documentation for the *neigh_modify command*.

7.3 Reporting bugs

If you are confident that you have found a bug in LAMMPS, please follow the steps outlined below:

- Check the New features and bug fixes section of the LAMMPS WWW site or the GitHub Releases page to see if the bug has already been addressed in a patch release.
- Check that your issue can be reproduced with the latest development version of LAMMPS.
- Check the manual carefully to verify that the unexpected behavior you are observing is indeed in conflict with the documentation
- Check the GitHub Issue page if your issue has already been reported and if it is still open.
- Check the GitHub Pull Requests page to see if there is already a fix for your bug pending.
- Check the LAMMPS forum at MatSci to see if the issue has been discussed before.

If none of these steps yields any useful information, please file a new bug report on the GitHub Issue page. The website will offer you to select a suitable template with explanations and then you should replace those explanations with the information that you can provide to reproduce your issue.

The most useful thing you can do to help us verify and fix a bug is to isolate the problem. Run it on the smallest number of atoms and fewest number of processors with the simplest input script that reproduces the bug. Try to identify what command or combination of commands is causing the problem and upload the complete input deck as a tar or zip archive. Please avoid using binary restart files unless the issue requires it. In the latter case you should also include an input deck to quickly generate this restart from a data file or a simple additional input. This input deck can be used with tools like a debugger or valgrind to further *debug the crash*.

You may also post a message in the development category of the LAMMPS forum at MatSci describing the problem with the same kind of information. The forum can provide a faster response, especially if the bug reported is actually expected behavior or other LAMMPS users have come across it before.

7.4 Debugging crashes

If LAMMPS crashes with a "segmentation fault" or a "bus error" or similar message, then you can use the following two methods to further narrow down the origin of the issue. This will help the LAMMPS developers (or yourself) to understand the reason for the crash and apply a fix (either to the input script or the source code). This requires that your LAMMPS executable includes the required *debug information*. Otherwise it is not possible to look up the names of functions or variables.

The following patch will introduce a bug into the code for pair style *lj/cut* when using the examples/melt/in.melt input. We use it to show how to identify the origin of a segmentation fault.

```
--- a/src/pair_lj_cut.cpp
+++ b/src/pair_lj_cut.cpp

+  }
+  printf("comx = %g\n",comx);
   if (vflag_fdotr) virial_fdotr_compute();
 }
```

After recompiling LAMMPS and running the input you should get something like this:

```
$ ./lmp -in in.melt
LAMMPS (19 Mar 2020)
  using 1 OpenMP thread(s) per MPI task
Lattice spacing in x,y,z = 1.6796 1.6796 1.6796

      bin: standard
Setting up Verlet run ...
  Unit style    : lj
  Current step  : 0
  Time step     : 0.005
Segmentation fault (core dumped)
```

7.4.1 Using the GDB debugger to get a stack trace

There are two options to use the GDB debugger for identifying the origin of the segmentation fault or similar crash. The GDB debugger has many more features and options, as can be seen for example its online documentation.

Run LAMMPS from within the debugger

Running LAMMPS under the control of the debugger as shown below only works for a single MPI rank (for debugging a program running in parallel you usually need a parallel debugger program). A simple way to launch GDB is to prefix the LAMMPS command-line with gdb --args and then type the command "run" at the GDB prompt. This will launch the debugger, load the LAMMPS executable and its debug info, and then run it. When it reaches the code causing the segmentation fault, it will stop with a message why it stopped, print the current line of code, and drop back to the GDB prompt.

```
(gdb) run
[...]
```

(continues on next page)

(continued from previous page)

```
Setting up Verlet run ...
  Unit style    : lj
  Current step  : 0
  Time step     : 0.005

Program received signal SIGSEGV, Segmentation fault.
0x00000000006653ab in LAMMPS_NS::PairLJCut::compute (this=0x829740, eflag=1, vflag=<optimized␣
↪out>) at /home/akohlmey/compile/lammps/src/pair_lj_cut.cpp:139
139       comx += atom->rmass[i]*x[i][0]; /* BUG */
(gdb)
```

Now typing the command "where" will show the stack of functions starting from the current function back to "main()".

```
(gdb) where
#0  0x00000000006653ab in LAMMPS_NS::PairLJCut::compute (this=0x829740, eflag=1, vflag=
↪<optimized out>) at /home/akohlmey/compile/lammps/src/pair_lj_cut.cpp:139

↪compile/lammps/src/verlet.cpp:131
#2  0x000000000049db42 in LAMMPS_NS::Run::command (this=this@entry=0x7fffffffcca0,␣
↪narg=narg@entry=1, arg=arg@entry=0x7e8750)
    at /home/akohlmey/compile/lammps/src/run.cpp:177
#3  0x000000000041258a in LAMMPS_NS::Input::command_creator<LAMMPS_NS::Run> (lmp=
↪<optimized out>, narg=1, arg=0x7e8750)
    at /home/akohlmey/compile/lammps/src/input.cpp:878
#4  0x0000000000410ad3 in LAMMPS_NS::Input::execute_command (this=0x7d1410) at /home/
↪akohlmey/compile/lammps/src/input.cpp:864
#5  0x00000000004111fb in LAMMPS_NS::Input::file (this=0x7d1410) at /home/akohlmey/compile/
↪lammps/src/input.cpp:229
#6  0x000000000040933a in main (argc=<optimized out>, argv=<optimized out>) at /home/akohlmey/
↪compile/lammps/src/main.cpp:65
(gdb)
```

You can also print the value of variables and see if there is anything unexpected. Segmentation faults, for example, commonly happen when a pointer variable is not assigned and still initialized to NULL.

```
(gdb) print x
$1 = (double **) 0x7ffff7ca1010
(gdb) print i
$2 = 0
(gdb) print x[0]
$3 = (double *) 0x7ffff6d80010
(gdb) print x[0][0]
$4 = 0
(gdb) print x[1][0]
$5 = 0.83979809569125363
(gdb) print atom->rmass
$6 = (double *) 0x0
(gdb)
```

Inspect a core dump file with the debugger

When an executable crashes with a "core dumped" message, it creates a file "core" or "core.<PID#>" which contains the information about the current state. This file may be located in the folder where you ran LAMMPS or in some hidden folder managed by the systemd daemon. In the latter case, you need to "extract" the core file with the coredumpctl utility to the current folder. Example: coredumpctl -o core dump lmp. Now you can launch the debugger to load the executable, its debug info and the core dump and drop you to a prompt like before.

```
$ gdb lmp core
Reading symbols from lmp...
[New LWP 1928535]
[Thread debugging using libthread_db enabled]
Using host libthread_db library "/lib64/libthread_db.so.1".
Core was generated by `./lmp -in in.melt'.
Program terminated with signal SIGSEGV, Segmentation fault.
#0  0x00000000006653ab in LAMMPS_NS::PairLJCut::compute (this=0x1b10740, eflag=1, vflag=
↪<optimized out>)
    at /home/akohlmey/compile/lammps/src/pair_lj_cut.cpp:139
139       comx += atom->rmass[i]*x[i][0]; /* BUG */
(gdb)
```

From here on, you use the same commands as shown before to get a stack trace and print current values of (pointer) variables.

7.4.2 Using valgrind to get a stack trace

The valgrind suite of tools allows to closely inspect the behavior of a compiled program by essentially emulating a CPU and instrumenting the program while running. This slows down execution quite significantly, but can also report issues that are not resulting in a crash. The default valgrind tool is a memory checker and you can use it by prefixing the normal command-line with valgrind. Unlike GDB, this will also work for parallel execution, but it is recommended to redirect the valgrind output to a file (e.g. with --log-file=crash-%p.txt, the %p will be substituted with the process ID) so that the messages of the multiple valgrind instances to the console are not mixed.

```
$ valgrind ./lmp -in in.melt

```

As you can see, the stack trace information is similar to that obtained from GDB. In addition you get a more specific hint about what cause the segmentation fault, i.e. that it is a NULL pointer dereference. To find out which pointer exactly was NULL, you need to use the debugger, though.

7.5 Debugging when LAMMPS appears to be stuck

Sometimes the LAMMPS calculation appears to be stuck, that is the LAMMPS process or processes are active, but there is no visible progress. This can have multiple reasons:

- The selected styles are slow and require a lot of CPU time and the system is large. When extrapolating the expected speed from smaller systems, one has to factor in that not all models scale linearly with system size, e.g. *kspace styles like ewald or pppm*. There is very little that can be done in this case.
- The output interval is not set or set to a large value with the *thermo* command. I the first case, there will be output only at the first and last step.
- The output is block-buffered and instead of line-buffered. The output will only be written to the screen after 4096 or 8192 characters of output have accumulated. This most often happens for files but also with MPI parallel executables for output to the screen, since the output to the screen is handled by the MPI library so that output from all processes can be shown. This can be suppressed by using the -nonblock or -nb command-line flag, which turns off buffering for screen and logfile output.
- An MPI parallel calculation has a bug where a collective MPI function is called (e.g. MPI_Barrier(), MPI_Bcast(), MPI_Allreduce() and so on) before pending point-to-point communications are completed or when the collective function is only called from a subset of the MPI processes. This also applies to some internal LAMMPS functions like Error::all() which uses MPI_Barrier() and thus Error::one() must be called, if the error condition does not happen on all MPI processes simultaneously.
- Some function in LAMMPS has a bug where a for or while loop does not trigger the exit condition and thus will loop forever. This can happen when the wrong variable is incremented or when one value in a comparison becomes NaN due to an overflow.

In the latter two cases, further information and stack traces (see above) can be obtain by attaching a debugger to a running process. For that the process ID (PID) is needed; this can be found on Linux machines with the top, htop, ps,

or pstree commands.

Then running the (GNU) debugger gdb with the -p flag followed by the process id will attach the process to the debugger and stop execution of that specific process. From there on it is possible to issue all debugger commands in the same way as when LAMMPS was started from the debugger (see above). Most importantly it is possible to obtain a stack trace with the where command and thus determine where in the execution of a timestep this process is. Also internal data can be printed and execution single stepped or continued. When the debugger is exited, the calculation will resume normally.

7.6 Error messages

This is an alphabetic list of some of the ERROR messages LAMMPS prints out and the reason why. If the explanation here is not sufficient, the documentation for the offending command may help. This is a historic list and no longer updated. Instead the LAMMPS developers are trying to provide more details right with the error message or link to a paragraph with *detailed explanations*.

Error messages also list the source file and line number where the error was generated. For example, a message like this:

```
ERROR: Illegal velocity command (velocity.cpp:78)
```

means that line #78 in the file src/velocity.cpp generated the error. Looking in the source code may help you figure out what went wrong.

Please also see the page with *Warning messages*.

Accelerator sharing is not currently supported on system
Multiple MPI processes cannot share the accelerator on your system. For NVIDIA GPUs, see the nvidia-smi command to change this setting.

All angle coeffs are not set
All angle coefficients must be set in the data file or by the angle_coeff command before running a simulation.

All bond coeffs are not set
All bond coefficients must be set in the data file or by the bond_coeff command before running a simulation.

All dihedral coeffs are not set
All dihedral coefficients must be set in the data file or by the dihedral_coeff command before running a simulation.

All improper coeffs are not set
All improper coefficients must be set in the data file or by the improper_coeff command before running a simulation.

All masses are not set
For atom styles that define masses for each atom type, all masses must be set in the data file or by the mass command before running a simulation. They must also be set before using the velocity command.

All mol IDs should be set for fix gcmc group atoms
The molecule flag is on, yet not all molecule ids in the fix group have been set to non-zero positive values by the user. This is an error since all atoms in the fix gcmc group are eligible for deletion, rotation, and translation and therefore must have valid molecule ids.

All pair coeffs are not set
All pair coefficients must be set in the data file or by the pair_coeff command before running a simulation.

All read_dump x,y,z fields must be specified for scaled, triclinic coords
For triclinic boxes and scaled coordinates you must specify all 3 of the x,y,z fields, else LAMMPS cannot reconstruct the unscaled coordinates.

Angle atom missing in delete_bonds
The delete_bonds command cannot find one or more atoms in a particular angle on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid angle.

Angle atom missing in set command
The set command cannot find one or more atoms in a particular angle on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid angle.

Angle coeff for hybrid has invalid style
Angle style hybrid uses another angle style as one of its coefficients. The angle style used in the angle_coeff command or read from a restart file is not recognized.

Angle coeffs are not set
No angle coefficients have been assigned in the data file or via the angle_coeff command.

Angle extent > half of periodic box length
This error was detected by the neigh_modify check yes setting. It is an error because the angle atoms are so far apart it is ambiguous how it should be defined.

Angle potential must be defined for SHAKE
When shaking angles, an angle_style potential must be used.

Angle table parameters did not set N
List of angle table parameters must include N setting.

Angle_coeff command before angle_style is defined
Coefficients cannot be set in the data file or via the angle_coeff command until an angle_style has been assigned.

Angle_coeff command before simulation box is defined
The angle_coeff command cannot be used before a read_data, read_restart, or create_box command.

Angle_coeff command when no angles allowed
The chosen atom style does not allow for angles to be defined.

Angle_style command when no angles allowed
The chosen atom style does not allow for angles to be defined.

Angles assigned incorrectly
Angles read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

Angles defined but no angle types
The data file header lists angles but no angle types.

Append boundary must be shrink/minimum
The boundary style of the face where atoms are added must be of type m (shrink/minimum).

Arccos of invalid value in variable formula
Argument of arccos() must be between -1 and 1.

Arcsin of invalid value in variable formula
Argument of arcsin() must be between -1 and 1.

Atom IDs must be used for molecular systems
Atom IDs are used to identify and find partner atoms in bonds.

Atom count changed in fix neb
This is not allowed in a NEB calculation.

Atom count is inconsistent, cannot write data file
The sum of atoms across processors does not equal the global number of atoms. Probably some atoms have been lost.

Atom count is inconsistent, cannot write restart file
Sum of atoms across processors does not equal initial total count. This is probably because you have lost some atoms.

Atom sort did not operate correctly
This is an internal LAMMPS error. Please report it to the developers.

Atom style template molecule must have atom types
The defined molecule(s) does not specify atom types.

Atom style was redefined after using fix property/atom
This is not allowed.

Atom vector in equal-style variable formula
Atom vectors generate one value per atom which is not allowed in an equal-style variable.

Atom-style variable in equal-style variable formula
Atom-style variables generate one value per atom which is not allowed in an equal-style variable.

Atom_modify id command after simulation box is defined
The atom_modify id command cannot be used after a read_data, read_restart, or create_box command.

Atom_modify map command after simulation box is defined
The atom_modify map command cannot be used after a read_data, read_restart, or create_box command.

Atom_style command after simulation box is defined
The atom_style command cannot be used after a read_data, read_restart, or create_box command.

Atomfile variable could not read values
Check the file assigned to the variable.

Attempt to pop empty stack in fix box/relax
Internal LAMMPS error. Please report it to the developers.

Attempt to push beyond stack limit in fix box/relax
Internal LAMMPS error. Please report it to the developers.

Attempting to rescale a 0.0 temperature
Cannot rescale a temperature that is already 0.0.

Bad FENE bond
Two atoms in a FENE bond have become so far apart that the bond cannot be computed.

Bad TIP4P angle type for PPPM/TIP4P
Specified angle type is not valid.

Bad TIP4P angle type for PPPMDisp/TIP4P
Specified angle type is not valid.

Bad TIP4P bond type for PPPM/TIP4P
Specified bond type is not valid.

Bad TIP4P bond type for PPPMDisp/TIP4P
Specified bond type is not valid.

Bad fix ID in fix append/atoms command
The value of the fix_id for keyword spatial must start with “f_”.

Bad grid of processors
The 3d grid of processors defined by the processors command does not match the number of processors LAMMPS is being run on.

Bad kspace_modify kmax/ewald parameter
Kspace_modify values for the kmax/ewald keyword must be integers > 0

Bad kspace_modify slab parameter
Kspace_modify value for the slab/volume keyword must be >= 2.0.

Bad matrix inversion in mldivide3
This error should not occur unless the matrix is badly formed.

Bad principal moments
Fix rigid did not compute the principal moments of inertia of a rigid group of atoms correctly.

Bad quadratic solve for particle/line collision
This is an internal error. It should normally not occur.

Bad quadratic solve for particle/tri collision
This is an internal error. It should normally not occur.

Bad real space Coulombic cutoff in fix tune/kspace
Fix tune/kspace tried to find the optimal real space Coulombic cutoff using the Newton-Rhaphson method, but found a non-positive or NaN cutoff

Balance command before simulation box is defined
The balance command cannot be used before a read_data, read_restart, or create_box command.

Balance produced bad splits
This should not occur. It means two or more cutting plane locations are on top of each other or out of order. Report the problem to the developers.

Balance rcb cannot be used with comm_style brick
Comm_style tiled must be used instead.

Balance shift string is invalid
The string can only contain the characters "x", "y", or "z".

Bias compute does not calculate a velocity bias
The specified compute must compute a bias for temperature.

Bias compute does not calculate temperature
The specified compute must compute temperature.

Bias compute group does not match compute group
The specified compute must operate on the same group as the parent compute.

Big particle in fix srd cannot be point particle
Big particles must be extended spheroids or ellipsoids.

Bigint setting in lmptype.h is invalid
Size of bigint is less than size of tagint.

Bigint setting in lmptype.h is not compatible
Format of bigint stored in restart file is not consistent with LAMMPS version you are running. See the settings in src/lmptype.h

Bitmapped lookup tables require int/float be same size
Cannot use pair tables on this machine, because of word sizes. Use the pair_modify command with table 0 instead.

Bitmapped table in file does not match requested table
Setting for bitmapped table in pair_coeff command must match table in file exactly.

Bitmapped table is incorrect length in table file
Number of table entries is not a correct power of 2.

Bond and angle potentials must be defined for TIP4P
Cannot use TIP4P pair potential unless bond and angle potentials are defined.

Bond atom missing in box size check
The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond atom missing in delete_bonds
The delete_bonds command cannot find one or more atoms in a particular bond on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid bond.

Bond atom missing in set command
The set command cannot find one or more atoms in a particular bond on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid bond.

Bond coeff for hybrid has invalid style
Bond style hybrid uses another bond style as one of its coefficients. The bond style used in the bond_coeff command or read from a restart file is not recognized.

Bond coeffs are not set
No bond coefficients have been assigned in the data file or via the bond_coeff command.

Bond extent > half of periodic box length
This error was detected by the neigh_modify check yes setting. It is an error because the bond atoms are so far apart it is ambiguous how it should be defined.

Bond potential must be defined for SHAKE
Cannot use fix shake unless bond potential is defined.

Bond style quartic cannot be used with 3,4-body interactions
No angle, dihedral, or improper styles can be defined when using bond style quartic.

Bond style quartic cannot be used with atom style template
This bond style can change the bond topology which is not allowed with this atom style.

Bond style quartic requires special_bonds = 1,1,1
This is a restriction of the current bond quartic implementation.

Bond table parameters did not set N
List of bond table parameters must include N setting.

Bond table values are not increasing
The values in the tabulated file must be monotonically increasing.

BondAngle coeff for hybrid angle has invalid format
No "ba" field should appear in data file entry.

BondBond coeff for hybrid angle has invalid format
No "bb" field should appear in data file entry.

Bond_coeff command before bond_style is defined
Coefficients cannot be set in the data file or via the bond_coeff command until an bond_style has been assigned.

Bond_coeff command before simulation box is defined
The bond_coeff command cannot be used before a read_data, read_restart, or create_box command.

Bond_coeff command when no bonds allowed
The chosen atom style does not allow for bonds to be defined.

Bond_style command when no bonds allowed
The chosen atom style does not allow for bonds to be defined.

Bonds assigned incorrectly
Bonds read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

Bonds defined but no bond types
The data file header lists bonds but no bond types.

Both sides of boundary must be periodic
Cannot specify a boundary as periodic only on the lo or hi side. Must be periodic on both sides.

Boundary command after simulation box is defined
The boundary command cannot be used after a read_data, read_restart, or create_box command.

Box bounds are invalid
The box boundaries specified in the read_data file are invalid. The lo value must be less than the hi value for all 3 dimensions.

Box command after simulation box is defined
The box command cannot be used after a read_data, read_restart, or create_box command.

CPU neighbor lists must be used for ellipsoid/sphere mix.
When using Gay-Berne or RE-squared pair styles with both ellipsoidal and spherical particles, the neighbor list must be built on the CPU

Can not specify Pxy/Pxz/Pyz in fix box/relax with non-triclinic box
Only triclinic boxes can be used with off-diagonal pressure components. See the region prism command for details.

Can not specify Pxy/Pxz/Pyz in fix nvt/npt/nph with non-triclinic box
Only triclinic boxes can be used with off-diagonal pressure components. See the region prism command for details.

Cannot (yet) do analytic differentiation with pppm/gpu
This is a current restriction of this command.

Cannot (yet) request ghost atoms with Kokkos half neighbor list
This feature is not yet supported.

Cannot (yet) use 'electron' units with dipoles
This feature is not yet supported.

Cannot (yet) use Ewald with triclinic box and slab correction
This feature is not yet supported.

Cannot (yet) use K-space slab correction with compute group/group for triclinic systems
This option is not yet supported.

Cannot (yet) use MSM with 2d simulation
This feature is not yet supported.

Cannot (yet) use PPPM with triclinic box and TIP4P
This feature is not yet supported.

Cannot (yet) use PPPM with triclinic box and kspace_modify diff ad
This feature is not yet supported.

Cannot (yet) use PPPM with triclinic box and slab correction
This feature is not yet supported.

Cannot (yet) use kspace slab correction with long-range dipoles and non-neutral systems or per-atom energy
This feature is not yet supported.

Cannot (yet) use kspace_modify diff ad with compute group/group
This option is not yet supported.

Cannot (yet) use kspace_style pppm/stagger with triclinic systems
This feature is not yet supported.

Cannot (yet) use single precision with MSM (remove -DFFT_SINGLE from Makefile and re-compile)
Single precision cannot be used with MSM.

Cannot add atoms to fix move variable
Atoms can not be added afterwards to this fix option.

Cannot append atoms to a triclinic box
The simulation box must be defined with edges aligned with the Cartesian axes.

Cannot change box ortho/triclinic with certain fixes defined
This is because those fixes store the shape of the box. You need to use unfix to discard the fix, change the box, then redefine a new fix.

Cannot change box ortho/triclinic with dumps defined
This is because some dumps store the shape of the box. You need to use undump to discard the dump, change the box, then redefine a new dump.

Cannot change box tilt factors for orthogonal box
Cannot use tilt factors unless the simulation box is non-orthogonal.

Cannot change dump_modify every for dump dcd
The frequency of writing dump dcd snapshots cannot be changed.

Cannot change dump_modify every for dump xtc
The frequency of writing dump xtc snapshots cannot be changed.

Cannot change timestep once fix srd is setup
This is because various SRD properties depend on the timestep size.

Cannot change timestep with fix pour
This is because fix pour pre-computes the time delay for particles to fall out of the insertion volume due to gravity.

Cannot change_box after reading restart file with per-atom info
This is because the restart file info cannot be migrated with the atoms. You can get around this by performing a 0-timestep run which will assign the restart file info to actual atoms.

Cannot clear group all
This operation is not allowed.

Cannot close restart file - MPI error: %s
This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot compute initial g_ewald_disp
LAMMPS failed to compute an initial guess for the PPPM_disp g_ewald_6 factor that partitions the computation between real space and k-space for Dispersion interactions.

Cannot create an atom map unless atoms have IDs
The simulation requires a mapping from global atom IDs to local atoms, but the atoms that have been defined have no IDs.

Cannot create atoms with undefined lattice
Must use the lattice command before using the create_atoms command.

Cannot create/grow a vector/array of pointers for %s
LAMMPS code is making an illegal call to the templated memory allocators, to create a vector or array of pointers.

Cannot create_atoms after reading restart file with per-atom info
The per-atom info was stored to be used when by a fix that you may re-define. If you add atoms before re-defining the fix, then there will not be a correct amount of per-atom info.

Cannot create_box after simulation box is defined
A simulation box can only be defined once.

Cannot currently use pair reax with pair hybrid
This is not yet supported.

Cannot displace_atoms after reading restart file with per-atom info
This is because the restart file info cannot be migrated with the atoms. You can get around this by performing a 0-timestep run which will assign the restart file info to actual atoms.

Cannot do GCMC on atoms in atom_modify first group
This is a restriction due to the way atoms are organized in a list to enable the atom_modify first command.

Cannot do atom/swap on atoms in atom_modify first group
This is a restriction due to the way atoms are organized in a list to enable the atom_modify first command.

Cannot dump sort when multiple dump files are written
In this mode, each processor dumps its atoms to a file, so no sorting is allowed.

Cannot embed Python when also extending Python with LAMMPS
When running LAMMPS via Python through the LAMMPS library interface you cannot also user the input script python command.

Cannot evaporate atoms in atom_modify first group
This is a restriction due to the way atoms are organized in a list to enable the atom_modify first command.

Cannot find delete_bonds group ID
Group ID used in the delete_bonds command does not exist.

Cannot have both pair_modify shift and tail set to yes
These 2 options are contradictory.

Cannot intersect groups using a dynamic group
This operation is not allowed.

Cannot open ADP potential file %s
The specified ADP potential file cannot be opened. Check that the path and name are correct.

Cannot open AIREBO potential file %s
The specified AIREBO potential file cannot be opened. Check that the path and name are correct.

Cannot open BOP potential file %s
The specified BOP potential file cannot be opened. Check that the path and name are correct.

Cannot open COMB potential file %s
The specified COMB potential file cannot be opened. Check that the path and name are correct.

Cannot open COMB3 lib.comb3 file
The COMB3 library file cannot be opened. Check that the path and name are correct.

Cannot open COMB3 potential file %s
The specified COMB3 potential file cannot be opened. Check that the path and name are correct.

Cannot open EAM potential file %s
The specified EAM potential file cannot be opened. Check that the path and name are correct.

Cannot open EIM potential file %s
The specified EIM potential file cannot be opened. Check that the path and name are correct.

Cannot open LCBOP potential file %s
The specified LCBOP potential file cannot be opened. Check that the path and name are correct.

Cannot open MEAM potential file %s
The specified MEAM potential file cannot be opened. Check that the path and name are correct.

Cannot open SNAP coefficient file %s
The specified SNAP coefficient file cannot be opened. Check that the path and name are correct.

Cannot open SNAP parameter file %s
The specified SNAP parameter file cannot be opened. Check that the path and name are correct.

Cannot open Stillinger-Weber potential file %s
The specified SW potential file cannot be opened. Check that the path and name are correct.

Cannot open Tersoff potential file %s
The specified potential file cannot be opened. Check that the path and name are correct.

Cannot open Vashishta potential file %s
The specified Vashishta potential file cannot be opened. Check that the path and name are correct.

Cannot open coul/streitz potential file %s
The specified coul/streitz potential file cannot be opened. Check that the path and name are correct.

Cannot open data file %s
The specified file cannot be opened. Check that the path and name are correct.

Cannot open dir to search for restart file
Using a "*" in the name of the restart file will open the current directory to search for matching file names.

Cannot open dump file %s
The output file for the dump command cannot be opened. Check that the path and name are correct.

Cannot open file %s
The specified file cannot be opened. Check that the path and name are correct. If the file is a compressed file, also check that the gzip executable can be found and run.

Cannot open file variable file %s
The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix ave/chunk file %s
The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix ave/correlate file %s
The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix ave/histo file %s
The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix ave/time file %s
The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix print file %s
The output file generated by the fix print command cannot be opened

Cannot open fix qeq parameter file %s
The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix qeq/comb file %s
The output file for the fix qeq/combs command cannot be opened. Check that the path and name are correct.

Cannot open fix reax/bonds file %s
The output file for the fix reax/bonds command cannot be opened. Check that the path and name are correct.

Cannot open fix rigid infile %s
The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix rigid restart file %s
The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix rigid/small infile %s
The specified file cannot be opened. Check that the path and name are correct.

Cannot open fix tmd file %s
The output file for the fix tmd command cannot be opened. Check that the path and name are correct.

Cannot open fix ttm file %s
The output file for the fix ttm command cannot be opened. Check that the path and name are correct.

Cannot open gzipped file
LAMMPS was compiled without support for reading and writing gzipped files through a pipeline to the gzip program with -DLAMMPS_GZIP.

Cannot open log.cite file
This file is created when you use some LAMMPS features, to indicate what paper you should cite on behalf of those who implemented the feature. Check that you have write privileges into the directory you are running in.

Cannot open log.lammps for writing
The default LAMMPS log file cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot open logfile
The LAMMPS log file named in a command-line argument cannot be opened. Check that the path and name are correct.

Cannot open logfile %s
The LAMMPS log file specified in the input script cannot be opened. Check that the path and name are correct.

Cannot open molecule file %s
The specified file cannot be opened. Check that the path and name are correct.

Cannot open nb3b/harmonic potential file %s
The specified potential file cannot be opened. Check that the path and name are correct.

Cannot open pair_write file
The specified output file for pair energies and forces cannot be opened. Check that the path and name are correct.

Cannot open polymorphic potential file %s
The specified polymorphic potential file cannot be opened. Check that the path and name are correct.

Cannot open restart file for reading - MPI error: %s
This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot open restart file for writing - MPI error: %s
This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot open screen file
The screen file specified as a command-line argument cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot open universe log file
For a multi-partition run, the master log file cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot open universe screen file
For a multi-partition run, the master screen file cannot be opened. Check that the directory you are running in allows for files to be created.

Cannot read from restart file - MPI error: %s
This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot read_restart after simulation box is defined
The read_restart command cannot be used after a read_data, read_restart, or create_box command.

Cannot redefine variable as a different style
An equal-style variable can be re-defined but only if it was originally an equal-style variable.

Cannot replicate 2d simulation in z dimension
The replicate command cannot replicate a 2d simulation in the z dimension.

Cannot replicate with fixes that store atom quantities
Either fixes are defined that create and store atom-based vectors or a restart file was read which included atom-based vectors for fixes. The replicate command cannot duplicate that information for new atoms. You should use the replicate command before fixes are applied to the system.

Cannot reset timestep with a dynamic region defined
Dynamic regions (see the region command) have a time dependence. Thus you cannot change the timestep when one or more of these are defined.

Cannot reset timestep with a time-dependent fix defined
You cannot reset the timestep when a fix that keeps track of elapsed time is in place.

Cannot run 2d simulation with non-periodic Z dimension
Use the boundary command to make the z dimension periodic in order to run a 2d simulation.

Cannot set bond topology types for atom style template
The bond, angle, etc types cannot be changed for this atom style since they are static settings in the molecule template files.

Cannot set both respa pair and inner/middle/outer
In the rRESPA integrator, you must compute pairwise potentials either all together (pair), or in pieces (inner/middle/outer). You can't do both.

Cannot set mass for this atom style
This atom style does not support mass settings for each atom type. Instead they are defined on a per-atom basis in the data file.

Cannot set respa hybrid and any of pair/inner/middle/outer
In the rRESPA integrator, you must compute pairwise potentials either all together (pair), with different cutoff regions (inner/middle/outer), or per hybrid sub-style (hybrid). You cannot mix those.

Cannot set respa middle without inner/outer
In the rRESPA integrator, you must define both a inner and outer setting in order to use a middle setting.

Cannot set restart file size - MPI error: %s
This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot set temperature for fix rigid/nph
The temp keyword cannot be specified.

Cannot set this attribute for this atom style
The attribute being set does not exist for the defined atom style.

Cannot subtract groups using a dynamic group
This operation is not allowed.

Cannot union groups using a dynamic group
This operation is not allowed.

Cannot use Ewald with 2d simulation
The kspace style ewald cannot be used in 2d simulations. You can use 2d Ewald in a 3d simulation; see the kspace_modify command.

Cannot use Ewald/disp solver on system with no charge, dipole, or LJ particles
No atoms in system have a non-zero charge or dipole, or are LJ particles. Change charges/dipoles or change options of the kspace solver/pair style.

Cannot use EwaldDisp with 2d simulation
This is a current restriction of this command.

Cannot use NEB unless atom map exists
Use the atom_modify command to create an atom map.

Cannot use NEB with atom_modify sort enabled
This is current restriction for NEB implemented in LAMMPS.

Cannot use PPPM with 2d simulation
The kspace style pppm cannot be used in 2d simulations. You can use 2d PPPM in a 3d simulation; see the kspace_modify command.

Cannot use PPPMDisp with 2d simulation
The kspace style pppm/disp cannot be used in 2d simulations. You can use 2d pppm/disp in a 3d simulation; see the kspace_modify command.

Cannot use PRD with a changing box
The current box dimensions are not copied between replicas

Cannot use PRD with a time-dependent fix defined
PRD alters the timestep in ways that will mess up these fixes.

Cannot use PRD with a time-dependent region defined
PRD alters the timestep in ways that will mess up these regions.

Cannot use PRD with atom_modify sort enabled
This is a current restriction of PRD. You must turn off sorting, which is enabled by default, via the atom_modify command.

Cannot use PRD with multi-processor replicas unless atom map exists
Use the atom_modify command to create an atom map.

Cannot use TAD unless atom map exists for NEB
See atom_modify map command to set this.

Cannot use TAD with a single replica for NEB
NEB requires multiple replicas.

Cannot use TAD with atom_modify sort enabled for NEB
This is a current restriction of NEB.

Cannot use a damped dynamics min style with fix box/relax
This is a current restriction in LAMMPS. Use another minimizer style.

Cannot use a damped dynamics min style with per-atom DOF
This is a current restriction in LAMMPS. Use another minimizer style.

Cannot use append/atoms in periodic dimension
The boundary style of the face where atoms are added can not be of type p (periodic).

Cannot use chosen neighbor list style with buck/kk
That style is not supported by Kokkos.

Cannot use chosen neighbor list style with coul/cut/kk
That style is not supported by Kokkos.

Cannot use chosen neighbor list style with coul/dsf/kk
That style is not supported by Kokkos.

Cannot use chosen neighbor list style with coul/wolf/kk
That style is not supported by Kokkos.

Cannot use chosen neighbor list style with lj/cut/coul/cut/kk
That style is not supported by Kokkos.

Cannot use chosen neighbor list style with lj/cut/coul/long/kk
That style is not supported by Kokkos.

Cannot use chosen neighbor list style with lj/cut/kk
That style is not supported by Kokkos.

Cannot use chosen neighbor list style with lj/spica/kk
That style is not supported by Kokkos.

Cannot use chosen neighbor list style with pair eam/kk
That style is not supported by Kokkos.

Cannot use compute cluster/atom unless atoms have IDs
Atom IDs are used to identify clusters.

Cannot use create_bonds unless atoms have IDs
This command requires a mapping from global atom IDs to local atoms, but the atoms that have been defined have no IDs.

Cannot use cwiggle in variable formula between runs
This is a function of elapsed time.

Cannot use delete_atoms bond yes with atom_style template
This is because the bonds for that atom style are hardwired in the molecule template.

Cannot use delete_atoms unless atoms have IDs
Your atoms do not have IDs, so the delete_atoms command cannot be used.

Cannot use delete_bonds with non-molecular system
Your choice of atom style does not have bonds.

Cannot use dynamic group with fix adapt atom
This is not yet supported.

Cannot use fix TMD unless atom map exists
Using this fix requires the ability to lookup an atom index, which is provided by an atom map. An atom map does not exist (by default) for non-molecular problems. Using the atom_modify map command will force an atom map to be created.

Cannot use fix bond/break with non-molecular systems
Only systems with bonds that can be changed can be used. Atom_style template does not qualify.

Cannot use fix bond/create with non-molecular systems
Only systems with bonds that can be changed can be used. Atom_style template does not qualify.

Cannot use fix bond/swap with non-molecular systems
Only systems with bonds that can be changed can be used. Atom_style template does not qualify.

Cannot use fix box/relax on a 2nd non-periodic dimension
When specifying an off-diagonal pressure component, the second of the two dimensions must be periodic. E.g. if the xy component is specified, then the y dimension must be periodic.

Cannot use fix box/relax on a non-periodic dimension
When specifying a diagonal pressure component, the dimension must be periodic.

Cannot use fix box/relax with both relaxation and scaling on a tilt factor
When specifying scaling on a tilt factor component, that component can not also be controlled by the barostat. E.g. if scalexy yes is specified and also keyword tri or xy, this is wrong.

Cannot use fix box/relax with tilt factor scaling on a 2nd non-periodic dimension
When specifying scaling on a tilt factor component, the second of the two dimensions must be periodic. E.g. if the xy component is specified, then the y dimension must be periodic.

Cannot use fix deform on a shrink-wrapped boundary
The x, y, z options cannot be applied to shrink-wrapped dimensions.

Cannot use fix deform tilt on a shrink-wrapped 2nd dim
This is because the shrink-wrapping will change the value of the strain implied by the tilt factor.

Cannot use fix deform trate on a box with zero tilt
The trate style alters the current strain.

Cannot use fix deposit rigid and shake
These two attributes are conflicting.

Cannot use fix gcmc in a 2d simulation
Fix gcmc is set up to run in 3d only. No 2d simulations with fix gcmc are allowed.

Cannot use fix npt and fix deform on same component of stress tensor
This would be changing the same box dimension twice.

Cannot use fix nvt/npt/nph on a 2nd non-periodic dimension
When specifying an off-diagonal pressure component, the second of the two dimensions must be periodic. E.g. if the xy component is specified, then the y dimension must be periodic.

Cannot use fix nvt/npt/nph on a non-periodic dimension
When specifying a diagonal pressure component, the dimension must be periodic.

Cannot use fix nvt/npt/nph with xy scaling when y is non-periodic dimension
The second dimension in the barostatted tilt factor must be periodic.

Cannot use fix nvt/npt/nph with xz scaling when z is non-periodic dimension
The second dimension in the barostatted tilt factor must be periodic.

Cannot use fix nvt/npt/nph with yz scaling when z is non-periodic dimension
The second dimension in the barostatted tilt factor must be periodic.

Cannot use fix pour rigid and shake
These two attributes are conflicting.

Cannot use fix pour with triclinic box
This option is not yet supported.

Cannot use fix press/berendsen and fix deform on same component of stress tensor
These commands both change the box size/shape, so you cannot use both together.

Cannot use fix rigid npt/nph and fix deform on same component of stress tensor
This would be changing the same box dimension twice.

Cannot use fix rigid npt/nph on a non-periodic dimension
When specifying a diagonal pressure component, the dimension must be periodic.

Cannot use fix rigid/small npt/nph on a non-periodic dimension
When specifying a diagonal pressure component, the dimension must be periodic.

Cannot use fix shake with non-molecular system
Your choice of atom style does not have bonds.

Cannot use fix ttm with 2d simulation
This is a current restriction of this fix due to the grid it creates.

Cannot use fix ttm with triclinic box
This is a current restriction of this fix due to the grid it creates.

Cannot use fix tune/kspace without a pair style
This fix (tune/kspace) can only be used when a pair style has been specified.

Cannot use fix wall/srd more than once
Nor is their a need to since multiple walls can be specified in one command.

Cannot use lines with fix srd unless overlap is set
This is because line segments are connected to each other.

Cannot use neigh_modify exclude with GPU neighbor builds
This is a current limitation of the GPU implementation in LAMMPS.

Cannot use non-zero forces in an energy minimization
Fix setforce cannot be used in this manner. Use fix addforce instead.

Cannot use non-periodic boundares with fix ttm
This fix requires a fully periodic simulation box.

Cannot use non-periodic boundaries with Ewald
For kspace style ewald, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.

Cannot use non-periodic boundaries with EwaldDisp
For kspace style ewald/disp, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.

Cannot use non-periodic boundaries with PPPM
For kspace style pppm, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.

Cannot use non-periodic boundaries with PPPMDisp
For kspace style pppm/disp, all 3 dimensions must have periodic boundaries unless you use the kspace_modify command to define a 2d slab with a non-periodic z dimension.

Cannot use package gpu neigh yes with triclinic box
This is a current restriction in LAMMPS.

Cannot use pair tail corrections with 2d simulations
The correction factors are only currently defined for 3d systems.

Cannot use processors part command without using partitions
See the command-line -partition switch.

Cannot use ramp in variable formula between runs
This is because the ramp() function is time dependent.

Cannot use region INF or EDGE when box does not exist
Regions that extend to the box boundaries can only be used after the create_box command has been used.

Cannot use set atom with no atom IDs defined
Atom IDs are not defined, so they cannot be used to identify an atom.

Cannot use swiggle in variable formula between runs
This is a function of elapsed time.

Cannot use tris with fix srd unless overlap is set
This is because triangles are connected to each other.

Cannot use variable energy with constant force in fix addforce
This is because for constant force, LAMMPS can compute the change in energy directly.

Cannot use variable every setting for dump dcd
The format of DCD dump files requires snapshots be output at a constant frequency.

Cannot use variable every setting for dump xtc
The format of this file requires snapshots at regular intervals.

Cannot use vdisplace in variable formula between runs
This is a function of elapsed time.

Cannot use velocity create loop all unless atoms have IDs
Atoms in the simulation to do not have IDs, so this style of velocity creation cannot be performed.

Cannot wiggle and shear fix wall/gran
Cannot specify both options at the same time.

Cannot write to restart file - MPI error: %s
This error was generated by MPI when reading/writing an MPI-IO restart file.

Cannot yet use KSpace solver with grid with comm style tiled
This is current restriction in LAMMPS.

Cannot yet use compute tally with Kokkos
This feature is not yet supported.

Cannot yet use fix bond/break with this improper style
This is a current restriction in LAMMPS.

Cannot yet use fix bond/create with this improper style
This is a current restriction in LAMMPS.

Cannot yet use minimize with Kokkos
This feature is not yet supported.

Cannot yet use pair hybrid with Kokkos
This feature is not yet supported.

Cannot zero Langevin force of 0 atoms
The group has zero atoms, so you cannot request its force be zeroed.

Cannot zero gld force for zero atoms
There are no atoms currently in the group.

Change_box volume used incorrectly
The "dim volume" option must be used immediately following one or two settings for "dim1 ..." (and optionally "dim2 ...") and must be for a different dimension, i.e. dim != dim1 and dim != dim2.

Comm tiled invalid index in box drop brick
Internal error check in comm_style tiled which should not occur. Contact the developers.

Comm tiled mis-match in box drop brick
Internal error check in comm_style tiled which should not occur. Contact the developers.

Communication cutoff too small for SNAP micro load balancing
This can happen if you change the neighbor skin after your pair_style command or if your box dimensions grow during a run. You can set the cutoff explicitly via the comm_modify cutoff command.

Compute %s does not allow use of dynamic group
Dynamic groups have not yet been enabled for this compute.

Compute angle/local used when angles are not allowed
The atom style does not support angles.

Compute angmom/chunk does not use chunk/atom compute
The style of the specified compute is not chunk/atom.

Compute bond/local used when bonds are not allowed
The atom style does not support bonds.

Compute centro/atom requires a pair style be defined
This is because the computation of the centro-symmetry values uses a pairwise neighbor list.

Compute chunk/atom bin/cylinder radius is too large for periodic box
Radius cannot be bigger than 1/2 of a non-axis periodic dimension.

Compute chunk/atom bin/sphere radius is too large for periodic box
Radius cannot be bigger than 1/2 of any periodic dimension.

Compute chunk/atom ids once but nchunk is not once
You cannot assign chunks IDs to atom permanently if the number of chunks may change.

Compute chunk/atom stores no IDs for compute property/chunk
It will only store IDs if its compress option is enabled.

Compute chunk/atom stores no coord1 for compute property/chunk
Only certain binning options for compute chunk/atom store coordinates.

Compute chunk/atom stores no coord2 for compute property/chunk
Only certain binning options for compute chunk/atom store coordinates.

Compute chunk/atom stores no coord3 for compute property/chunk
Only certain binning options for compute chunk/atom store coordinates.

Compute chunk/atom without bins cannot use discard mixed
That discard option only applies to the binning styles.

Compute cluster/atom cutoff is longer than pairwise cutoff
Cannot identify clusters beyond cutoff.

Compute cluster/atom requires a pair style be defined
This is so that the pair style defines a cutoff distance which is used to find clusters.

Compute com/chunk does not use chunk/atom compute
The style of the specified compute is not chunk/atom.

Compute coord/atom cutoff is longer than pairwise cutoff
Cannot compute coordination at distances longer than the pair cutoff, since those atoms are not in the neighbor list.

Compute damage/atom requires peridynamic potential
Damage is a Peridynamic-specific metric. It requires you to be running a Peridynamics simulation.

Compute dihedral/local used when dihedrals are not allowed
The atom style does not support dihedrals.

Compute does not allow an extra compute or fix to be reset
This is an internal LAMMPS error. Please report it to the developers.

Compute erotate/asphere requires extended particles
This compute cannot be used with point particles.

Compute event/displace has invalid fix event assigned
This is an internal LAMMPS error. Please report it to the developers.

Compute gyration/chunk does not use chunk/atom compute
The style of the specified compute is not chunk/atom.

Compute hexorder/atom cutoff is longer than pairwise cutoff
Cannot compute order parameter beyond cutoff.

Compute improper/local used when impropers are not allowed
The atom style does not support impropers.

Compute inertia/chunk does not use chunk/atom compute
The style of the specified compute is not chunk/atom.

Compute msd/chunk does not use chunk/atom compute
The style of the specified compute is not chunk/atom.

Compute msd/chunk nchunk is not static
This is required because the MSD cannot be computed consistently if the number of chunks is changing. Compute chunk/atom allows setting nchunk to be static.

Compute omega/chunk does not use chunk/atom compute
The style of the specified compute is not chunk/atom.

Compute orientorder/atom cutoff is longer than pairwise cutoff
Cannot compute order parameter beyond cutoff.

Compute pair must use group all
Pair styles accumulate energy on all atoms.

Compute pe must use group all
Energies computed by potentials (pair, bond, etc) are computed on all atoms.

Compute pressure must use group all
Virial contributions computed by potentials (pair, bond, etc) are computed on all atoms.

Compute pressure requires temperature ID to include kinetic energy
The keflag cannot be used unless a temperature compute is provided.

Compute pressure temperature ID does not compute temperature
The compute ID assigned to a pressure computation must compute temperature.

Compute property/atom floating point vector does not exist
The command is accessing a vector added by the fix property/atom command, that does not exist.

Compute property/atom integer vector does not exist
The command is accessing a vector added by the fix property/atom command, that does not exist.

Compute property/chunk does not use chunk/atom compute
The style of the specified compute is not chunk/atom.

Compute property/local cannot use these inputs together
Only inputs that generate the same number of datums can be used together. E.g. bond and angle quantities cannot be mixed.

Compute reduce compute calculates global values
A compute that calculates peratom or local values is required.

Compute reduce fix calculates global values
A fix that calculates peratom or local values is required.

Compute stress/atom temperature ID does not compute temperature
The specified compute must compute temperature.

Compute temp/asphere requires extended particles
This compute cannot be used with point particles.

Compute temp/body requires bodies
This compute can only be applied to body particles.

Compute temp/chunk does not use chunk/atom compute
The style of the specified compute is not chunk/atom.

Compute temp/cs requires ghost atoms store velocity
Use the comm_modify vel yes command to enable this.

Compute temp/cs used when bonds are not allowed
This compute only works on pairs of bonded particles.

Compute torque/chunk does not use chunk/atom compute
The style of the specified compute is not chunk/atom.

Compute used in dump between runs is not current
The compute was not invoked on the current timestep, therefore it cannot be used in a dump between runs.

Compute used in variable between runs is not current
Computes cannot be invoked by a variable in between runs. Thus they must have been evaluated on the last timestep of the previous run in order for their value(s) to be accessed. See the page for the variable command for more info.

Compute used in variable thermo keyword between runs is not current
Some thermo keywords rely on a compute to calculate their value(s). Computes cannot be invoked by a variable in between runs. Thus they must have been evaluated on the last timestep of the previous run in order for their value(s) to be accessed. See the page for the variable command for more info.

Compute vcm/chunk does not use chunk/atom compute
The style of the specified compute is not chunk/atom.

Computed temperature for fix temp/rescale cannot be 0.0
Cannot rescale the temperature to a new value if the current temperature is 0.0.

Core/shell partner atom not found
Could not find one of the atoms in the bond pair.

Core/shell partners were not all found
Could not find or more atoms in the bond pairs.

Could not adjust g_ewald_6
The Newton-Raphson solver failed to converge to a good value for g_ewald. This error should not occur for typical problems. Please send an email to the developers.

Could not compute g_ewald
The Newton-Raphson solver failed to converge to a good value for g_ewald. This error should not occur for typical problems. Please send an email to the developers.

Could not compute grid size
The code is unable to compute a grid size consistent with the desired accuracy. This error should not occur for typical problems. Please send an email to the developers.

Could not compute grid size for Coulomb interaction
The code is unable to compute a grid size consistent with the desired accuracy. This error should not occur for typical problems. Please send an email to the developers.

Could not compute grid size for Dispersion
The code is unable to compute a grid size consistent with the desired accuracy. This error should not occur for typical problems. Please send an email to the developers.

Could not create 3d FFT plan
The FFT setup for the PPPM solver failed, typically due to lack of memory. This is an unusual error. Check the size of the FFT grid you are requesting.

Could not create 3d grid of processors
The specified constraints did not allow a Px by Py by Pz grid to be created where Px * Py * Pz = P = total number of processors.

Could not create 3d remap plan
The FFT setup in pppm failed.

Could not create Python function arguments
This is an internal Python error, possibly because the number of inputs to the function is too large.

Could not create numa grid of processors
The specified constraints did not allow this style of grid to be created. Usually this is because the total processor count is not a multiple of the cores/node or the user specified processor count is > 1 in one of the dimensions.

Could not create twolevel 3d grid of processors
The specified constraints did not allow this style of grid to be created.

Could not find Python function
The provided Python code was run successfully, but it not define a callable function with the required name.

Could not find change_box group ID
Group ID used in the change_box command does not exist.

Could not find compute msd/chunk fix ID
The compute creates an internal fix, which has been deleted.

Could not find compute pressure temperature ID
The compute ID for calculating temperature does not exist.

Could not find delete_atoms group ID
Group ID used in the delete_atoms command does not exist.

Could not find delete_atoms region ID
Region ID used in the delete_atoms command does not exist.

Could not find displace_atoms group ID
Group ID used in the displace_atoms command does not exist.

Could not find dump group ID
A group ID used in the dump command does not exist.

Could not find fix adapt storage fix ID
This should not happen unless you explicitly deleted a secondary fix that fix adapt created internally.

Could not find fix group ID
A group ID used in the fix command does not exist.

Could not find fix recenter group ID
A group ID used in the fix recenter command does not exist.

Could not find fix rigid group ID
A group ID used in the fix rigid command does not exist.

Could not find fix_modify ID
A fix ID used in the fix_modify command does not exist.

Could not find fix_modify pressure ID
The compute ID for computing pressure does not exist.

Could not find fix_modify temperature ID
The compute ID for computing temperature does not exist.

Could not find pair fix ID
A fix is created internally by the pair style to store shear history information. You cannot delete it.

Could not find set group ID
Group ID specified in set command does not exist.

Could not find thermo compute ID
Compute ID specified in thermo_style command does not exist.

Could not find thermo custom compute ID
The compute ID needed by thermo style custom to compute a requested quantity does not exist.

Could not find thermo custom fix ID
The fix ID needed by thermo style custom to compute a requested quantity does not exist.

Could not find thermo fix ID
Fix ID specified in thermo_style command does not exist.

Could not find thermo_modify pressure ID
The compute ID needed by thermo style custom to compute pressure does not exist.

Could not find thermo_modify temperature ID
The compute ID needed by thermo style custom to compute temperature does not exist.

Could not find undump ID
A dump ID used in the undump command does not exist.

Could not find velocity group ID
A group ID used in the velocity command does not exist.

Could not find velocity temperature ID
The compute ID needed by the velocity command to compute temperature does not exist.

Could not find/initialize a specified accelerator device
Could not initialize at least one of the devices specified for the gpu package

Could not initialize embedded Python
The main module in Python was not accessible.

Could not open Python file
The specified file of Python code cannot be opened. Check that the path and name are correct.

Could not process Python file
The Python code in the specified file was not run successfully by Python, probably due to errors in the Python code.

Could not process Python string
The Python code in the here string was not run successfully by Python, probably due to errors in the Python code.

Coulomb PPPMDisp order has been reduced below minorder
The default minimum order is 2. This can be reset by the kspace_modify minorder command.

Coulombic cutoff not supported in pair_style buck/long/coul/coul
Must use long-range Coulombic interactions.

Coulombic cutoff not supported in pair_style lj/long/coul/long
Must use long-range Coulombic interactions.

Coulombic cutoff not supported in pair_style lj/long/tip4p/long
Must use long-range Coulombic interactions.

Coulombic cutoffs of pair hybrid sub-styles do not match
If using a Kspace solver, all Coulombic cutoffs of long pair styles must be the same.

Coulombic cut not supported in pair_style lj/long/dipole/long
Must use long-range Coulombic interactions.

Create_atoms command before simulation box is defined
The create_atoms command cannot be used before a read_data, read_restart, or create_box command.

Create_atoms molecule has atom IDs, but system does not
The atom_style id command can be used to force atom IDs to be stored.

Create_atoms molecule must have atom types
The defined molecule does not specify atom types.

Create_atoms molecule must have coordinates
The defined molecule does not specify coordinates.

Create_atoms region ID does not exist
A region ID used in the create_atoms command does not exist.

Create_bonds command requires no kspace_style be defined
This is so that atom pairs that are already bonded to not appear in the neighbor list.

Create_bonds command requires special_bonds 1-2 weights be 0.0
This is so that atom pairs that are already bonded to not appear in the neighbor list.

Create_bonds max distance > neighbor cutoff
Can only create bonds for atom pairs that will be in neighbor list.

Create_box region does not support a bounding box
Not all regions represent bounded volumes. You cannot use such a region with the create_box command.

Custom floating point vector for fix store/state does not exist
The command is accessing a vector added by the fix property/atom command, that does not exist.

Custom integer vector for fix store/state does not exist
The command is accessing a vector added by the fix property/atom command, that does not exist.

Degenerate lattice primitive vectors
Invalid set of 3 lattice vectors for lattice command.

Delete_atoms command before simulation box is defined
The delete_atoms command cannot be used before a read_data, read_restart, or create_box command.

Delete_atoms cutoff > max neighbor cutoff
Can only delete atoms in atom pairs that will be in neighbor list.

Delete_atoms mol yes requires atom attribute molecule
Cannot use this option with a non-molecular system.

Delete_atoms requires a pair style be defined
This is because atom deletion within a cutoff uses a pairwise neighbor list.

Delete_bonds command before simulation box is defined
The delete_bonds command cannot be used before a read_data, read_restart, or create_box command.

Delete_bonds command with no atoms existing
No atoms are yet defined so the delete_bonds command cannot be used.

Did not assign all restart atoms correctly
Atoms read in from the restart file were not assigned correctly to processors. This is likely due to some atom coordinates being outside a non-periodic simulation box. Normally this should not happen. You may wish to use the "remap" option on the read_restart command to see if this helps.

Did not find all elements in MEAM library file
Some requested elements were not found in the MEAM file. Check spelling etc.

Did not find fix shake partner info
Could not find bond partners implied by fix shake command. This error can be triggered if the delete_bonds command was used before fix shake, and it removed bonds without resetting the 1-2, 1-3, 1-4 weighting list via the special keyword.

Did not find keyword in table file
Keyword used in pair_coeff command was not found in table file.

Did not set pressure for fix rigid/nph
The press keyword must be specified.

Did not set temperature for fix rigid/nvt
The temp keyword must be specified.

Did not set temperature or pressure for fix rigid/npt
The temp and press keywords must be specified.

Dihedral atom missing in delete_bonds
The delete_bonds command cannot find one or more atoms in a particular dihedral on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid dihedral.

Dihedral atom missing in set command
The set command cannot find one or more atoms in a particular dihedral on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid dihedral.

Dihedral charmm is incompatible with Pair style
Dihedral style charmm must be used with a pair style charmm in order for the 1-4 epsilon/sigma parameters to be defined.

Dihedral coeff for hybrid has invalid style
Dihedral style hybrid uses another dihedral style as one of its coefficients. The dihedral style used in the dihedral_coeff command or read from a restart file is not recognized.

Dihedral coeffs are not set
No dihedral coefficients have been assigned in the data file or via the dihedral_coeff command.

Dihedral/improper extent > half of periodic box length
This error was detected by the neigh_modify check yes setting. It is an error because the dihedral atoms are so far apart it is ambiguous how it should be defined.

Dihedral_coeff command before dihedral_style is defined
Coefficients cannot be set in the data file or via the dihedral_coeff command until an dihedral_style has been assigned.

Dihedral_coeff command before simulation box is defined
The dihedral_coeff command cannot be used before a read_data, read_restart, or create_box command.

Dihedral_coeff command when no dihedrals allowed
The chosen atom style does not allow for dihedrals to be defined.

Dihedral_style command when no dihedrals allowed
The chosen atom style does not allow for dihedrals to be defined.

Dihedrals assigned incorrectly
Dihedrals read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

Dihedrals defined but no dihedral types
The data file header lists dihedrals but no dihedral types.

Dimension command after simulation box is defined
The dimension command cannot be used after a read_data, read_restart, or create_box command.

Dispersion PPPMDisp order has been reduced below minorder
The default minimum order is 2. This can be reset by the kspace_modify minorder command.

Displace_atoms command before simulation box is defined
The displace_atoms command cannot be used before a read_data, read_restart, or create_box command.

Divide by 0 in influence function
This should not normally occur. It is likely a problem with your model.

Divide by 0 in influence function of pair peri/lps
This should not normally occur. It is likely a problem with your model.

Dump atom/gz only writes compressed files
The dump atom/gz output file name must have a .gz suffix.

Dump cfg arguments must start with 'mass type xs ys zs' or 'mass type xsu ysu zsu'
This is a requirement of the CFG output format. See the dump cfg doc page for more details.

Dump cfg requires one snapshot per file
Use the wildcard "*" character in the filename.

Dump cfg/gz only writes compressed files
The dump cfg/gz output file name must have a .gz suffix.

Dump custom and fix not computed at compatible times
The fix must produce per-atom quantities on timesteps that dump custom needs them.

Dump custom variable is not atom-style variable
Only atom-style variables generate per-atom quantities, needed for dump output.

Dump custom/gz only writes compressed files
The dump custom/gz output file name must have a .gz suffix.

Dump dcd of non-matching # of atoms
Every snapshot written by dump dcd must contain the same # of atoms.

Dump dcd requires sorting by atom ID
Use the dump_modify sort command to enable this.

Dump every variable returned a bad timestep
The variable must return a timestep greater than the current timestep.

Dump file MPI-IO output not allowed with % in filename
This is because a % signifies one file per processor and MPI-IO creates one large file for all processors.

Dump image requires one snapshot per file
Use a "*" in the filename.

Dump local and fix not computed at compatible times
The fix must produce per-atom quantities on timesteps that dump local needs them.

Dump local cannot sort by atom ID
This is because dump local does not really dump per-atom info.

Dump local count is not consistent across input fields
Every column of output must be the same length.

Dump modify element names do not match atom types
Number of element names must equal number of atom types.

Dump xtc requires sorting by atom ID
Use the dump_modify sort command to enable this.

Dump xyz/gz only writes compressed files
The dump xyz/gz output file name must have a .gz suffix.

Dump_modify format string is too short
There are more fields to be dumped in a line of output than your format string specifies.

Dumping an atom property that is not allocated
The chosen atom style does not define the per-atom quantity being dumped.

Duplicate particle in PeriDynamic bond - simulation box is too small
This is likely because your box length is shorter than 2 times the bond length.

Electronic temperature dropped below zero
Something has gone wrong with the fix ttm electron temperature model.

Element not defined in potential file
The specified element is not in the potential file.

Empty brackets in variable
There is no variable syntax that uses empty brackets. Check the variable doc page.

Epsilon or sigma reference not set by pair style in ewald/n
The pair style is not providing the needed epsilon or sigma values.

Error in vdw spline: inner radius > outer radius
A pre-tabulated spline is invalid. Likely a problem with the potential parameters.

Error writing averaged chunk data
Something in the output to the file triggered an error.

Error writing file header
Something in the output to the file triggered an error.

Error writing out correlation data
Something in the output to the file triggered an error.

Error writing out histogram data
Something in the output to the file triggered an error.

Error writing out time averaged data
Something in the output to the file triggered an error.

Failed to allocate %ld bytes for array %s
Your LAMMPS simulation has run out of memory. You need to run a smaller simulation or on more processors.

Failed to open FFmpeg pipeline to file %s
The specified file cannot be opened. Check that the path and name are correct and writable and that the FFmpeg executable can be found and run.

Failed to reallocate %ld bytes for array %s
Your LAMMPS simulation has run out of memory. You need to run a smaller simulation or on more processors.

Fewer SRD bins than processors in some dimension
This is not allowed. Make your SRD bin size smaller.

File variable could not read value
Check the file assigned to the variable.

Fix %s does not allow use of dynamic group
Dynamic groups have not yet been enabled for this fix.

Fix SRD: bad bin assignment for SRD advection
Something has gone wrong in your SRD model; try using more conservative settings.

Fix SRD: bad search bin assignment
Something has gone wrong in your SRD model; try using more conservative settings.

Fix SRD: bad stencil bin for big particle
Something has gone wrong in your SRD model; try using more conservative settings.

Fix SRD: too many big particles in bin
Reset the ATOMPERBIN parameter at the top of fix_srd.cpp to a larger value, and re-compile the code.

Fix SRD: too many walls in bin
This should not happen unless your system has been setup incorrectly.

Fix adapt interface to this pair style not supported
New coding for the pair style would need to be done.

Fix adapt pair style param not supported
The pair style does not know about the parameter you specified.

Fix adapt requires atom attribute charge
The atom style being used does not specify an atom charge.

Fix adapt requires atom attribute diameter
The atom style being used does not specify an atom diameter.

Fix append/atoms requires a lattice be defined
Use the lattice command for this purpose.

Fix ave/atom compute does not calculate a per-atom vector
A compute used by fix ave/atom must generate per-atom values.

Fix ave/atom compute does not calculate per-atom values
A compute used by fix ave/atom must generate per-atom values.

Fix ave/atom fix does not calculate a per-atom vector
A fix used by fix ave/atom must generate per-atom values.

Fix ave/atom fix does not calculate per-atom values
A fix used by fix ave/atom must generate per-atom values.

Fix ave/atom variable is not atom-style variable
A variable used by fix ave/atom must generate per-atom values.

Fix ave/chunk does not use chunk/atom compute
The specified compute is not for a compute chunk/atom command.

Fix ave/histo inputs are not all global, peratom, or local
All inputs in a single fix ave/histo command must be of the same style.

Fix ave/time cannot set output array intensive/extensive from these inputs
One of more of the vector inputs has individual elements which are flagged as intensive or extensive. Such an input cannot be flagged as all intensive/extensive when turned into an array by fix ave/time.

Fix ave/time cannot use variable with vector mode
Variables produce scalar values.

Fix balance rcb cannot be used with comm_style brick
Comm_style tiled must be used instead.

Fix balance shift string is invalid
The string can only contain the characters "x", "y", or "z".

Fix bond/break needs ghost atoms from further away
This is because the fix needs to walk bonds to a certain distance to acquire needed info, The comm_modify cutoff command can be used to extend the communication range.

Fix bond/create cutoff is longer than pairwise cutoff
This is not allowed because bond creation is done using the pairwise neighbor list.

Fix bond/create induced too many angles/dihedrals/impropers per atom
See the read_data command for info on using the "extra/angle/per/atom", (or dihedral, improper) keywords to allow for additional angles, dihedrals, and impropers to be formed.

Fix bond/create needs ghost atoms from further away
This is because the fix needs to walk bonds to a certain distance to acquire needed info, The comm_modify cutoff command can be used to extend the communication range.

Fix bond/react: Cannot use fix bond/react with non-molecular systems
Only systems with bonds that can be changed can be used. Atom_style template does not qualify.

Fix bond/react: Invalid template atom ID in map file
Atom IDs in molecule templates range from 1 to the number of atoms in the template.

Fix bond/react: Rmax cutoff is longer than pairwise cutoff
This is not allowed because bond creation is done using the pairwise neighbor list.

Fix bond/react: Molecule template ID for fix bond/react does not exist
A valid molecule template must have been created with the molecule command.

Fix bond/react: Reaction templates must contain the same number of atoms
There should be a one-to-one correspondence between atoms in the pre-reacted and post-reacted templates, as specified by the map file.

Fix bond/react: Unknown section in map file
Please ensure reaction map files are properly formatted.

Fix bond/react: Atom/Bond type affected by reaction too close to template edge
This means an atom which changes type or connectivity during the reaction is too close to an 'edge' atom defined in the map file. This could cause incorrect assignment of bonds, angle, etc. Generally, this means you must include more atoms in your templates, such that there are at least two atoms between each atom involved in the reaction and an edge atom.

Fix bond/react: Fix bond/react needs ghost atoms from farther away
This is because a processor needs to map the entire unreacted molecule template onto simulation atoms it knows about. The comm_modify cutoff command can be used to extend the communication range.

Fix bond/react: Molecule template 'Coords' section required for chiralIDs keyword
The coordinates of atoms in the pre-reacted template are used to determine chirality.

Fix bond/react special bond generation overflow
The number of special bonds per-atom created by a reaction exceeds the system setting. See the read_data or create_box command for how to specify this value.

Fix bond/react topology/atom exceed system topology/atom
The number of bonds, angles etc per-atom created by a reaction exceeds the system setting. See the read_data or create_box command for how to specify this value.

Fix bond/swap cannot use dihedral or improper styles
These styles cannot be defined when using this fix.

Fix box/relax generated negative box length
The pressure being applied is likely too large. Try applying it incrementally, to build to the high pressure.

Fix command before simulation box is defined
The fix command cannot be used before a read_data, read_restart, or create_box command.

Fix deform cannot use yz variable with xy
The yz setting cannot be a variable if xy deformation is also specified. This is because LAMMPS cannot determine if the yz setting will induce a box flip which would be invalid if xy is also changing.

Fix deform is changing yz too much with xy
When both yz and xy are changing, it induces changes in xz if the box must flip from one tilt extreme to another. Thus it is not allowed for yz to grow so much that a flip is induced.

Fix deform tilt factors require triclinic box
Cannot deform the tilt factors of a simulation box unless it is a triclinic (non-orthogonal) box.

Fix deform volume setting is invalid
Cannot use volume style unless other dimensions are being controlled.

Fix deposit molecule must have atom types
The defined molecule does not specify atom types.

Fix deposit molecule must have coordinates
The defined molecule does not specify coordinates.

Fix deposit molecule template ID must be same as atom_style template ID
When using atom_style template, you cannot deposit molecules that are not in that template.

Fix deposit region cannot be dynamic
Only static regions can be used with fix deposit.

Fix deposit region does not support a bounding box
Not all regions represent bounded volumes. You cannot use such a region with the fix deposit command.

Fix efield requires atom attribute q or mu
The atom style defined does not have this attribute.

Fix efield with dipoles cannot use atom-style variables
This option is not supported.

Fix evaporate molecule requires atom attribute molecule
The atom style being used does not define a molecule ID.

Fix external callback function not set
This must be done by an external program in order to use this fix.

Fix for fix ave/atom not computed at compatible time
Fixes generate their values on specific timesteps. Fix ave/atom is requesting a value on a non-allowed timestep.

Fix for fix ave/chunk not computed at compatible time
Fixes generate their values on specific timesteps. Fix ave/chunk is requesting a value on a non-allowed timestep.

Fix for fix ave/correlate not computed at compatible time
Fixes generate their values on specific timesteps. Fix ave/correlate is requesting a value on a non-allowed timestep.

Fix for fix ave/histo not computed at compatible time
Fixes generate their values on specific timesteps. Fix ave/histo is requesting a value on a non-allowed timestep.

Fix for fix ave/spatial not computed at compatible time
Fixes generate their values on specific timesteps. Fix ave/spatial is requesting a value on a non-allowed timestep.

Fix for fix ave/time not computed at compatible time
Fixes generate their values on specific timesteps. Fix ave/time is requesting a value on a non-allowed timestep.

Fix for fix store/state not computed at compatible time
Fixes generate their values on specific timesteps. Fix store/state is requesting a value on a non-allowed timestep.

Fix for fix vector not computed at compatible time
Fixes generate their values on specific timesteps. Fix vector is requesting a value on a non-allowed timestep.

Fix freeze requires atom attribute torque
The atom style defined does not have this attribute.

Fix gcmc cannot exchange individual atoms belonging to a molecule
This is an error since you should not delete only one atom of a molecule. The user has specified atomic (non-molecular) gas exchanges, but an atom belonging to a molecule could be deleted.

Fix gcmc molecule command requires that atoms have molecule attributes
Should not choose the gcmc molecule feature if no molecules are being simulated. The general molecule flag is off, but gcmc's molecule flag is on.

Fix gcmc molecule must have atom types
The defined molecule does not specify atom types.

Fix gcmc molecule must have coordinates
The defined molecule does not specify coordinates.

Fix gcmc molecule template ID must be same as atom_style template ID
When using atom_style template, you cannot insert molecules that are not in that template.

Fix gcmc put atom outside box
This should not normally happen. Contact the developers.

Fix gcmc ran out of available atom IDs
See the setting for tagint in the src/lmptype.h file.

Fix gcmc ran out of available molecule IDs
See the setting for tagint in the src/lmptype.h file.

Fix gcmc region cannot be dynamic
Only static regions can be used with fix gcmc.

Fix gcmc region does not support a bounding box
Not all regions represent bounded volumes. You cannot use such a region with the fix gcmc command.

Fix heat kinetic energy of an atom went negative
This will cause the velocity rescaling about to be performed by fix heat to be invalid.

Fix heat kinetic energy went negative
This will cause the velocity rescaling about to be performed by fix heat to be invalid.

Fix in variable not computed at compatible time
Fixes generate their values on specific timesteps. The variable is requesting the values on a non-allowed timestep.

Fix langevin angmom is not yet implemented with kokkos
This option is not yet available.

Fix langevin angmom requires extended particles
This fix option cannot be used with point particles.

Fix langevin gjf cannot have period equal to dt/2
If the period is equal to dt/2 then division by zero will happen.

Fix langevin gjf with tbias is not yet implemented with kokkos
This option is not yet available.

Fix langevin omega is not yet implemented with kokkos
This option is not yet available.

Fix langevin omega requires extended particles
One of the particles has radius 0.0.

Fix langevin period must be > 0.0
The time window for temperature relaxation must be > 0

Fix npt/nph has tilted box too far in one step - periodic cell is too far from equilibrium state
Self-explanatory. The change in the box tilt is too extreme on a short timescale.

Fix numdiff requires an atom map, see atom_modify
Self-explanatory. Efficient loop over all atoms for numerical difference requires an atom map.

Fix numdiff requires consecutive atom IDs
Self-explanatory. Efficient loop over all atoms for numerical difference requires consecutive atom IDs.

Fix numdiff/virial must use group all
Virial contributions computed by this fix are computed on all atoms.

Fix nve/asphere requires extended particles
This fix can only be used for particles with a shape setting.

Fix nve/asphere/noforce requires extended particles
One of the particles is not an ellipsoid.

Fix nve/body requires bodies
This fix can only be used for particles that are bodies.

Fix nve/sphere dipole requires atom attribute mu
An atom style with this attribute is needed.

Fix nve/sphere requires extended particles
This fix can only be used for particles of a finite size.

Fix nvt/nph/npt asphere requires extended particles
The shape setting for a particle in the fix group has shape = 0.0, which means it is a point particle.

Fix nvt/sphere requires extended particles
This fix can only be used for particles of a finite size.

Fix orient/fcc file open failed
The fix orient/fcc command could not open a specified file.

Fix orient/fcc file read failed
The fix orient/fcc command could not read the needed parameters from a specified file.

Fix orient/fcc found self twice
The neighbor lists used by fix orient/fcc are messed up. If this error occurs, it is likely a bug, so send an email to the developers.

Fix peri neigh does not exist
Somehow a fix that the pair style defines has been deleted.

Fix pour molecule must have atom types
The defined molecule does not specify atom types.

Fix pour molecule must have coordinates
The defined molecule does not specify coordinates.

Fix pour molecule template ID must be same as atom style template ID
When using atom_style template, you cannot pour molecules that are not in that template.

Fix pour region cannot be dynamic
Only static regions can be used with fix pour.

Fix pour region does not support a bounding box
Not all regions represent bounded volumes. You cannot use such a region with the fix pour command.

Fix pour requires atom attributes radius, rmass
The atom style defined does not have these attributes.

Fix property/atom vector name already exists
The name for an integer or floating-point vector must be unique.

Fix qeq/comb requires atom attribute q
An atom style with charge must be used to perform charge equilibration.

Fix qeq/point has insufficient QEq matrix size
Occurs when number of neighbor atoms for an atom increased too much during a run. Increase SAFE_ZONE and MIN_CAP in fix_qeq.h and re-compile.

Fix qeq/shielded has insufficient QEq matrix size
Occurs when number of neighbor atoms for an atom increased too much during a run. Increase SAFE_ZONE and MIN_CAP in fix_qeq.h and re-compile.

Fix qeq/slater could not extract params from pair coul/streitz
This should not happen unless pair coul/streitz has been altered.

Fix qeq/slater has insufficient QEq matrix size
Occurs when number of neighbor atoms for an atom increased too much during a run. Increase SAFE_ZONE and MIN_CAP in fix_qeq.h and re-compile.

Fix reax/bonds numbonds > nsbmax_most
The limit of the number of bonds expected by the ReaxFF force field was exceeded.

Fix rigid atom has non-zero image flag in a non-periodic dimension
Image flags for non-periodic dimensions should not be set.

Fix rigid npt/nph does not yet allow triclinic box
This is a current restriction in LAMMPS.

Fix rigid/small atom has non-zero image flag in a non-periodic dimension
Image flags for non-periodic dimensions should not be set.

Fix rigid/small molecule must have atom types
The defined molecule does not specify atom types.

Fix rigid/small molecule must have coordinates
The defined molecule does not specify coordinates.

Fix rigid: Bad principal moments
The principal moments of inertia computed for a rigid body are not within the required tolerances.

Fix shake cannot be used with minimization
Cannot use fix shake while doing an energy minimization since it turns off bonds that should contribute to the energy.

Fix shake molecule template must have shake info
The defined molecule does not specify SHAKE information.

Fix srd can only currently be used with comm_style brick
This is a current restriction in LAMMPS.

Fix srd lamda must be >= 0.6 of SRD grid size
This is a requirement for accuracy reasons.

Fix srd no-slip requires atom attribute torque
This is because the SRD collisions will impart torque to the solute particles.

Fix srd requires ghost atoms store velocity
Use the comm_modify vel yes command to enable this.

Fix store/state compute does not calculate a per-atom array
The compute calculates a per-atom vector.

Fix store/state compute does not calculate a per-atom vector
The compute calculates a per-atom vector.

Fix store/state compute does not calculate per-atom values
Computes that calculate global or local quantities cannot be used with fix store/state.

Fix store/state fix does not calculate a per-atom array
The fix calculates a per-atom vector.

Fix store/state fix does not calculate a per-atom vector
The fix calculates a per-atom array.

Fix store/state fix does not calculate per-atom values
Fixes that calculate global or local quantities cannot be used with fix store/state.

Fix store/state variable is not atom-style variable
Only atom-style variables calculate per-atom quantities.

Fix temp/csld is not compatible with fix rattle or fix shake
These two commands cannot currently be used together with fix temp/csld.

Fix tfmc is not compatible with fix shake
These two commands cannot currently be used together.

Fix tmd must come after integration fixes
Any fix tmd command must appear in the input script after all time integration fixes (nve, nvt, npt). See the fix tmd documentation for details.

Fix used in compute chunk/atom not computed at compatible time
The chunk/atom compute cannot query the output of the fix on a timestep it is needed.

Fix used in compute reduce not computed at compatible time
Fixes generate their values on specific timesteps. Compute reduce is requesting a value on a non-allowed timestep.

Fix used in compute slice not computed at compatible time
Fixes generate their values on specific timesteps. Compute slice is requesting a value on a non-allowed timestep.

Fix vector cannot set output array intensive/extensive from these inputs
The inputs to the command have conflicting intensive/extensive attributes. You need to use more than one fix vector command.

Fix wall/colloid requires extended particles
One of the particles has radius 0.0.

Fix wall/gran is incompatible with Pair style
Must use a granular pair style to define the parameters needed for this fix.

Fix wall/piston command only available at zlo
The face keyword must be zlo.

Fix wall/region colloid requires extended particles
One of the particles has radius 0.0.

Fix_modify pressure ID does not compute pressure
The compute ID assigned to the fix must compute pressure.

Fix_modify temperature ID does not compute temperature
The compute ID assigned to the fix must compute temperature.

For triclinic deformation, specified target stress must be hydrostatic
Triclinic pressure control is allowed using the tri keyword, but non-hydrostatic pressure control can not be used in this case.

Found no restart file matching pattern
When using a "*" in the restart file name, no matching file was found.

GPU particle split must be set to 1 for this pair style.
For this pair style, you cannot run part of the force calculation on the host. See the package command.

GPUs are requested but Kokkos has not been compiled for CUDA
Re-compile Kokkos with CUDA support to use GPUs.

Ghost velocity forward comm not yet implemented with Kokkos
This is a current restriction.

Gmask function in equal-style variable formula
Gmask is per-atom operation.

Gravity changed since fix pour was created
The gravity vector defined by fix gravity must be static.

Grmask function in equal-style variable formula
Grmask is per-atom operation.

Group ID does not exist
A group ID used in the group command does not exist.

Group all cannot be made dynamic
This operation is not allowed.

Group command before simulation box is defined
The group command cannot be used before a read_data, read_restart, or create_box command.

Group region ID does not exist
A region ID used in the group command does not exist.

If read_dump purges it cannot replace or trim
These operations are not compatible. See the read_dump doc page for details.

Illegal . . . command
Self-explanatory. Check the input script syntax and compare to the documentation for the command. You can use -echo screen as a command-line option when running LAMMPS to see the offending line.

Illegal COMB parameter
One or more of the coefficients defined in the potential file is invalid.

Illegal COMB3 parameter
One or more of the coefficients defined in the potential file is invalid.

Illegal Stillinger-Weber parameter
One or more of the coefficients defined in the potential file is invalid.

Illegal Tersoff parameter
One or more of the coefficients defined in the potential file is invalid.

Illegal Vashishta parameter
One or more of the coefficients defined in the potential file is invalid.

Illegal coul/streitz parameter
One or more of the coefficients defined in the potential file is invalid.

Illegal fix gcmc gas mass <= 0
The computed mass of the designated gas molecule or atom type was less than or equal to zero.

Illegal fix tfmc random seed
Seeds can only be nonzero positive integers.

Illegal fix wall/piston velocity
The piston velocity must be positive.

Illegal nb3b/harmonic parameter
One or more of the coefficients defined in the potential file is invalid.

Illegal number of angle table entries
There must be at least 2 table entries.

Illegal number of bond table entries
There must be at least 2 table entries.

Illegal number of pair table entries
There must be at least 2 table entries.

Illegal or unset periodicity in restart
This error should not normally occur unless the restart file is invalid.

Illegal range increment value
The increment must be >= 1.

Illegal simulation box
The lower bound of the simulation box is greater than the upper bound.

Illegal size double vector read requested
This error should not normally occur unless the restart file is invalid.

Illegal size integer vector read requested
This error should not normally occur unless the restart file is invalid.

Illegal size string or corrupt restart
This error should not normally occur unless the restart file is invalid.

Imageint setting in lmptype.h is invalid
Imageint must be as large or larger than smallint.

Imageint setting in lmptype.h is not compatible
Format of imageint stored in restart file is not consistent with LAMMPS version you are running. See the settings in src/lmptype.h

Improper atom missing in delete_bonds
The delete_bonds command cannot find one or more atoms in a particular improper on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid improper.

Improper atom missing in set command
The set command cannot find one or more atoms in a particular improper on a particular processor. The pairwise cutoff is too short or the atoms are too far apart to make a valid improper.

Improper coeff for hybrid has invalid style
Improper style hybrid uses another improper style as one of its coefficients. The improper style used in the improper_coeff command or read from a restart file is not recognized.

Improper coeffs are not set
No improper coefficients have been assigned in the data file or via the improper_coeff command.

Improper_coeff command before improper_style is defined
Coefficients cannot be set in the data file or via the improper_coeff command until an improper_style has been assigned.

Improper_coeff command before simulation box is defined
The improper_coeff command cannot be used before a read_data, read_restart, or create_box command.

Improper_coeff command when no impropers allowed
The chosen atom style does not allow for impropers to be defined.

Improper_style command when no impropers allowed
The chosen atom style does not allow for impropers to be defined.

Impropers assigned incorrectly
Impropers read in from the data file were not assigned correctly to atoms. This means there is something invalid about the topology definitions.

Impropers defined but no improper types
The data file header lists improper but no improper types.

Incompatible KIM Simulator Model
The requested KIM Simulator Model was defined for a different MD code and thus is not compatible with LAMMPS.

Incompatible units for KIM Simulator Model
The selected unit style is not compatible with the requested KIM Simulator Model.

Incomplete use of variables in create_atoms command
The var and set options must be used together.

Inconsistent iparam/jparam values in fix bond/create command
If itype and jtype are the same, then their maxbond and newtype settings must also be the same.

Inconsistent line segment in data file
The end points of the line segment are not equal distances from the center point which is the atom coordinate.

Inconsistent triangle in data file
The centroid of the triangle as defined by the corner points is not the atom coordinate.

Inconsistent use of finite-size particles by molecule template molecules
Not all of the molecules define a radius for their constituent particles.

Incorrect # of floating-point values in Bodies section of data file
See page for body style.

Incorrect # of integer values in Bodies section of data file
See page for body style.

Incorrect %s format in data file
A section of the data file being read by fix property/atom does not have the correct number of values per line.

Incorrect SNAP parameter file
The file cannot be parsed correctly, check its internal syntax.

Incorrect atom format in data file
Number of values per atom line in the data file is not consistent with the atom style.

Incorrect atom format in neb file
The number of fields per line is not what expected.

Incorrect bonus data format in data file
See the read_data page for a description of how various kinds of bonus data must be formatted for certain atom styles.

Incorrect boundaries with slab Ewald
Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with Ewald.

Incorrect boundaries with slab EwaldDisp
Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with Ewald.

Incorrect boundaries with slab PPPM
Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with PPPM.

Incorrect boundaries with slab PPPMDisp
Must have periodic x,y dimensions and non-periodic z dimension to use 2d slab option with pppm/disp.

Incorrect conversion in format string
A format style variable was not using either a %f, a %g, or a %e conversion. Or an immediate variable with format suffix was not using either a %f, a %g or a %e conversion in the format suffix.

Incorrect element names in ADP potential file
The element names in the ADP file do not match those requested.

Incorrect element names in EAM potential file
The element names in the EAM file do not match those requested.

Incorrect format in COMB potential file
Incorrect number of words per line in the potential file.

Incorrect format in COMB3 potential file
Incorrect number of words per line in the potential file.

Incorrect format in MEAM library file
Incorrect number of words per line in the potential file.

Incorrect format in SNAP coefficient file
Incorrect number of words per line in the coefficient file.

Incorrect format in SNAP parameter file
Incorrect number of words per line in the parameter file.

Incorrect format in Stillinger-Weber potential file
Incorrect number of words per line in the potential file.

Incorrect format in TMD target file
Format of file read by fix tmd command is incorrect.

Incorrect format in Tersoff potential file
Incorrect number of words per line in the potential file.

Incorrect format in Vashishta potential file
Incorrect number of words per line in the potential file.

Incorrect format in coul/streitz potential file
Incorrect number of words per line in the potential file.

Incorrect format in nb3b/harmonic potential file
Incorrect number of words per line in the potential file.

Incorrect integer value in Bodies section of data file
See page for body style.

Incorrect rigid body format in fix rigid file
The number of fields per line is not what expected.

Incorrect rigid body format in fix rigid/small file
The number of fields per line is not what expected.

Incorrect velocity format in data file
Each atom style defines a format for the Velocity section of the data file. The read-in lines do not match.

Indexed per-atom vector in variable formula without atom map
Accessing a value from an atom vector requires the ability to lookup an atom index, which is provided by an atom map. An atom map does not exist (by default) for non-molecular problems. Using the atom_modify map command will force an atom map to be created.

Input line quote not followed by white-space
An end quote must be followed by white-space.

Insufficient Jacobi rotations for body nparticle
Eigensolve for rigid body was not sufficiently accurate.

Insufficient Jacobi rotations for rigid body
Eigensolve for rigid body was not sufficiently accurate.

Insufficient Jacobi rotations for rigid molecule
Eigensolve for rigid body was not sufficiently accurate.

Insufficient Jacobi rotations for triangle
The calculation of the inertia tensor of the triangle failed. This should not happen if it is a reasonably shaped triangle.

Insufficient memory on accelerator
There is insufficient memory on one of the devices specified for the gpu package

Internal error in atom_style body
This error should not occur. Contact the developers.

Invalid LAMMPS restart file
The file does not appear to be a LAMMPS restart file since it does not contain the correct magic string at the beginning.

Invalid molecule ID in molecule file
Molecule ID must be a non-zero positive integer.

Invalid REAX atom type
There is a mis-match between LAMMPS atom types and the elements listed in the ReaxFF force field file.

Invalid angle table length
Length must be 2 or greater.

Invalid angle type in Angles section of data file
Angle type must be positive integer and within range of specified angle types.

Invalid args for non-hybrid pair coefficients
"NULL" is only supported in pair_coeff calls when using pair hybrid

Invalid argument to factorial %d
N must be >= 0 and <= 167, otherwise the factorial result is too large.

Invalid atom ID in %s section of data file
An atom in a section of the data file being read by fix property/atom has an invalid atom ID that is <= 0 or > the maximum existing atom ID.

Invalid atom ID in Angles section of data file
Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Atoms section of data file
Atom IDs must be positive integers.

Invalid atom ID in Bodies section of data file
Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Bonds section of data file
Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Bonus section of data file
Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Dihedrals section of data file
Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Impropers section of data file
Atom IDs must be positive integers and within range of defined atoms.

Invalid atom ID in Velocities section of data file
Atom IDs must be positive integers and within range of defined atoms.

Invalid atom IDs in neb file
An ID in the file was not found in the system.

Invalid atom diameter in molecule file
Diameters must be >= 0.0.

Invalid atom mass for fix shake
Mass specified in fix shake command must be > 0.0.

Invalid atom mass in molecule file
Masses must be > 0.0.

Invalid atom type in Atoms section of data file
Atom types must range from 1 to specified # of types.

Invalid atom type in create_atoms command
The create_box command specified the range of valid atom types. An invalid type is being requested.

Invalid atom type in create_atoms mol command
The atom types in the defined molecule are added to the value specified in the create_atoms command, as an offset. The final value for each atom must be between 1 to N, where N is the number of atom types.

Invalid atom type in fix atom/swap command
The atom type specified in the atom/swap command does not exist.

Invalid atom type in fix deposit mol command
The atom types in the defined molecule are added to the value specified in the create_atoms command, as an offset. The final value for each atom must be between 1 to N, where N is the number of atom types.

Invalid atom type in fix gcmc command
The atom type specified in the gcmc command does not exist.

Invalid atom type in fix pour mol command
The atom types in the defined molecule are added to the value specified in the create_atoms command, as an offset. The final value for each atom must be between 1 to N, where N is the number of atom types.

Invalid atom type in molecule file
Atom types must range from 1 to specified # of types.

Invalid atom type in neighbor exclusion list
Atom types must range from 1 to Ntypes inclusive.

Invalid atom type index for fix shake
Atom types must range from 1 to Ntypes inclusive.

Invalid atom types in pair_write command
Atom types must range from 1 to Ntypes inclusive.

Invalid atom vector in variable formula
The atom vector is not recognized.

Invalid atom_style body command
No body style argument was provided.

Invalid basis setting in create_atoms command
The basis index must be between 1 to N where N is the number of basis atoms in the lattice. The type index must be between 1 to N where N is the number of atom types.

Invalid basis setting in fix append/atoms command
The basis index must be between 1 to N where N is the number of basis atoms in the lattice. The type index must be between 1 to N where N is the number of atom types.

Invalid bin bounds in compute chunk/atom
The lo/hi values are inconsistent.

Invalid bin bounds in fix ave/spatial
The lo/hi values are inconsistent.

Invalid body nparticle command
Arguments in atom-style command are not correct.

Invalid bond table length
Length must be 2 or greater.

Invalid bond type in Bonds section of data file
Bond type must be positive integer and within range of specified bond types.

Invalid coeffs for this dihedral style
Cannot set class 2 coeffs in data file for this dihedral style.

Invalid color in dump_modify command
The specified color name was not in the list of recognized colors. See the dump_modify doc page.

Invalid color map min/max values
The min/max values are not consistent with either each other or with values in the color map.

Invalid command-line argument
One or more command-line arguments is invalid. Check the syntax of the command you are using to launch LAMMPS.

Invalid compute ID in variable formula
The compute is not recognized.

Invalid create_atoms rotation vector for 2d model
The rotation vector can only have a z component.

Invalid custom OpenCL parameter string.
There are not enough or too many parameters in the custom string for package GPU.

Invalid cutoff in comm_modify command
Specified cutoff must be >= 0.0.

Invalid cutoffs in pair_write command
Inner cutoff must be larger than 0.0 and less than outer cutoff.

Invalid d1 or d2 value for pair colloid coeff
Neither d1 or d2 can be < 0.

Invalid data file section: Angle Coeffs
Atom style does not allow angles.

Invalid data file section: AngleAngle Coeffs
Atom style does not allow impropers.

Invalid data file section: AngleAngleTorsion Coeffs
Atom style does not allow dihedrals.

Invalid data file section: AngleTorsion Coeffs
Atom style does not allow dihedrals.

Invalid data file section: Angles
Atom style does not allow angles.

Invalid data file section: Bodies
Atom style does not allow bodies.

Invalid data file section: Bond Coeffs
Atom style does not allow bonds.

Invalid data file section: BondAngle Coeffs
Atom style does not allow angles.

Invalid data file section: BondBond Coeffs
Atom style does not allow angles.

Invalid data file section: BondBond13 Coeffs
Atom style does not allow dihedrals.

Invalid data file section: Bonds
Atom style does not allow bonds.

Invalid data file section: Dihedral Coeffs
Atom style does not allow dihedrals.

Invalid data file section: Dihedrals
Atom style does not allow dihedrals.

Invalid data file section: Ellipsoids
Atom style does not allow ellipsoids.

Invalid data file section: EndBondTorsion Coeffs
Atom style does not allow dihedrals.

Invalid data file section: Improper Coeffs
Atom style does not allow impropers.

Invalid data file section: Impropers
Atom style does not allow impropers.

Invalid data file section: Lines
Atom style does not allow lines.

Invalid data file section: MiddleBondTorsion Coeffs
Atom style does not allow dihedrals.

Invalid data file section: Triangles
Atom style does not allow triangles.

Invalid delta_conf in tad command
The value must be between 0 and 1 inclusive.

Invalid density in Atoms section of data file
Density value cannot be <= 0.0.

Invalid density in set command
Density must be > 0.0.

Invalid dihedral type in Dihedrals section of data file
Dihedral type must be positive integer and within range of specified dihedral types.

Invalid displace_atoms rotate axis for 2d
Axis must be in z direction.

Invalid dump dcd filename
Filenames used with the dump dcd style cannot be binary or compressed or cause multiple files to be written.

Invalid dump frequency
Dump frequency must be 1 or greater.

Invalid dump image element name
The specified element name was not in the standard list of elements. See the dump_modify doc page.

Invalid dump image filename
The file produced by dump image cannot be binary and must be for a single processor.

Invalid dump image theta value
Theta must be between 0.0 and 180.0 inclusive.

Invalid dump image zoom value
Zoom value must be > 0.0.

Invalid dump movie filename
The file produced by dump movie cannot be binary or compressed and must be a single file for a single processor.

Invalid dump xtc filename
Filenames used with the dump xtc style cannot be binary or compressed or cause multiple files to be written.

Invalid dump xyz filename
Filenames used with the dump xyz style cannot be binary or cause files to be written by each processor.

Invalid dump_modify threshold operator
Operator keyword used for threshold specification in not recognized.

Invalid fix ID in variable formula
The fix is not recognized.

Invalid fix box/relax command for a 2d simulation
Fix box/relax styles involving the z dimension cannot be used in a 2d simulation.

Invalid fix box/relax command pressure settings
If multiple dimensions are coupled, those dimensions must be specified.

Invalid fix box/relax pressure settings
Settings for coupled dimensions must be the same.

Invalid fix nvt/npt/nph command for a 2d simulation
Cannot control z dimension in a 2d model.

Invalid fix nvt/npt/nph command pressure settings
If multiple dimensions are coupled, those dimensions must be specified.

Invalid fix nvt/npt/nph pressure settings
Settings for coupled dimensions must be the same.

Invalid fix press/berendsen for a 2d simulation
The z component of pressure cannot be controlled for a 2d model.

Invalid fix press/berendsen pressure settings
Settings for coupled dimensions must be the same.

Invalid fix qeq parameter file
Element index > number of atom types.

Invalid fix rigid npt/nph command for a 2d simulation
Cannot control z dimension in a 2d model.

Invalid fix rigid npt/nph command pressure settings
If multiple dimensions are coupled, those dimensions must be specified.

Invalid fix rigid/small npt/nph command for a 2d simulation
Cannot control z dimension in a 2d model.

Invalid fix rigid/small npt/nph command pressure settings
If multiple dimensions are coupled, those dimensions must be specified.

Invalid flag in force field section of restart file
Unrecognized entry in restart file.

Invalid flag in header section of restart file
Unrecognized entry in restart file.

Invalid flag in peratom section of restart file
The format of this section of the file is not correct.

Invalid flag in type arrays section of restart file
Unrecognized entry in restart file.

Invalid frequency in temper command
Nevery must be > 0.

Invalid group ID in neigh_modify command
A group ID used in the neigh_modify command does not exist.

Invalid group function in variable formula
Group function is not recognized.

Invalid image up vector
Up vector cannot be (0,0,0).

Invalid immediate variable
Syntax of immediate value is incorrect.

Invalid improper type in Impropers section of data file
Improper type must be positive integer and within range of specified improper types.

Invalid index for non-body particles in compute body/local command
Only indices 1,2,3 can be used for non-body particles.

Invalid keyword in pair table parameters
Keyword used in list of table parameters is not recognized.

Invalid option in lattice command for non-custom style
Certain lattice keywords are not supported unless the lattice style is "custom".

Invalid order of forces within respa levels
For respa, ordering of force computations within respa levels must obey certain rules. E.g. bonds cannot be compute less frequently than angles, pairwise forces cannot be computed less frequently than kspace, etc.

Invalid pair table cutoff
Cutoffs in pair_coeff command are not valid with read-in pair table.

Invalid pair table length
Length of read-in pair table is invalid

Invalid param file for fix qeq/shielded
Invalid value of gamma.

Invalid param file for fix qeq/slater
Zeta value is 0.0.

Invalid partitions in processors part command
Valid partitions are numbered 1 to N and the sender and receiver cannot be the same partition.

Invalid python command
Self-explanatory. Check the input script syntax and compare to the documentation for the command. You can use -echo screen as a command-line option when running LAMMPS to see the offending line.

Invalid radius in Atoms section of data file
Radius must be >= 0.0.

Invalid random number seed in fix ttm command
Random number seed must be > 0.

Invalid random number seed in set command
Random number seed must be > 0.

Invalid rigid body ID in fix rigid file
The ID does not match the number of an existing ID of rigid bodies that are defined by the fix rigid command.

Invalid rigid body ID in fix rigid/small file
The ID does not match the number of an existing ID of rigid bodies that are defined by the fix rigid/small command.

Invalid run command N value
The number of timesteps must fit in a 32-bit integer. If you want to run for more steps than this, perform multiple shorter runs.

Invalid seed for Marsaglia random # generator
The initial seed for this random number generator must be a positive integer less than or equal to 900 million.

Invalid seed for Park random # generator
The initial seed for this random number generator must be a positive integer.

Invalid shape in Triangles section of data file
Two or more of the triangle corners are duplicate points.

Invalid t_event in tad command
The value must be greater than 0.

Invalid template atom in Atoms section of data file
The atom indices must be between 1 to N, where N is the number of atoms in the template molecule the atom belongs to.

Invalid template index in Atoms section of data file
The template indices must be between 1 to N, where N is the number of molecules in the template.

Invalid threads_per_atom specified.
For 3-body potentials on the GPU, the threads_per_atom setting cannot be greater than 4 for NVIDIA GPUs.

Invalid timestep reset for fix ave/atom
Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/chunk
Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/correlate
Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/histo
Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/spatial
Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid timestep reset for fix ave/time
Resetting the timestep has invalidated the sequence of timesteps this fix needs to process.

Invalid tmax in tad command
The value must be greater than 0.0.

Invalid type for mass set
Mass command must set a type from 1-N where N is the number of atom types.

Invalid label2type() function syntax in variable formula
The first argument must be a label map kind (atom, bond, angle, dihedral, or improper) and the second argument must be a valid type label that has been assigned to a numeric type.

Invalid use of library file() function
This function is called through the library interface. This error should not occur. Contact the developers if it does.

Invalid value in set command
The value specified for the setting is invalid, likely because it is too small or too large.

Invalid variable evaluation in variable formula
A variable used in a formula could not be evaluated.

Invalid variable name
Variable name used in an input script line is invalid.

Invalid variable name in variable formula
Variable name is not recognized.

Invalid variable style in special function next
Only file-style or atomfile-style variables can be used with next().

Invalid variable style with next command
Variable styles *equal* and *world* cannot be used in a next command.

Invalid volume in set command
Volume must be > 0.0.

Invoked pair single on pair style none
A command (e.g. a dump) attempted to invoke the single() function on a pair style none, which is illegal. You are probably attempting to compute per-atom quantities with an undefined pair style.

Invoking coulombic in pair style lj/coul requires atom attribute q
The atom style defined does not have this attribute.

Invoking coulombic in pair style lj/long/dipole/long requires atom attribute q
The atom style defined does not have these attributes.

KIM Simulator Model has no Model definition
There is no model definition (key: model-defn) in the KIM Simulator Model. Please contact the OpenKIM database maintainers to verify and potentially correct this.

KSpace accuracy must be > 0
The kspace accuracy designated in the input must be greater than zero.

KSpace accuracy too large to estimate G vector
Reduce the accuracy request or specify gewald explicitly via the kspace_modify command.

KSpace accuracy too low
Requested accuracy must be less than 1.0.

KSpace solver requires a pair style
No pair style is defined.

KSpace style does not yet support triclinic geometries
The specified kspace style does not allow for non-orthogonal simulation boxes.

KSpace style has not yet been set
Cannot use kspace_modify command until a kspace style is set.

KSpace style is incompatible with Pair style
Setting a kspace style requires that a pair style with matching long-range Coulombic or dispersion components be used.

Kokkos has been compiled for CUDA but no GPUs are requested
One or more GPUs must be used when Kokkos is compiled for CUDA.

Kspace_modify mesh parameter must be all zero or all positive
Valid kspace mesh parameters are >0. The code will try to auto-detect suitable values when all three mesh sizes are set to zero (the default).

Kspace_modify mesh/disp parameter must be all zero or all positive
Valid kspace mesh/disp parameters are >0. The code will try to auto-detect suitable values when all three mesh sizes are set to zero **and** the required accuracy via *force/disp/real* as well as *force/disp/kspace* is set.

Kspace style requires atom attribute q
The atom style defined does not have these attributes.

LAMMPS is not built with Python embedded
This is done by including the PYTHON package before LAMMPS is built. This is required to use python-style variables.

Label map is incomplete: all types must be assigned a unique type label
For a given type-kind (atom types, bond types, etc.) to be written to the data file, all associated types must be assigned a type label, and each type label can be assigned to only one numeric type.

Labelmap command before simulation box is defined
The labelmap command cannot be used before a read_data, read_restart, or create_box command.

Lattice orient vectors are not orthogonal
The three specified lattice orientation vectors must be mutually orthogonal.

Lattice orient vectors are not right-handed
The three specified lattice orientation vectors must create a right-handed coordinate system such that a1 cross a2 = a3.

Lattice primitive vectors are collinear
The specified lattice primitive vectors do not for a unit cell with non-zero volume.

Lattice settings are not compatible with 2d simulation
One or more of the specified lattice vectors has a non-zero z component.

Lattice spacings are invalid
Each x,y,z spacing must be > 0.

Lattice style incompatible with simulation dimension
2d simulation can use sq, sq2, or hex lattice. 3d simulation can use sc, bcc, or fcc lattice.

Lost atoms via balance: original %ld current %ld
This should not occur. Report the problem to the developers.

MEAM library error %d
A call to the MEAM Fortran library returned an error.

MPI_LMP_BIGINT and bigint in lmptype.h are not compatible
The size of the MPI datatype does not match the size of a bigint.

MPI_LMP_TAGINT and tagint in lmptype.h are not compatible
The size of the MPI datatype does not match the size of a tagint.

MSM can only currently be used with comm_style brick
This is a current restriction in LAMMPS.

MSM grid is too large
The global MSM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 16384. You likely need to decrease the requested accuracy.

MSM order must be 4, 6, 8, or 10
This is a limitation of the MSM implementation in LAMMPS: the MSM order can only be 4, 6, 8, or 10.

Mass command before simulation box is defined
The mass command cannot be used before a read_data, read_restart, or create_box command.

Matrix factorization to split dispersion coefficients failed
This should not normally happen. Contact the developers.

Min_style command before simulation box is defined
The min_style command cannot be used before a read_data, read_restart, or create_box command.

Minimization could not find thermo_pe compute
This compute is created by the thermo command. It must have been explicitly deleted by a uncompute command.

Minimize command before simulation box is defined
The minimize command cannot be used before a read_data, read_restart, or create_box command.

Mismatched compute in variable formula
A compute is referenced incorrectly or a compute that produces per-atom values is used in an equal-style variable formula.

Mismatched fix in variable formula
A fix is referenced incorrectly or a fix that produces per-atom values is used in an equal-style variable formula.

Mismatched parameter in MEAM library file: z!=lat
The coordination number and lattice do not match, check that consistent values are given.

Mismatched variable in variable formula
A variable is referenced incorrectly or an atom-style variable that produces per-atom values is used in an equal-style variable formula.

Molecule IDs too large for compute chunk/atom
The IDs must not be larger than can be stored in a 32-bit integer since chunk IDs are 32-bit integers.

Molecule file shake flags not before shake atoms
The order of the two sections is important.

Molecule file shake flags not before shake bonds
The order of the two sections is important.

Molecule file shake info is incomplete
All 3 SHAKE sections are needed.

Molecule file special list does not match special count
The number of values in an atom's special list does not match count.

More than one fix deform
Only one fix deform can be defined at a time.

More than one fix freeze
Only one of these fixes can be defined, since the granular pair potentials access it.

More than one fix shake
Only one fix shake can be defined.

Must define angle_style before Angle Coeffs
Must use an angle_style command before reading a data file that defines Angle Coeffs.

Must define angle_style before BondAngle Coeffs
Must use an angle_style command before reading a data file that defines Angle Coeffs.

Must define angle_style before BondBond Coeffs
Must use an angle_style command before reading a data file that defines Angle Coeffs.

Must define bond_style before Bond Coeffs
Must use a bond_style command before reading a data file that defines Bond Coeffs.

Must define dihedral_style before AngleAngleTorsion Coeffs
Must use a dihedral_style command before reading a data file that defines AngleAngleTorsion Coeffs.

Must define dihedral_style before AngleTorsion Coeffs
Must use a dihedral_style command before reading a data file that defines AngleTorsion Coeffs.

Must define dihedral_style before BondBond13 Coeffs
Must use a dihedral_style command before reading a data file that defines BondBond13 Coeffs.

Must define dihedral_style before Dihedral Coeffs
Must use a dihedral_style command before reading a data file that defines Dihedral Coeffs.

Must define dihedral_style before EndBondTorsion Coeffs
Must use a dihedral_style command before reading a data file that defines EndBondTorsion Coeffs.

Must define dihedral_style before MiddleBondTorsion Coeffs
Must use a dihedral_style command before reading a data file that defines MiddleBondTorsion Coeffs.

Must define improper_style before AngleAngle Coeffs
Must use an improper_style command before reading a data file that defines AngleAngle Coeffs.

Must define improper_style before Improper Coeffs
Must use an improper_style command before reading a data file that defines Improper Coeffs.

Must define pair_style before Pair Coeffs
Must use a pair_style command before reading a data file that defines Pair Coeffs.

Must define pair_style before PairIJ Coeffs
Must use a pair_style command before reading a data file that defines PairIJ Coeffs.

Must have more than one processor partition to temper
Cannot use the temper command with only one processor partition. Use the -partition command-line option.

Must read Angle Type Labels before Angles
An Angle Type Labels section of a data file must come before the Angles section.

Must read Atom Type Labels before Atoms
An Atom Type Labels section of a data file must come before the Atoms section.

Must read Atoms before Angles
The Atoms section of a data file must come before an Angles section.

Must read Atoms before Bodies
The Atoms section of a data file must come before a Bodies section.

Must read Atoms before Bonds
The Atoms section of a data file must come before a Bonds section.

Must read Atoms before Dihedrals
The Atoms section of a data file must come before a Dihedrals section.

Must read Atoms before Ellipsoids
The Atoms section of a data file must come before a Ellipsoids section.

Must read Atoms before Impropers
The Atoms section of a data file must come before an Impropers section.

Must read Atoms before Lines
The Atoms section of a data file must come before a Lines section.

Must read Atoms before Triangles
The Atoms section of a data file must come before a Triangles section.

Must read Atoms before Velocities
The Atoms section of a data file must come before a Velocities section.

Must read Bond Type Labels before Bonds
A Bond Type Labels section of a data file must come before the Bonds section.

Must read Dihedral Type Labels before Dihedrals
An Dihedral Type Labels section of a data file must come before the Dihedrals section.

Must read Improper Type Labels before Impropers
An Improper Type Labels section of a data file must come before the Impropers section.

Must re-specify non-restarted pair style (xxx) after read_restart
For pair styles, that do not store their settings in a restart file, it must be defined with a new 'pair_style' command after read_restart.

Must set both respa inner and outer
Cannot use just the inner or outer option with respa without using the other.

Must set number of threads via package omp command
Because you are using the OPENMP package, set the number of threads via its settings, not by the pair_style snap nthreads setting.

Must shrink-wrap piston boundary
The boundary style of the face where the piston is applied must be of type s (shrink-wrapped).

Must specify a region in fix deposit
The region keyword must be specified with this fix.

Must use 'kspace_modify pressure/scalar no' for rRESPA with kspace_style MSM
The kspace scalar pressure option cannot (yet) be used with rRESPA.

Must use 'kspace_modify pressure/scalar no' for tensor components with kspace_style msm
Otherwise MSM will compute only a scalar pressure. See the kspace_modify command for details on this setting.

Must use 'kspace_modify pressure/scalar no' to obtain per-atom virial with kspace_style MSM
The kspace scalar pressure option cannot be used to obtain per-atom virial.

Must use 'kspace_modify pressure/scalar no' with GPU MSM Pair styles
The kspace scalar pressure option is not (yet) compatible with GPU MSM Pair styles.

Must use 'kspace_modify pressure/scalar no' with kspace_style msm/cg
The kspace scalar pressure option is not compatible with kspace_style msm/cg.

Must use -in switch with multiple partitions
A multi-partition simulation cannot read the input script from stdin. The -in command-line option must be used to specify a file.

Must use Kokkos half/thread or full neighbor list with threads or GPUs
Using Kokkos half-neighbor lists with threading is not allowed.

Must use a bond style with TIP4P potential
TIP4P potentials assume bond lengths in water are constrained by a fix shake command.

Must use an angle style with TIP4P potential
TIP4P potentials assume angles in water are constrained by a fix shake command.

Must use atom map style array with Kokkos
See the atom_modify map command.

Must use variable energy with fix addforce
Must define an energy variable when applying a dynamic force during minimization.

Must use variable energy with fix efield
You must define an energy when performing a minimization with a variable E-field.

NEB requires damped dynamics minimizer
Use a different minimization style.

NL ramp in wall/piston only implemented in zlo for now
The ramp keyword can only be used for piston applied to face zlo.

Needed bonus data not in data file
Some atom styles require bonus data. See the read_data page for details.

Needed molecular topology not in data file
The header of the data file indicated bonds, angles, etc would be included, but they are not present.

Neighbor delay must be 0 or multiple of every setting
The delay and every parameters set via the neigh_modify command are inconsistent. If the delay setting is non-zero, then it must be a multiple of the every setting.

Neighbor include group not allowed with ghost neighbors
This is a current restriction within LAMMPS.

Neighbor list overflow, boost neigh_modify one
There are too many neighbors of a single atom. Use the neigh_modify command to increase the max number of neighbors allowed for one atom. You may also want to boost the page size.

Neighbor multi not yet enabled for ghost neighbors
This is a current restriction within LAMMPS.

Neighbor page size must be >= 10x the one atom setting
This is required to prevent wasting too much memory.

New atom IDs exceed maximum allowed ID
See the setting for tagint in the src/lmptype.h file.

New bond exceeded bonds per atom in create_bonds
See the read_data command for info on using the "extra/bond/per/atom" keyword to allow for additional bonds to be formed

New bond exceeded bonds per atom in fix bond/create
See the read_data command for info on using the "extra/bond/per/atom" keyword to allow for additional bonds to be formed

New bond exceeded special list size in fix bond/create
See the "read_data extra/special/per/atom" command (or the "create_box extra/special/per/atom" command) for info on how to leave space in the special bonds list to allow for additional bonds to be formed.

Newton bond change after simulation box is defined
The newton command cannot be used to change the newton bond value after a read_data, read_restart, or create_box command.

Next command must list all universe and uloop variables
This is to ensure they stay in sync.

No OpenMP support compiled in
An OpenMP flag is set, but LAMMPS was not built with OpenMP support.

No atoms in data file
The header of the data file indicated that atoms would be included, but they are not present.

No basis atoms in lattice
Basis atoms must be defined for lattice style user.

No count or invalid atom count in molecule file
The number of atoms must be specified.

No dump custom arguments specified
The dump custom command requires that atom quantities be specified to output to dump file.

No fix gravity defined for fix pour
Gravity is required to use fix pour.

No matching element in ADP potential file
The ADP potential file does not contain elements that match the requested elements.

No matching element in EAM potential file
The EAM potential file does not contain elements that match the requested elements.

No molecule topology allowed with atom style template
The data file cannot specify the number of bonds, angles, etc, because this info if inferred from the molecule templates.

No pair coul/streitz for fix qeq/slater
These commands must be used together.

No pair style defined for compute group/group
Cannot calculate group interactions without a pair style defined.

No rigid bodies defined
The fix specification did not end up defining any rigid bodies.

Non integer # of swaps in temper command
Swap frequency in temper command must evenly divide the total # of timesteps.

Number of core atoms != number of shell atoms
There must be a one-to-one pairing of core and shell atoms.

One or more Atom IDs is negative
Atom IDs must be positive integers.

One or more atom IDs is too big
The limit on atom IDs is set by the SMALLBIG, BIGBIG setting in your LAMMPS build. See the *Build settings* page for more info.

One or more atom IDs is zero
Either all atoms IDs must be zero or none of them.

One or more atoms belong to multiple rigid bodies
Two or more rigid bodies defined by the fix rigid command cannot contain the same atom.

One or zero atoms in rigid body
Any rigid body defined by the fix rigid command must contain 2 or more atoms.

Overflow of allocated fix vector storage
This should not normally happen if the fix correctly calculated how long the vector will grow to. Contact the developers.

Overlapping large/large in pair colloid
This potential is infinite when there is an overlap.

Overlapping small/large in pair colloid
This potential is infinite when there is an overlap.

PPPM can only currently be used with comm_style brick
This is a current restriction in LAMMPS.

PPPM grid is too large
The global PPPM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 4096. You likely need to decrease the requested accuracy.

PPPM grid stencil extends beyond nearest neighbor processor
This is not allowed if the kspace_modify overlap setting is no.

PPPM order < minimum allowed order
The default minimum order is 2. This can be reset by the kspace_modify minorder command.

PPPM order cannot be < 2 or > than %d
This is a limitation of the PPPM implementation in LAMMPS.

PPPMDisp Coulomb grid is too large
The global PPPM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 4096. You likely need to decrease the requested accuracy.

PPPMDisp Dispersion grid is too large
The global PPPM grid is larger than OFFSET in one or more dimensions. OFFSET is currently set to 4096. You likely need to decrease the requested accuracy.

PPPMDisp can only currently be used with comm_style brick
This is a current restriction in LAMMPS.

PPPMDisp coulomb order cannot be greater than %d
This is a limitation of the PPPM implementation in LAMMPS.

PPPMDisp used but no parameters set, for further information please see the pppm/disp documentation
An efficient and accurate usage of the pppm/disp requires settings via the kspace_modify command. Please see the pppm/disp documentation for further instructions.

PRD command before simulation box is defined
The prd command cannot be used before a read_data, read_restart, or create_box command.

Package command after simulation box is defined
The package command cannot be used after a read_data, read_restart, or create_box command.

Package gpu command without GPU package installed
The GPU package must be installed via "make yes-gpu" before LAMMPS is built.

Package intel command without INTEL package installed
The INTEL package must be installed via "make yes-intel" before LAMMPS is built.

Package kokkos command without KOKKOS package enabled
The KOKKOS package must be installed via "make yes-kokkos" before LAMMPS is built, and the "-k on" must be used to enable the package.

Package omp command without OPENMP package installed
The OPENMP package must be installed via "make yes-openmp" before LAMMPS is built.

Pair body requires body style nparticle
This pair style is specific to the nparticle body style.

Pair brownian requires extended particles
One of the particles has radius 0.0.

Pair brownian requires monodisperse particles
All particles must be the same finite size.

Pair brownian/poly requires extended particles
One of the particles has radius 0.0.

Pair coeff for hybrid has invalid style
Style in pair coeff must have been listed in pair_style command.

Pair coul/wolf requires atom attribute q
The atom style defined does not have this attribute.

Pair cutoff < Respa interior cutoff
One or more pairwise cutoffs are too short to use with the specified rRESPA cutoffs.

Pair dipole/cut requires atom attributes q, mu, torque
The atom style defined does not have these attributes.

Pair dipole/cut/gpu requires atom attributes q, mu, torque
The atom style defined does not have this attribute.

Pair dipole/long requires atom attributes q, mu, torque
The atom style defined does not have these attributes.

Pair dipole/sf/gpu requires atom attributes q, mu, torque
The atom style defined does not one or more of these attributes.

Pair distance < table inner cutoff
Two atoms are closer together than the pairwise table allows.

Pair distance > table outer cutoff
Two atoms are further apart than the pairwise table allows.

Pair dpd requires ghost atoms store velocity
Use the comm_modify vel yes command to enable this.

Pair gayberne epsilon a,b,c coeffs are not all set
Each atom type involved in pair_style gayberne must have these 3 coefficients set at least once.

Pair granular requires atom attributes radius, rmass
The atom style defined does not have these attributes.

Pair granular requires ghost atoms store velocity
Use the comm_modify vel yes command to enable this.

Pair granular with shear history requires newton pair off
This is a current restriction of the implementation of pair granular styles with history.

Pair hybrid sub-style does not support single call
You are attempting to invoke a single() call on a pair style that does not support it.

Pair hybrid sub-style is not used
No pair_coeff command used a sub-style specified in the pair_style command.

Pair inner cutoff < Respa interior cutoff
One or more pairwise cutoffs are too short to use with the specified rRESPA cutoffs.

Pair inner cutoff >= Pair outer cutoff
The specified cutoffs for the pair style are inconsistent.

Pair lj/long/dipole/long requires atom attributes mu, torque
The atom style defined does not have these attributes.

Pair lubricate requires ghost atoms store velocity
Use the comm_modify vel yes command to enable this.

Pair lubricate requires monodisperse particles
All particles must be the same finite size.

Pair lubricate/poly requires extended particles
One of the particles has radius 0.0.

Pair lubricate/poly requires ghost atoms store velocity
Use the comm_modify vel yes command to enable this.

Pair lubricateU requires ghost atoms store velocity
Use the comm_modify vel yes command to enable this.

Pair lubricateU requires monodisperse particles
All particles must be the same finite size.

Pair lubricateU/poly requires ghost atoms store velocity
Use the comm_modify vel yes command to enable this.

Pair peri lattice is not identical in x, y, and z
The lattice defined by the lattice command must be cubic.

Pair peri requires a lattice be defined
Use the lattice command for this purpose.

Pair peri requires an atom map, see atom_modify
Even for atomic systems, an atom map is required to find Peridynamic bonds. Use the atom_modify command to define one.

Pair style AIREBO requires atom IDs
This is a requirement to use the AIREBO potential.

Pair style AIREBO requires newton pair on
See the newton command. This is a restriction to use the AIREBO potential.

Pair style BOP requires atom IDs
This is a requirement to use the BOP potential.

Pair style BOP requires newton pair on
See the newton command. This is a restriction to use the BOP potential.

Pair style COMB requires atom IDs
This is a requirement to use the AIREBO potential.

Pair style COMB requires newton pair on
See the newton command. This is a restriction to use the COMB potential.

Pair style COMB3 requires atom IDs
This is a requirement to use the COMB3 potential.

Pair style COMB3 requires newton pair on
See the newton command. This is a restriction to use the COMB3 potential.

Pair style LCBOP requires atom IDs
This is a requirement to use the LCBOP potential.

Pair style LCBOP requires newton pair on
See the newton command. This is a restriction to use the Tersoff potential.

Pair style MEAM requires newton pair on
See the newton command. This is a restriction to use the MEAM potential.

Pair style SNAP requires newton pair on
See the newton command. This is a restriction to use the SNAP potential.

Pair style Stillinger-Weber requires atom IDs
This is a requirement to use the SW potential.

Pair style Stillinger-Weber requires newton pair on
See the newton command. This is a restriction to use the SW potential.

Pair style Tersoff requires atom IDs
This is a requirement to use the Tersoff potential.

Pair style Tersoff requires newton pair on
See the newton command. This is a restriction to use the Tersoff potential.

Pair style Vashishta requires atom IDs
This is a requirement to use the Vashishta potential.

Pair style Vashishta requires newton pair on
See the newton command. This is a restriction to use the Vashishta potential.

Pair style bop requires comm ghost cutoff at least 3x larger than %g
Use the communicate ghost command to set this. See the pair bop page for more details.

Pair style born/coul/long requires atom attribute q
An atom style that defines this attribute must be used.

Pair style born/coul/long/gpu requires atom attribute q
The atom style defined does not have this attribute.

Pair style born/coul/wolf requires atom attribute q
The atom style defined does not have this attribute.

Pair style buck/coul/cut requires atom attribute q
The atom style defined does not have this attribute.

Pair style buck/coul/long requires atom attribute q
The atom style defined does not have these attributes.

Pair style buck/coul/long/gpu requires atom attribute q
The atom style defined does not have this attribute.

Pair style buck/long/coul/long requires atom attribute q
The atom style defined does not have this attribute.

Pair style coul/cut requires atom attribute q
The atom style defined does not have these attributes.

Pair style coul/cut/gpu requires atom attribute q
The atom style defined does not have this attribute.

Pair style coul/debye/gpu requires atom attribute q
The atom style defined does not have this attribute.

Pair style coul/dsf requires atom attribute q
The atom style defined does not have this attribute.

Pair style coul/dsf/gpu requires atom attribute q
The atom style defined does not have this attribute.

Pair style coul/long/gpu requires atom attribute q
The atom style defined does not have these attributes.

Pair style does not have extra field requested by compute pair/local
The pair style does not support the pN value requested by the compute pair/local command.

Pair style does not support bond_style quartic
The pair style does not have a single() function, so it can not be invoked by bond_style quartic.

Pair style does not support compute group/group
The pair_style does not have a single() function, so it cannot be invoked by the compute group/group command.

Pair style does not support compute pair/local
The pair style does not have a single() function, so it can not be invoked by compute pair/local.

Pair style does not support compute property/local
The pair style does not have a single() function, so it can not be invoked by fix bond/swap.

Pair style does not support fix bond/swap
The pair style does not have a single() function, so it can not be invoked by fix bond/swap.

Pair style does not support pair_write
The pair style does not have a single() function, so it can not be invoked by pair write.

Pair style does not support rRESPA inner/middle/outer
You are attempting to use rRESPA options with a pair style that does not support them.

Pair style granular with history requires atoms have IDs
Atoms in the simulation do not have IDs, so history effects cannot be tracked by the granular pair potential.

Pair style hbond/dreiding requires newton pair on
See the newton command for details.

Pair style is incompatible with KSpace style
If a pair style with a long-range Coulombic component is selected, then a kspace style must also be used.

Pair style is incompatible with TIP4P KSpace style
The pair style does not have the requires TIP4P settings.

Pair style lj/charmm/coul/charmm requires atom attribute q
The atom style defined does not have these attributes.

Pair style lj/charmm/coul/long requires atom attribute q
The atom style defined does not have these attributes.

Pair style lj/charmm/coul/long/gpu requires atom attribute q
The atom style defined does not have this attribute.

Pair style lj/class2/coul/cut requires atom attribute q
The atom style defined does not have this attribute.

Pair style lj/class2/coul/long requires atom attribute q
The atom style defined does not have this attribute.

Pair style lj/class2/coul/long/gpu requires atom attribute q
The atom style defined does not have this attribute.

Pair style lj/cut/coul/cut requires atom attribute q
The atom style defined does not have this attribute.

Pair style lj/cut/coul/cut/gpu requires atom attribute q
The atom style defined does not have this attribute.

Pair style lj/cut/coul/debye/gpu requires atom attribute q
The atom style defined does not have this attribute.

Pair style lj/cut/coul/dsf requires atom attribute q
The atom style defined does not have these attributes.

Pair style lj/cut/coul/dsf/gpu requires atom attribute q
The atom style defined does not have this attribute.

Pair style lj/cut/coul/long requires atom attribute q
The atom style defined does not have this attribute.

Pair style lj/cut/coul/long/gpu requires atom attribute q
The atom style defined does not have this attribute.

Pair style lj/cut/tip4p/cut requires atom IDs
This is a requirement to use this potential.

Pair style lj/cut/tip4p/cut requires atom attribute q
The atom style defined does not have this attribute.

Pair style lj/cut/tip4p/cut requires newton pair on
See the newton command. This is a restriction to use this potential.

Pair style lj/cut/tip4p/long requires atom IDs
There are no atom IDs defined in the system and the TIP4P potential requires them to find O,H atoms with a water molecule.

Pair style lj/cut/tip4p/long requires atom attribute q
The atom style defined does not have these attributes.

Pair style lj/cut/tip4p/long requires newton pair on
This is because the computation of constraint forces within a water molecule adds forces to atoms owned by other processors.

Pair style lj/gromacs/coul/gromacs requires atom attribute q
An atom_style with this attribute is needed.

Pair style lj/long/dipole/long does not currently support respa
This feature is not yet supported.

Pair style lj/long/tip4p/long requires atom IDs
There are no atom IDs defined in the system and the TIP4P potential requires them to find O,H atoms with a water molecule.

Pair style lj/long/tip4p/long requires atom attribute q
The atom style defined does not have these attributes.

Pair style lj/long/tip4p/long requires newton pair on
This is because the computation of constraint forces within a water molecule adds forces to atoms owned by other processors.

Pair style lj/spica/coul/long/gpu requires atom attribute q
The atom style defined does not have this attribute.

Pair style nb3b/harmonic requires atom IDs
This is a requirement to use this potential.

Pair style nb3b/harmonic requires newton pair on
See the newton command. This is a restriction to use this potential.

Pair style nm/cut/coul/cut requires atom attribute q
The atom style defined does not have this attribute.

Pair style nm/cut/coul/long requires atom attribute q
The atom style defined does not have this attribute.

Pair style polymorphic requires atom IDs
This is a requirement to use the polymorphic potential.

Pair style polymorphic requires newton pair on
See the newton command. This is a restriction to use the polymorphic potential.

Pair style reax requires atom IDs
This is a requirement to use the ReaxFF potential.

Pair style reax requires atom attribute q
The atom style defined does not have this attribute.

Pair style reax requires newton pair on
This is a requirement to use the ReaxFF potential.

Pair style requires a KSpace style
No kspace style is defined.

Pair style sw/gpu requires atom IDs
This is a requirement to use this potential.

Pair style sw/gpu requires newton pair off
See the newton command. This is a restriction to use this potential.

Pair style vashishta/gpu requires atom IDs
This is a requirement to use this potential.

Pair style vashishta/gpu requires newton pair off
See the newton command. This is a restriction to use this potential.

Pair style tersoff/gpu requires atom IDs
This is a requirement to use the tersoff/gpu potential.

Pair style tersoff/gpu requires newton pair off
See the newton command. This is a restriction to use this pair style.

Pair style tip4p/cut requires atom IDs
This is a requirement to use this potential.

Pair style tip4p/cut requires atom attribute q
The atom style defined does not have this attribute.

Pair style tip4p/cut requires newton pair on
See the newton command. This is a restriction to use this potential.

Pair style tip4p/long requires atom IDs
There are no atom IDs defined in the system and the TIP4P potential requires them to find O,H atoms with a water molecule.

Pair style tip4p/long requires atom attribute q
The atom style defined does not have these attributes.

Pair style tip4p/long requires newton pair on
This is because the computation of constraint forces within a water molecule adds forces to atoms owned by other processors.

Pair table cutoffs must all be equal to use with KSpace
When using pair style table with a long-range KSpace solver, the cutoffs for all atom type pairs must all be the same, since the long-range solver starts at that cutoff.

Pair table parameters did not set N
List of pair table parameters must include N setting.

Pair tersoff/zbl requires metal or real units
This is a current restriction of this pair potential.

Pair tersoff/zbl/kk requires metal or real units
This is a current restriction of this pair potential.

PairKIM only works with 3D problems
This is a current limitation.

Pair_coeff command before simulation box is defined
The pair_coeff command cannot be used before a read_data, read_restart, or create_box command.

Pair_modify special setting for pair hybrid incompatible with global special_bonds setting
Cannot override a setting of 0.0 or 1.0 or change a setting between 0.0 and 1.0.

Particle on or inside fix wall surface
Particles must be "exterior" to the wall in order for energy/force to be calculated.

Particle outside surface of region used in fix wall/region
Particles must be inside the region for energy/force to be calculated. A particle outside the region generates an error.

Per-atom compute in equal-style variable formula
Equal-style variables cannot use per-atom quantities.

Per-atom fix in equal-style variable formula
Equal-style variables cannot use per-atom quantities.

Per-processor system is too big
The number of owned atoms plus ghost atoms on a single processor must fit in 32-bit integer.

Potential energy ID for fix nvt/nph/npt does not exist
A compute for potential energy must be defined.

Potential file has duplicate entry
The potential file has more than one entry for the same element.

Potential file is missing an entry
The potential file does not have a needed entry.

Pressure ID for fix box/relax does not exist
The compute ID needed to compute pressure for the fix does not exist.

Pressure ID for fix press/berendsen does not exist
The compute ID needed to compute pressure for the fix does not exist.

Pressure ID for thermo does not exist
The compute ID needed to compute pressure for thermodynamics does not exist.

Pressure control must be used with fix nphug
A pressure control keyword (iso, aniso, tri, x, y, or z) must be provided.

Processor partitions do not match number of allocated processors
The total number of processors in all partitions must match the number of processors LAMMPS is running on.

Processors command after simulation box is defined
The processors command cannot be used after a read_data, read_restart, or create_box command.

Processors custom grid file is inconsistent
The vales in the custom file are not consistent with the number of processors you are running on or the Px,Py,Pz settings of the processors command. Or there was not a setting for every processor.

Processors grid numa and map style are incompatible
Using numa for gstyle in the processors command requires using cart for the map option.

Processors part option and grid style are incompatible
Cannot use gstyle numa or custom with the part option.

Python function evaluation failed
The Python function did not run successfully and/or did not return a value (if it is supposed to return a value). This is probably due to some error condition in the function.

Python function is not callable
The provided Python code was run successfully, but it not define a callable function with the required name.

Python invoke of undefined function
Cannot invoke a function that has not been previously defined.

Python variable does not match Python function
This matching is defined by the python-style variable and the python command.

Python variable has no function
No python command was used to define the function associated with the python-style variable.

QEQ with 'newton pair off' not supported
See the newton command. This is a restriction to use the QEQ fixes.

R0 < 0 for fix spring command
Equilibrium spring length is invalid.

RATTLE determinant = 0.0
The determinant of the matrix being solved for a single cluster specified by the fix rattle command is numerically invalid.

RATTLE failed
Certain constraints were not satisfied.

Read data add offset is too big
It cannot be larger than the size of atom IDs, e.g. the maximum 32-bit integer.

Read restart MPI-IO input not allowed with % in filename
This is because a % signifies one file per processor and MPI-IO creates one large file for all processors.

Read_data shrink wrap did not assign all atoms correctly
This is typically because the box-size specified in the data file is large compared to the actual extent of atoms in a shrink-wrapped dimension. When LAMMPS shrink-wraps the box atoms will be lost if the processor they are re-assigned to is too far away. Choose a box size closer to the actual extent of the atoms.

Read_dump command before simulation box is defined
The read_dump command cannot be used before a read_data, read_restart, or create_box command.

Read_dump triclinic status does not match simulation
Both the dump snapshot and the current LAMMPS simulation must be using either an orthogonal or triclinic box.

Reax_defs.h setting for NATDEF is too small
Edit the setting in the ReaxFF library and re-compile the library and re-build LAMMPS.

Reax_defs.h setting for NNEIGHMAXDEF is too small
Edit the setting in the ReaxFF library and re-compile the library and re-build LAMMPS.

Receiving partition in processors part command is already a receiver
Cannot specify a partition to be a receiver twice.

Region union or intersect cannot be dynamic
The sub-regions can be dynamic, but not the combined region.

Region union region ID does not exist
One or more of the region IDs specified by the region union command does not exist.

Replacing a fix, but new style != old style
A fix ID can be used a second time, but only if the style matches the previous fix. In this case it is assumed you want to reset a fix's parameters. This error may mean you are mistakenly re-using a fix ID when you do not intend to.

Replicate command before simulation box is defined
The replicate command cannot be used before a read_data, read_restart, or create_box command.

Replicate did not assign all atoms correctly
Atoms replicated by the replicate command were not assigned correctly to processors. This is likely due to some atom coordinates being outside a non-periodic simulation box.

Replicated system atom IDs are too big
See the setting for tagint in the src/lmptype.h file.

Replicated system is too big
See the setting for bigint in the src/lmptype.h file.

Required border comm not yet implemented with Kokkos
There are various limitations in the communication options supported by Kokkos.

Rerun command before simulation box is defined
The rerun command cannot be used before a read_data, read_restart, or create_box command.

Resetting timestep size is not allowed with fix move
This is because fix move is moving atoms based on elapsed time.

Respa inner cutoffs are invalid
The first cutoff must be <= the second cutoff.

Respa middle cutoffs are invalid
The first cutoff must be <= the second cutoff.

Restart file MPI-IO output not allowed with % in filename
This is because a % signifies one file per processor and MPI-IO creates one large file for all processors.

Restart file byte ordering is not recognized
The file does not appear to be a LAMMPS restart file since it does not contain a recognized byte-ordering flag at the beginning.

Restart file byte ordering is swapped
The file was written on a machine with different byte-ordering than the machine you are reading it on. Convert it to a text data file instead, on the machine you wrote it on.

Restart file incompatible with current version
This is probably because you are trying to read a file created with a version of LAMMPS that is too old compared to the current version. Use your older version of LAMMPS and convert the restart file to a data file.

Restart file is a MPI-IO file
The file is inconsistent with the filename you specified for it.

Restart file is a multi-proc file
The file is inconsistent with the filename you specified for it.

Restart file is not a MPI-IO file
The file is inconsistent with the filename you specified for it.

Restart file is not a multi-proc file
The file is inconsistent with the filename you specified for it.

Restart variable returned a bad timestep
The variable must return a timestep greater than the current timestep.

Restrain atoms %d %d %d %d missing on proc %d at step %ld
The 4 atoms in a restrain dihedral specified by the fix restrain command are not all accessible to a processor. This probably means an atom has moved too far.

Restrain atoms %d %d %d missing on proc %d at step %ld
The three atoms in a restrain angle specified by the fix restrain command are not all accessible to a processor. This probably means an atom has moved too far.

Restrain atoms %d %d missing on proc %d at step %ld
The two atoms in a restrain bond specified by the fix restrain command are not all accessible to a processor. This probably means an atom has moved too far.

Reuse of compute ID
A compute ID cannot be used twice.

Reuse of dump ID
A dump ID cannot be used twice.

Reuse of molecule template ID
The template IDs must be unique.

Reuse of region ID
A region ID cannot be used twice.

Rigid body atoms %d %d missing on proc %d at step %ld
This means that an atom cannot find the atom that owns the rigid body it is part of, or vice versa. The solution is to use the communicate cutoff command to ensure ghost atoms are acquired from far enough away to encompass the max distance printed when the fix rigid/small command was invoked.

Rigid fix must come before NPT/NPH fix
NPT/NPH fix must be defined in input script after all rigid fixes, else the rigid fix contribution to the pressure virial is incorrect.

Rmask function in equal-style variable formula
Rmask is per-atom operation.

Run command before simulation box is defined
The run command cannot be used before a read_data, read_restart, or create_box command.

Run_style command before simulation box is defined
The run_style command cannot be used before a read_data, read_restart, or create_box command.

SRD bin size for fix srd differs from user request
Fix SRD had to adjust the bin size to fit the simulation box. See the cubic keyword if you want this message to be an error vs warning.

SRD bins for fix srd are not cubic enough
The bin shape is not within tolerance of cubic. See the cubic keyword if you want this message to be an error vs warning.

SRD particle %d started inside big particle %d on step %ld bounce %d
See the inside keyword if you want this message to be an error vs warning.

SRD particle %d started inside wall %d on step %ld bounce %d
See the inside keyword if you want this message to be an error vs warning.

Sending partition in processors part command is already a sender
Cannot specify a partition to be a sender twice.

Set command before simulation box is defined
The set command cannot be used before a read_data, read_restart, or create_box command.

Set command with no atoms existing
No atoms are yet defined so the set command cannot be used.

Set region ID does not exist
Region ID specified in set command does not exist.

Shake angles have different bond types
All 3-atom angle-constrained SHAKE clusters specified by the fix shake command that are the same angle type, must also have the same bond types for the two bonds in the angle.

Shake atoms %d %d %d %d missing on proc %d at step %ld
The 4 atoms in a single shake cluster specified by the fix shake command are not all accessible to a processor. This probably means an atom has moved too far.

Shake atoms %d %d %d missing on proc %d at step %ld
The three atoms in a single shake cluster specified by the fix shake command are not all accessible to a processor. This probably means an atom has moved too far.

Shake atoms %d %d missing on proc %d at step %ld
The two atoms in a single shake cluster specified by the fix shake command are not all accessible to a processor. This probably means an atom has moved too far.

Shake cluster of more than 4 atoms
A single cluster specified by the fix shake command can have no more than 4 atoms.

Shake clusters are connected
A single cluster specified by the fix shake command must have a single central atom with up to 3 other atoms bonded to it.

Shake determinant = 0.0
The determinant of the matrix being solved for a single cluster specified by the fix shake command is numerically invalid.

Shake fix must come before NPT/NPH fix
NPT fix must be defined in input script after SHAKE fix, else the SHAKE fix contribution to the pressure virial is incorrect.

Shear history overflow, boost neigh_modify one
There are too many neighbors of a single atom. Use the neigh_modify command to increase the max number of neighbors allowed for one atom. You may also want to boost the page size.

Small to big integers are not sized correctly
This error occurs when the sizes of smallint, imageint, tagint, bigint, as defined in src/lmptype.h are not what is expected. Contact the developers if this occurs.

Smallint setting in lmptype.h is invalid
It has to be the size of an integer.

Smallint setting in lmptype.h is not compatible
Smallint stored in restart file is not consistent with LAMMPS version you are running.

Special list size exceeded in fix bond/create
See the "read_data extra/special/per/atom" command (or the "create_box extra/special/per/atom" command) for info on how to leave space in the special bonds list to allow for additional bonds to be formed.

Species XXX is not supported by this KIM Simulator Model
The kim_style define command was referencing a species that is not present in the requested KIM Simulator Model.

Specified processors != physical processors
The 3d grid of processors defined by the processors command does not match the number of processors LAMMPS is being run on.

Subsequent read data induced too many angles per atom
See the extra/angle/per/atom keyword for the create_box or the read_data command to set this limit larger

Subsequent read data induced too many bonds per atom
See the extra/bond/per/atom keyword for the create_box or the read_data command to set this limit larger

Subsequent read data induced too many dihedrals per atom
See the extra/dihedral/per/atom keyword for the create_box or the read_data command to set this limit larger

Subsequent read data induced too many impropers per atom
See the extra/improper/per/atom keyword for the create_box or the read_data command to set this limit larger

Support for writing images in JPEG format not included
LAMMPS was not built with the -DLAMMPS_JPEG switch in the Makefile.

Support for writing images in PNG format not included
LAMMPS was not built with the -DLAMMPS_PNG switch in the Makefile.

Support for writing movies not included
LAMMPS was not built with the -DLAMMPS_FFMPEG switch in the Makefile

System in data file is too big
See the setting for bigint in the src/lmptype.h file.

System is not charge neutral, net charge = %g
The total charge on all atoms on the system is not 0.0. For some KSpace solvers this is an error.

TIP4P hydrogen has incorrect atom type
The TIP4P pairwise computation found an H atom whose type does not agree with the specified H type.

TIP4P hydrogen is missing
The TIP4P pairwise computation failed to find the correct H atom within a water molecule.

TMD target file did not list all group atoms
The target file for the fix tmd command did not list all atoms in the fix group.

Tagint setting in lmptype.h is invalid
Tagint must be as large or larger than smallint.

Tagint setting in lmptype.h is not compatible
Format of tagint stored in restart file is not consistent with LAMMPS version you are running. See the settings in src/lmptype.h

Temper command before simulation box is defined
The temper command cannot be used before a read_data, read_restart, or create_box command.

Temperature compute degrees of freedom < 0
This should not happen if you are calculating the temperature on a valid set of atoms.

Temperature control must be used with fix nphug
The temp keyword must be provided.

Temperature for fix nvt/sllod does not have a bias
The specified compute must compute temperature with a bias.

Tempering could not find thermo_pe compute
This compute is created by the thermo command. It must have been explicitly deleted by a uncompute command.

Tempering fix ID is not defined
The fix ID specified by the temper command does not exist.

Tempering temperature fix is not valid
The fix specified by the temper command is not one that controls temperature (nvt or langevin).

Test_descriptor_string already allocated
This is an internal error. Contact the developers.

Thermo and fix not computed at compatible times
Fixes generate values on specific timesteps. The thermo output does not match these timesteps.

Thermo custom variable is not equal-style variable
Only equal-style variables can be output with thermodynamics, not atom-style variables.

Thermo every variable returned a bad timestep
The variable must return a timestep greater than the current timestep.

Thermo keyword in variable requires thermo to use/init pe
You are using a thermo keyword in a variable that requires potential energy to be calculated, but your thermo output does not use it. Add it to your thermo output.

Thermo keyword in variable requires thermo to use/init press
You are using a thermo keyword in a variable that requires pressure to be calculated, but your thermo output does not use it. Add it to your thermo output.

Thermo keyword in variable requires thermo to use/init temp
You are using a thermo keyword in a variable that requires temperature to be calculated, but your thermo output does not use it. Add it to your thermo output.

Thermo style does not use press
Cannot use thermo_modify to set this parameter since the thermo_style is not computing this quantity.

Thermo style does not use temp
Cannot use thermo_modify to set this parameter since the thermo_style is not computing this quantity.

Thermo_modify every variable returned a bad timestep
The returned timestep is less than or equal to the current timestep.

Thermo_modify pressure ID does not compute pressure
The specified compute ID does not compute pressure.

Thermo_modify temperature ID does not compute temperature
The specified compute ID does not compute temperature.

Thermo_style command before simulation box is defined
The thermo_style command cannot be used before a read_data, read_restart, or create_box command.

This variable thermo keyword cannot be used between runs
Keywords that refer to time (such as cpu, elapsed) do not make sense in between runs.

Threshold for an atom property that is not allocated
A dump threshold has been requested on a quantity that is not defined by the atom style used in this simulation.

Timestep must be >= 0
Specified timestep is invalid.

Too big a problem to use velocity create loop all
The system size must fit in a 32-bit integer to use this option.

Too big a timestep for dump dcd
The timestep must fit in a 32-bit integer to use this dump style.

Too big a timestep for dump xtc
The timestep must fit in a 32-bit integer to use this dump style.

Too few bits for lookup table
Table size specified via pair_modify command does not work with your machine's floating point representation.

Too many -pk arguments in command-line
The string formed by concatenating the arguments is too long. Use a package command in the input script instead.

Too many MSM grid levels
The max number of MSM grid levels is hardwired to 10.

Too many args in variable function
More args are used than any variable function allows.

Too many atom pairs for pair bop
The number of atomic pairs exceeds the expected number. Check your atomic structure to ensure that it is realistic.

Too many atom sorting bins
This is likely due to an immense simulation box that has blown up to a large size.

Too many atom triplets for pair bop
The number of three atom groups for angle determinations exceeds the expected number. Check your atomic structure to ensure that it is realistic.

Too many atoms for dump dcd
The system size must fit in a 32-bit integer to use this dump style.

Too many atoms for dump xtc
The system size must fit in a 32-bit integer to use this dump style.

Too many elements extracted from MEAM library.
Increase 'maxelt' in meam.h and recompile.

Too many exponent bits for lookup table
Table size specified via pair_modify command does not work with your machine's floating point representation.

Too many groups
The maximum number of atom groups (including the "all" group) is given by MAX_GROUP in group.cpp and is 32.

Too many iterations
You must use a number of iterations that fit in a 32-bit integer for minimization.

Too many lines in one body in data file - boost MAXBODY
MAXBODY is a setting at the top of the src/read_data.cpp file. Set it larger and re-compile the code.

Too many local+ghost atoms for neighbor list
The number of nlocal + nghost atoms on a processor is limited by the size of a 32-bit integer with 2 bits removed for masking 1-2, 1-3, 1-4 neighbors.

Too many mantissa bits for lookup table
Table size specified via pair_modify command does not work with your machine's floating point representation.

Too many masses for fix shake
The fix shake command cannot list more masses than there are atom types.

Too many molecules for fix rigid
The limit is 2^31 = ~2 billion molecules.

Too many timesteps
The cumulative timesteps must fit in a 64-bit integer.

Too many timesteps for NEB
You must use a number of timesteps that fit in a 32-bit integer for NEB.

Too many total atoms
See the setting for bigint in the src/lmptype.h file.

Too many total bits for bitmapped lookup table
Table size specified via pair_modify command is too large. Note that a value of N generates a 2^N size table.

Too much buffered per-proc info for dump
The size of the buffered string must fit in a 32-bit integer for a dump.

Too much per-proc info for dump
Number of local atoms times number of columns must fit in a 32-bit integer for dump.

Topology type exceeds system topology type
The number of bond, angle, etc types exceeds the system setting. See the create_box or read_data command for how to specify these values.

Trying to build an occasional neighbor list before initialization completed
This is not allowed. Source code caller needs to be modified.

Two fix ave commands using same compute chunk/atom command in incompatible ways
They are both attempting to "lock" the chunk/atom command so that the chunk assignments persist for some number of timesteps, but are doing it in different ways.

The %s type label %s is already in use for type %s
For a given type-kind (atom types, bond types, etc.), a given type label can be assigned to only one numeric type.

Type label string %s for %s type %s is invalid
See the labelmap command documentation for valid type labels.

Unable to initialize accelerator for use
There was a problem initializing an accelerator for the gpu package

Unbalanced quotes in input line
No matching end double quote was found following a leading double quote.

Unexpected empty line in Angle Coeffs section
Read a blank line where there should be coefficient data.

Unexpected empty line in Bond Coeffs section
Read a blank line where there should be coefficient data.

Unexpected empty line in Dihedral Coeffs section
Read a blank line where there should be coefficient data.

Unexpected empty line in Improper Coeffs section
Read a blank line where there should be coefficient data.

Unexpected empty line in Pair Coeffs section
Read a blank line where there should be coefficient data.

Unexpected end of data file
LAMMPS hit the end of the data file while attempting to read a section. Something is wrong with the format of the data file.

Unexpected end of dump file
A read operation from the file failed.

Unexpected end of fix rigid file
A read operation from the file failed.

Unexpected end of fix rigid/small file
A read operation from the file failed.

Unexpected end of neb file
A read operation from the file failed.

Units command after simulation box is defined
The units command cannot be used after a read_data, read_restart, or create_box command.

Universe/uloop variable count < # of partitions
A universe or uloop style variable must specify a number of values >= to the number of processor partitions.

Unknown keyword in thermo_style custom command
One or more specified keywords are not recognized.

Unknown pair_modify hybrid sub-style
The choice of sub-style is unknown.

Unknown table style in pair_style command
Style of table is invalid for use with pair_style table command.

Unrecognized lattice type in MEAM library file
The lattice type in an entry of the MEAM library file is not valid.

Unrecognized lattice type in MEAM parameter file
The lattice type in an entry of the MEAM parameter file is not valid.

Unsupported mixing rule in kspace_style ewald/disp
Only geometric mixing is supported.

Unsupported order in kspace_style ewald/disp
Only 1/r^6 dispersion or dipole terms are supported.

Unsupported order in kspace_style pppm/disp, pair_style %s
Only pair styles with 1/r and 1/r^6 dependence are currently supported.

Use cutoff keyword to set cutoff in single mode
Mode is single so cutoff/multi keyword cannot be used.

Use cutoff/multi keyword to set cutoff in multi mode
Mode is multi so cutoff keyword cannot be used.

Using fix nvt/sllod with inconsistent fix deform remap option
Fix nvt/sllod requires that deforming atoms have a velocity profile provided by "remap v" as a fix deform option.

Using fix srd with inconsistent fix deform remap option
When shearing the box in an SRD simulation, the remap v option for fix deform needs to be used.

Using pair lubricate with inconsistent fix deform remap option
Must use remap v option with fix deform with this pair style.

Using pair lubricate/poly with inconsistent fix deform remap option
If fix deform is used, the remap v option is required.

Variable atom ID is too large
Specified ID is larger than the maximum allowed atom ID.

Variable evaluation before simulation box is defined
Cannot evaluate a compute or fix or atom-based value in a variable before the simulation has been setup.

Variable evaluation in fix wall gave bad value
The returned value for epsilon or sigma < 0.0.

Variable evaluation in region gave bad value
Variable returned a radius < 0.0.

Variable for create_atoms is invalid style
The variables must be equal-style variables.

Variable for displace_atoms is invalid style
It must be an equal-style or atom-style variable.

Variable for dump every is invalid style
Only equal-style variables can be used.

Variable for dump image center is invalid style
Must be an equal-style variable.

Variable for dump image phi is invalid style
Must be an equal-style variable.

Variable for dump image theta is invalid style
Must be an equal-style variable.

Variable for dump image zoom is invalid style
Must be an equal-style variable.

Variable for fix adapt is invalid style
Only equal-style variables can be used.

Variable for fix aveforce is invalid style
Only equal-style variables can be used.

Variable for fix deform is invalid style
The variable must be an equal-style variable.

Variable for fix efield is invalid style
The variable must be an equal- or atom-style variable.

Variable for fix gravity is invalid style
Only equal-style variables can be used.

Variable for fix heat is invalid style
Only equal-style or atom-style variables can be used.

Variable for fix indent is invalid style
Only equal-style variables can be used.

Variable for fix indent is not equal style
Only equal-style variables can be used.

Variable for fix langevin is invalid style
It must be an equal-style variable.

Variable for fix move is invalid style
Only equal-style variables can be used.

Variable for fix setforce is invalid style
Only equal-style variables can be used.

Variable for fix temp/berendsen is invalid style
Only equal-style variables can be used.

Variable for fix temp/csld is invalid style
Only equal-style variables can be used.

Variable for fix temp/csvr is invalid style
Only equal-style variables can be used.

Variable for fix temp/rescale is invalid style
Only equal-style variables can be used.

Variable for fix wall is invalid style
Only equal-style variables can be used.

Variable for fix wall/reflect is invalid style
Only equal-style variables can be used.

Variable for fix wall/srd is invalid style
Only equal-style variables can be used.

Variable for group dynamic is invalid style
The variable must be an atom-style variable.

Variable for group is invalid style
Only atom-style variables can be used.

Variable for region cylinder is invalid style
Only equal-style variables are allowed.

Variable for region is invalid style
Only equal-style variables can be used.

Variable for region sphere is invalid style
Only equal-style variables are allowed.

Variable for restart is invalid style
Only equal-style variables can be used.

Variable for set command is invalid style
Only atom-style variables can be used.

Variable for thermo every is invalid style
Only equal-style variables can be used.

Variable for velocity set is invalid style
Only atom-style variables can be used.

Variable has circular dependency
A circular dependency is when variable "a" in used by variable "b" and variable "b" is also used by variable "a". Circular dependencies with longer chains of dependence are also not allowed.

Velocity command before simulation box is defined
The velocity command cannot be used before a read_data, read_restart, or create_box command.

Velocity command with no atoms existing
A velocity command has been used, but no atoms yet exist.

Velocity temperature ID does calculate a velocity bias
The specified compute must compute a bias for temperature.

Velocity temperature ID does not compute temperature
The compute ID given to the velocity command must compute temperature.

Verlet/split can only currently be used with comm_style brick
This is a current restriction in LAMMPS.

Verlet/split does not yet support TIP4P
This is a current limitation.

Verlet/split requires 2 partitions
See the -partition command-line switch.

Verlet/split requires Rspace partition layout be multiple of Kspace partition layout in each dim
This is controlled by the processors command.

Verlet/split requires Rspace partition size be multiple of Kspace partition size
This is so there is an equal number of Rspace processors for every Kspace processor.

Voro++ error: narea and neigh have a different size
This error is returned by the Voro++ library.

Water H epsilon must be 0.0 for pair style lj/cut/tip4p/cut
This is because LAMMPS does not compute the Lennard-Jones interactions with these particles for efficiency reasons.

Water H epsilon must be 0.0 for pair style lj/cut/tip4p/long
This is because LAMMPS does not compute the Lennard-Jones interactions with these particles for efficiency reasons.

Water H epsilon must be 0.0 for pair style lj/long/tip4p/long
This is because LAMMPS does not compute the Lennard-Jones interactions with these particles for efficiency reasons.

World variable count does not match # of partitions
A world-style variable must specify a number of values equal to the number of processor partitions.

Write_restart command before simulation box is defined
The write_restart command cannot be used before a read_data, read_restart, or create_box command.

7.7 Warning messages

This is an alphabetic list of some of the WARNING messages LAMMPS prints out and the reason why. If the explanation here is not sufficient, the documentation for the offending command may help. This is a historic list and no longer updated. Instead the LAMMPS developers are trying to provide more details right with the error message or link to a paragraph with *detailed explanations*.

Warning messages also list the source file and line number where the warning was generated. For example, a message like this:

```
WARNING: Bond atom missing in box size check (domain.cpp:187)
```

means that line #187 in the file src/domain.cpp generated the error. Looking in the source code may help you figure out what went wrong.

Please also see the page with *Error messages*

Adjusting Coulombic cutoff for MSM, new cutoff = %g
The adjust/cutoff command is turned on and the Coulombic cutoff has been adjusted to match the user-specified accuracy.

Angle atoms missing at step %ld
One or more of three atoms needed to compute a particular angle are missing on this processor. Typically this is because the pairwise cutoff is set too short or the angle has blown apart and an atom is too far away.

Angles are defined but no angle style is set
The topology contains angles, but there are no angle forces computed since there was no angle_style command.

Bond atom missing in box size check
The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond atom missing in image check
The second atom in a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bond atoms missing at step %ld
The second atom needed to compute a particular bond is missing on this processor. Typically this is because the pairwise cutoff is set too short or the bond has blown apart and an atom is too far away.

Bonds are defined but no bond style is set
The topology contains bonds, but there are no bond forces computed since there was no bond_style command.

Bond/angle/dihedral extent > half of periodic box length
This is a restriction because LAMMPS can be confused about which image of an atom in the bonded interaction is the correct one to use. "Extent" in this context means the maximum end-to-end length of the bond/angle/dihedral. LAMMPS computes this by taking the maximum bond length, multiplying by the number of bonds in the interaction (e.g. 3 for a dihedral) and adding a small amount of stretch.

Calling write_dump before a full system init.
The write_dump command is used before the system has been fully initialized as part of a 'run' or 'minimize' command. Not all dump styles and features are fully supported at this point and thus the command may fail or produce incomplete or incorrect output. Insert a "run 0" command, if a full system init is required.

Cannot count rigid body degrees-of-freedom before bodies are fully initialized
This means the temperature associated with the rigid bodies may be incorrect on this timestep.

Cannot count rigid body degrees-of-freedom before bodies are initialized
This means the temperature associated with the rigid bodies may be incorrect on this timestep.

Communication cutoff is 0.0. No ghost atoms will be generated. Atoms may get lost
The communication cutoff defaults to the maximum of what is inferred from pair and bond styles (will be zero, if none are defined) and what is specified via *comm_modify cutoff* (defaults to 0.0). If this results to 0.0, no ghost atoms will be generated and LAMMPS may lose atoms or use incorrect periodic images of atoms in interaction lists. To avoid, either use *pair style zero* with a suitable cutoff or use *comm_modify cutoff*.

Communication cutoff is shorter than a bond length based estimate. This may lead to errors.
Since LAMMPS stores topology data with individual atoms, all atoms comprising a bond, angle, dihedral or improper must be present on any subdomain that "owns" the atom with the information, either as a local or a ghost atom. The communication cutoff is what determines up to what distance from a subdomain boundary ghost atoms are created. The communication cutoff is by default the largest non-bonded cutoff plus the neighbor skin distance, but for short or non-bonded cutoffs and/or long bonds, this may not be sufficient. This warning indicates that there is an increased risk of a simulation stopping unexpectedly because of Bond/Angle/Dihedral/Improper atoms missing. It can be silenced by manually setting the communication cutoff via *comm_modify cutoff*. However, since the heuristic used to determine the estimate is not always accurate, it is not changed automatically and the warning may be ignored depending on the specific system being simulated.

Compute cna/atom cutoff may be too large to find ghost atom neighbors
The neighbor cutoff used may not encompass enough ghost atoms to perform this operation correctly.

Computing temperature of portions of rigid bodies
The group defined by the temperature compute does not encompass all the atoms in one or more rigid bodies, so the change in degrees-of-freedom for the atoms in those partial rigid bodies will not be accounted for.

Create_bonds max distance > minimum neighbor cutoff
This means atom pairs for some atom types may not be in the neighbor list and thus no bond can be created between them.

Delete_atoms cutoff > minimum neighbor cutoff
This means atom pairs for some atom types may not be in the neighbor list and thus an atom in that pair cannot be deleted.

Dihedral atoms missing at step %ld
One or more of 4 atoms needed to compute a particular dihedral are missing on this processor. Typically this is because the pairwise cutoff is set too short or the dihedral has blown apart and an atom is too far away.

Dihedral problem
Conformation of the 4 listed dihedral atoms is extreme; you may want to check your simulation geometry.

Dihedral problem: %d %ld %d %d %d %d
Conformation of the 4 listed dihedral atoms is extreme; you may want to check your simulation geometry.

Dihedrals are defined but no dihedral style is set
The topology contains dihedrals, but there are no dihedral forces computed since there was no dihedral_style command.

Dump dcd/xtc timestamp may be wrong with fix dt/reset
If the fix changes the timestep, the dump dcd file will not reflect the change.

Energy due to X extra global DOFs will be included in minimizer energies
When using fixes like box/relax, the potential energy used by the minimizer is augmented by an additional energy provided by the fix. Thus the printed converged energy may be different from the total potential energy.

Estimated error in splitting of dispersion coeffs is %g
Error is greater than 0.0001 percent.

FENE bond too long
A FENE bond has stretched dangerously far. It's interaction strength will be truncated to attempt to prevent the bond from blowing up.

FENE bond too long: %ld %d %d %g
A FENE bond has stretched dangerously far. It's interaction strength will be truncated to attempt to prevent the bond from blowing up.

FENE bond too long: %ld %g
A FENE bond has stretched dangerously far. It's interaction strength will be truncated to attempt to prevent the bond from blowing up.

Fix SRD walls overlap but fix srd overlap not set
You likely want to set this in your input script.

Fix bond/create is used multiple times or with fix bond/break - may not work as expected
When using fix bond/create multiple times or in combination with fix bond/break, the individual fix instances do not share information about changes they made at the same time step and thus it may result in unexpected behavior.

Fix bond/react: Atom affected by reaction too close to template edge
This means an atom which changes type or connectivity during the reaction is too close to an 'edge' atom defined in the superimpose file. This could cause incorrect assignment of bonds, angle, etc. Generally, this means you must include more atoms in your templates, such that there are at least two atoms between each atom involved in the reaction and an edge atom.

Fix bond/swap will ignore defined angles
See the page for fix bond/swap for more info on this restriction.

Fix deposit near setting < possible overlap separation %g
This test is performed for finite size particles with a diameter, not for point particles. The near setting is smaller than the particle diameter which can lead to overlaps.

Fix evaporate may delete atom with non-zero molecule ID
This is probably an error, since you should not delete only one atom of a molecule.

Fix gcmc using full_energy option
Fix gcmc has automatically turned on the full_energy option since it is required for systems like the one specified by the user. User input included one or more of the following: kspace, triclinic, a hybrid pair style, an eam pair style, or no "single" function for the pair style.

Fix langevin gjf using random gaussians is not implemented with kokkos
This will most likely cause errors in kinetic fluctuations.

Fix property/atom mol or charge w/out ghost communication
A model typically needs these properties defined for ghost atoms.

Fix qeq has non-zero lower Taper radius cutoff
Absolute value must be <= 0.01.

Fix qeq has very low Taper radius cutoff
Value should typically be >= 5.0.

Fix rattle should come after all other integration fixes
This fix is designed to work after all other integration fixes change atom positions. Thus it should be the last integration fix specified. If not, it will not satisfy the desired constraints as well as it otherwise would.

Fix recenter should come after all other integration fixes
Other fixes may change the position of the center-of-mass, so fix recenter should come last.

Fix srd SRD moves may trigger frequent reneighboring
This is because the SRD particles may move long distances.

Fix srd grid size > 1/4 of big particle diameter
This may cause accuracy problems.

Fix srd particle moved outside valid domain
This may indicate a problem with your simulation parameters.

Fix srd particles may move > big particle diameter
This may cause accuracy problems.

Fix srd viscosity < 0.0 due to low SRD density
This may cause accuracy problems.

Fixes cannot send data in Kokkos communication, switching to classic communication
This is current restriction with Kokkos.

For better accuracy use 'pair_modify table 0'
The user-specified force accuracy cannot be achieved unless the table feature is disabled by using 'pair_modify table 0'.

Group for fix_modify temp != fix group
The fix_modify command is specifying a temperature computation that computes a temperature on a different group of atoms than the fix itself operates on. This is probably not what you want to do.

H matrix size has been exceeded: m_fill=%d H.m=%dn
This is the size of the matrix.

Ignoring unknown or incorrect info command flag
Self-explanatory. An unknown argument was given to the info command. Compare your input with the documentation.

Improper atoms missing at step %ld
One or more of 4 atoms needed to compute a particular improper are missing on this processor. Typically this is because the pairwise cutoff is set too short or the improper has blown apart and an atom is too far away.

Improper problem: %d %ld %d %d %d %d
Conformation of the 4 listed improper atoms is extreme; you may want to check your simulation geometry.

Impropers are defined but no improper style is set
The topology contains impropers, but there are no improper forces computed since there was no improper_style command.

Increasing communication cutoff for GPU style
The pair style has increased the communication cutoff to be consistent with the communication cutoff requirements for this pair style when run on the GPU.

Kspace_modify slab param < 2.0 may cause unphysical behavior
The kspace_modify slab parameter should be larger to ensure periodic grids padded with empty space do not overlap.

Less insertions than requested
The fix pour command was unsuccessful at finding open space for as many particles as it tried to insert.

Library error in lammps_gather_atoms
This library function cannot be used if atom IDs are not defined or are not consecutively numbered.

Library error in lammps_scatter_atoms
This library function cannot be used if atom IDs are not defined or are not consecutively numbered, or if no atom map is defined. See the atom_modify command for details about atom maps.

Likewise 1-2 special neighbor interactions != 1.0
The topology contains bonds, but there is no bond style defined and a 1-2 special neighbor scaling factor was not 1.0. This means that pair style interactions may have scaled or missing pairs in the neighbor list in expectation of interactions for those pairs being computed from the bond style.

Likewise 1-3 special neighbor interactions != 1.0
The topology contains angles, but there is no angle style defined and a 1-3 special neighbor scaling factor was not 1.0. This means that pair style interactions may have scaled or missing pairs in the neighbor list in expectation of interactions for those pairs being computed from the angle style.

Likewise 1-4 special neighbor interactions != 1.0
The topology contains dihedrals, but there is no dihedral style defined and a 1-4 special neighbor scaling factor was not 1.0. This means that pair style interactions may have scaled or missing pairs in the neighbor list in expectation of interactions for those pairs being computed from the dihedral style.

Lost atoms via change_box: original %ld current %ld
The command options you have used caused atoms to be lost.

Lost atoms via displace_atoms: original %ld current %ld
The command options you have used caused atoms to be lost.

Lost atoms: original %ld current %ld
Lost atoms are checked for each time thermo output is done. See the thermo_modify lost command for options. Lost atoms usually indicate bad dynamics, e.g. atoms have been blown far out of the simulation box, or moved further than one processor's subdomain away before reneighboring.

Mismatch between velocity and compute groups
The temperature computation used by the velocity command will not be on the same group of atoms that velocities are being set for.

Molecule has bond topology but no special bond settings
This means the bonded atoms will not be excluded in pairwise interactions.

Molecule template for create_atoms has multiple molecules
The create_atoms command will only create molecules of a single type, i.e. the first molecule in the template.

Molecule template for fix gcmc has multiple molecules
The fix gcmc command will only create molecules of a single type, i.e. the first molecule in the template.

Molecule template for fix shake has multiple molecules
The fix shake command will only recognize molecules of a single type, i.e. the first molecule in the template.

More than one compute centro/atom
It is not efficient to use compute centro/atom more than once.

More than one compute cluster/atom
It is not efficient to use compute cluster/atom more than once.

More than one compute cna/atom defined
It is not efficient to use compute cna/atom more than once.

More than one compute contact/atom
It is not efficient to use compute contact/atom more than once.

More than one compute coord/atom
It is not efficient to use compute coord/atom more than once.

More than one compute damage/atom
It is not efficient to use compute ke/atom more than once.

More than one compute erotate/sphere/atom
It is not efficient to use compute erorate/sphere/atom more than once.

More than one compute hexorder/atom
It is not efficient to use compute hexorder/atom more than once.

More than one compute ke/atom
It is not efficient to use compute ke/atom more than once.

More than one compute orientorder/atom
It is not efficient to use compute orientorder/atom more than once.

More than one fix rigid
It is not efficient to use fix rigid more than once.

Neighbor exclusions used with KSpace solver may give inconsistent Coulombic energies
This is because excluding specific pair interactions also excludes them from long-range interactions which may not be the desired effect. The special_bonds command handles this consistently by ensuring excluded (or weighted) 1-2, 1-3, 1-4 interactions are treated consistently by both the short-range pair style and the long-range solver. This is not done for exclusions of charged atom pairs via the neigh_modify exclude command.

New thermo_style command, previous thermo_modify settings will be lost
If a thermo_style command is used after a thermo_modify command, the settings changed by the thermo_modify command will be reset to their default values. This is because the thermo_modify command acts on the currently defined thermo style, and a thermo_style command creates a new style.

No Kspace calculation with verlet/split
The second partition performs a kspace calculation so the kspace_style command must be used.

No automatic unit conversion to XTC file format conventions possible for units lj
This means no scaling will be performed.

No fixes defined, atoms won't move
If you are not using a fix like nve, nvt, npt then atom velocities and coordinates will not be updated during timestepping.

Not using real units with pair reaxff
This is most likely an error, unless you have created your own ReaxFF parameter file in a different set of units.

Number of MSM mesh points changed to be a multiple of 2
MSM requires that the number of grid points in each direction be a multiple of two and the number of grid points in one or more directions have been adjusted to meet this requirement.

OMP_NUM_THREADS environment is not set.
This environment variable must be set appropriately to use the OPENMP package.

One or more atoms are time integrated more than once
This is probably an error since you typically do not want to advance the positions or velocities of an atom more than once per timestep.

One or more chunks do not contain all atoms in molecule
This may not be what you intended.

One or more dynamic groups may not be updated at correct point in timestep
If there are other fixes that act immediately after the initial stage of time integration within a timestep (i.e. after atoms move), then the command that sets up the dynamic group should appear after those fixes. This will ensure that dynamic group assignments are made after all atoms have moved.

One or more respa levels compute no forces
This is computationally inefficient.

Pair COMB charge %.10f with force %.10f hit max barrier
Something is possibly wrong with your model.

Pair COMB charge %.10f with force %.10f hit min barrier
Something is possibly wrong with your model.

Pair dsmc: num_of_collisions > number_of_A
Collision model in DSMC is breaking down.

Pair dsmc: num_of_collisions > number_of_B
Collision model in DSMC is breaking down.

Pair style restartinfo set but has no restart support
This pair style has a bug, where it does not support reading and writing information to a restart file, but does not set the member variable "restartinfo" to 0 as required in that case.

Particle deposition was unsuccessful
The fix deposit command was not able to insert as many atoms as needed. The requested volume fraction may be too high, or other atoms may be in the insertion region.

Proc subdomain size < neighbor skin, could lead to lost atoms
The decomposition of the physical domain (likely due to load balancing) has led to a processor's subdomain being smaller than the neighbor skin in one or more dimensions. Since reneighboring is triggered by atoms moving the skin distance, this may lead to lost atoms, if an atom moves all the way across a neighboring processor's subdomain before reneighboring is triggered.

Reducing PPPM order b/c stencil extends beyond nearest neighbor processor
This may lead to a larger grid than desired. See the kspace_modify overlap command to prevent changing of the PPPM order.

Reducing PPPMDisp Coulomb order b/c stencil extends beyond neighbor processor
This may lead to a larger grid than desired. See the kspace_modify overlap command to prevent changing of the PPPM order.

Reducing PPPMDisp dispersion order b/c stencil extends beyond neighbor processor
This may lead to a larger grid than desired. See the kspace_modify overlap command to prevent changing of the PPPM order.

Replacing a fix, but new group != old group
The ID and style of a fix match for a fix you are changing with a fix command, but the new group you are specifying does not match the old group.

Replicating in a non-periodic dimension
The parameters for a replicate command will cause a non-periodic dimension to be replicated; this may cause unwanted behavior.

Resetting reneighboring criteria during PRD
A PRD simulation requires that neigh_modify settings be delay = 0, every = 1, check = yes. Since these settings were not in place, LAMMPS changed them and will restore them to their original values after the PRD simulation.

Resetting reneighboring criteria during TAD
A TAD simulation requires that neigh_modify settings be delay = 0, every = 1, check = yes. Since these settings were not in place, LAMMPS changed them and will restore them to their original values after the PRD simulation.

Resetting reneighboring criteria during minimization
Minimization requires that neigh_modify settings be delay = 0, every = 1, check = yes. Since these settings were not in place, LAMMPS changed them and will restore them to their original values after the minimization.

Restart file used different # of processors
The restart file was written out by a LAMMPS simulation running on a different number of processors. Due to round-off, the trajectories of your restarted simulation may diverge a little more quickly than if you ran on the same # of processors.

Restart file used different 3d processor grid
The restart file was written out by a LAMMPS simulation running on a different 3d grid of processors. Due to round-off, the trajectories of your restarted simulation may diverge a little more quickly than if you ran on the same # of processors.

Restart file used different boundary settings, using restart file values
Your input script cannot change these restart file settings.

Restart file used different newton bond setting, using restart file value
The restart file value will override the setting in the input script.

Restart file used different newton pair setting, using input script value
The input script value will override the setting in the restart file.

Restrain problem: %d %ld %d %d %d %d
Conformation of the 4 listed dihedral atoms is extreme; you may want to check your simulation geometry.

Running PRD with only one replica
This is allowed, but you will get no parallel speed-up.

SRD bin shifting turned on due to small lamda
This is done to try to preserve accuracy.

SRD bin size for fix srd differs from user request
Fix SRD had to adjust the bin size to fit the simulation box. See the cubic keyword if you want this message to be an error vs warning.

SRD bins for fix srd are not cubic enough
The bin shape is not within tolerance of cubic. See the cubic keyword if you want this message to be an error vs warning.

SRD particle %d started inside big particle %d on step %ld bounce %d
See the inside keyword if you want this message to be an error vs warning.

SRD particle %d started inside wall %d on step %ld bounce %d
See the inside keyword if you want this message to be an error vs warning.

Shake determinant < 0.0
The determinant of the quadratic equation being solved for a single cluster specified by the fix shake command is numerically suspect. LAMMPS will set it to 0.0 and continue.

Shell command returned with non-zero status
This may indicate the shell command did not operate as expected.

Should not allow rigid bodies to bounce off reflecting walls
LAMMPS allows this, but their dynamics are not computed correctly.

Should not use fix nve/limit with fix shake or fix rattle
This will lead to invalid constraint forces in the SHAKE/RATTLE computation.

Slab correction not needed for MSM
Slab correction is intended to be used with Ewald or PPPM and is not needed by MSM.

System is not charge neutral, net charge = %g
The total charge on all atoms on the system is not 0.0. For some KSpace solvers this is only a warning.

Table inner cutoff >= outer cutoff
You specified an inner cutoff for a Coulombic table that is longer than the global cutoff. Probably not what you wanted.

Temperature for MSST is not for group all
User-assigned temperature to MSST fix does not compute temperature for all atoms. Since MSST computes a global pressure, the kinetic energy contribution from the temperature is assumed to also be for all atoms. Thus the pressure used by MSST could be inaccurate.

Temperature for NPT is not for group all
User-assigned temperature to NPT fix does not compute temperature for all atoms. Since NPT computes a global pressure, the kinetic energy contribution from the temperature is assumed to also be for all atoms. Thus the pressure used by NPT could be inaccurate.

Temperature for fix modify is not for group all
The temperature compute is being used with a pressure calculation which does operate on group all, so this may be inconsistent.

Temperature for thermo pressure is not for group all
User-assigned temperature to thermo via the thermo_modify command does not compute temperature for all atoms. Since thermo computes a global pressure, the kinetic energy contribution from the temperature is assumed to also be for all atoms. Thus the pressure printed by thermo could be inaccurate.

The minimizer does not re-orient dipoles when using fix efield
This means that only the atom coordinates will be minimized, not the orientation of the dipoles.

Too many common neighbors in CNA %d times
More than the maximum # of neighbors was found multiple times. This was unexpected.

Too many neighbors in CNA for %d atoms
More than the maximum # of neighbors was found multiple times. This was unexpected.

Use special bonds = 0,1,1 with bond style fene
Most FENE models need this setting for the special_bonds command.

Use special bonds = 0,1,1 with bond style fene/expand
Most FENE models need this setting for the special_bonds command.

Using a many-body potential with bonds/angles/dihedrals and special_bond exclusions
This is likely not what you want to do. The exclusion settings will eliminate neighbors in the neighbor list, which the many-body potential needs to calculated its terms correctly.

Using compute temp/deform with inconsistent fix deform remap option
Fix nvt/sllod assumes deforming atoms have a velocity profile provided by "remap v" or "remap none" as a fix deform option.

Using compute temp/deform with no fix deform defined
This is probably an error, since it makes little sense to use compute temp/deform in this case.

Using fix srd with box deformation but no SRD thermostat
The deformation will heat the SRD particles so this can be dangerous.

Using pair potential shift with pair_modify compute no
The shift effects will thus not be computed.

Using pair tail corrections with nonperiodic system
This is probably a bogus thing to do, since tail corrections are computed by integrating the density of a periodic system out to infinity.

Using pair tail corrections with pair_modify compute no
The tail corrections will thus not be computed.

CHAPTER

EIGHT

COMMANDS

These pages describe how a LAMMPS input script is formatted and the commands in it are used to define a LAMMPS simulation.

8.1 LAMMPS input scripts

LAMMPS executes calculations by reading commands from a input script (text file), one line at a time. When the input script ends, LAMMPS exits. This is different from programs that read and process the entire input before starting a calculation.

Each command causes LAMMPS to take some immediate action without regard for any commands that may be processed later. Commands may set an internal variable, read in a file, or run a simulation. These actions can be grouped into three categories:

a) commands that change a global setting (examples: *timestep*, *newton*, *echo*, *log*, *thermo*, *restart*),

b) commands that add, modify, remove, or replace "styles" that are executed during a "run" (examples: *pair_style*, *fix*, *compute*, *dump*, *thermo_style*, *pair_modify*), and

c) commands that execute a "run" or perform some other computation or operation (examples: *print*, *run*, *minimize*, *temper*, *write_dump*, *rerun*, *read_data*, *read_restart*)

Commands in category a) have default settings, which means you only need to use the command if you wish to change the defaults.

In many cases, the ordering of commands in an input script is not important, but can have consequences when the global state is changed between commands in the c) category. The following rules apply:

(1) LAMMPS does not read your entire input script and then perform a simulation with all the settings. Rather, the input script is read one line at a time and each command takes effect when it is read. Thus this sequence of commands:

```
timestep 0.5
run      100
run      100
```

does something different than this sequence:

```
run      100
timestep 0.5
run      100
```

In the first case, the specified timestep (0.5 fs) is used for two simulations of 100 timesteps each. In the second case, the default timestep (1.0 fs) is used for the first 100 step simulation and a 0.5 fs timestep is used for the second one.

(2) Some commands are only valid when they follow other commands. For example you cannot set the temperature of a group of atoms until atoms have been defined and a group command is used to define which atoms belong to the group.

(3) Sometimes command B will use values that can be set by command A. This means command A must precede command B in the input script if it is to have the desired effect. For example, the *read_data* command initializes the system by setting up the simulation box and assigning atoms to processors. If default values are not desired, the *processors* and *boundary* commands need to be used before read_data to tell LAMMPS how to map processors to the simulation box.

Many input script errors are detected by LAMMPS and an ERROR or WARNING message is printed. The *Errors* page gives more information on what errors mean. The documentation for each command lists restrictions on how the command can be used.

You can use the *-skiprun* command-line flag to have LAMMPS skip the execution of any run, minimize, or similar commands to check the entire input for correct syntax to avoid crashes on typos or syntax errors in long runs.

8.2 Parsing rules for input scripts

Each non-blank line in the input script is treated as a command. LAMMPS commands are case sensitive. Command names are lower-case, as are specified command arguments. Upper case letters may be used in file names or user-chosen ID strings.

Here are 6 rules for how each line in the input script is parsed by LAMMPS:

1. If the last printable character on the line is a "&" character, the command is assumed to continue on the next line. The next line is concatenated to the previous line by removing the "&" character and line break. This allows long commands to be continued across two or more lines. See the discussion of triple quotes in *6* for how to continue a command across multiple line without using "&" characters.

2. All characters from the first "#" character onward are treated as comment and discarded. The exception to this rule is described in *6*. Note that a comment after a trailing "&" character will prevent the command from continuing on the next line. Also note that for multi-line commands a single leading "#" will comment out the entire command.

```
# this is a comment
timestep  1.0   # this is also a comment
```

3. The line is searched repeatedly for $ characters, which indicate variables that are replaced with a text string. The exception to this rule is described in *6*.

   If the $ is followed by text in curly brackets '{}', then the variable name is the text inside the curly brackets. If no curly brackets follow the $, then the variable name is the single character immediately following the $. Thus ${myTemp} and $x refer to variables named "myTemp" and "x", while $xx will be interpreted as a variable named "x" followed by an "x" character.

   How the variable is converted to a text string depends on what style of variable it is; see the *variable* page for details. It can be a variable that stores multiple text strings, and return one of them. The returned text string can be multiple "words" (space separated) which will then be interpreted as multiple arguments in the input command. The variable can also store a numeric formula which will be evaluated and its numeric result returned as a string.

   As a special case, if the $ is followed by parenthesis "()", then the text inside the parenthesis is treated as an "immediate" variable and evaluated as an *equal-style variable*. This is a way to use numeric formulas in an input script without having to assign them to variable names. For example, these 3 input script lines:

```
variable X equal (xlo+xhi)/2+sqrt(v_area)
region 1 block $X 2 INF INF EDGE EDGE
variable X delete
```

can be replaced by:

```
region 1 block $((xlo+xhi)/2+sqrt(v_area)) 2 INF INF EDGE EDGE
```

so that you do not have to define (or discard) a temporary variable, "X" in this case.

Additionally, the entire "immediate" variable expression may be followed by a colon, followed by a C-style format string, e.g. :%f or :%.10g. The format string must be appropriate for a double-precision floating-point value. The format string is used to output the result of the variable expression evaluation. If a format string is not specified, a high-precision %.20g is used as the default format.

This can be useful for formatting print output to a desired precision:

```
print "Final energy per atom: $(v_ke_per_atom+v_pe_per_atom:%10.3f) eV/atom"
```

Note that neither the curly-bracket or immediate form of variables can contain nested $ characters for other variables to substitute for. Thus you may **NOT** do this:

```
variable    a equal 2
variable    b2 equal 4
print       "B2 = ${b$a}"
```

Nor can you specify an expression like $($x-1.0) for an immediate variable, but you could use $(v_x-1.0), since the latter is valid syntax for an *equal-style variable*.

See the *variable* command for more details of how strings are assigned to variables and evaluated, and how they can be used in input script commands.

4. The line is broken into "words" separated by white-space (tabs, spaces). Note that words can thus contain letters, digits, underscores, or punctuation characters.

5. The first word is the command name. All successive words in the line are arguments.

6. If you want text with spaces to be treated as a single argument, it can be enclosed in either single (') or double (") or triple ("""") quotes. A long single argument enclosed in single or double quotes can span multiple lines if the "&" character is used, as described in *1* above. When the lines are concatenated together by LAMMPS (and the "&" characters and line breaks removed), the combined text will become a single line. If you want multiple lines of an argument to retain their line breaks, the text can be enclosed in triple quotes, in which case "&" characters are not needed and do not function as line continuation character. For example:

```
print "Volume = $v"
print 'Volume = $v'
if "${steps} > 1000" then quit
variable a string "red green blue &
                   purple orange cyan"
print """
System volume = $v
System temperature = $t
"""
```

In each of these cases, the single, double, or triple quotes are removed and the enclosed text stored internally as a single argument.

See the *dump modify format*, *print*, *if*, and *python* commands for examples.

A "#" or "$" character that is between quotes will not be treated as a comment indicator in *2* or substituted for as a variable in *3*.

Note

If the argument is itself a command that requires a quoted argument (e.g. using a *print* command as part of an *if* or *run every* command), then single, double, or triple quotes can be nested in the usual manner. See the doc pages for those commands for examples. Only one of level of nesting is allowed, but that should be sufficient for most use cases.

ASCII versus UTF-8

LAMMPS expects and processes 7-bit ASCII format text internally. Many modern environments use UTF-8 encoding, which is a superset of the 7-bit ASCII character table and thus mostly compatible. However, there are several non-ASCII characters that can look very similar to their ASCII equivalents or are invisible (so they look like a blank), but are encoded differently. Web browsers, PDF viewers, document editors are known to sometimes replace one with the other for a better looking output. However, that can lead to problems, for instance, when using cut-n-paste of input file examples from web pages, or when using a document editor (not a dedicated plain text editor) for writing LAMMPS inputs. LAMMPS will try to detect this and substitute the non-ASCII characters with their ASCII equivalents where known. There also is going to be a warning printed, if this occurs. It is recommended to avoid such characters altogether in LAMMPS input, data and potential files. The replacement tables are likely incomplete and dependent on users reporting problems processing correctly looking input containing UTF-8 encoded non-ASCII characters.

8.3 Input script structure

This page describes the structure of a typical LAMMPS input script. The examples directory in the LAMMPS distribution contains many sample input scripts; it is discussed on the *Examples* doc page.

A LAMMPS input script typically has 4 parts:

1. *Initialization*
2. *System definition*
3. *Simulation settings*
4. *Run a simulation*

The last 2 parts can be repeated as many times as desired. I.e. run a simulation, change some settings, run some more, etc. Each of the 4 parts is now described in more detail. Remember that almost all commands need only be used if a non-default value is desired.

8.3.1 Initialization

Set parameters that need to be defined before atoms are created or read-in from a file.

The relevant commands are *units*, *dimension*, *newton*, *processors*, *boundary*, *atom_style*, *atom_modify*.

If force-field parameters appear in the files that will be read, these commands tell LAMMPS what kinds of force fields are being used: *pair_style*, *bond_style*, *angle_style*, *dihedral_style*, *improper_style*.

8.3.2 System definition

There are 3 ways to define the simulation cell and reserve space for force field info and fill it with atoms in LAMMPS. Read them in from (1) a data file or (2) a restart file via the *read_data* or *read_restart* commands, respectively. These files can also contain molecular topology information. Or (3) create a simulation cell and fill it with atoms on a lattice (with no molecular topology), using these commands: *lattice*, *region*, *create_box*, *create_atoms* or *read_dump*.

The entire set of atoms can be duplicated to make a larger simulation using the *replicate* command.

8.3.3 Simulation settings

Once atoms and molecular topology are defined, a variety of settings can be specified: force field coefficients, simulation parameters, output options, and more.

Force field coefficients are set by these commands (they can also be set in the read-in files): *pair_coeff*, *bond_coeff*, *angle_coeff*, *dihedral_coeff*, *improper_coeff*, *kspace_style*, *dielectric*, *special_bonds*.

Various simulation parameters are set by these commands: *neighbor*, *neigh_modify*, *group*, *timestep*, *reset_timestep*, *run_style*, *min_style*, *min_modify*.

Fixes impose a variety of boundary conditions, time integration, and diagnostic options. The *fix* command comes in many flavors.

Various computations can be specified for execution during a simulation using the *compute*, *compute_modify*, and *variable* commands.

Output options are set by the *thermo*, *dump*, and *restart* commands.

8.3.4 Run a simulation

A molecular dynamics simulation is run using the *run* command. Energy minimization (molecular statics) is performed using the *minimize* command. A parallel tempering (replica-exchange) simulation can be run using the *temper* command.

8.4 Commands by category

This page lists most of the LAMMPS commands, grouped by category. The *General commands* page lists all general commands alphabetically. Style options for entries like fix, compute, pair etc. have their own pages where they are listed alphabetically.

8.4.1 Initialization

newton	*package*	*processors*	*suffix*	*units*

8.4.2 Setup simulation box

boundary	*change_box*	*create_box*	*dimension*
lattice	*region*		

8.4.3 Setup atoms

atom_modify	*atom_style*	*balance*	*create_atoms*
create_bonds	*delete_atoms*	*delete_bonds*	*displace_atoms*
group	*mass*	*molecule*	*read_data*
read_dump	*read_restart*	*replicate*	*set*
velocity			

8.4.4 Force fields

angle_coeff	*angle_style*	*bond_coeff*	*bond_style*
bond_write	*dielectric*	*dihedral_coeff*	*dihedral_style*
improper_coeff	*improper_style*	*kspace_modify*	*kspace_style*
pair_coeff	*pair_modify*	*pair_style*	*pair_write*
special_bonds			

8.4.5 Settings

comm_modify	*comm_style*	*info*	*min_modify*
min_style	*neigh_modify*	*neighbor*	*partition*
reset_timestep	*run_style*	*timer*	*timestep*

8.4.6 Operations within timestepping (fixes) and diagnostics (computes)

compute	*compute_modify*	*fix*	*fix_modify*
uncompute	*unfix*		

8.4.7 Output

dump image	*dump movie*	*dump*	*dump_modify*
restart	*thermo*	*thermo_modify*	*thermo_style*
undump	*write_coeff*	*write_data*	*write_dump*
write_restart			

8.4.8 Actions

minimize	*neb*	*neb_spin*	*prd*	*rerun*	*run*
tad	*temper*				

8.4.9 Input script control

clear	*echo*	*if*	*include*	*info*	*jump*	*label*
log	*next*	*print*	*python*	*quit*	*shell*	*variable*

8.5 General commands

An alphabetic list of general LAMMPS commands.

angle_coeff	*angle_style*	*angle_write*	*atom_modify*	*atom_style*	*balance*
bond_coeff	*bond_style*	*bond_write*	*boundary*	*change_box*	*clear*
comm_modify	*comm_style*	*compute*	*compute_modify*	*create_atoms*	*create_bonds*
create_box	*delete_atoms*	*delete_bonds*	*dielectric*	*dihedral_coeff*	*dihedral_style*
dihedral_write	*dimension*	*displace_atoms*	*dump*	*dump_modify*	*echo*
fix	*fix_modify*	*geturl*	*group*	*if*	*improper_coeff*
improper_style	*include*	*info*	*jump*	*kspace_modify*	*kspace_style*
label	*labelmap*	*lattice*	*log*	*mass*	*minimize*
min_modify	*min_style*	*molecule*	*neigh_modify*	*neighbor*	*newton*
next	*package*	*pair_coeff*	*pair_modify*	*pair_style*	*pair_write*
partition	*print*	*processors*	*quit*	*read_data*	*read_dump*
read_restart	*region*	*replicate*	*rerun*	*reset_atoms*	*reset_timestep*
restart	*run*	*run_style*	*set*	*shell*	*special_bonds*
suffix	*thermo*	*thermo_modify*	*thermo_style*	*timer*	*timestep*
uncompute	*undump*	*unfix*	*units*	*variable*	*velocity*
write_coeff	*write_data*	*write_dump*	*write_restart*		

Additional general LAMMPS commands provided by packages. A few commands have accelerated versions. This is indicated by an additional letter in parenthesis: k = KOKKOS.

dynamical_matrix (k)	*group2ndx*	*hyper*	*kim*	*fitpod*	*mdi*
ndx2group	*neb*	*neb/spin*	*plugin*	*prd*	*python*
region2vmd	*tad*	*temper*	*temper/grem*	*temper/npt*	*third_order (k)*

8.6 Fix styles

An alphabetic list of all LAMMPS *fix* commands. Some styles have accelerated versions. This is indicated by additional letters in parenthesis: g = GPU, i = INTEL, k = KOKKOS, o = OPENMP, t = OPT.

8.15 Removed commands and packages

Contents

- *Removed commands and packages*
  - *ATC, AWPMD, and POEMS packages*
  - *Neighbor style and comm mode multi/old*
  - *LAMMPS-GUI source code*
  - *GJF formulation in fix langevin*
  - *LAMMPS shell*

- *i-PI tool*
- *USER-REAXC package*
- *MPIIO package*
- *MSCG package*
- *LATTE package*
- *Minimize style fire/old*
- *Pair style mesont/tpm, compute style mesont, atom style mesont*
- *Box command*
- *Reset_ids, reset_atom_ids, reset_mol_ids commands*
- *MESSAGE package*
- *REAX package*
- *MEAM package*
- *USER-CUDA package*
- *Compute atom/molecule*
- *Fix ave/spatial and fix ave/spatial/sphere*
- *restart2data tool*

This page lists LAMMPS commands and packages that have been removed from the distribution and provides suggestions for alternatives or replacements. LAMMPS has special dummy styles implemented, that will stop LAMMPS and print a suitable error message in most cases, when a style/command is used that has been removed or will replace the command with the direct alternative (if available) and print a warning.

8.15.1 ATC, AWPMD, and POEMS packages

Deprecated since version 10Sep2025.

The ATC, AWPMD, and POEMS packages are removed.because there were unmaintained for a long time and their legacy C++ programming style started to create problems with modern C++ compilers. LAMMPS version 22 July 2025 is the last version that contains them. You have to download and compile this version, if you want to use any of these packages.

8.15.2 Neighbor style and comm mode multi/old

Deprecated since version 10Sep2025.

The original implementation of neighbor style multi and comm mode multi, most recently available under "multi/old" has been removed. The new implementation should be used instead.

8.15.3 LAMMPS-GUI source code

Deprecated since version 10Sep2025.

The LAMMPS-GUI sources used to be included in LAMMPS but they are now hosted in their own git repository at https://github.com/akohlmey/lammps-gui/ and the corresponding online documentation is at https://lammps-gui.lammps.org/

8.15.4 GJF formulation in fix langevin

Deprecated since version 22Jul2025.

The *gjf* keyword in fix langevin has been removed. The GJF functionality has been moved to its own fix style *fix gjf*.

8.15.5 LAMMPS shell

Deprecated since version 29Aug2024.

The LAMMPS shell has been removed from the LAMMPS distribution. Users are encouraged to use the *LAMMPS-GUI* tool instead.

8.15.6 i-PI tool

Deprecated since version 27Jun2024.

The i-PI tool has been removed from the LAMMPS distribution. Instead, instructions to install i-PI from PyPI via pip are provided.

8.15.7 USER-REAXC package

Deprecated since version 7Feb2024.

The USER-REAXC package has been renamed to *REAXFF*. In the process also the pair style and related fixes were renamed to use the "reaxff" string instead of "reax/c". For a while LAMMPS was maintaining backward compatibility by providing aliases for the styles. These have been removed, so using "reaxff" is now *required*.

8.15.8 MPIIO package

Deprecated since version 21Nov2023.

The MPIIO package has been removed from LAMMPS since it was unmaintained for many years and thus not updated to incorporate required changes that had been applied to the corresponding non-MPIIO commands. As a consequence the MPIIO commands had become unreliable and sometimes crashing LAMMPS or corrupting data. Similar functionality is available through the *ADIOS package* and the *NETCDF package*. Also, the *dump_modify nfile or dump_modify fileper* keywords may be used for an efficient way of writing out dump files when running on large numbers of processors. Similarly, the "nfile" and "fileper" keywords exist for restarts: see *restart*, *read_restart*, *write_restart*.

8.15.9 MSCG package

Deprecated since version 21Nov2023.

The MSCG package has been removed from LAMMPS since it was unmaintained for many years and instead superseded by the OpenMSCG software of the Voth group at the University of Chicago, which can be used independent from LAMMPS.

8.15.10 LATTE package

Deprecated since version 15Jun2023.

The LATTE package with the fix latte command was removed from LAMMPS. This functionality has been superseded by *fix mdi/qm* and *fix mdi/qmmm* from the *MDI package*. These fixes are compatible with several quantum software packages, including LATTE. See the examples/QUANTUM dir and the *MDI coupling HOWTO* page. MDI supports running LAMMPS with LATTE as a plugin library (similar to the way fix latte worked), as well as on a different set of MPI processors.

8.15.11 Minimize style fire/old

Deprecated since version 8Feb2023.

Minimize style *fire/old* has been removed. Its functionality can be reproduced with style *fire* with specific options. Please see the *min_modify command* documentation for details.

8.15.12 Pair style mesont/tpm, compute style mesont, atom style mesont

Deprecated since version 8Feb2023.

Pair style *mesont/tpm*, compute style *mesont*, and atom style *mesont* have been removed from the *MESONT package*. The same functionality is available through *pair style mesocnt*, *bond style mesocnt* and *angle style mesocnt*.

8.15.13 Box command

Deprecated since version 22Dec2022.

The *box* command has been removed and the LAMMPS code changed so it won't be needed. If present, LAMMPS will ignore the command and print a warning.

8.15.14 Reset_ids, reset_atom_ids, reset_mol_ids commands

Deprecated since version 22Dec2022.

The *reset_ids*, *reset_atom_ids*, and *reset_mol_ids* commands have been folded into the *reset_atoms* command. If present, LAMMPS will replace the commands accordingly and print a warning.

8.15.15 MESSAGE package

Deprecated since version 4May2022.

The MESSAGE package has been removed since it was superseded by the *MDI package*. MDI implements the same functionality and in a more general way with direct support for more applications.

8.15.16 REAX package

Deprecated since version 4Jan2019.

The REAX package has been removed since it was superseded by the *REAXFF package*. The REAXFF package has been tested to yield equivalent results to the REAX package, offers better performance, supports OpenMP multi-threading via OPENMP, and GPU and threading parallelization through KOKKOS. The new pair styles are not syntax compatible with the removed reax pair style, so input files will have to be adapted. The REAXFF package was originally called USER-REAXC.

8.15.17 MEAM package

Deprecated since version 4Jan2019.

The MEAM package in Fortran has been replaced by a C++ implementation. The code in the *MEAM package* is a translation of the Fortran code of MEAM into C++, which removes several restrictions (e.g. there can be multiple instances in hybrid pair styles) and allows for some optimizations leading to better performance. The pair style *meam* has the exact same syntax. For a transition period the C++ version of MEAM was called USER-MEAMC so it could coexist with the Fortran version.

8.15.18 USER-CUDA package

Deprecated since version 31May2016.

The USER-CUDA package had been removed, since it had been unmaintained for a long time and had known bugs and problems. Significant parts of the design were transferred to the *KOKKOS package*, which has similar performance characteristics on NVIDIA GPUs. Both, the KOKKOS and the *GPU package* are maintained and allow running LAMMPS with GPU acceleration.

8.15.19 Compute atom/molecule

Deprecated since version 11: Dec2015

The atom/molecule command has been removed from LAMMPS since it was superseded by the more general and extensible "chunk infrastructure". Here the system is partitioned in one of many possible ways - including using molecule IDs - through the *compute chunk/atom* command and then summing is done using *compute reduce/chunk* Please refer to the *chunk HOWTO* section for an overview.

8.15.20 Fix ave/spatial and fix ave/spatial/sphere

Deprecated since version 11Dec2015.

The fixes ave/spatial and ave/spatial/sphere have been removed from LAMMPS since they were superseded by the more general and extensible "chunk infrastructure". Here the system is partitioned in one of many possible ways through the *compute chunk/atom* command and then averaging is done using *fix ave/chunk*. Please refer to the *chunk HOWTO* section for an overview.

8.15.21 restart2data tool

Deprecated since version 23Nov2013.

The functionality of the restart2data tool has been folded into the LAMMPS executable directly instead of having a separate tool. A combination of the commands *read_restart* and *write_data* can be used to the same effect. For added convenience this conversion can also be triggered by *command-line flags*

CHAPTER

NINE

ACCELERATE PERFORMANCE

This section describes various methods for improving LAMMPS performance for different classes of problems running on different kinds of machines.

There are two thrusts to the discussion that follows. The first is using code options that implement alternate algorithms that can speed-up a simulation. The second is to use one of the several accelerator packages provided with LAMMPS that contain code optimized for certain kinds of hardware, including multicore CPUs, GPUs, and Intel Xeon Phi co-processors.

The Benchmark page of the LAMMPS website gives performance results for the various accelerator packages discussed on the *Accelerator packages* page, for several of the standard LAMMPS benchmark problems, as a function of problem size and number of compute nodes, on different hardware platforms.

9.1 Benchmarks

Current LAMMPS performance is discussed on the Benchmarks page of the LAMMPS website where timings and parallel efficiency are listed. The page has several sections, which are briefly described below:

- CPU performance on 5 standard problems, strong and weak scaling
- GPU and Xeon Phi performance on same and related problems
- Comparison of cost of interatomic potentials
- Performance of huge, billion-atom problems

The 5 standard problems are as follow:

1. LJ = atomic fluid, Lennard-Jones potential with 2.5 sigma cutoff (55 neighbors per atom), NVE integration
2. Chain = bead-spring polymer melt of 100-mer chains, FENE bonds and LJ pairwise interactions with a $2^{\frac{1}{6}}$ sigma cutoff (5 neighbors per atom), NVE integration
3. EAM = metallic solid, Cu EAM potential with 4.95 Angstrom cutoff (45 neighbors per atom), NVE integration
4. Chute = granular chute flow, frictional history potential with 1.1 sigma cutoff (7 neighbors per atom), NVE integration
5. Rhodo = rhodopsin protein in solvated lipid bilayer, CHARMM force field with a 10 Angstrom LJ cutoff (440 neighbors per atom), particle-particle particle-mesh (PPPM) for long-range Coulombics, NPT integration

Input files for these 5 problems are provided in the bench directory of the LAMMPS distribution. Each has 32,000 atoms and runs for 100 timesteps. The size of the problem (number of atoms) can be varied using command-line switches as described in the bench/README file. This is an easy way to test performance and either strong or weak scalability on your machine.

The bench directory includes a few log.* files that show performance of these 5 problems on 1 or 4 cores of Linux desktop. The bench/FERMI and bench/KEPLER directories have input files and scripts and instructions for running

the same (or similar) problems using OpenMP or GPU or Xeon Phi acceleration options. See the README files in those directories and the *Accelerator packages* pages for instructions on how to build LAMMPS and run on that kind of hardware.

The bench/POTENTIALS directory has input files which correspond to the table of results on the Potentials section of the Benchmarks web page. So you can also run those test problems on your machine.

The billion-atom section of the Benchmarks web page has performance data for very large benchmark runs of simple Lennard-Jones (LJ) models, which use the bench/in.lj input script.

For all the benchmarks, a useful metric is the CPU cost per atom per timestep. Since performance scales roughly linearly with problem size and timesteps for all LAMMPS models (i.e. interatomic or coarse-grained potentials), the run time of any problem using the same model (atom style, force field, cutoff, etc) can then be estimated.

Performance on a parallel machine can also be predicted from one-core or one-node timings if the parallel efficiency can be estimated. The communication bandwidth and latency of a particular parallel machine affects the efficiency. On most machines LAMMPS will give a parallel efficiency on these benchmarks above 50% so long as the number of atoms/core is a few 100 or greater, and closer to 100% for large numbers of atoms/core. This is for all-MPI mode with one MPI task per core. For nodes with accelerator options or hardware (OpenMP, GPU, Phi), you should first measure single node performance. Then you can estimate parallel performance for multi-node runs using the same logic as for all-MPI mode, except that now you will typically need many more atoms/node to achieve good scalability.

9.2 Measuring performance

9.2.1 Factors that influence performance

Before trying to make your simulation run faster, you should understand how it currently performs and where the bottlenecks are. We generally distinguish between serial performance (how fast can a single process do the calculations?) and parallel efficiency (how much faster does a calculation get by using more processes?). There are many factors affecting either and below are some lists discussing some commonly known but also some less known factors.

Factors affecting serial performance (in no specific order):

- CPU hardware: clock rate, cache sizes, CPU architecture (instructions per clock, vectorization support, fused multiply-add support and more)
- RAM speed and number of channels that the CPU can use to access RAM
- Cooling: CPUs can change the CPU clock based on thermal load, thus the degree of cooling can affect the speed of a CPU. Sometimes even the temperature of neighboring compute nodes in a cluster can make a difference.
- Compiler optimization: most of LAMMPS is written to be easy to modify and thus compiler optimization can speed up calculations. However, too aggressive compiler optimization can produce incorrect results or crashes (during compilation or at runtime).
- Source code improvements: styles in the OPT, OPENMP, and INTEL package can be faster than their base implementation due to improved data access patterns, cache efficiency, or vectorization. Compiler optimization is required to take full advantage of these.
- Number and kind of fixes, computes, or variables used during a simulation, especially if they result in collective communication operations
- Pair style cutoffs and system density: calculations get slower the more neighbors are in the neighbor list and thus for which interactions need to be computed. Force fields with pair styles that compute interactions between triples or quadruples of atoms or that use embedding energies or charge equilibration will need to walk the neighbor lists multiple times.

- Neighbor list settings: tradeoff between neighbor list skin (larger skin = more neighbors, more distances to compute before applying the cutoff) and frequency of neighbor list builds (larger skin = fewer neighbor list builds).
- Proximity of per-atom data in physical memory that for atoms that are close in space improves cache efficiency (thus LAMMPS will by default sort atoms in local storage accordingly)
- Using r-RESPA multi-timestepping or a SHAKE or RATTLE fix to constrain bonds with higher-frequency vibrations may allow a larger (outer) timestep and thus fewer force evaluations (usually the most time consuming step in MD) for the same simulated time (with some tradeoff in accuracy).

Factors affecting parallel efficiency (in no specific order):

- Bandwidth and latency of communication between processes. This can vary a lot between processes on the same CPU or physical node and processes on different physical nodes and there vary between different communication technologies (like Ethernet or InfiniBand or other high-speed interconnects)
- Frequency and complexity of communication patterns required
- Number of "work units" (usually correlated with the number of atoms and choice of force field) per MPI-process required for one time step (if this number becomes too small, the cost of communication becomes dominant).
- Choice of parallelization method (MPI-only, OpenMP-only, MPI+OpenMP, MPI+GPU, MPI+GPU+OpenMP)
- Algorithmic complexity of the chosen force field (pair-wise vs. many-body potential, Ewald vs. PPPM vs. (compensated or smoothed) cutoff-Coulomb)
- Communication cutoff: a larger cutoff results in more ghost atoms and thus more data that needs to be communicated
- Frequency of neighbor list builds: during a neighbor list build the domain decomposition is updated and the list of ghost atoms rebuilt which requires multiple global communication steps
- FFT-grid settings and number of MPI processes for kspace style PPPM: PPPM uses parallel 3d FFTs which will drop much faster in parallel efficiency with respect to the number of MPI processes than other parts of the force computation. Thus using MPI+OpenMP parallelization or *run style verlet/split* can improve parallel efficiency by limiting the number of MPI processes used for the FFTs.
- Load (im-)balance: LAMMPS' domain decomposition assumes that atoms are evenly distributed across the entire simulation box. If there are areas of vacuum, this may lead to different amounts of work for different MPI processes. Using the *processors command* to change the spatial decomposition, or MPI+OpenMP parallelization instead of only-MPI to have larger sub-domains, or the (fix) balance command (without or with switching to communication style tiled) to change the sub-domain volumes are all methods that can help to avoid load imbalances.

9.2.2 Examples comparing serial performance

Before looking at your own input deck(s), you should get some reference data from a known input so that you know what kind of performance you should expect from your input. For the following we therefore use the in.rhodo.scaled input file and data.rhodo data file from the bench folder. This is a system of 32000 atoms using the CHARMM force field and long-range electrostatics running for 100 MD steps. The performance data is printed at the end of a run and only measures the performance during propagation and excludes the setup phase.

Running with a single MPI process on an AMD Ryzen Threadripper PRO 9985WX CPU (64 cores, 128 threads, base clock: 3.2GHz, max. clock 5.4GHz, L1/L2/L3 cache 5MB/64MB/256MB, 8 DDR5-6400 memory channels) one gets the following performance report:

```
Performance: 1.232 ns/day, 19.476 hours/ns, 7.131 timesteps/s, 228.197 katom-step/s
99.2% CPU use with 1 MPI tasks x 1 OpenMP threads
```

The %CPU value should be at 100% or very close. Lower values would be an indication that there are *other* processes also using the same CPU core and thus invalidating the performance data. The katom-step/s value is best suited for comparisons, since it is fairly independent from the system size. The *in.rhodo.scaled* input can be easily made larger through replication in the three dimensions by settings variables "x", "y", "z" to values other than 1 from the command line with the "-var" flag. Example:

- 32000 atoms: 228.8 katom-step/s
- 64000 atoms: 231.6 katom-step/s
- 128000 atoms: 231.1 katom-step/s
- 256000 atoms: 226.4 katom-step/s
- 864000 atoms: 229.6 katom-step/s

Comparing to an AMD Ryzen 7 7840HS CPU (8 cores, 16 threads, base clock 3.8GHz, max. clock 5.1GHz, L1/L2/L3 cache 512kB/8MB/16MB, 2 DDR5-5600 memory channels), we get similar single core performance (~220 katom-step/s vs. ~230 katom-step/s) due to the similar clock and architecture:

- 32000 atoms: 219.8 katom-step/s
- 64000 atoms: 222.5 katom-step/s
- 128000 atoms: 216.8 katom-step/s
- 256000 atoms: 221.0 katom-step/s
- 864000 atoms: 221.1 katom-step/s

Switching to an older Intel Xeon E5-2650 v4 CPU (12 cores, 12 threads, base clock 2.2GHz, max. clock 2.9GHz, L1/L2/L3 cache (64kB/256kB/30MB, 4 DDR4-2400 memory channels) leads to a lower performance of approximately 109 katom-step/s due to differences in architecture and clock. In all cases, when looking at multiple runs, the katom-step/s property fluctuates by approximately 1% around the average.

From here on we are looking at the performance for the 256000 atom system only and change several settings incrementally:

1. No compiler optimization GCC (-Og -g): 183.8 katom-step/s
2. Moderate optimization with debug info GCC (-O2 -g): 231.1 katom-step/s
3. Full compiler optimization GCC (-DNDEBUG -O3): 236.0 katom-step/s
4. Aggressive compiler optimization GCC (-O3 -ffast-math -march=native): 239.9 katom-step/s
5. Source code optimization in OPENMP package (1 thread): 266.7 katom-step/s
6. Use *fix nvt* instead of *fix npt* (compute virial only every 50 steps): 272.9 katom-step/s
7. Increase pair style cutoff by 2 Å: 181.2 katom-step/s
8. Use tight PPPM convergence (1.0e-6 instead of 1.0e-4): 161.9 katom-step/s
9. Use Ewald summation instead of PPPM (at 1.0e-4 convergence): 19.9 katom-step/s

The numbers show that gains from aggressive compiler optimizations are rather small in LAMMPS, the data access optimizations in the OPENMP (and OPT) packages are more prominent. On the other side, using more accurate force field settings causes, not unexpectedly, a significant slowdown (to about half the speed). Finally, using regular Ewald summation causes a massive slowdown due to the bad algorithmic scaling with system size.

9.2.3 Examples comparing parallel performance

The parallel performance usually goes on top of the serial performance. Using twice as many processors should increase the performance metric by up to a factor of two. With the number of processors N and the serial performance p_1 and the performance for N processors p_N we can define a *parallel efficiency* in percent as follows:

$$P_{eff} = \frac{p_N}{p_1 \cdot N} \cdot 100\%$$

For the AMD Ryzen Threadripper PRO 9985WX CPU and the serial simulation settings of point 6. from above, we get the following parallel efficiency data for the 256000 atom system:

- 1 MPI task: 273.6 katom-step/s, P_{eff} = 100%
- 2 MPI tasks: 530.6 katom-step/s, P_{eff} = 97%
- 4 MPI tasks: 1.021 Matom-step/s, P_{eff} = 93%
- 8 MPI tasks: 1.837 Matom-step/s, P_{eff} = 84%
- 16 MPI tasks: 3.574 Matom-step/s, P_{eff} = 82%
- 32 MPI tasks: 6.479 Matom-step/s, P_{eff} = 74%
- 64 MPI tasks: 9.032 Matom-step/s, P_{eff} = 52%
- 128 MPI tasks: 12.03 Matom-step/s, P_{eff} = 34%

The 128 MPI tasks run uses CPU cores from hyper-threading.

For a small system with only 32000 atoms the parallel efficiency drops off earlier when the number of work units is too small relative to the communication overhead:

- 1 MPI task: 270.8 katom-step/s, P_{eff} = 100%
- 2 MPI tasks: 529.3 katom-step/s, P_{eff} = 98%
- 4 MPI tasks: 989.8 katom-step/s, P_{eff} = 91%
- 8 MPI tasks: 1.832 Matom-step/s, P_{eff} = 85%
- 16 MPI tasks: 3.463 Matom-step/s, P_{eff} = 80%
- 32 MPI tasks: 5.970 Matom-step/s, P_{eff} = 69%
- 64 MPI tasks: 7.477 Matom-step/s, P_{eff} = 42%
- 128 MPI tasks: 8.069 Matom-step/s, P_{eff} = 23%

9.2.4 Measuring performance of your input deck

The best way to do this is run the your system (actual number of atoms) for a modest number of timesteps (say 100 steps) on several different processor counts, including a single processor if possible. Do this for an equilibrium version of your system, so that the 100-step timings are representative of a much longer run. There is typically no need to run for 1000s of timesteps to get accurate timings; you can simply extrapolate from short runs.

For the set of runs, look at the timing data printed to the screen and log file at the end of each LAMMPS run. The *screen and logfile output* page gives an overview.

Running on one (or a few processors) should give a good estimate of the serial performance and what portions of the timestep are taking the most time. Running the same problem on a few different processor counts should give an estimate of parallel scalability. I.e. if the simulation runs 16x faster on 16 processors, its 100% parallel efficient; if it runs 8x faster on 16 processors, it's 50% efficient.

The most important data to look at in the timing info is the timing breakdown and relative percentages. For example, trying different options for speeding up the long-range solvers will have little impact if they only consume 10% of

the run time. If the pairwise time is dominating, you may want to look at GPU or OMP versions of the pair style, as discussed below. Comparing how the percentages change as you increase the processor count gives you a sense of how different operations within the timestep are scaling. If you are using PPPM as Kspace solver, you can turn on an additional output with *kspace_modify fftbench yes* which measures the time spent during PPPM on the 3d FFTs, which can be communication intensive for larger processor counts. This provides an indication whether it is worth trying out alternatives to the default FFT settings for additional performance.

Another important detail in the timing info are the histograms of atoms counts and neighbor counts. If these vary widely across processors, you have a load-imbalance issue. This often results in inaccurate relative timing data, because processors have to wait when communication occurs for other processors to catch up. Thus the reported times for "Communication" or "Other" may be higher than they really are, due to load-imbalance. If this is an issue, you can use the *timer sync* command to obtain synchronized timings.

9.3 General tips

Note

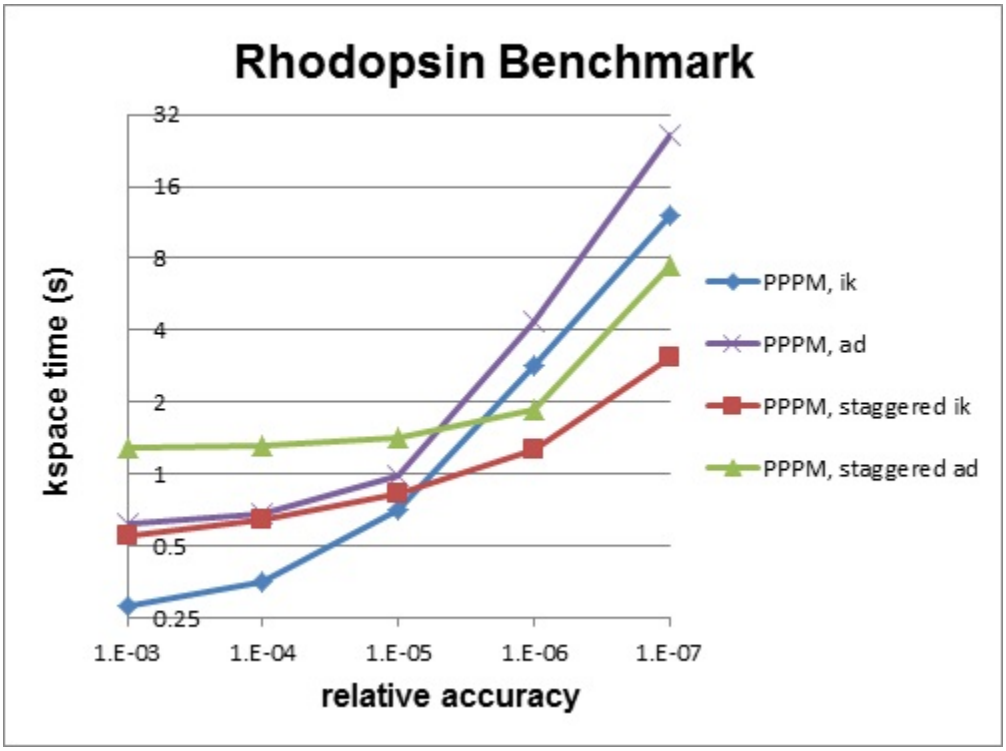
this page is still a work in progress

Here is a list of general ideas for improving simulation performance. Most of them are only applicable to certain models and certain bottlenecks in the current performance, so let the timing data you generate be your guide. It is hard, if not impossible, to predict how much difference these options will make, since it is a function of problem size, number of processors used, and your machine. There is no substitute for identifying performance bottlenecks, and trying out various options.

- rRESPA
- Two-FFT PPPM
- Staggered PPPM
- single vs double PPPM
- partial charge PPPM
- verlet/split run style
- processor command for proc layout and numa layout
- load-balancing: balance and fix balance

Two-FFT PPPM, also called *analytic differentiation* or *ad* PPPM, uses 2 FFTs instead of the 4 FFTs used by the default *ik differentiation* PPPM. However, 2-FFT PPPM also requires a slightly larger mesh size to achieve the same accuracy as 4-FFT PPPM. For problems where the FFT cost is the performance bottleneck (typically large problems running on many processors), 2-FFT PPPM may be faster than 4-FFT PPPM.

Staggered PPPM performs calculations using two different meshes, one shifted slightly with respect to the other. This can reduce force aliasing errors and increase the accuracy of the method, but also doubles the amount of work required. For high relative accuracy, using staggered PPPM allows one to half the mesh size in each dimension as compared to regular PPPM, which can give around a 4x speedup in the kspace time. However, for low relative accuracy, using staggered PPPM gives little benefit and can be up to 2x slower in the kspace time. For example, the rhodopsin benchmark was run on a single processor, and results for kspace time vs. relative accuracy for the different methods are shown in the figure below. For this system, staggered PPPM (using ik differentiation) becomes useful when using a relative accuracy of slightly greater than 1e-5 and above.



Note

Using staggered PPPM may not give the same increase in accuracy of energy and pressure as it does in forces, so some caution must be used if energy and/or pressure are quantities of interest, such as when using a barostat.

9.4 Accelerator packages

Accelerated versions of various *pair_style*, *fixes*, *computes*, and other commands have been added to LAMMPS, which will typically run faster than the standard non-accelerated versions. Some require appropriate hardware to be present on your system, e.g. GPUs or Intel Xeon Phi co-processors.

All of these commands are in packages provided with LAMMPS. An overview of packages is give on the *Packages* doc pages.

These are the accelerator packages currently in LAMMPS:

GPU Package	for GPUs via CUDA, OpenCL, or ROCm HIP
INTEL Package	for Intel CPUs and Intel Xeon Phi
KOKKOS Package	for NVIDIA GPUs, Intel Xeon Phi, and OpenMP threading
OPENMP Package	for OpenMP threading and generic CPU optimizations
OPT Package	generic CPU optimizations

9.4.1 GPU package

The GPU package was developed by Mike Brown while at SNL and ORNL (now at Intel Corp.) and his collaborators, particularly Trung Nguyen (now at Northwestern). Support for AMD GPUs via HIP was added by Vsevolod Nikolskiy and coworkers at HSE University.

The GPU package provides GPU versions of many pair styles and for parts of the *kspace_style pppm* for long-range Coulombics. It has the following general features:

- It is designed to exploit common GPU hardware configurations where one or more GPUs are coupled to many cores of one or more multicore CPUs, e.g. within a node of a parallel machine.
- Atom-based data (e.g. coordinates, forces) are moved back-and-forth between the CPU(s) and GPU every timestep.
- Neighbor lists can be built on the CPU or on the GPU
- The charge assignment and force interpolation portions of PPPM can be run on the GPU. The FFT portion, which requires MPI communication between processors, runs on the CPU.
- Force computations of different style (pair vs. bond/angle/dihedral/improper) can be performed concurrently on the GPU and CPU(s), respectively.
- It allows for GPU computations to be performed in single or double precision, or in mixed-mode precision, where pairwise forces are computed in single precision, but accumulated into double-precision force vectors.
- LAMMPS-specific code is in the GPU package. It makes calls to a generic GPU library in the lib/gpu directory. This library provides either Nvidia support, AMD support, or more general OpenCL support (for Nvidia GPUs, AMD GPUs, Intel GPUs, and multicore CPUs). so that the same functionality is supported on a variety of hardware.

Required hardware/software

To compile and use this package in CUDA mode, you currently need to have an NVIDIA GPU and install the corresponding NVIDIA CUDA toolkit software on your system (this is only tested on Linux and unsupported on Windows):

- Check if you have an NVIDIA GPU: cat /proc/driver/nvidia/gpus/*/information
- Go to https://developer.nvidia.com/cuda-downloads
- Install a driver and toolkit appropriate for your system (SDK is not necessary)
- Run lammps/lib/gpu/nvc_get_devices (after building the GPU library, see below) to list supported devices and properties

To compile and use this package in OpenCL mode, you currently need to have the OpenCL headers and the (vendor neutral) OpenCL library installed. In OpenCL mode, the acceleration depends on having an OpenCL Installable Client Driver (ICD) installed. There can be multiple of them for the same or different hardware (GPUs, CPUs, Accelerators) installed at the same time. OpenCL refers to those as 'platforms'. The GPU library will try to auto-select the best suitable platform, but this can be overridden using the platform option of the *package* command. run lammps/lib/gpu/ocl_get_devices to get a list of available platforms and devices with a suitable ICD available.

To compile and use this package for Intel GPUs, OpenCL or the Intel oneAPI HPC Toolkit can be installed using linux package managers. The latter also provides optimized C++, MPI, and many other libraries and tools. See:

- https://software.intel.com/content/www/us/en/develop/tools/oneapi/hpc-toolkit/download.html

If you do not have a discrete GPU card installed, this package can still provide significant speedups on some CPUs that include integrated GPUs. Additionally, for many macs, OpenCL is already included with the OS and Makefiles are available in the lib/gpu directory.

To compile and use this package in HIP mode, you have to have the AMD ROCm software installed. Versions of ROCm older than 3.5 are currently deprecated by AMD.

Building LAMMPS with the GPU package

See the *Build extras* page for instructions.

Run with the GPU package from the command-line

The mpirun or mpiexec command sets the total number of MPI tasks used by LAMMPS (one or multiple per compute node) and the number of MPI tasks used per node. E.g. the mpirun command in MPICH does this via its -np and -ppn switches. Ditto for OpenMPI via -np and -npernode.

When using the GPU package, you cannot assign more than one GPU to a single MPI task. However multiple MPI tasks can share the same GPU, and in many cases it will be more efficient to run this way. Likewise it may be more efficient to use less MPI tasks/node than the available # of CPU cores. Assignment of multiple MPI tasks to a GPU will happen automatically if you create more MPI tasks/node than there are GPUs/mode. E.g. with 8 MPI tasks/node and 2 GPUs, each GPU will be shared by 4 MPI tasks.

The GPU package also has limited support for OpenMP for both multi-threading and vectorization of routines that are run on the CPUs. This requires that the GPU library and LAMMPS are built with flags to enable OpenMP support (e.g. -fopenmp). Some styles for time integration are also available in the GPU package. These run completely on the CPUs in full double precision, but exploit multi-threading and vectorization for faster performance.

Use the -sf gpu *command-line switch*, which will automatically append "gpu" to styles that support it. Use the -pk gpu Ng *command-line switch* to set Ng = # of GPUs/node to use. If Ng is 0, the number is selected automatically as the number of matching GPUs that have the highest number of compute cores.

```
# 1 MPI task uses 1 GPU
lmp_machine -sf gpu -pk gpu 1 -in in.script

# 12 MPI tasks share 2 GPUs on a single 16-core (or whatever) node
mpirun -np 12 lmp_machine -sf gpu -pk gpu 2 -in in.script

# ditto on 4 16-core nodes
mpirun -np 48 -ppn 12 lmp_machine -sf gpu -pk gpu 2 -in in.script
```

Note that if the -sf gpu switch is used, it also issues a default *package gpu 0* command, which will result in automatic selection of the number of GPUs to use.

Using the -pk switch explicitly allows for setting of the number of GPUs/node to use and additional options. Its syntax is the same as the package gpu command. See the *package* command page for details, including the default values used for all its options if it is not specified.

Note that the default for the *package gpu* command is to set the Newton flag to "off" pairwise interactions. It does not affect the setting for bonded interactions (LAMMPS default is "on"). The "off" setting for pairwise interaction is currently required for GPU package pair styles.

Run with the GPU package by editing an input script

The discussion above for the mpirun or mpiexec command, MPI tasks/node, and use of multiple MPI tasks/GPU is the same.

Use the *suffix gpu* command, or you can explicitly add an "gpu" suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/gpu 2.5
```

You must also use the *package gpu* command to enable the GPU package, unless the -sf gpu or -pk gpu *command-line switches* were used. It specifies the number of GPUs/node to use, as well as other options.

Speed-up to expect

The performance of a GPU versus a multicore CPU is a function of your hardware, which pair style is used, the number of atoms/GPU, and the precision used on the GPU (double, single, mixed). Using the GPU package in OpenCL mode on CPUs (which uses vectorization and multithreading) is usually resulting in inferior performance compared to using LAMMPS' native threading and vectorization support in the OPENMP and INTEL packages.

See the Benchmark page of the LAMMPS website for performance of the GPU package on various hardware, including the Titan HPC platform at ORNL.

You should also experiment with how many MPI tasks per GPU to use to give the best performance for your problem and machine. This is also a function of the problem size and the pair style being using. Likewise, you should experiment with the precision setting for the GPU library to see if single or mixed precision will give accurate results, since they will typically be faster.

MPI parallelism typically outperforms OpenMP parallelism, but in some cases using fewer MPI tasks and multiple OpenMP threads with the GPU package can give better performance. 3-body potentials can often perform better with multiple OMP threads because the inter-process communication is higher for these styles with the GPU package in order to allow deterministic results.

Guidelines for best performance

- Using multiple MPI tasks (2-10) per GPU will often give the best performance, as allowed my most multicore CPU/GPU configurations. Using too many MPI tasks will result in worse performance due to growing overhead with the growing number of MPI tasks.
- If the number of particles per MPI task is small (e.g. 100s of particles), it can be more efficient to run with fewer MPI tasks per GPU, even if you do not use all the cores on the compute node.
- The *package gpu* command has several options for tuning performance. Neighbor lists can be built on the GPU or CPU. Force calculations can be dynamically balanced across the CPU cores and GPUs. GPU-specific settings can be made which can be optimized for different hardware. See the *package* command page for details.
- As described by the *package gpu* command, GPU accelerated pair styles can perform computations asynchronously with CPU computations. The "Pair" time reported by LAMMPS will be the maximum of the time required to complete the CPU pair style computations and the time required to complete the GPU pair style computations. Any time spent for GPU-enabled pair styles for computations that run simultaneously with *bond*, *angle*, *dihedral*, *improper*, and *long-range* calculations will not be included in the "Pair" time.
- Since only part of the pppm kspace style is GPU accelerated, it may be faster to only use GPU acceleration for Pair styles with long-range electrostatics. See the "pair/only" keyword of the *package command* for a shortcut to do that. The distribution of work between kspace on the CPU and non-bonded interactions on the GPU can be balanced through adjusting the coulomb cutoff without loss of accuracy.
- When the *mode* setting for the package gpu command is force/neigh, the time for neighbor list calculations on the GPU will be added into the "Pair" time, not the "Neigh" time. An additional breakdown of the times required for various tasks on the GPU (data copy, neighbor calculations, force computations, etc) are output only with the LAMMPS screen output (not in the log file) at the end of each run. These timings represent total time spent on the GPU for each routine, regardless of asynchronous CPU calculations.
- The output section "GPU Time Info (average)" reports "Max Mem / Proc". This is the maximum memory used at one time on the GPU for data storage by a single MPI process.

Restrictions

When using *hybrid pair styles*, the neighbor list must be generated on the host instead of the GPU and thus the potential GPU acceleration is reduced.

9.4.2 INTEL package

The INTEL package is maintained by Mike Brown at Intel Corporation. It provides two methods for accelerating simulations, depending on the hardware you have. The first is acceleration on Intel CPUs by running in single, mixed, or double precision with vectorization. The second is acceleration on Intel Xeon Phi co-processors via offloading neighbor list and non-bonded force calculations to the Phi. The same C++ code is used in both cases. When offloading to a co-processor from a CPU, the same routine is run twice, once on the CPU and once with an offload flag. This allows LAMMPS to run on the CPU cores and co-processor cores simultaneously.

Currently Available INTEL Styles

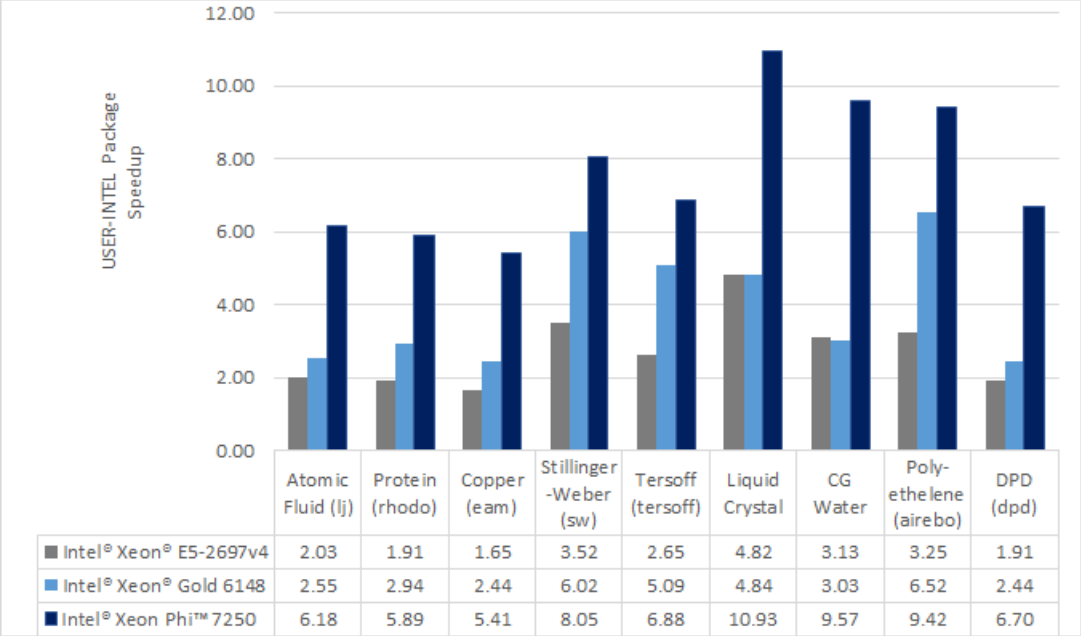
- Angle Styles: charmm, harmonic
- Bond Styles: fene, harmonic
- Dihedral Styles: charmm, fourier, harmonic, opls
- Fixes: nve, npt, nvt, nvt/sllod, nve/asphere, electrode/conp, electrode/conq, electrode/thermo
- Improper Styles: cvff, harmonic
- Pair Styles: airebo, airebo/morse, buck/coul/cut, buck/coul/long, buck, dpd, eam, eam/alloy, eam/fs, gayberne, lj/charmm/coul/charmm, lj/charmm/coul/long, lj/cut, lj/cut/coul/long, lj/long/coul/long, rebo, snap, sw, tersoff
- K-Space Styles: pppm, pppm/disp, pppm/electrode

Warning

None of the styles in the INTEL package currently support computing per-atom stress. If any compute or fix in your input requires it, LAMMPS will abort with an error message.

Speed-up to expect

The speedup will depend on your simulation, the hardware, which styles are used, the number of atoms, and the floating-point precision mode. Performance improvements are shown compared to LAMMPS *without using other acceleration packages* as these are under active development (and subject to performance changes). The measurements were performed using the input files available in the src/INTEL/TEST directory with the provided run script. These are scalable in size; the results given are with 512K particles (524K for Liquid Crystal). Most of the simulations are standard LAMMPS benchmarks (indicated by the filename extension in parenthesis) with modifications to the run length and to add a warm-up run (for use with offload benchmarks).



Results are speedups obtained on Intel Xeon E5-2697v4 processors (code-named Broadwell), Intel Xeon Phi 7250 processors (code-named Knights Landing), and Intel Xeon Gold 6148 processors (code-named Skylake) with "June 2017" LAMMPS built with Intel Parallel Studio 2017 update 2. Results are with 1 MPI task per physical core. See src/INTEL/TEST/README for the raw simulation rates and instructions to reproduce.

Accuracy and order of operations

In most molecular dynamics software, parallelization parameters (# of MPI, OpenMP, and vectorization) can change the results due to changing the order of operations with finite-precision calculations. The INTEL package is deterministic. This means that the results should be reproducible from run to run with the *same* parallel configurations and when using deterministic libraries or library settings (MPI, OpenMP, FFT). However, there are differences in the INTEL package that can change the order of operations compared to LAMMPS without acceleration:

- Neighbor lists can be created in a different order
- Bins used for sorting atoms can be oriented differently
- The default stencil order for PPPM is 7. By default, LAMMPS will calculate other PPPM parameters to fit the desired accuracy with this order
- The *newton* setting applies to all atoms, not just atoms shared between MPI tasks
- Vectorization can change the order for adding pairwise forces
- When using the -DLMP_USE_MKL_RNG define (all included intel optimized makefiles do) at build time, the random number generator for dissipative particle dynamics (pair style dpd/intel) uses the Mersenne Twister generator included in the Intel MKL library (that should be more robust than the default Masaglia random number generator)

The precision mode (described below) used with the INTEL package can change the *accuracy* of the calculations. For the default *mixed* precision option, calculations between pairs or triplets of atoms are performed in single precision, intended to be within the inherent error of MD simulations. All accumulation is performed in double precision to prevent the error from growing with the number of atoms in the simulation. *Single* precision mode should not be used without appropriate validation.

Quick Start for Experienced Users

LAMMPS should be built with the INTEL package installed. Simulations should be run with 1 MPI task per physical *core*, not *hardware thread*.

- Edit src/MAKE/OPTIONS/Makefile.intel_cpu_intelmpi as necessary.
- Set the environment variable KMP_BLOCKTIME=0
- -pk intel 0 omp $t -sf intel added to LAMMPS command-line
- $t should be 2 for Intel Xeon CPUs and 2 or 4 for Intel Xeon Phi
- For some of the simple 2-body potentials without long-range electrostatics, performance and scalability can be better with the newton off setting added to the input script
- For simulations on higher node counts, add processors * * * grid numa to the beginning of the input script for better scalability
- If using kspace_style pppm in the input script, add kspace_modify diff ad for better performance

For Intel Xeon Phi CPUs:

- Runs should be performed using MCDRAM.

For simulations using kspace_style pppm on Intel CPUs supporting AVX-512:

- Add kspace_modify diff ad to the input script
- The command-line option should be changed to -pk intel 0 omp $r lrt yes -sf intel where $r is the number of threads minus 1.
- Do not use thread affinity (set KMP_AFFINITY=none)
- The newton off setting may provide better scalability

For Intel Xeon Phi co-processors (Offload):

- Edit src/MAKE/OPTIONS/Makefile.intel_co-processor as necessary
- -pk intel N omp 1 added to command-line where N is the number of co-processors per node.

Required hardware/software

When using Intel compilers version 16.0 or later is required.

In order to use offload to co-processors, an Intel Xeon Phi co-processor and an Intel compiler are required.

Although any compiler can be used with the INTEL package, currently, vectorization directives are disabled by default when not using Intel compilers due to lack of standard support and observations of decreased performance. The OpenMP standard now supports directives for vectorization and we plan to transition the code to this standard once it is available in most compilers. We expect this to allow improved performance and support with other compilers.

For Intel Xeon Phi x200 series processors (code-named Knights Landing), there are multiple configuration options for the hardware. For best performance, we recommend that the MCDRAM is configured in "Flat" mode and with the cluster mode set to "Quadrant" or "SNC4". "Cache" mode can also be used, although the performance might be slightly lower.

Notes about Simultaneous Multithreading

Modern CPUs often support Simultaneous Multithreading (SMT). On Intel processors, this is called Hyper-Threading (HT) technology. SMT is hardware support for running multiple threads efficiently on a single core. *Hardware threads* or *logical cores* are often used to refer to the number of threads that are supported in hardware. For example, the Intel Xeon E5-2697v4 processor is described as having 36 cores and 72 threads. This means that 36 MPI processes or OpenMP threads can run simultaneously on separate cores, but that up to 72 MPI processes or OpenMP threads can be running on the CPU without costly operating system context switches.

Molecular dynamics simulations will often run faster when making use of SMT. If a thread becomes stalled, for example because it is waiting on data that has not yet arrived from memory, another thread can start running so that the CPU pipeline is still being used efficiently. Although benefits can be seen by launching a MPI task for every hardware thread, for multinode simulations, we recommend that OpenMP threads are used for SMT instead, either with the INTEL package, *OPENMP package*, or *KOKKOS package*. In the example above, up to 36X speedups can be observed by using all 36 physical cores with LAMMPS. By using all 72 hardware threads, an additional 10-30% performance gain can be achieved.

The BIOS on many platforms allows SMT to be disabled, however, we do not recommend this on modern processors as there is little to no benefit for any software package in most cases. The operating system will report every hardware thread as a separate core allowing one to determine the number of hardware threads available. On Linux systems, this information can normally be obtained with:

```
cat /proc/cpuinfo
```

Building LAMMPS with the INTEL package

See the *Build extras* page for instructions. Some additional details are covered here.

For building with make, several example Makefiles for building with the Intel compiler are included with LAMMPS in the src/MAKE/OPTIONS/ directory:

```
Makefile.intel_cpu_intelmpi # Intel Compiler, Intel MPI, No Offload
Makefile.knl                # Intel Compiler, Intel MPI, No Offload
Makefile.intel_cpu_mpich    # Intel Compiler, MPICH, No Offload
Makefile.intel_cpu_openpmi  # Intel Compiler, OpenMPI, No Offload
Makefile.intel_co-processor  # Intel Compiler, Intel MPI, Offload
```

Makefile.knl is identical to Makefile.intel_cpu_intelmpi except that it explicitly specifies that vectorization should be for Intel Xeon Phi x200 processors making it easier to cross-compile. For users with recent installations of Intel Parallel Studio, the process can be as simple as:

```
make yes-intel
source /opt/intel/parallel_studio_xe_2016.3.067/psxevars.sh
# or psxevars.csh for C-shell
make intel_cpu_intelmpi
```

Note that if you build with support for a Phi co-processor, the same binary can be used on nodes with or without co-processors installed. However, if you do not have co-processors on your system, building without offload support will produce a smaller binary.

The general requirements for Makefiles with the INTEL package are as follows. When using Intel compilers, -restrict is required and -qopenmp is highly recommended for CCFLAGS and LINKFLAGS. CCFLAGS should include -DLMP_INTEL_USELRT (unless POSIX Threads are not supported in the build environment) and -DLMP_USE_MKL_RNG (unless Intel Math Kernel Library (MKL) is not available in the build environment). For Intel compilers, LIB should include -ltbbmalloc or if the library is not available, -DLMP_INTEL_NO_TBB can be added to CCFLAGS. For builds supporting offload, -DLMP_INTEL_OFFLOAD is required for CCFLAGS

and -qoffload is required for LINKFLAGS. Other recommended CCFLAG options for best performance are -O2 -fno-alias -ansi-alias -qoverride-limits fp-model fast=2 -no-prec-div.

Note

See the src/INTEL/README file for additional flags that might be needed for best performance on Intel server processors code-named "Skylake".

Note

The vectorization and math capabilities can differ depending on the CPU. For Intel compilers, the -x flag specifies the type of processor for which to optimize. -xHost specifies that the compiler should build for the processor used for compiling. For Intel Xeon Phi x200 series processors, this option is -xMIC-AVX512. For fourth generation Intel Xeon (v4/Broadwell) processors, -xCORE-AVX2 should be used. For older Intel Xeon processors, -xAVX will perform best in general for the different simulations in LAMMPS. The default in most of the example Makefiles is to use -xHost, however this should not be used when cross-compiling.

Running LAMMPS with the INTEL package

Running LAMMPS with the INTEL package is similar to normal use with the exceptions that one should 1) specify that LAMMPS should use the INTEL package, 2) specify the number of OpenMP threads, and 3) optionally specify the specific LAMMPS styles that should use the INTEL package. 1) and 2) can be performed from the command-line or by editing the input script. 3) requires editing the input script. Advanced performance tuning options are also described below to get the best performance.

When running on a single node (including runs using offload to a co-processor), best performance is normally obtained by using 1 MPI task per physical core and additional OpenMP threads with SMT. For Intel Xeon processors, 2 OpenMP threads should be used for SMT. For Intel Xeon Phi CPUs, 2 or 4 OpenMP threads should be used (best choice depends on the simulation). In cases where the user specifies that LRT mode is used (described below), 1 or 3 OpenMP threads should be used. For multi-node runs, using 1 MPI task per physical core will often perform best, however, depending on the machine and scale, users might get better performance by decreasing the number of MPI tasks and using more OpenMP threads. For performance, the product of the number of MPI tasks and OpenMP threads should not exceed the number of available hardware threads in almost all cases.

Note

Setting core affinity is often used to pin MPI tasks and OpenMP threads to a core or group of cores so that memory access can be uniform. Unless disabled at build time, affinity for MPI tasks and OpenMP threads on the host (CPU) will be set by default on the host *when using offload to a co-processor*. In this case, it is unnecessary to use other methods to control affinity (e.g. taskset, numactl, I_MPI_PIN_DOMAIN, etc.). This can be disabled with the *no_affinity* option to the *package intel* command or by disabling the option at build time (by adding -DINTEL_OFFLOAD_NOAFFINITY to the CCFLAGS line of your Makefile). Disabling this option is not recommended, especially when running on a machine with Intel Hyper-Threading technology disabled.

Run with the INTEL package from the command-line

To enable INTEL optimizations for all available styles used in the input script, the -sf intel *command-line switch* can be used without any requirement for editing the input script. This switch will automatically append "intel" to styles that support it. It also invokes a default command: *package intel 1*. This package command is used to set options for the INTEL package. The default package command will specify that INTEL calculations are performed in mixed precision, that the number of OpenMP threads is specified by the OMP_NUM_THREADS environment variable, and

that if co-processors are present and the binary was built with offload support, that 1 co-processor per node will be used with automatic balancing of work between the CPU and the co-processor.

You can specify different options for the INTEL package by using the -pk intel Nphi *command-line switch* with keyword/value pairs as specified in the documentation. Here, Nphi = # of Xeon Phi co-processors/node (ignored without offload support). Common options to the INTEL package include *omp* to override any OMP_NUM_THREADS setting and specify the number of OpenMP threads, *mode* to set the floating-point precision mode, and *lrt* to enable Long-Range Thread mode as described below. See the *package intel* command for details, including the default values used for all its options if not specified, and how to set the number of OpenMP threads via the OMP_NUM_THREADS environment variable if desired.

Examples (see documentation for your MPI/Machine for differences in launching MPI applications):

```
# 2 nodes, 36 MPI tasks/node, $OMP_NUM_THREADS OpenMP Threads
mpirun -np 72 -ppn 36 lmp_machine -sf intel -in in.script

# Don't use any co-processors that might be available,
# use 2 OpenMP threads for each task, use double precision
mpirun -np 72 -ppn 36 lmp_machine -sf intel -in in.script \
      -pk intel 0 omp 2 mode double
```

Or run with the INTEL package by editing an input script

As an alternative to adding command-line arguments, the input script can be edited to enable the INTEL package. This requires adding the *package intel* command to the top of the input script. For the second example above, this would be:

```
package intel 0 omp 2 mode double
```

To enable the INTEL package only for individual styles, you can add an "intel" suffix to the individual style, e.g.:

```
pair_style lj/cut/intel 2.5
```

Alternatively, the *suffix intel* command can be added to the input script to enable INTEL styles for the commands that follow in the input script.

Tuning for Performance

Note

The INTEL package will perform better with modifications to the input script when *PPPM* is used: *kspace_modify diff ad* should be added to the input script.

Long-Range Thread (LRT) mode is an option to the *package intel* command that can improve performance when using *PPPM* for long-range electrostatics on processors with SMT. It generates an extra pthread for each MPI task. The thread is dedicated to performing some of the PPPM calculations and MPI communications. This feature requires setting the pre-processor flag -DLMP_INTEL_USELRT in the makefile when compiling LAMMPS. It is unset in the default makefiles (Makefile.mpi and Makefile.serial) but it is set in all makefiles tuned for the INTEL package. On Intel Xeon Phi x200 series CPUs, the LRT feature will likely improve performance, even on a single node. On Intel Xeon processors, using this mode might result in better performance when using multiple nodes, depending on the specific machine configuration. To enable LRT mode, specify that the number of OpenMP threads is one less than would normally be used for the run and add the lrt yes option to the -pk command-line suffix or "package intel" command. For example, if a run would normally perform best with "-pk intel 0 omp 4", instead use -pk intel 0 omp 3 lrt yes. When using LRT, you should set the environment variable KMP_AFFINITY=none. LRT mode is not supported when using offload.

Note

Changing the *newton* setting to off can improve performance and/or scalability for simple 2-body potentials such as lj/cut or when using LRT mode on processors supporting AVX-512.

Not all styles are supported in the INTEL package. You can mix the INTEL package with styles from the *OPT* package or the *OPENMP package*. Of course, this requires that these packages were installed at build time. This can performed automatically by using -sf hybrid intel opt or -sf hybrid intel omp command-line options. Alternatively, the "opt" and "omp" suffixes can be appended manually in the input script. For the latter, the *package omp* command must be in the input script or the -pk omp Nt *command-line switch* must be used where Nt is the number of OpenMP threads. The number of OpenMP threads should not be set differently for the different packages. Note that the *suffix hybrid intel omp* command can also be used within the input script to automatically append the "omp" suffix to styles when INTEL styles are not available.

Note

For simulations on higher node counts, add *processors * * * grid numa* to the beginning of the input script for better scalability.

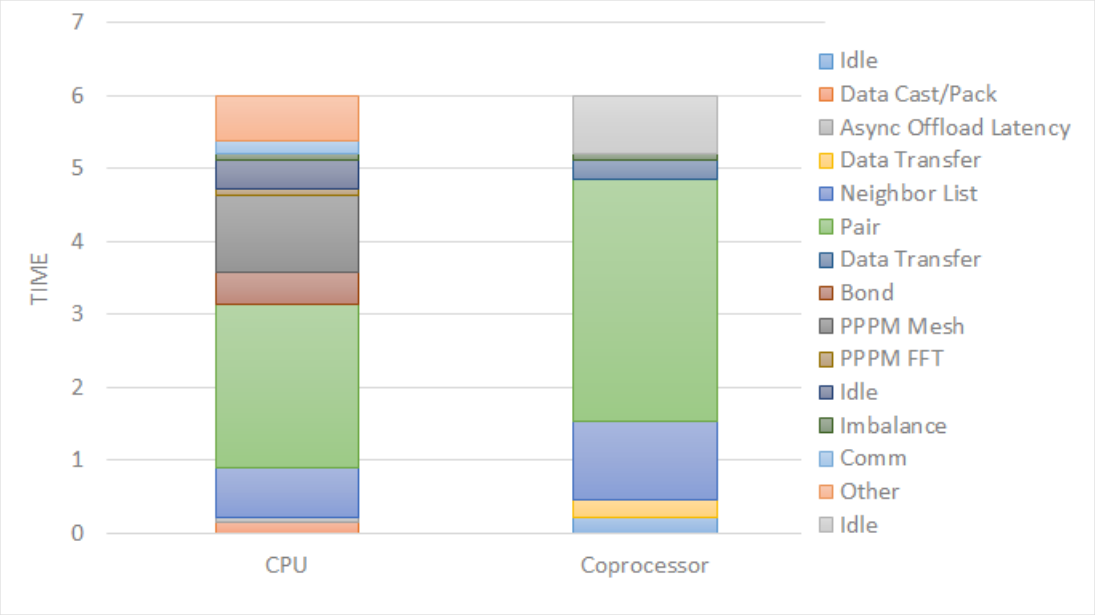
When running on many nodes, performance might be better when using fewer OpenMP threads and more MPI tasks. This will depend on the simulation and the machine. Using the *verlet/split* run style might also give better performance for simulations with *PPPM* electrostatics. Note that this is an alternative to LRT mode and the two cannot be used together.

Currently, when using Intel MPI with Intel Xeon Phi x200 series CPUs, better performance might be obtained by setting the environment variable I_MPI_SHM_LMT=shm for Linux kernels that do not yet have full support for AVX-512. Runs on Intel Xeon Phi x200 series processors will always perform better using MCDRAM. Please consult your system documentation for the best approach to specify that MPI runs are performed in MCDRAM.

Tuning for Offload Performance

The default settings for offload should give good performance.

When using LAMMPS with offload to Intel co-processors, best performance will typically be achieved with concurrent calculations performed on both the CPU and the co-processor. This is achieved by offloading only a fraction of the neighbor and pair computations to the co-processor or using *hybrid* pair styles where only one style uses the "intel" suffix. For simulations with long-range electrostatics or bond, angle, dihedral, improper calculations, computation and data transfer to the co-processor will run concurrently with computations and MPI communications for these calculations on the host CPU. This is illustrated in the figure below for the rhodopsin protein benchmark running on E5-2697v2 processors with a Intel Xeon Phi 7120p co-processor. In this plot, the vertical access is time and routines running at the same time are running concurrently on both the host and the co-processor.



The fraction of the offloaded work is controlled by the *balance* keyword in the *package intel* command. A balance of 0 runs all calculations on the CPU. A balance of 1 runs all supported calculations on the co-processor. A balance of 0.5 runs half of the calculations on the co-processor. Setting the balance to -1 (the default) will enable dynamic load balancing that continuously adjusts the fraction of offloaded work throughout the simulation. Because data transfer cannot be timed, this option typically produces results within 5 to 10 percent of the optimal fixed balance.

If running short benchmark runs with dynamic load balancing, adding a short warm-up run (10-20 steps) will allow the load-balancer to find a near-optimal setting that will carry over to additional runs.

The default for the *package intel* command is to have all the MPI tasks on a given compute node use a single Xeon Phi co-processor. In general, running with a large number of MPI tasks on each node will perform best with offload. Each MPI task will automatically get affinity to a subset of the hardware threads available on the co-processor. For example, if your card has 61 cores, with 60 cores available for offload and 4 hardware threads per core (240 total threads), running with 24 MPI tasks per node will cause each MPI task to use a subset of 10 threads on the co-processor. Fine tuning of the number of threads to use per MPI task or the number of threads to use per core can be accomplished with keyword settings of the *package intel* command.

The INTEL package has two modes for deciding which atoms will be handled by the co-processor. This choice is controlled with the *ghost* keyword of the *package intel* command. When set to 0, ghost atoms (atoms at the borders between MPI tasks) are not offloaded to the card. This allows for overlap of MPI communication of forces with computation on the co-processor when the *newton* setting is "on". The default is dependent on the style being used, however, better performance may be achieved by setting this option explicitly.

When using offload with CPU Hyper-Threading disabled, it may help performance to use fewer MPI tasks and OpenMP threads than available cores. This is due to the fact that additional threads are generated internally to handle the asynchronous offload tasks.

If pair computations are being offloaded to an Intel Xeon Phi co-processor, a diagnostic line is printed to the screen (not to the log file), during the setup phase of a run, indicating that offload mode is being used and indicating the number of co-processor threads per MPI task. Additionally, an offload timing summary is printed at the end of each run. When offloading, the frequency for *atom sorting* is changed to 1 so that the per-atom data is effectively sorted at every rebuild of the neighbor lists. All the available co-processor threads on each Phi will be divided among MPI tasks, unless the `tptask` option of the `-pk intel` *command-line switch* is used to limit the co-processor threads per MPI task.

Restrictions

When offloading to a co-processor, *hybrid* styles that require skip lists for neighbor builds cannot be offloaded. Using *hybrid/overlay* is allowed. Only one intel accelerated style may be used with hybrid styles when offloading. *Special_bonds* exclusion lists are not currently supported with offload, however, the same effect can often be accomplished by setting cutoffs for excluded atom types to 0. None of the pair styles in the INTEL package currently support the "inner", "middle", "outer" options for rRESPA integration via the *run_style respa* command; only the "pair" option is supported.

9.4.3 KOKKOS package

Kokkos is a templated C++ library that provides abstractions to allow a single implementation of an application kernel (e.g. a pair style) to run efficiently on different kinds of hardware, such as GPUs, Intel Xeon Phis, or many-core CPUs. Kokkos maps the C++ kernel onto different back end languages such as CUDA, OpenMP, or Pthreads. The Kokkos library also provides data abstractions to adjust (at compile time) the memory layout of data structures like 2d and 3d arrays to optimize performance on different hardware. For more information on Kokkos, see the Kokkos GitHub page.

The LAMMPS KOKKOS package contains versions of pair, fix, and atom styles that use data structures and macros provided by the Kokkos library, which is included with LAMMPS in /lib/kokkos. The KOKKOS package was developed primarily by Christian Trott (Sandia) and Stan Moore (Sandia) with contributions of various styles by others, including Sikandar Mashayak (UIUC), Ray Shan (Sandia), and Dan Ibanez (Sandia). For more information on developing using Kokkos abstractions see the Kokkos Wiki.

Note

The Kokkos library is under active development and tracking the availability of accelerator hardware, so is the KOKKOS package in LAMMPS. This means that only a certain range of versions of the Kokkos library are compatible with the KOKKOS package of a certain range of LAMMPS versions. For that reason LAMMPS comes with a bundled version of the Kokkos library that has been validated on multiple platforms and may contain selected back-ported bug fixes from upstream Kokkos versions. While it is possible to build LAMMPS with an external version of Kokkos, it is untested and may result in incorrect execution or crashes.

Kokkos currently provides full support for 4 modes of execution (per MPI task). These are Serial (MPI-only for CPUs and Intel Phi), OpenMP (threading for many-core CPUs and Intel Phi), CUDA (for NVIDIA GPUs) and HIP (for AMD GPUs). Additional modes (e.g. OpenMP target, Intel data center GPUs) are under development. You choose the mode at build time to produce an executable compatible with a specific hardware.

The following compatibility notes have been last updated for LAMMPS version 23 November 2023 and Kokkos version 4.2.

C++17 support

Kokkos requires using a compiler that supports the c++17 standard. For some compilers, it may be necessary to add a flag to enable c++17 support. For example, the GNU compiler uses the -std=c++17 flag. For a list of compilers that have been tested with the Kokkos library, see the requirements document of the Kokkos Wiki.

NVIDIA CUDA support

To build with Kokkos support for NVIDIA GPUs, the NVIDIA CUDA toolkit software version 11.0 or later must be installed on your system. See the discussion for the *GPU package* for details of how to check and do this.

AMD ROCm (HIP) support

To build with Kokkos support for AMD GPUs, the AMD ROCm toolkit software version 5.2.0 or later must be installed on your system.

Intel Data Center GPU support

Support for Kokkos with Intel Data Center GPU accelerators (formerly known under the code name "Ponte Vecchio") in LAMMPS is still a work in progress. Only a subset of the functionality works correctly. Please contact the LAMMPS developers if you run into problems.

CUDA and MPI library compatibility

Kokkos with CUDA currently implicitly assumes that the MPI library is GPU-aware. This is not always the case, especially when using pre-compiled MPI libraries provided by a Linux distribution. This is not a problem when using only a single GPU with a single MPI rank. When running with multiple MPI ranks, you may see segmentation faults without GPU-aware MPI support. These can be avoided by adding the flags *-pk kokkos gpu/aware off* to the LAMMPS command-line or by using the command *package kokkos gpu/aware off* in the input file.

Using multiple MPI ranks per GPU

Unlike with the GPU package, there are limited benefits from using multiple MPI processes per GPU with KOKKOS. But when doing this it is **required** to enable CUDA MPS (Multi-Process Service :: GPU Deployment and Management Documentation) to get acceptable performance.

Building LAMMPS with the KOKKOS package

See the *Build extras* page for instructions.

Running LAMMPS with the KOKKOS package

All Kokkos operations occur within the context of an individual MPI task running on a single node of the machine. The total number of MPI tasks used by LAMMPS (one or multiple per compute node) is set in the usual manner via the mpirun or mpiexec commands, and is independent of Kokkos. E.g. the mpirun command in OpenMPI does this via its -np and -npernode switches. Ditto for MPICH via -np and -ppn.

Running on a multicore CPU

Here is a quick overview of how to use the KOKKOS package for CPU acceleration, assuming one or more 16-core nodes.

```
# 1 node, 16 MPI tasks/node, no multi-threading
mpirun -np 16 lmp_kokkos_mpi_only -k on -sf kk -in in.lj

# 2 nodes, 1 MPI task/node, 16 threads/task
mpirun -np 2 -ppn 1 lmp_kokkos_omp -k on t 16 -sf kk -in in.lj

# 1 node,  2 MPI tasks/node, 8 threads/task
mpirun -np 2 lmp_kokkos_omp -k on t 8 -sf kk -in in.lj

# 8 nodes, 4 MPI tasks/node, 4 threads/task
mpirun -np 32 -ppn 4 lmp_kokkos_omp -k on t 4 -sf kk -in in.lj
```

To run using the KOKKOS package, use the -k on, -sf kk and -pk kokkos *command-line switches* in your mpirun command. You must use the -k on *command-line switch* to enable the KOKKOS package. It takes additional arguments for hardware settings appropriate to your system. For OpenMP use:

```
-k on t Nt
```

The t Nt option specifies how many OpenMP threads per MPI task to use with a node. The default is Nt = 1, which is MPI-only mode. Note that the product of MPI tasks * OpenMP threads/task should not exceed the physical number of cores (on a node), otherwise performance will suffer. If Hyper-Threading (HT) is enabled, then the product of MPI tasks * OpenMP threads/task should not exceed the physical number of cores * hardware threads. The -k on switch also issues a package kokkos command (with no additional arguments) which sets various KOKKOS options to default values, as discussed on the *package* command doc page.

The -sf kk *command-line switch* will automatically append the "/kk" suffix to styles that support it. In this manner no modification to the input script is needed. Alternatively, one can run with the KOKKOS package by editing the input script as described below.

Note

When using a single OpenMP thread, the Kokkos Serial back end (i.e. Makefile.kokkos_mpi_only) will give better performance than the OpenMP back end (i.e. Makefile.kokkos_omp) because some of the overhead to make the code thread-safe is removed.

Note

Use the -pk kokkos *command-line switch* to change the default *package kokkos* options. See its doc page for details and default settings. Experimenting with its options can provide a speed-up for specific calculations. For example:

```
# Newton on, Half neighbor list, non-threaded comm
mpirun -np 16 lmp_kokkos_mpi_only -k on -sf kk \
     -pk kokkos newton on neigh half comm no -in in.lj
```

If the *newton* command is used in the input script, it can also override the Newton flag defaults.

For half neighbor lists and OpenMP, the KOKKOS package uses data duplication (i.e. thread-private arrays) by default to avoid thread-level write conflicts in the force arrays (and other data structures as necessary). Data duplication

is typically fastest for small numbers of threads (i.e. 8 or less) but does increase memory footprint and is not scalable to large numbers of threads. An alternative to data duplication is to use thread-level atomic operations which do not require data duplication. The use of atomic operations can be enforced by compiling LAMMPS with the -DLMP_KOKKOS_USE_ATOMICS pre-processor flag. Most but not all Kokkos-enabled pair_styles support data duplication. Alternatively, full neighbor lists avoid the need for duplication or atomic operations but require more compute operations per atom. When using the Kokkos Serial back end or the OpenMP back end with a single thread, no duplication or atomic operations are used. For CUDA and half neighbor lists, the KOKKOS package always uses atomic operations.

CPU Cores, Sockets and Thread Affinity

When using multi-threading, it is important for performance to bind both MPI tasks to physical cores, and threads to physical cores, so they do not migrate during a simulation.

If you are not certain MPI tasks are being bound (check the defaults for your MPI installation), binding can be forced with these flags:

```
# OpenMPI 1.8
mpirun -np 2 --bind-to socket --map-by socket ./lmp_openmpi ...

# Mvapich2 2.0
mpiexec -np 2 --bind-to socket --map-by socket ./lmp_mvapich ...
```

For binding threads with KOKKOS OpenMP, use thread affinity environment variables to force binding. With OpenMP 3.1 (gcc 4.7 or later, intel 12 or later) setting the environment variable OMP_PROC_BIND=true should be sufficient. In general, for best performance with OpenMP 4.0 or later set OMP_PROC_BIND=spread and OMP_PLACES=threads. For binding threads with the KOKKOS pthreads option, compile LAMMPS with the hwloc or libnuma support enabled as described in the *extra build options page*.

Running on Knight's Landing (KNL) Intel Xeon Phi

Here is a quick overview of how to use the KOKKOS package for the Intel Knight's Landing (KNL) Xeon Phi:

KNL Intel Phi chips have 68 physical cores. Typically 1 to 4 cores are reserved for the OS, and only 64 or 66 cores are used. Each core has 4 Hyper-Threads,so there are effectively N = 256 (4*64) or N = 264 (4*66) cores to run on. The product of MPI tasks * OpenMP threads/task should not exceed this limit, otherwise performance will suffer. Note that with the KOKKOS package you do not need to specify how many KNLs there are per node; each KNL is simply treated as running some number of MPI tasks.

Examples of mpirun commands that follow these rules are shown below.

```
# Running on an Intel KNL node with 68 cores
# (272 threads/node via 4x hardware threading):

# 1 node, 64 MPI tasks/node, 4 threads/task
mpirun -np 64 lmp_kokkos_phi -k on t 4 -sf kk -in in.lj

# 1 node, 66 MPI tasks/node, 4 threads/task
mpirun -np 66 lmp_kokkos_phi -k on t 4 -sf kk -in in.lj

# 1 node, 32 MPI tasks/node, 8 threads/task
mpirun -np 32 lmp_kokkos_phi -k on t 8 -sf kk -in in.lj

# 8 nodes, 64 MPI tasks/node, 4 threads/task
mpirun -np 512 -ppn 64 lmp_kokkos_phi -k on t 4 -sf kk -in in.lj
```

The -np setting of the mpirun command sets the number of MPI tasks/node. The -k on t Nt command-line switch sets the number of threads/task as Nt. The product of these two values should be N, i.e. 256 or 264.

Note

The default for the *package kokkos* command when running on KNL is to use "half" neighbor lists and set the Newton flag to "on" for both pairwise and bonded interactions. This will typically be best for many-body potentials. For simpler pairwise potentials, it may be faster to use a "full" neighbor list with Newton flag to "off". Use the -pk kokkos *command-line switch* to change the default *package kokkos* options. See its documentation page for details and default settings. Experimenting with its options can provide a speed-up for specific calculations. For example:

```
#  Newton on, half neighbor list, threaded comm
mpirun -np 64 lmp_kokkos_phi -k on t 4 -sf kk -pk kokkos comm host -in in.reax

# Newton off, full neighbor list, non-threaded comm
mpirun -np 64 lmp_kokkos_phi -k on t 4 -sf kk \
      -pk kokkos newton off neigh full comm no -in in.lj
```

Note

MPI tasks and threads should be bound to cores as described above for CPUs.

Note

To build with Kokkos support for Intel Xeon Phi co-processors such as Knight's Corner (KNC), your system must be configured to use them in "native" mode, not "offload" mode like the INTEL package supports.

Running on GPUs

Use the -k *command-line switch* to specify the number of GPUs per node. Typically the -np setting of the mpirun command should set the number of MPI tasks/node to be equal to the number of physical GPUs on the node. You can assign multiple MPI tasks to the same GPU with the KOKKOS package, but this is usually only faster if some portions of the input script have not been ported to use Kokkos. In this case, also packing/unpacking communication buffers on the host may give speedup (see the KOKKOS *package* command). Using CUDA MPS is recommended in this scenario.

Using a GPU-aware MPI library is highly recommended. GPU-aware MPI use can be avoided by using *-pk kokkos gpu/aware off*. As above for multicore CPUs (and no GPU), if N is the number of physical cores/node, then the number of MPI tasks/node should not exceed N.

```
-k on g Ng
```

Here are examples of how to use the KOKKOS package for GPUs, assuming one or more nodes, each with two GPUs:

```
# 1 node,  2 MPI tasks/node, 2 GPUs/node
mpirun -np 2 lmp_kokkos_cuda_openmpi -k on g 2 -sf kk -in in.lj

# 16 nodes, 2 MPI tasks/node, 2 GPUs/node (32 GPUs total)
mpirun -np 32 -ppn 2 lmp_kokkos_cuda_openmpi -k on g 2 -sf kk -in in.lj
```

Note

The default for the *package kokkos* command when running on GPUs is to use "full" neighbor lists and set the Newton flag to "off" for both pairwise and bonded interactions, along with threaded communication. When running on Maxwell or Kepler GPUs, this will typically be best. For Pascal GPUs and beyond, using "half" neighbor lists and setting the Newton flag to "on" may be faster. For many pair styles, setting the neighbor binsize equal to twice the CPU default value will give speedup, which is the default when running on GPUs. Use the -pk kokkos *command-line switch* to change the default *package kokkos* options. See its documentation page for details and default settings. Experimenting with its options can provide a speed-up for specific calculations. For example:

```
# Newton on, half neighbor list, set binsize = neighbor ghost cutoff
mpirun -np 2 lmp_kokkos_cuda_openmpi -k on g 2 -sf kk \
     -pk kokkos newton on neigh half binsize 2.8 -in in.lj
```

Note

The default binsize for *atom sorting* on GPUs is equal to the default CPU neighbor binsize (i.e. 2x smaller than the default GPU neighbor binsize). When running simple pair-wise potentials like Lennard Jones on GPUs, using a 2x larger binsize for atom sorting (equal to the default GPU neighbor binsize) and a more frequent sorting than default (e.g. sorting every 100 time steps instead of 1000) may improve performance.

Note

When running on GPUs with many MPI ranks (tens of thousands and more), the creation of the atom map (required for molecular systems) on the GPU can slow down significantly or run out of GPU memory and thus slow down the whole calculation or cause a crash. You can use the -pk kokkos atom/map no *command-line switch* of the *package kokkos atom/map no* command to create the atom map on the CPU instead.

Note

When using a GPU, you will achieve the best performance if your input script does not use fix or compute styles which are not yet Kokkos-enabled. This allows data to stay on the GPU for multiple timesteps, without being copied back to the host CPU. Invoking a non-Kokkos fix or compute, or performing I/O for *thermo* or *dump* output will cause data to be copied back to the CPU incurring a performance penalty.

Note

To get an accurate timing breakdown between time spend in pair, kspace, etc., you must set the environment variable CUDA_LAUNCH_BLOCKING=1. However, this will reduce performance and is not recommended for production runs.

Troubleshooting segmentation faults on GPUs

As noted above, KOKKOS by default assumes that the MPI library is GPU-aware. This is not always the case and can lead to segmentation faults when using more than one MPI process. Normally, LAMMPS will print a warning like "*Turning off GPU-aware MPI since it is not detected*", or an error message like "*Kokkos with GPU-enabled backend assumes GPU-aware MPI is available*", OR a **segmentation fault**. To confirm that a segmentation fault is caused by

this, you can turn off the GPU-aware assumption via the *package kokkos command* or the corresponding command-line flag.

If you still get a segmentation fault, despite running with only one MPI process or using the command-line flag to turn off expecting a GPU-aware MPI library, then using the CMake compile setting -DKokkos_ENABLE_DEBUG=on or adding KOKKOS_DEBUG=yes to your machine makefile for building with traditional make will generate useful output that can be passed to the LAMMPS developers for further debugging.

Troubleshooting memory allocation on GPUs

Kokkos Tools provides a set of lightweight profiling and debugging utilities, which interface with instrumentation hooks (eg. space-time-stack) built directly into the Kokkos runtime. After compiling a dynamic LAMMPS library, you then have to set the environment variable KOKKOS_TOOLS_LIBS before executing your LAMMPS Kokkos run. Example:

```
export KOKKOS_TOOLS_LIBS=${HOME}/kokkos-tools/src/tools/memory-events/kp_memory_event.
↪so
mpirun -np 4 lmp_kokkos_cuda_openmpi -in in.lj -k on g 4 -sf kk
```

Starting with the NVIDIA Pascal GPU architecture, CUDA supports "Unified Virtual Memory" (UVM) which enables allocating more memory than a GPU possesses by also using memory on the host CPU and then CUDA will transparently move data between CPU and GPU as needed. The resulting LAMMPS performance depends on memory access pattern, data residency, and GPU memory oversubscription . The CMake option -DKokkos_ENABLE_CUDA_UVM=on or the makefile setting KOKKOS_CUDA_OPTIONS=enable_lambda,force_uvm enables using *UVM with Kokkos* when compiling LAMMPS.

Run with the KOKKOS package by editing an input script

Alternatively the effect of the -sf or -pk switches can be duplicated by adding the *package kokkos* or *suffix kk* commands to your input script.

The discussion above for building LAMMPS with the KOKKOS package, the mpirun or mpiexec command, and setting appropriate thread properties are the same.

You must still use the -k on *command-line switch* to enable the KOKKOS package, and specify its additional arguments for hardware options appropriate to your system, as documented above.

You can use the *suffix kk* command, or you can explicitly add a "kk" suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/kk 2.5
```

You only need to use the *package kokkos* command if you wish to change any of its option defaults, as set by the "-k on" *command-line switch*.

Using OpenMP threading and CUDA together:

With the KOKKOS package, both OpenMP multi-threading and GPUs can be compiled and used together in a few special cases. In the makefile for the conventional build, the KOKKOS_DEVICES variable must include both, "Cuda" and "OpenMP", as is the case for /src/MAKE/OPTIONS/Makefile.kokkos_cuda_mpi.

```
KOKKOS_DEVICES=Cuda,OpenMP
```

When building with CMake you need to enable both features as it is done in the kokkos-cuda.cmake CMake preset file.

```
cmake -DKokkos_ENABLE_CUDA=yes -DKokkos_ENABLE_OPENMP=yes ../cmake
```

The suffix "/kk" is equivalent to "/kk/device", and for Kokkos CUDA, using the -sf kk in the command-line gives the default CUDA version everywhere. However, if the "/kk/host" suffix is added to a specific style in the input script, the Kokkos OpenMP (CPU) version of that specific style will be used instead. Set the number of OpenMP threads as t Nt and the number of GPUs as g Ng

```
-k on t Nt g Ng
```

For example, the command to run with 1 GPU and 8 OpenMP threads is then:

```
mpiexec -np 1 lmp_kokkos_cuda_openmpi -in in.lj -k on g 1 t 8 -sf kk
```

Conversely, if the -sf kk/host is used in the command-line and then the "/kk" or "/kk/device" suffix is added to a specific style in your input script, then only that specific style will run on the GPU while everything else will run on the CPU in OpenMP mode. Note that the execution of the CPU and GPU styles will NOT overlap, except for a special case:

A kspace style and/or molecular topology (bonds, angles, etc.) running on the host CPU can overlap with a pair style running on the GPU. First compile with --default-stream per-thread added to CCFLAGS in the Kokkos CUDA Makefile. Then explicitly use the "/kk/host" suffix for kspace and bonds, angles, etc. in the input file and the "kk" suffix (equal to "kk/device") on the command-line. Also make sure the environment variable CUDA_LAUNCH_BLOCKING is not set to "1" so CPU/GPU overlap can occur.

Performance to expect

The performance of KOKKOS running in different modes is a function of your hardware, which KOKKOS-enable styles are used, and the problem size.

Generally speaking, the following rules of thumb apply:

- When running on CPUs only, with a single thread per MPI task, performance of a KOKKOS style is somewhere between the standard (un-accelerated) styles (MPI-only mode), and those provided by the OPENMP package. However the difference between all 3 is small (less than 20%).
- When running on CPUs only, with multiple threads per MPI task, performance of a KOKKOS style is a bit slower than the OPENMP package.
- When running large number of atoms per GPU, KOKKOS is typically faster than the GPU package when compiled for double precision. The benefit of using single or mixed precision with the GPU package depends significantly on the hardware in use and the simulated system and pair style.
- When running on Intel Phi hardware, KOKKOS is not as fast as the INTEL package, which is optimized for x86 hardware (not just from Intel) and compilation with the Intel compilers. The INTEL package also can increase the vector length of vector instructions by switching to single or mixed precision mode.
- The KOKKOS package by default assumes that you are using exactly one MPI rank per GPU. When trying to use multiple MPI ranks per GPU it is mandatory to enable CUDA Multi-Process Service (MPS) to get good performance. In this case it is better to not use all available MPI ranks in order to avoid competing with the MPS daemon for CPU resources.

See the Benchmark page of the LAMMPS website for performance of the KOKKOS package on different hardware.

Advanced Kokkos options

There are other allowed options when building with the KOKKOS package that can improve performance or assist in debugging or profiling. They are explained on the *KOKKOS section of the build extras* doc page,

Restrictions

Currently, there are no precision options with the KOKKOS package. All compilation and computation is performed in double precision.

9.4.4 OPENMP package

The OPENMP package was developed by Axel Kohlmeyer at Temple University. It provides optimized and multi-threaded versions of many pair styles, nearly all bonded styles (bond, angle, dihedral, improper), several Kspace styles, and a few fix styles. It uses the OpenMP interface for multi-threading, but can also be compiled without OpenMP support, providing optimized serial styles in that case.

Required hardware/software

To enable multi-threading, your compiler must support the OpenMP interface. You should have one or more multicore CPUs, as multiple threads can only be launched by each MPI task on the local node (using shared memory).

Building LAMMPS with the OPENMP package

See the *Build extras* page for instructions.

Run with the OPENMP package from the command-line

These examples assume one or more 16-core nodes.

```
# 1 MPI task, 16 threads according to OMP_NUM_THREADS
env OMP_NUM_THREADS=16 lmp_omp -sf omp -in in.script

# 1 MPI task, no threads, optimized kernels
lmp_mpi -sf omp -in in.script

# 4 MPI tasks, 4 threads/task
mpirun -np 4 lmp_omp -sf omp -pk omp 4 -in in.script

# 8 nodes, 4 MPI tasks/node, 4 threads/task
mpirun -np 32 -ppn 4 lmp_omp -sf omp -pk omp 4 -in in.script
```

The mpirun or mpiexec command sets the total number of MPI tasks used by LAMMPS (one or multiple per compute node) and the number of MPI tasks used per node. E.g. the mpirun command in MPICH does this via its -np and -ppn switches. Ditto for OpenMPI via -np and -npernode.

You need to choose how many OpenMP threads per MPI task will be used by the OPENMP package. Note that the product of MPI tasks * threads/task should not exceed the physical number of cores (on a node), otherwise performance will suffer.

As in the lines above, use the -sf omp *command-line switch*, which will automatically append "omp" to styles that support it. The -sf omp switch also issues a default *package omp 0* command, which will set the number of threads per MPI task via the OMP_NUM_THREADS environment variable.

You can also use the -pk omp Nt *command-line switch*, to explicitly set Nt = # of OpenMP threads per MPI task to use, as well as additional options. Its syntax is the same as the *package omp* command whose page gives details, including the default values used if it is not specified. It also gives more details on how to set the number of threads via the OMP_NUM_THREADS environment variable.

Or run with the OPENMP package by editing an input script

The discussion above for the mpirun or mpiexec command, MPI tasks/node, and threads/MPI task is the same.

Use the *suffix omp* command, or you can explicitly add an "omp" suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/omp 2.5
```

You must also use the *package omp* command to enable the OPENMP package. When you do this you also specify how many threads per MPI task to use. The command page explains other options and how to set the number of threads via the OMP_NUM_THREADS environment variable.

Speed-up to expect

Depending on which styles are accelerated, you should look for a reduction in the "Pair time", "Bond time", "KSpace time", and "Loop time" values printed at the end of a run.

You may see a small performance advantage (5 to 20%) when running a OPENMP style (in serial or parallel) with a single thread per MPI task, versus running standard LAMMPS with its standard un-accelerated styles (in serial or all-MPI parallelization with 1 task/core). This is because many of the OPENMP styles contain similar optimizations to those used in the OPT package, described in *the OPT package* doc page.

With multiple threads/task, the optimal choice of number of MPI tasks/node and OpenMP threads/task can vary a lot and should always be tested via benchmark runs for a specific simulation running on a specific machine, paying attention to guidelines discussed in the next subsection.

A description of the multi-threading strategy used in the OPENMP package and some performance examples are presented here.

Guidelines for best performance

For many problems on current generation CPUs, running the OPENMP package with a single thread/task is faster than running with multiple threads/task. This is because the MPI parallelization in LAMMPS is often more efficient than multi-threading as implemented in the OPENMP package. The parallel efficiency (in a threaded sense) also varies for different OPENMP styles.

Using multiple threads/task can be more effective under the following circumstances:

- Individual compute nodes have a significant number of CPU cores but the CPU itself has limited memory bandwidth, e.g. for Intel Xeon 53xx (Clovertown) and 54xx (Harpertown) quad-core processors. Running one MPI task per CPU core will result in significant performance degradation, so that running with 4 or even only 2 MPI tasks per node is faster. Running in hybrid MPI+OpenMP mode will reduce the inter-node communication bandwidth contention in the same way, but offers an additional speedup by utilizing the otherwise idle CPU cores.
- The interconnect used for MPI communication does not provide sufficient bandwidth for a large number of MPI tasks per node. For example, this applies to running over gigabit ethernet or on Cray XT4 or XT5 series supercomputers. As in the aforementioned case, this effect worsens when using an increasing number of nodes.
- The system has a spatially inhomogeneous particle density which does not map well to the *domain decomposition scheme* or *load-balancing* options that LAMMPS provides. This is because multi-threading achieves parallelism over the number of particles, not via their distribution in space.
- A machine is being used in "capability mode", i.e. near the point where MPI parallelism is maxed out. For example, this can happen when using the *PPPM solver* for long-range electrostatics on large numbers of nodes. The scaling of the KSpace calculation (see the *kspace_style* command) becomes the performance-limiting factor. Using multi-threading allows less MPI tasks to be invoked and can speed-up the long-range solver, while increasing overall performance by parallelizing the pairwise and bonded calculations via OpenMP. Likewise additional speedup can be sometimes be achieved by increasing the length of the Coulombic cutoff and thus reducing the work done by the long-range solver. Using the *run_style verlet/split* command, which is compatible with the OPENMP package, is an alternative way to reduce the number of MPI tasks assigned to the KSpace calculation.

Additional performance tips are as follows:

- The best parallel efficiency from *omp* styles is typically achieved when there is at least one MPI task per physical CPU chip, i.e. socket or die.
- It is usually most efficient to restrict threading to a single socket, i.e. use one or more MPI task per socket.
- NOTE: By default, several current MPI implementations use a processor affinity setting that restricts each MPI task to a single CPU core. Using multi-threading in this mode will force all threads to share the one core and thus is likely to be counterproductive. Instead, binding MPI tasks to a (multicore) socket, should solve this issue.

Restrictions

None.

9.4.5 OPT package

The OPT package was developed by James Fischer (High Performance Technologies), David Richie, and Vincent Natoli (Stone Ridge Technologies). It contains a handful of pair styles whose compute() methods were rewritten in C++ templated form to reduce the overhead due to if tests and other conditional code.

Required hardware/software

Any hardware. Any compiler.

Building LAMMPS with the OPT package

See the *Build extras* page for instructions.

Run with the OPT package from the command-line

```
lmp_mpi -sf opt -in in.script                 # run in serial
mpirun -np 4 lmp_mpi -sf opt -in in.script    # run in parallel
```

Use the "-sf opt" *command-line switch*, which will automatically append "opt" to styles that support it.

Or run with the OPT package by editing an input script

Use the *suffix opt* command, or you can explicitly add an "opt" suffix to individual styles in your input script, e.g.

```
pair_style lj/cut/opt 2.5
```

Speed-up to expect

You should see a reduction in the "Pair time" value printed at the end of a run. On most machines for reasonable problem sizes, it will be a 5 to 20% savings.

Guidelines for best performance

Just try out an OPT pair style to see how it performs.

Restrictions

None.

Inverting this list, LAMMPS currently has acceleration support for three kinds of hardware, via the listed packages:

Many-core CPUs	*INTEL*, *KOKKOS*, *OPENMP*, *OPT* packages
GPUs	*GPU*, *KOKKOS* packages
Intel Phi/AVX	*INTEL*, *KOKKOS* packages

Which package is fastest for your hardware may depend on the size problem you are running and what commands (accelerated and non-accelerated) are invoked by your input script. While these doc pages include performance guidelines, there is no substitute for trying out the different packages appropriate to your hardware.

Any accelerated style has the same name as the corresponding standard style, except that a suffix is appended. Otherwise, the syntax for the command that uses the style is identical, their functionality is the same, and the numerical results it produces should also be the same, except for precision and round-off effects.

For example, all of these styles are accelerated variants of the Lennard-Jones *pair_style lj/cut*:

- *pair_style lj/cut/gpu*
- *pair_style lj/cut/intel*
- *pair_style lj/cut/kk*
- *pair_style lj/cut/omp*
- *pair_style lj/cut/opt*

To see what accelerate styles are currently available for a particular style, find the style name in the *Commands* style pages (fix,compute,pair,etc) and see what suffixes are listed (g,i,k,o,t) with it. The doc pages for individual commands (e.g. *pair lj/cut* or *fix nve*) also list any accelerated variants available for that style.

To use an accelerator package in LAMMPS, and one or more of the styles it provides, follow these general steps. Details vary from package to package and are explained in the individual accelerator doc pages, listed above:

build the accelerator library	only for GPU package
install the accelerator package	make yes-opt, make yes-intel, etc
add compile/link flags to Makefile.machine in src/MAKE	only for INTEL, KOKKOS, OPENMP, OPT packages
re-build LAMMPS	make machine
prepare and test a regular LAMMPS simulation	lmp_machine -in in.script; mpirun -np 32 lmp_machine -in in.script
enable specific accelerator support via -k on *command-line switch*	only needed for KOKKOS package
set any needed options for the package via -pk *command-line switch* or *package* command	only if defaults need to be changed
use accelerated styles in your input via -sf *command-line switch* or *suffix* command	lmp_machine -in in.script -sf gpu

Note that the first 4 steps can be done as a single command with suitable make command invocations. This is discussed on the *Packages* doc pages, and its use is illustrated in the individual accelerator sections. Typically these steps only need to be done once, to create an executable that uses one or more accelerator packages.

The last 4 steps can all be done from the command-line when LAMMPS is launched, without changing your input script, as illustrated in the individual accelerator sections. Or you can add *package* and *suffix* commands to your input script.

Note

With a few exceptions, you can build a single LAMMPS executable with all its accelerator packages installed. Note however that the INTEL and KOKKOS packages require you to choose one of their hardware options when building for a specific platform. I.e. CPU or Phi option for the INTEL package. Or the OpenMP, CUDA, HIP, SYCL, or Phi option for the KOKKOS package. Or the OpenCL, HIP, or CUDA option for the GPU package.

These are the exceptions. You cannot build a single executable with:

- both the INTEL Phi and KOKKOS Phi options
- the INTEL Phi or Kokkos Phi option, and the GPU package

As mentioned above, the Benchmark page of the LAMMPS website gives performance results for the various accelerator packages for several of the standard LAMMPS benchmark problems, as a function of problem size and number of compute nodes, on different hardware platforms.

Here is a brief summary of what the various packages provide. Details are in the individual accelerator sections.

- Styles with a "gpu" suffix are part of the GPU package and can be run on Intel, NVIDIA, or AMD GPUs. The speed-up on a GPU depends on a variety of factors, discussed in the accelerator sections.
- Styles with an "intel" suffix are part of the INTEL package. These styles support vectorized single and mixed precision calculations, in addition to full double precision. In extreme cases, this can provide speedups over 3.5x on CPUs. The package also supports acceleration in "offload" mode to Intel(R) Xeon Phi(TM) co-processors. This can result in additional speedup over 2x depending on the hardware configuration.
- Styles with a "kk" suffix are part of the KOKKOS package, and can be run using OpenMP on multicore CPUs, on an NVIDIA or AMD GPU, or on an Intel Xeon Phi in "native" mode. The speed-up depends on a variety of factors, as discussed on the KOKKOS accelerator page.
- Styles with an "omp" suffix are part of the OPENMP package and allow a pair-style to be run in multi-threaded mode using OpenMP. This can be useful on nodes with high-core counts when using less MPI processes than cores is advantageous, e.g. when running with PPPM so that FFTs are run on fewer MPI processors or when the many MPI tasks would overload the available bandwidth for communication.
- Styles with an "opt" suffix are part of the OPT package and typically speed-up the pairwise calculations of your simulation by 5-25% on a CPU.

The individual accelerator package doc pages explain:

- what hardware and software the accelerated package requires
- how to build LAMMPS with the accelerated package
- how to run with the accelerated package either via command-line switches or modifying the input script
- speed-ups to expect
- guidelines for best performance
- restrictions

9.5 Comparison of various accelerator packages

The next section compares and contrasts the various accelerator options, since there are multiple ways to perform OpenMP threading, run on GPUs, optimize for vector units on CPUs and run on Intel Xeon Phi (co-)processors.

All of these packages can accelerate a LAMMPS calculation taking advantage of hardware features, but they do it in different ways and acceleration is not always guaranteed.

As a consequence, for a particular simulation on specific hardware, one package may be faster than the other. We give some guidelines below, but the best way to determine which package is faster for your input script is to try multiple

of them on your machine and experiment with available performance tuning settings. See the benchmarking section below for examples where this has been done.

Guidelines for using each package optimally:

- Both, the GPU and the KOKKOS package allows you to assign multiple MPI ranks (= CPU cores) to the same GPU. For the GPU package, this can lead to a speedup through better utilization of the GPU (by overlapping computation and data transfer) and more efficient computation of the non-GPU accelerated parts of LAMMPS through MPI parallelization, as all system data is maintained and updated on the host. For KOKKOS, there is less to no benefit from this, due to its different memory management model, which tries to retain data on the GPU.
- The GPU package moves per-atom data (coordinates, forces, and (optionally) neighbor list data, if not computed on the GPU) between the CPU and GPU at every timestep. The KOKKOS/CUDA package only does this on timesteps when a CPU calculation is required (e.g. to invoke a fix or compute that is non-GPU-ized). Hence, if you can formulate your input script to only use GPU-ized fixes and computes, and avoid doing I/O too often (thermo output, dump file snapshots, restart files), then the data transfer cost of the KOKKOS/CUDA package can be very low, causing it to run faster than the GPU package.
- The GPU package is often faster than the KOKKOS/CUDA package, when the number of atoms per GPU is on the smaller side. The crossover point, in terms of atoms/GPU at which the KOKKOS/CUDA package becomes faster depends strongly on the pair style. For example, for a simple Lennard Jones system the crossover (in single precision) is often about 50K-100K atoms per GPU. When performing double precision calculations the crossover point can be significantly smaller.
- When using LAMMPS with multiple MPI ranks assigned to the same GPU, its performance depends to some extent on the available bandwidth between the CPUs and the GPU. This can differ significantly based on the available bus technology, capability of the host CPU and mainboard, the wiring of the buses and whether switches are used to increase the number of available bus slots, or if GPUs are housed in an external enclosure. This can become quite complex.
- To achieve significant acceleration through GPUs, both KOKKOS and GPU package require capable GPUs with fast on-device memory and efficient data transfer rates. This requests capable upper mid-level to high-end (desktop) GPUs. Using lower performance GPUs (e.g. on laptops) may result in a slowdown instead.
- For the GPU package, specifically when running in parallel with MPI, if it often more efficient to exclude the PPPM kspace style from GPU acceleration and instead run it - concurrently with a GPU accelerated pair style - on the CPU. This can often be easily achieved with placing a *suffix off* command before and a *suffix on* command after the *kspace_style pppm* command.
- The KOKKOS/OpenMP and OPENMP package have different thread management strategies, which should result in OPENMP being more efficient for a small number of threads with increasing overhead as the number of threads per MPI rank grows. The KOKKOS/OpenMP kernels have less overhead in that case, but have lower performance with few threads.
- The INTEL package contains many options and settings for achieving additional performance on Intel hardware (CPU and accelerator cards), but to unlock this potential, an Intel compiler is required. The package code will compile with GNU gcc, but it will not be as efficient.

Differences between the GPU and KOKKOS packages:

- The GPU package accelerates only pair force, neighbor list, and (parts of) PPPM calculations (and runs the remaining force computations on the CPU concurrently). The KOKKOS package attempts to run most of the calculation on the GPU, but can transparently support non-accelerated code (with a performance penalty due to having data transfers between host and GPU).
- The list of which styles are accelerated by the GPU or KOKKOS package differs with some overlap.
- The GPU package requires neighbor lists to be built on the CPU when using hybrid pair styles, exclusion lists, or a triclinic simulation box.

- The GPU package benefits from running multiple MPI processes (2-8) per GPU to parallelize the non-GPU accelerated styles. The KOKKOS package usually not, especially when all parts of the calculation have KOKKOS support.
- The GPU package can be compiled for CUDA, HIP, or OpenCL and thus supports NVIDIA, AMD, and Intel GPUs well. On NVIDIA or AMD hardware, using native CUDA or HIP compilation, respectively, with either GPU or KOKKOS results in equal or better performance over OpenCL.
- OpenCL in the GPU package supports NVIDIA, AMD, and Intel GPUs at the *same time* and with the *same executable*. KOKKOS currently does not support OpenCL.
- The GPU package supports single precision floating point, mixed precision floating point, and double precision floating point math on the GPU. This must be chosen at compile time. KOKKOS currently only supports double precision floating point math. Using single or mixed precision (recommended) results in significantly improved performance on consumer GPUs for some loss in accuracy (which is rather small with mixed precision). Single and mixed precision support for KOKKOS is in development (no ETA yet).
- Some pair styles (for example *snap*, *mliap* or *reaxff* in the KOKKOS package have seen extensive optimizations and specializations for GPUs and CPUs.

CHAPTER

TEN

HOWTO DISCUSSIONS

These doc pages describe how to perform various tasks with LAMMPS, both for users and developers. The glossary website page also lists MD terminology, with links to corresponding LAMMPS manual pages. The example input scripts included in the examples directory of the LAMMPS source code distribution and highlighted on the *Example scripts* page also show how to set up and run various kinds of simulations.

10.1 General howto

10.1.1 Restart a simulation

There are 3 ways to continue a long LAMMPS simulation. Multiple *run* commands can be used in the same input script. Each run will continue from where the previous run left off. Or binary restart files can be saved to disk using the *restart* command. At a later time, these binary files can be read via a *read_restart* command in a new script. Or they can be converted to text data files using the *-r command-line switch* and read by a *read_data* command in a new script.

Here we give examples of 2 scripts that read either a binary restart file or a converted data file and then issue a new run command to continue where the previous run left off. They illustrate what settings must be made in the new script. Details are discussed in the documentation for the *read_restart* and *read_data* commands.

Look at the *in.chain* input script provided in the *bench* directory of the LAMMPS distribution to see the original script that these 2 scripts are based on. If that script had the line

```
restart       50 tmp.restart
```

added to it, it would produce two binary restart files (tmp.restart.50 and tmp.restart.100) as it ran.

This script could be used to read the first restart file and re-run the last 50 timesteps:

```
read_restart    tmp.restart.50

neighbor        0.4 bin
neigh_modify    every 1 delay 1

fix             1 all nve
fix             2 all langevin 1.0 1.0 10.0 904297

timestep        0.012

run             50
```

Note that the following commands do not need to be repeated because their settings are included in the restart file: units, atom_style, special_bonds, pair_style, bond_style. However, these commands do need to be used, since their settings are not in the restart file: neighbor, fix, timestep.

If you actually use this script to perform a restarted run, you will notice that the thermodynamic data match at step 50 (if you also put a thermo 50 command in the original script), but do not match at step 100. This is because the *fix langevin* command uses random numbers in a way that does not allow for perfect restarts.

As an alternate approach, the restart file could be converted to a data file as follows:

```
lmp_g++ -r tmp.restart.50 tmp.restart.data
```

Then, this script could be used to re-run the last 50 steps:

```
units          lj
atom_style     bond
pair_style     lj/cut 1.12
pair_modify    shift yes
bond_style     fene
special_bonds  0.0 1.0 1.0

read_data      tmp.restart.data

neighbor       0.4 bin
neigh_modify   every 1 delay 1

fix            1 all nve
fix            2 all langevin 1.0 1.0 10.0 904297

timestep       0.012

reset_timestep 50
run            50
```

Note that nearly all the settings specified in the original in.chain script must be repeated, except the pair_coeff and bond_coeff commands, since the new data file lists the force field coefficients. Also, the *reset_timestep* command is used to tell LAMMPS the current timestep. This value is stored in restart files, but not in data files.

10.1.2 Visualize LAMMPS snapshots

Snapshots from LAMMPS simulations can be viewed, visualized, and analyzed in a variety of ways.

LAMMPS snapshots are created by the *dump* command, which can create files in several formats. The native LAMMPS dump format is a text file (see dump atom or dump custom) which can be visualized by several visualization tools for MD simulation trajectories. OVITO and VMD seem to be the most popular choices among them.

The *dump image* and *dump movie* styles can output internally rendered images or convert them to a movie during the MD run. It is also possible to create visualizations from LAMMPS inputs or restart file with LAMMPS-GUI, which uses the *dump image* command internally. The Snapshot Image Viewer in LAMMPS-GUI can be used to adjust the visualization settings of the current system interactively and then export the corresponding LAMMPS commands to the clipboard to be inserted into an input file.

Programs included with LAMMPS as auxiliary tools can convert between LAMMPS format files and other formats. See the *Tools* page for details. These are rarely needed these days.

10.1.3 Run multiple simulations from one input script

This can be done in several ways. See the documentation for individual commands for more details on how these examples work.

If "multiple simulations" means to continue a previous simulation for more timesteps, then you simply use the *run* command multiple times. For example, this script

```
units lj
atom_style atomic
read_data data.lj
run 10000
run 10000
run 10000
run 10000
run 10000
```

would run 5 successive simulations of the same system for a total of 50,000 timesteps.

If you wish to run totally different simulations, one after the other, the *clear* command can be used in between them to re-initialize LAMMPS. For example, this script

```
units lj
atom_style atomic
read_data data.lj
run 10000
clear
units lj
atom_style atomic
read_data data.lj.new
run 10000
```

would run 2 independent simulations, one after the other.

For large numbers of independent simulations, you can use *variables* and the *next* and *jump* commands to loop over the same input script multiple times with different settings. For example, this script, named in.polymer

```
variable d index run1 run2 run3 run4 run5 run6 run7 run8
shell cd $d
read_data data.polymer
run 10000
shell cd ..
clear
next d
jump in.polymer
```

would run 8 simulations in different directories, using a data.polymer file in each directory. The same concept could be used to run the same system at 8 different temperatures, using a temperature variable and storing the output in different log and dump files, for example

```
variable a loop 8
variable t index 0.8 0.85 0.9 0.95 1.0 1.05 1.1 1.15
log log.$a
read data.polymer
velocity all create $t 352839
fix 1 all nvt $t $t 100.0
dump 1 all atom 1000 dump.$a
run 100000
clear
next t
```

(continues on next page)

(continued from previous page)

```
next a
jump in.polymer
```

All of the above examples work whether you are running on 1 or multiple processors, but assumed you are running LAMMPS on a single partition of processors. LAMMPS can be run on multiple partitions via the *-partition command-line switch*.

In the last 2 examples, if LAMMPS were run on 3 partitions, the same scripts could be used if the index and loop variables were replaced with *universe*-style variables, as described in the *variable* command. Also, the next t and next a commands would need to be replaced with a single next a t command. With these modifications, the 8 simulations of each script would run on the 3 partitions one after the other until all were finished. Initially, 3 simulations would be started simultaneously, one on each partition. When one finished, that partition would then start the fourth simulation, and so forth, until all 8 were completed.

10.1.4 Multi-replica simulations

Several commands in LAMMPS run multi-replica simulations, meaning that multiple instances (replicas) of your simulation are run simultaneously, with small amounts of data exchanged between replicas periodically.

These are the relevant commands:

- *hyper* for bond boost hyperdynamics (HD)
- *neb* for nudged elastic band calculations (NEB)
- *neb_spin* for magnetic nudged elastic band calculations
- *prd* for parallel replica dynamics (PRD)
- *tad* for temperature accelerated dynamics (TAD)
- *temper* for parallel tempering with fixed volume
- *temper/npt* for parallel tempering extended for NPT
- *temper/grem* for parallel tempering with generalized replica exchange (gREM)
- *fix pimd* for path-integral molecular dynamics (PIMD)

NEB is a method for finding transition states and barrier potential energies. HD, PRD, and TAD are methods for performing accelerated dynamics to find and perform infrequent events. Parallel tempering or replica exchange runs different replicas at a series of temperature to facilitate rare-event sampling. PIMD runs different replicas whose individual particles in different replicas are coupled together by springs to model a system of ring-polymers which can represent the quantum nature of atom cores.

These commands can only be used if LAMMPS was built with the REPLICA package. See the *Build package* page for more info.

In all these cases, you must run with one or more processors per replica. The processors assigned to each replica are determined at run-time by using the *-partition command-line switch* to launch LAMMPS on multiple partitions, which in this context are the same as replicas. E.g. these commands:

```
mpirun -np 16 lmp_linux -partition 8x2 -in in.temper
mpirun -np 8 lmp_linux -partition 8x1 -in in.neb
```

would each run 8 replicas, on either 16 or 8 processors. Note the use of the *-in command-line switch* to specify the input script which is required when running in multi-replica mode.

Also note that with MPI installed on a machine (e.g. your desktop), you can run on more (virtual) processors than you have physical processors. Thus, the above commands could be run on a single-processor (or few-processor) desktop so that you can run a multi-replica simulation on more replicas than you have physical processors. This is useful for

testing and debugging, since with most modern processors and MPI libraries, the efficiency of a calculation can severely diminish when oversubscribing processors.

10.1.5 Library interface to LAMMPS

As described on the *Build basics* doc page, LAMMPS can be built as a static or shared library, so that it can be called by another code, used in a *coupled manner* with other codes, or driven through a *Python interface*.

At the core of LAMMPS is the LAMMPS class, which encapsulates the state of the simulation program through the state of the various class instances that it is composed of. So a calculation using LAMMPS requires creating an instance of the LAMMPS class and then send it (text) commands, either individually or from a file, or perform other operations that modify the state stored inside that instance or drive simulations. This is essentially what the src/main.cpp file does as well for the standalone LAMMPS executable, reading commands either from an input file or the standard input.

Creating a LAMMPS instance can be done by using C++ code directly or through a C-style interface library to LAMMPS that is provided in the files src/library.cpp and src/library.h. This *C language API*, can be used from C and C++, and is also the basis for the *Python* and *Fortran* interfaces or the *SWIG based wrappers* included in the LAMMPS source code.

The examples/COUPLE and python/examples directories contain some example programs written in C++, C, Fortran, and Python, which show how a driver code can link to LAMMPS as a library, run LAMMPS on a subset of processors (so the others are available to run some other code concurrently), grab data from LAMMPS, change it, and send it back into LAMMPS.

A detailed documentation of the available APIs and examples of how to use them can be found in the *Programmer Guide* section of this manual.

10.1.6 Coupling LAMMPS to other codes

LAMMPS is designed to support being coupled to other codes. For example, a quantum mechanics code might compute forces on a subset of atoms and pass those forces to LAMMPS. Or a continuum finite element (FE) simulation might use atom positions as boundary conditions on FE nodal points, compute a FE solution, and return interpolated forces on MD atoms.

LAMMPS can be coupled to other codes in at least 4 different ways. Each has advantages and disadvantages, which you will have to think about in the context of your application.

1. Define a new *fix* or *compute* command that calls the other code. In this scenario, LAMMPS is the driver code. During timestepping, the fix or compute is invoked, and can make library calls to the other code, which has been linked to LAMMPS as a library. This is the way the *VORONOI* package, which computes Voronoi tesselations using the Voro++ library, is interfaced to LAMMPS. See the *compute voronoi* command for more details. Also see the *Modify* pages for information on how to add a new fix or compute to LAMMPS.

2. Define a new LAMMPS command that calls the other code. This is conceptually similar to method (1), but in this case LAMMPS and the other code are on a more equal footing. Note that now the other code is not called during the timestepping of a LAMMPS run, but between runs. The LAMMPS input script can be used to alternate LAMMPS runs with calls to the other code, invoked via the new command. The *run* command facilitates this with its *every* option, which makes it easy to run a few steps, invoke the command, run a few steps, invoke the command, etc.

   In this scenario, the other code can be called as a library, as in 1., or it could be a stand-alone code, invoked by a system() call made by the command (assuming your parallel machine allows one or more processors to start up another program). In the latter case the stand-alone code could communicate with LAMMPS through files that the command writes and reads.

   See the *Modify command* page for information on how to add a new command to LAMMPS.

3. Use LAMMPS as a library called by another code. In this case, the other code is the driver and calls LAMMPS as needed. Alternately, a wrapper code could link and call both LAMMPS and another code as libraries. Again,

the *run* command has options that allow it to be invoked with minimal overhead (no setup or clean-up) if you wish to do multiple short runs, driven by another program. Details about using the library interface are given in the *library API* documentation.

4. Couple LAMMPS with another code in a client/server fashion, using the MDI Library developed by the Molecular Sciences Software Institute (MolSSI) to run LAMMPS as either an MDI driver (client) or an MDI engine (server). The MDI driver issues commands to the MDI server to exchange data between them. See the *Using LAMMPS with the MDI library for code coupling* page for more information about how LAMMPS can operate in either of these modes.

10.1.7 Using LAMMPS with the MDI library for code coupling

Client/server coupling of two (or more) codes is where one code is the "client" and sends request messages (data) to one (or more) "server" code(s). A server responds to each request with a reply message (data). This enables two (or more) codes to work in tandem to perform a simulation. In this context, LAMMPS can act as either a client or server code. It does this by using the MolSSI Driver Interface (MDI) library, developed by the Molecular Sciences Software Institute (MolSSI), which is supported by the *MDI* package.

Alternate methods for coupling codes with LAMMPS are described on the *Coupling LAMMPS to other codes* page.

Some advantages of client/server coupling are that the codes can run as stand-alone executables; they need not be linked together. Thus, neither code needs to have a library interface. This also makes it easy to run the two codes on different numbers of processors. If a message protocol (format and content) is defined for a particular kind of simulation, then in principle any code which implements the client-side protocol can be used in tandem with any code which implements the server-side protocol. Neither code needs to know what specific other code it is working with.

In MDI nomenclature, a client code is the "driver", and a server code is an "engine". One driver code can communicate with one or more instances of one or more engine codes. Driver and engine codes can be written in any language: C, C++, Fortran, Python, etc.

In addition to allowing driver and engine(s) to run as stand-alone executables, MDI also enables an engine to be a *plugin* to the client code. In this scenario, server code(s) are compiled as shared libraries, and one (or more) instances of the server are instantiated by the driver code. If the driver code runs in parallel, it can split its MPI communicator into multiple sub-communicators, and launch each plugin engine instance on a sub-communicator. Driver processors within that sub-communicator exchange messages with the corresponding engine instance, and can also send MPI messages to other processors in the driver. The driver code can also destroy engine instances and re-instantiate them. LAMMPS can operate as either a stand-alone or plugin MDI engine. When it operates as a driver, it can use either stand-alone or plugin MDI engines.

The way in which an MDI driver communicates with an MDI engine is by making MDI_Send() and MDI_Recv() calls, which are conceptually similar to MPI_Send() and MPI_Recv() calls. Each send or receive operation uses a string to identify the command name, and optionally some data, which can be a single value or vector of values of any data type. Inside the MDI library, data is exchanged between the driver and engine via MPI calls or sockets. This is a run-time choice by the user.

The *MDI* package provides a *mdi engine* command, which enables LAMMPS to operate as an MDI engine. Its doc page explains the variety of standard and custom MDI commands which the LAMMPS engine recognizes and can respond to.

The package also provides a *mdi plugin* command, which enables LAMMPS to operate as an MDI driver and load an MDI engine as a plugin library.

The package furthermore includes a *fix mdi/qm* command, in which LAMMPS operates as an MDI driver in conjunction with a quantum mechanics code as an MDI engine. The post_force() method of the fix_mdi_qm.cpp file shows how a driver issues MDI commands to another code. This command can be used to couple to an MDI engine, which is either a stand-alone code or a plugin library.

As explained in the *fix mdi/qm* command documentation, it can be used to perform *ab initio* MD simulations or energy minimizations, or to evaluate the quantum energy and forces for a series of independent systems. The examples/mdi directory has example input scripts for all of these use cases.

The package also has a *fix mdi/qmmm* command in which LAMMPS operates as an MDI driver in conjunction with a quantum mechanics code as an MDI engine to perform QM/MM simulations. The LAMMPS input script partitions the system into QM and MM (molecular mechanics) atoms. As described below the examples/QUANTUM directory has examples for coupling to 3 different quantum codes in this manner.

The examples/mdi directory contains Python scripts and LAMMPS input script which use LAMMPS as either an MDI driver or engine, or both. Currently, 5 example use cases are provided:

- Run ab initio MD (AIMD) using 2 instances of LAMMPS. As a driver, LAMMPS performs the timestepping in either NVE or NPT mode. As an engine, LAMMPS computes forces and is a surrogate for a quantum code.
- LAMMPS runs an MD simulation as a driver. Every N steps it passes the current snapshot to an MDI engine to evaluate the energy, virial, and peratom forces. As the engine, LAMMPS is a surrogate for a quantum code.
- LAMMPS loops over a series of data files and passes the configuration to an MDI engine to evaluate the energy, virial, and peratom forces and thus acts as a simulation driver. As the engine, LAMMPS is used as a surrogate for a quantum code.
- A Python script driver invokes a sequence of unrelated LAMMPS calculations. Calculations can be single-point energy/force evaluations, MD runs, or energy minimizations.
- Run AIMD with a Python driver code and 2 LAMMPS instances as engines. The first LAMMPS instance performs MD timestepping. The second LAMMPS instance acts as a surrogate QM code to compute forces.

Note

In any of these examples where LAMMPS is used as an engine, an actual QM code (provided it has support for MDI) could be used in its place, without modifying the input scripts or launch commands, except to specify the name of the QM code.

The examples/mdi/Run.sh file illustrates how to launch both driver and engine codes so that they communicate using the MDI library via either MPI or sockets, or using the engine as a stand-alone code, or as a plugin library.

As of March 2023, these are quantum codes with MDI support provided via Python wrapper scripts included in the LAMMPS distribution. These can be used with the fix mdi/qm and fix mdi/qmmm commands to perform QM calculations of an entire system (e.g. AIMD) or QM/MM simulations. See the examples/QUANTUM sub-directories for more details:

- LATTE - AIMD only
- PySCF - QM/MM only
- NWChem - AIMD or QM/MM

There are also at least two quantum codes which have direct MDI support, Quantum ESPRESSO (QE) and INQ. There are also several QM codes which have indirect support through QCEngine or i-PI. The former means they require a wrapper program (QCEngine) with MDI support which writes/read files to pass data to the quantum code itself. The list of QCEngine-supported and i-PI-supported quantum codes is on the MDI webpage.

These direct- and indirect-support codes should be usable for full system calculations (e.g. AIMD). Whether they support QM/MM models depends on the individual QM code.

10.1.8 Broken Bonds

Typically, molecular bond interactions persist for the duration of a simulation in LAMMPS. However, some commands break bonds dynamically, including the following:

- *bond_style quartic*
- *fix bond/break*
- *fix bond/react*
- *BPM package* bond styles

A bond can break if it is stretched beyond a user-defined threshold or more generally if other criteria are met.

For the quartic bond style, when a bond is broken its bond type is set to 0 to effectively break it and pairwise forces between the two atoms in the broken bond are "turned on". Angles, dihedrals, etc cannot be defined for a system when *bond_style quartic* is used.

Similarly, bond styles in the BPM package are also incompatible with angles, dihedrals, etc. and when a bond breaks its type is set to zero. However, in the BPM package one can either turn off all pair interactions between bonded particles or leave them on, overlaying pair forces on top of bond forces. To remove pair forces, the special bond list is dynamically updated. More details can be found on the *Howto BPM* page.

The *fix bond/break* and *fix bond/react* commands allow breaking of bonds within a molecular topology with may also define angles, dihedrals, etc. These commands update internal topology data structures to remove broken bonds, as well as the appropriate angle, dihedral, etc interactions which include the bond. They also trigger a rebuild of the neighbor list when this occurs, to turn on the appropriate pairwise forces.

Note that when bonds are dumped to a file via the *dump local* command, bonds with type 0 are not included.

The *delete_bonds* command can be used to query the status of broken bonds with type = 0 or permanently delete them, e.g.:

```
delete_bonds all stats
delete_bonds all bond 0 remove
```

The compute *count/type* command tallies the current number of bonds (or angles, etc) for each bond (angle, etc) type. It also tallies broken bonds with type = 0.

The compute *nbond/atom* command tallies the current number of bonds each atom is part of, excluding broken bonds with type = 0.

10.2 Settings howto

10.2.1 2d simulations

You must use the *dimension* command to specify a 2d simulation. The default is 3d.

A 2d simulation box must be periodic in z as set by the *boundary* command. This is the default.

Simulation boxes in LAMMPS can be either orthogonal or triclinic in shape. Orthogonal boxes in 2d are a rectangle with 4 edges that are each perpendicular to either the x or y coordinate axes. Triclinic boxes in 2d are a parallelogram with opposite pairs of faces parallel to each other. LAMMPS supports two forms of triclinic boxes, restricted and general, which for 2d differ in how the box is oriented with respect to the xy coordinate axes. See the *Howto triclinic* for a detailed description of all 3 kinds of simulation boxes.

Here are examples of using the *create_box* command to define the simulation box for a 2d system.

```
# 2d orthogonal box using a block-style region
region mybox block -10 10 0 10 -0.5 0.5
create_box 1 mybox

# 2d restricted triclinic box using a prism-style region with only xy tilt
region mybox prism 0 10 0 10 -0.5 0.5 2.0 0.0 0.0
create_box 1 mybox

# 2d general triclinic box using a primitive cell for a 2d hex lattice
lattice       custom 1.0 a1 1.0 0.0 0.0 a2 0.5 0.86602540378 0.0 &
              a3 0.0 0.0 1.0 basis 0.0 0.0 0.0 triclinic/general
create_box    1 NULL 0 5 0 5 -0.5 0.5
```

Note that for 2d orthogonal or restricted triclinic boxes, the box has a 3rd dimension which must straddle z = 0.0 in the z dimension. Typically the width of box in the z dimension should be narrow, e.g. -0.5 to 0.5, but that is not required. For a 2d general triclinic box, the *a3* vector defined by the *lattice* command must be (0.0,0.0,1.0), which is its default value. Also the *clo* and *chi* arguments of the *create_box* command must be -0.5 and 0.5.

Here are examples of using the *read_data* command to define the simulation box for a 2d system via keywords in the header section of the data file. These are the same boxes as the examples for the *create_box* command

```
# 2d orthogonal box
-10 10   xlo xhi
0 10     ylo yhi
-0.5 0.5 zlo zhi       # this is the default, so no need to specify

# 2d restricted triclinic box with only xy tilt
-10 10   xlo xhi
0 10     ylo yhi
-0.5 0.5 zlo zhi       # this is the default, so no need to specify
2.0 0.0 0.0 xy xz yz

# 3d general triclinic box using a primitive cell for a 2d hex lattice
5 0 0              avec
2.5 4.3301270189 0 bvec
0 0 1              cvec          # this is the default, so no need to specify
0 0 -0.5           abc origin    # this is the default for 2d, so no need to specify
```

Note that for 2d orthogonal or restricted triclinic boxes, the box has a 3rd dimension specified by the *zlo zhi* values, which must straddle z = 0.0. Typically the width of box in the z dimension should be narrow, e.g. -0.5 to 0.5, but that is not required. For a 2d general triclinic box, the z component of *avec* and *bvec* must be zero, and *cvec* must be (0,0,1), which is the default. The z component of *abc origin* must also be -0.5, which is the default.

If using the *create_atoms* command to create atoms in the 2d simulation box, all the z coordinates of created atoms will be zero.

If using the *read_data* command to read in a data file of atom coordinates for a 2d system, the z coordinates of all atoms should be zero. A value within epsilon of zero is also allowed in case the data file was generated by another program with finite numeric precision, in which case the z coord for the atom will be set to zero.

Use the *fix enforce2d* command as the last fix defined in the input script. It ensures that the z-components of velocities and forces are zeroed out every timestep. The reason to make it the last fix is so that any forces added by other fixes will also be zeroed out.

Many of the example input scripts included in the examples directory are for 2d models.

Note

Some models in LAMMPS treat particles as finite-size spheres, as opposed to point particles. See the *atom_style sphere* and *fix nve/sphere* commands for details. By default, for 2d simulations, such particles will still be modeled as 3d spheres, not 2d discs (circles), meaning their moment of inertia will be that of a sphere. If you wish to model them as 2d discs, see the *set density/disc* command and the *disc* option for the *fix nve/sphere*, *fix nvt/sphere*, *fix nph/sphere*, *fix npt/sphere* commands.

10.2.2 Type labels

Added in version 15Sep2022.

Each atom in LAMMPS has an associated numeric atom type. Similarly, each bond, angle, dihedral, and improper is assigned a bond type, angle type, and so on. The primary use of these types is to map potential (force field) parameters to the interactions of the atom, bond, angle, dihedral, and improper.

By default, type values are entered as integers from 1 to Ntypes wherever they appear in LAMMPS input or output files. The total number Ntypes for each interaction is "locked in" when the simulation box is created.

A recent addition to LAMMPS is the option to use strings - referred to as type labels - as an alternative. Using type labels instead of numeric types can be advantageous in various scenarios. For example, type labels can make inputs more readable and generic (i.e. usable through the *include command* for different systems with different numerical values assigned to types. This generality also applies to other inputs like data files read by *read_data* or molecule template files read by the *molecule* command. A discussion of the current type label support can be found in *(Gissinger)*. See below for a list of other commands that can use type labels in different ways.

LAMMPS will *internally* continue to use numeric types, which means that many previous restrictions still apply. For example, the total number of types is locked in when creating the simulation box, and potential parameters for each type must be provided even if not used by any interactions.

A collection of type labels for all type-kinds (atom types, bond types, etc.) is stored as a "label map" which is simply a list of numeric types and their associated type labels. Within a type-kind, each type label must be unique. It can be assigned to only one numeric type. To read and write type labels to data files for a given type-kind, *all* associated numeric types need have a type label assigned. Partial maps can be saved with the *labelmap write* command and read back with the *include* command.

Valid type labels can contain most ASCII characters, but cannot start with a number, a '#', or a '*'. Also, labels must not contain whitespace characters. When using the *labelmap command* in the LAMMPS input, if certain characters appear in the type label, such as the single (') or double (") quote or the '#' character, the label must be put in either double, single, or triple ("""") quotes. Triple quotes allow for the most generic type label strings, but they require to have a leading and trailing blank space. When defining type labels the blanks will be ignored. Example:

```
labelmap angle 1 """ C1'-C2"-C3# """
```

This command will map the string `C1'-C2"-C3#` to the angle type 1.

There are two ways to define label maps. One is via the *labelmap* command. The other is via the *read_data* command. A data file can have sections such as *Atom Type Labels*, *Bond Type Labels*, etc., which assign type labels to numeric types. The label map can be written out to data files by the *write_data* command. This map is also written to and read from restart files, by the *write_restart* and *read_restart* commands.

Use of type labels in LAMMPS input or output

Many LAMMPS input script commands that take a numeric type as an argument can use the associated type label instead. If a type label is not defined for a particular numeric type, only its numeric type can be used.

This example assigns labels to the atom types, and then uses the type labels to redefine the pair coefficients.

```
pair_coeff 1 2 1.0 1.0          # numeric types
labelmap atom 1 C 2 H
pair_coeff C H 1.0 1.0          # type labels
```

Adding support for type labels to various commands is an ongoing project. If an input script command (or a section in a file read by a command) allows substituting a type label for a numeric type argument, it will be explicitly mentioned in that command's documentation page.

As a temporary measure, input script commands can take advantage of variables and how they can be expanded during processing of the input. The variables can use functions that will translate type label strings to their respective number as defined in the current label map. See the *variable* command for details.

For example, here is how the pair_coeff command could be used with type labels if it did not yet support them, either with an explicit variable command or an implicit variable used in the pair_coeff command.

```
labelmap atom 1 C 2 H
variable atom1 equal label2type(atom,C)
variable atom2 equal label2type(atom,H)
pair_coeff ${atom1} ${atom2} 1.0 1.0
```

```
labelmap atom 1 C 2 H
pair_coeff $(label2type(atom,C)) $(label2type(atom,H)) 80.0 1.2
```

Commands that can use label types

Any workflow that involves reading multiple data files, molecule templates or a combination of the two can be streamlined by using type labels instead of numeric types, because types are automatically synced between the files. The creation of simulation-ready reaction templates for *fix bond/react* is much simpler when using type labels, and results in templates that can be used without modification in multiple simulations or different systems.

10.2.3 Triclinic (non-orthogonal) simulation boxes

By default, LAMMPS uses an orthogonal simulation box to encompass the particles. The orthogonal box has its "origin" at (xlo,ylo,zlo) and extends to (xhi,yhi,zhi). Conceptually it is defined by 3 edge vectors starting from the origin given by **A** = (xhi-xlo,0,0); **B** = (0,yhi-ylo,0); **C** = (0,0,zhi-zlo). The *boundary* command sets the boundary conditions for the 6 faces of the box (periodic, non-periodic, etc). The 6 parameters (xlo,xhi,ylo,yhi,zlo,zhi) are defined at the time the simulation box is created by one of these commands:

- *create_box*
- *read_data*
- *read_restart*
- *read_dump*

Internally, LAMMPS defines box size parameters lx,ly,lz where lx = xhi-xlo, and similarly in the y and z dimensions. The 6 parameters, as well as lx,ly,lz, can be output via the *thermo_style custom* command. See the *Howto 2d* doc page for info on how zlo and zhi are defined for 2d simulations.

Triclinic simulation boxes

LAMMPS also allows simulations to be performed using triclinic (non-orthogonal) simulation boxes shaped as a 3d parallelepiped with triclinic symmetry. For 2d simulations a triclinic simulation box is effectively a parallelogram; see the *Howto 2d* doc page for details.

One use of triclinic simulation boxes is to model solid-state crystals with triclinic symmetry. The *lattice* command can be used with non-orthogonal basis vectors to define a lattice that will tile a triclinic simulation box via the *create_atoms* command.

A second use is to run Parrinello-Rahman dynamics via the *fix npt* command, which will adjust the xy, xz, yz tilt factors to compensate for off-diagonal components of the pressure tensor. The analog for an *energy minimization* is the *fix box/relax* command.

A third use is to shear a bulk solid to study the response of the material. The *fix deform* command can be used for this purpose. It allows dynamic control of the xy, xz, yz tilt factors as a simulation runs. This is discussed in the *Howto NEMD* doc page on non-equilibrium MD (NEMD) simulations.

Conceptually, a triclinic parallelepiped is defined with an "origin" at (xlo,ylo,zhi) and 3 edge vectors **A** = (ax,ay,az), **B** = (bx,by,bz), **C** = (cx,cy,cz) which can be arbitrary vectors, so long as they are non-zero, distinct, and not co-planar. In addition, they must define a right-handed system, such that (**A** cross **B**) points in the direction of **C**. Note that a left-handed system can be converted to a right-handed system by simply swapping the order of any pair of the **A**, **B**, **C** vectors.

The 4 commands listed above for defining orthogonal simulation boxes have triclinic options which allow for specification of the origin and edge vectors **A**, **B**, **C**. For each command, this can be done in one of two ways, for what LAMMPS calls a *general* triclinic box or a *restricted* triclinic box.

A *general* triclinic box is specified by an origin (xlo, ylo, zlo) and arbitrary edge vectors **A** = (ax,ay,az), **B** = (bx,by,bz), and **C** = (cx,cy,cz). So there are 12 parameters in total.

A *restricted* triclinic box also has an origin (xlo,ylo,zlo), but its edge vectors are of the following restricted form: **A** = (xhi-xlo,0,0), **B** = (xy,yhi-ylo,0), **C** = (xz,yz,zhi-zlo). So there are 9 parameters in total. Note that the restricted form requires **A** to be along the x-axis, **B** to be in the xy plane with a y-component in the +y direction, and **C** to have its z-component in the +z direction. Note that a restricted triclinic box is *right-handed* by construction since (**A** cross **B**) points in the direction of **C**.

The *xy,xz,yz* values can be zero or positive or negative. They are called "tilt factors" because they are the amount of displacement applied to edges of faces of an orthogonal box to change it into a restricted triclinic parallelepiped.

> **Note**
>
> Any right-handed general triclinic box (i.e. solid-state crystal basis vectors) can be rotated in 3d around its origin in order to conform to the LAMMPS definition of a restricted triclinic box. See the discussion in the next sub-section about general triclinic simulation boxes in LAMMPS.

Note that the *thermo_style custom* command has keywords for outputting the various parameters that define the size and shape of orthogonal, restricted triclinic, and general triclinic simulation boxes.

For orthogonal boxes there 6 thermo keywords (xlo,ylo,zlo) and (xhi,yhi,zhi).

For restricted triclinic boxes there are 9 thermo keywords for (xlo,ylo,zlo), (xhi,yhi,zhi), and the (xy,xz,yz) tilt factors.

For general triclinic boxes there are 12 thermo keywords for (xlo,ylo,zhi) and the components of the **A**, **B**, **C** edge vectors, namely (avecx,avecy,avecz), (bvecx,bvecy,bvecz), and (cvecx,cvecy,cvecz),

The remainder of this doc page explains (a) how LAMMPS operates with general triclinic simulation boxes, (b) mathematical transformations between general and restricted triclinic boxes which may be useful when creating LAMMPS inputs or interpreting outputs for triclinic simulations, and (c) how LAMMPS uses tilt factors for restricted triclinic simulation boxes.

General triclinic simulation boxes in LAMMPS

LAMMPS allows specification of general triclinic simulation boxes with their atoms as a convenience for users who may be converting data from solid-state crystallographic representations or from DFT codes for input to LAMMPS. Likewise it allows output of dump files, data files, and thermodynamic data (e.g. pressure tensor) in a general triclinic format.

However internally, LAMMPS only uses restricted triclinic simulation boxes. This is for parallel efficiency and to formulate partitioning of the simulation box across processors, neighbor list building, and inter-processor communication of per-atom data with methods similar to those used for orthogonal boxes.

This means 4 things which are important to understand:

- Input of a general triclinic system is immediately converted to a restricted triclinic system.
- If output of per-atom data for a general triclinic system is requested (e.g. for atom coordinates in a dump file), conversion from a restricted to general triclinic system is done at the time of output.
- The conversion of the simulation box and per-atom data from general triclinic to restricted triclinic (and vice versa) is a 3d rotation operation around an origin, which is the lower left corner of the simulation box. This means an input data file for a general triclinic system should specify all per-atom quantities consistent with the general triclinic box and its orientation relative to the standard x,y,z coordinate axes. For example, atom coordinates should be inside the general triclinic simulation box defined by the edge vectors **A**, **B**, **C** and its origin. Likewise per-atom velocities should be in directions consistent with the general triclinic box orientation. E.g. a velocity vector which will be in the +x direction once LAMMPS converts from a general to restricted triclinic box, should be specified in the data file in the direction of the **A** edge vector. See the *read_data* doc page for info on all the per-atom vector quantities to which this rule applies when a data file for a general triclinic box is input.
- If commands such as *write_data* or *dump custom* are used to output general triclinic information, it is effectively the inverse of the operation described in the preceding bullet.
- Other LAMMPS commands such as *region* or *velocity* or *set*, operate on a restricted triclinic system even if a general triclinic system was defined initially.

This is the list of commands which have general triclinic options:

- *create_box* - define a general triclinic box
- *create_atoms* - add atoms to a general triclinic box
- *lattice* - define a custom lattice consistent with the **A**, **B**, **C** edge vectors of a general triclinic box
- *read_data* - read a data file for a general triclinic system
- *write_data* - write a data file for a general triclinic system
- *dump atom, dump custom* - output dump snapshots in general triclinic format
- *dump_modify triclinic/general* - select general triclinic format for dump output
- *thermo_style* - output the pressure tensor in general triclinic format
- *thermo_modify triclinic/general* - select general triclinic format for thermo output

- *read_restart* - read a restart file for a general triclinic system
- *write_restart* - write a restart file for a general triclinic system

---

Transformation from general to restricted triclinic boxes

Let **A**,**B**,**C** be the right-handed edge vectors of a general triclinic simulation box. The equivalent LAMMPS **a**,**b**,**c** for a restricted triclinic box are a 3d rotation of **A**, **B**, and **C** and can be computed as follows:

$$\begin{pmatrix}\mathbf{a} & \mathbf{b} & \mathbf{c}\end{pmatrix} = \begin{pmatrix} a_x & b_x & c_x \\ 0 & b_y & c_y \\ 0 & 0 & c_z \end{pmatrix}$$

$$\begin{aligned}
a_x =& A \\
b_x =& \mathbf{B} \cdot \hat{\mathbf{A}} &=& B\cos\gamma \\
b_y =& |\hat{\mathbf{A}} \times \mathbf{B}| &=& B\sin\gamma &=& \sqrt{B^2 - {b_x}^2} \\
c_x =& \mathbf{C} \cdot \hat{\mathbf{A}} &=& C\cos\beta \\
c_y =& \mathbf{C} \cdot \widehat{(\mathbf{A} \times \mathbf{B})} \times \hat{\mathbf{A}} &=& \frac{\mathbf{B}\cdot\mathbf{C} - b_x c_x}{b_y} \\
c_z =& |\mathbf{C} \cdot \widehat{(\mathbf{A} \times \mathbf{B})}| &=& \sqrt{C^2 - {c_x}^2 - {c_y}^2}
\end{aligned}$$

where A = | **A** | indicates the scalar length of **A**. The hat symbol (^) indicates the corresponding unit vector. β and γ are angles between the **A**, **B**, **C** vectors as described below.

For consistency, the same rotation applied to the triclinic box edge vectors can also be applied to atom positions, velocities, and other vector quantities. This can be conveniently achieved by first converting to fractional coordinates in the general triclinic coordinates and then converting to coordinates in the restricted triclinic basis. The transformation is given by the following equation:

$$\mathbf{x} = \begin{pmatrix}\mathbf{a} & \mathbf{b} & \mathbf{c}\end{pmatrix} \cdot \frac{1}{V} \begin{pmatrix} \mathbf{B}\times\mathbf{C} \\ \mathbf{C}\times\mathbf{A} \\ \mathbf{A}\times\mathbf{B} \end{pmatrix} \cdot \mathbf{X}$$

where V is the volume of the box (same in either basis), **X** is the fractional vector in the general triclinic basis and **x** is the resulting vector in the restricted triclinic basis.

Crystallographic general triclinic representation of a simulation box

General triclinic crystal structures are often defined using three lattice constants a, b, and c, and three angles α, β, and γ. Note that in this nomenclature, the a, b, and c lattice constants are the scalar lengths of the edge vectors **a**, **b**, and **c** defined above. The relationship between these 6 quantities (a, b, c, α, β, γ) and the LAMMPS restricted triclinic box sizes (lx,ly,lz) = (xhi-xlo,yhi-ylo,zhi-zlo) and tilt factors (xy,xz,yz) is as follows:

$$\begin{aligned}
a =& \mathrm{lx} \\
b^2 =& \mathrm{ly}^2 + \mathrm{xy}^2 \\
c^2 =& \mathrm{lz}^2 + \mathrm{xz}^2 + \mathrm{yz}^2 \\
\cos\alpha =& \frac{\mathrm{xy} * \mathrm{xz} + \mathrm{ly} * \mathrm{yz}}{b * c} \\
\cos\beta =& \frac{\mathrm{xz}}{c} \\
\cos\gamma =& \frac{\mathrm{xy}}{b}
\end{aligned}$$

The inverse relationship can be written as follows:

$$
\begin{aligned}
\mathrm{lx} &= a \\
\mathrm{xy} &= b \cos\gamma \\
\mathrm{xz} &= c \cos\beta \\
\mathrm{ly}^2 &= b^2 - \mathrm{xy}^2 \\
\mathrm{yz} &= \frac{b * c \cos\alpha - \mathrm{xy} * \mathrm{xz}}{\mathrm{ly}} \\
\mathrm{lz}^2 &= c^2 - \mathrm{xz}^2 - \mathrm{yz}^2
\end{aligned}
$$

The values of a, b, c, α , β, and γ can be printed out or accessed by computes using the *thermo_style custom* keywords *cella*, *cellb*, *cellc*, *cellalpha*, *cellbeta*, *cellgamma*, respectively.

Output of restricted and general triclinic boxes in a dump file

As discussed on the *dump* command doc page, when the BOX BOUNDS for a snapshot is written to a dump file for a restricted triclinic box, an orthogonal bounding box which encloses the triclinic simulation box is output, along with the 3 tilt factors (xy, xz, yz) of the restricted triclinic box, formatted as follows:

```
ITEM: BOX BOUNDS xy xz yz
xlo_bound xhi_bound xy
ylo_bound yhi_bound xz
zlo_bound zhi_bound yz
```

This bounding box is convenient for many visualization programs and is calculated from the 9 restricted triclinic box parameters (xlo,xhi,ylo,yhi,zlo,zhi,xy,xz,yz) as follows:

```
xlo_bound = xlo + MIN(0.0,xy,xz,xy+xz)
xhi_bound = xhi + MAX(0.0,xy,xz,xy+xz)
ylo_bound = ylo + MIN(0.0,yz)
yhi_bound = yhi + MAX(0.0,yz)
zlo_bound = zlo
zhi_bound = zhi
```

These formulas can be inverted if you need to convert the bounding box back into the restricted triclinic box parameters, e.g. xlo = xlo_bound - MIN(0.0,xy,xz,xy+xz).

Periodicity and tilt factors for triclinic simulation boxes

There is no requirement that a triclinic box be periodic in any dimension, though it typically should be in y or z if you wish to enforce a shift in coordinates due to periodic boundary conditions across the y or z boundaries. See the doc page for the *boundary* command for an explanation of shifted coordinates for restricted triclinic boxes which are periodic.

Some commands that work with triclinic boxes, e.g. the *fix deform* and *fix npt* commands, require periodicity or non-shrink-wrap boundary conditions in specific dimensions. See the command doc pages for details.

A restricted triclinic box can be defined with all 3 tilt factors = 0.0, so that it is initially orthogonal. This is necessary if the box will become non-orthogonal, e.g. due to use of the *fix npt* or *fix deform* commands. Alternatively, you can use the *change_box* command to convert a simulation box from orthogonal to restricted triclinic and vice versa.

> **Note**
>
> Highly tilted restricted triclinic simulation boxes can be computationally inefficient. This is due to the large volume of communication needed to acquire ghost atoms around a processor's irregular-shaped subdomain. For extreme values of tilt, LAMMPS may also lose atoms and generate an error.

LAMMPS will issue a warning if you define a restricted triclinic box with a tilt factor which skews the box more than half the distance of the parallel box length, which is the first dimension in the tilt factor (e.g. x for xz).

For example, if xlo = 2 and xhi = 12, then the x box length is 10 and the xy tilt factor should be between -5 and 5 to avoid the warning. Similarly, both xz and yz should be between -(xhi-xlo)/2 and +(yhi-ylo)/2. Note that these are not limitations, since if the maximum tilt factor is 5 (as in this example), then simulations boxes and atom configurations with tilt = . . . , -15, -5, 5, 15, 25, . . . are all geometrically equivalent.

If the box tilt exceeds this limit during a dynamics run (e.g. due to the *fix deform* command), then by default the box is "flipped" to an equivalent shape with a tilt factor within the warning bounds, and the run continues. See the *fix deform* page for further details. Box flips that would normally occur using the *fix deform* or *fix npt* commands can be suppressed using the *flip no* option with either of the commands.

One exception to box flipping is if the first dimension in the tilt factor (e.g. x for xy) is non-periodic. In that case, the limits on the tilt factor are not enforced, since flipping the box in that dimension would not change the atom positions due to non-periodicity. In this mode, if the system tilts to large angles, the simulation will simply become inefficient, due to the highly skewed simulation box.

10.2.4 Thermostats

Thermostatting means controlling the temperature of particles in an MD simulation. *Barostatting* means controlling the pressure. Since the pressure includes a kinetic component due to particle velocities, both these operations require calculation of the temperature. Typically a target temperature (T) and/or pressure (P) is specified by the user, and the thermostat or barostat attempts to equilibrate the system to the requested T and/or P.

Thermostatting in LAMMPS is performed by *fixes*, or in one case by a pair style. Several thermostatting fixes are available: Nose-Hoover (nvt), Berendsen, CSVR, Langevin, and direct rescaling (temp/rescale). Dissipative particle dynamics (DPD) thermostatting can be invoked via the *dpd/tstat* pair style:

- *fix nvt*
- *fix nvt/sphere*
- *fix nvt/asphere*
- *fix nvt/sllod*
- *fix temp/berendsen*
- *fix temp/csvr*
- *fix ffl*
- *fix gjf*
- *fix gld*
- *fix gle*
- *fix langevin*
- *fix temp/rescale*
- *pair_style dpd/tstat*
- *pair_style dpd/ext/tstat*

Fix nvt only thermostats the translational velocity of particles. *Fix nvt/sllod* also does this, except that it subtracts out a velocity bias due to a deforming box and integrates the SLLOD equations of motion. See the *Howto nemd* page for further details. *Fix nvt/sphere* and *fix nvt/asphere* thermostat not only translation velocities but also rotational velocities for spherical and aspherical particles.

Note

A recent (2017) book by *(Daivis and Todd)* discusses use of the SLLOD method and non-equilibrium MD (NEMD) thermostatting generally, for both simple and complex fluids, e.g. molecular systems. The latter can be tricky to do correctly.

DPD thermostatting alters pairwise interactions in a manner analogous to the per-particle thermostatting of *fix langevin*.

Any of the thermostatting fixes can be instructed to use custom temperature computes that remove bias which has two effects: first, the current calculated temperature, which is compared to the requested target temperature, is calculated with the velocity bias removed; second, the thermostat adjusts only the thermal temperature component of the particle's velocities, which are the velocities with the bias removed. The removed bias is then added back to the adjusted velocities. See the doc pages for the individual fixes and for the *fix_modify* command for instructions on how to assign a temperature compute to a thermostatting fix.

For example, you can apply a thermostat only to atoms in a spatial region by using it in conjunction with *compute temp/region*. Or you can apply a thermostat to only the x and z components of velocity by using it with *compute temp/partial*. Of you could thermostat only the thermal temperature of a streaming flow of particles without affecting the streaming velocity, by using *compute temp/profile*.

Below is a list of custom temperature computes that can be used like that:

- *compute temp/asphere command*
- *compute temp/body command*
- *compute temp/chunk command*
- *compute temp/com command*
- *compute temp/deform command*
- *compute temp/partial command*
- *compute temp/profile command*
- *compute temp/ramp command*
- *compute temp/region command*
- *compute temp/rotate command*
- *compute temp/sphere command*

Note

Not all thermostat fixes perform time integration, meaning they update the velocities and positions of particles due to forces and velocities respectively. The other thermostat fixes only adjust velocities; they do NOT perform time integration updates. Thus, they should be used in conjunction with a constant NVE integration fix such as these:

- *fix nve*
- *fix nve/sphere*
- *fix nve/asphere*

Thermodynamic output, which can be setup via the *thermo_style* command, often includes temperature values. As explained on the page for the *thermo_style* command, the default temperature is setup by the thermo command itself. It is NOT the temperature associated with any thermostatting fix you have defined or with any compute you have defined that calculates a temperature. The doc pages for the thermostatting fixes explain the ID of the temperature compute they create. Thus if you want to view these temperatures, you need to specify them explicitly via the *thermo_style custom* command. Or you can use the *thermo_modify* command to re-define what temperature compute is used for default thermodynamic output.

(Daivis and Todd) Daivis and Todd, Nonequilibrium Molecular Dynamics (book), Cambridge University Press, https://doi.org/10.1017/9781139017848, (2017).

10.2.5 Barostats

Barostatting means controlling the pressure in an MD simulation. *Thermostatting* means controlling the temperature of the particles. Since the pressure includes a kinetic component due to particle velocities, both these operations require calculation of the temperature. Typically a target temperature (T) and/or pressure (P) is specified by the user, and the thermostat or barostat attempts to equilibrate the system to the requested T and/or P.

Barostatting in LAMMPS is performed by *fixes*. Three barostatting methods are currently available: Nose-Hoover (npt and nph), Berendsen, and various linear controllers in deform/pressure:

- *fix npt*
- *fix npt/sphere*
- *fix npt/asphere*
- *fix nph*
- *fix press/berendsen*
- *fix deform/pressure*

The *fix npt* commands include a Nose-Hoover thermostat and barostat. *Fix nph* is just a Nose/Hoover barostat; it does no thermostatting. The fixes *nph*, *press/berendsen*, and *deform/pressure* can be used in conjunction with any of the thermostatting fixes.

As with the *thermostats*, *fix npt* and *fix nph* only use translational motion of the particles in computing T and P and performing thermo/barostatting. *Fix npt/sphere* and *fix npt/asphere* thermo/barostat using not only translation velocities but also rotational velocities for spherical and aspherical particles.

All of the barostatting fixes use the *compute pressure* compute to calculate a current pressure. By default, this compute is created with a simple *compute temp* (see the last argument of the *compute pressure* command), which is used to calculated the kinetic component of the pressure. The barostatting fixes can also use temperature computes that remove bias for the purpose of computing the kinetic component which contributes to the current pressure. See the doc pages for the individual fixes and for the *fix_modify* command for instructions on how to assign a temperature or pressure compute to a barostatting fix.

> **Note**
>
> As with the thermostats, the Nose/Hoover methods (*fix npt* and *fix nph*) perform time integration. *Fix press/berendsen* and *fix deform/pressure* do NOT, so they should be used with one of the constant NVE fixes or with one of the NVT fixes.

Thermodynamic output, which can be setup via the *thermo_style* command, often includes pressure values. As explained on the page for the *thermo_style* command, the default pressure is setup by the thermo command itself. It is NOT the pressure associated with any barostatting fix you have defined or with any compute you have defined that

calculates a pressure. The doc pages for the barostatting fixes explain the ID of the pressure compute they create. Thus if you want to view these pressures, you need to specify them explicitly via the *thermo_style custom* command. Or you can use the *thermo_modify* command to re-define what pressure compute is used for default thermodynamic output.

10.2.6 Walls

Walls in an MD simulation are typically used to bound particle motion, i.e. to serve as a boundary condition.

Walls in LAMMPS can be of rough (made of particles) or idealized surfaces. Ideal walls can be smooth, generating forces only in the normal direction, or frictional, generating forces also in the tangential direction.

Rough walls, built of particles, can be created in various ways. The particles themselves can be generated like any other particle, via the *lattice* and *create_atoms* commands, or read in via the *read_data* command.

Their motion can be constrained by many different commands, so that they do not move at all, move together as a group at constant velocity or in response to a net force acting on them, move in a prescribed fashion (e.g. rotate around a point), etc. Note that if a time integration fix like *fix nve* or *fix nvt* is not used with the group that contains wall particles, their positions and velocities will not be updated.

- *fix aveforce* - set force on particles to average value, so they move together
- *fix setforce* - set force on particles to a value, e.g. 0.0
- *fix freeze* - freeze particles for use as granular walls
- *fix nve/noforce* - advect particles by their velocity, but without force
- *fix move* - prescribe motion of particles by a linear velocity, oscillation, rotation, variable

The *fix move* command offers the most generality, since the motion of individual particles can be specified with *variable* formula which depends on time and/or the particle position.

For rough walls, it may be useful to turn off pairwise interactions between wall particles via the *neigh_modify exclude* command.

Rough walls can also be created by specifying frozen particles that do not move and do not interact with mobile particles, and then tethering other particles to the fixed particles, via a *bond*. The bonded particles do interact with other mobile particles.

Idealized walls can be specified via several fix commands. *Fix wall/gran* creates frictional walls for use with granular particles; all the other commands create smooth walls.

- *fix wall/reflect* - reflective flat walls
- *fix wall/lj93* - flat walls, with Lennard-Jones 9/3 potential
- *fix wall/lj126* - flat walls, with Lennard-Jones 12/6 potential
- *fix wall/colloid* - flat walls, with *pair_style colloid* potential
- *fix wall/harmonic* - flat walls, with repulsive harmonic spring potential
- *fix wall/morse* - flat walls, with Morse potential
- *fix wall/region* - use region surface as wall
- *fix wall/gran* - flat or curved walls with *pair_style granular* potential

The *lj93*, *lj126*, *colloid*, *harmonic*, and *morse* styles all allow the flat walls to move with a constant velocity, or oscillate in time. The *fix wall/region* command offers the most generality, since the region surface is treated as a wall, and the geometry of the region can be a simple primitive volume (e.g. a sphere, or cube, or plane), or a complex volume made from the union and intersection of primitive volumes. *Regions* can also specify a volume "interior" or "exterior" to the specified primitive shape or *union* or *intersection*. *Regions* can also be "dynamic" meaning they move with constant velocity, oscillate, or rotate.

The only frictional idealized walls currently in LAMMPS are flat or curved surfaces specified by the *fix wall/gran* command. At some point we plan to allow region surfaces to be used as frictional walls, as well as triangulated surfaces.

10.2.7 NEMD simulations

Non-equilibrium molecular dynamics or NEMD simulations are typically used to measure a fluid's rheological properties such as viscosity. In LAMMPS, such simulations can be performed by first setting up a non-orthogonal simulation box (see the preceding Howto section).

A shear strain can be applied to the simulation box at a desired strain rate by using the *fix deform* command. The *fix nvt/sllod* command can be used to thermostat the sheared fluid and integrate the SLLOD equations of motion for the system. Fix nvt/sllod uses *compute temp/deform* to compute a thermal temperature by subtracting out the streaming velocity of the shearing atoms. The velocity profile or other properties of the fluid can be monitored via the *fix ave/chunk* command.

Note

A recent (2017) book by *(Daivis and Todd)* discusses use of the SLLOD method and non-equilibrium MD (NEMD) thermostatting generally, for both simple and complex fluids, e.g. molecular systems. The latter can be tricky to do correctly.

As discussed in the previous section on non-orthogonal simulation boxes, the amount of tilt or skew that can be applied is limited by LAMMPS for computational efficiency to be 1/2 of the parallel box length. However, *fix deform* can continuously strain a box by an arbitrary amount. As discussed in the *fix deform* command, when the tilt value reaches a limit, the box is flipped to the opposite limit which is an equivalent tiling of periodic space. The strain rate can then continue to change as before. In a long NEMD simulation these box re-shaping events may occur many times.

In a NEMD simulation, the "remap" option of *fix deform* should be set to "remap v", since that is what *fix nvt/sllod* assumes to generate a velocity profile consistent with the applied shear strain rate.

An alternative method for calculating viscosities is provided via the *fix viscosity* command.

NEMD simulations can also be used to measure transport properties of a fluid through a pore or channel. Simulations of steady-state flow can be performed using the *fix flow/gauss* command.

(Daivis and Todd) Daivis and Todd, Nonequilibrium Molecular Dynamics (book), Cambridge University Press, https://doi.org/10.1017/9781139017848, (2017).

10.2.8 Long-range dispersion settings

The PPPM method computes interactions by splitting the pair potential into two parts, one of which is computed in a normal pairwise fashion, the so-called real-space part, and one of which is computed using the Fourier transform, the so called reciprocal-space or kspace part. For both parts, the potential is not computed exactly but is approximated. Thus, there is an error in both parts of the computation, the real-space and the kspace error. The just mentioned facts are true both for the PPPM for Coulomb as well as dispersion interactions. The deciding difference - and also the reason why the parameters for pppm/disp have to be selected with more care - is the impact of the errors on the results: The kspace error of the PPPM for Coulomb and dispersion interaction and the real-space error of the PPPM for Coulomb interaction have the character of noise. In contrast, the real-space error of the PPPM for dispersion has a clear physical interpretation: the underprediction of cohesion. As a consequence, the real-space error has a much stronger effect than the kspace error on simulation results for pppm/disp. Parameters must thus be chosen in a way that this error is much smaller than the kspace error.

When using pppm/disp and not making any specifications on the PPPM parameters via the kspace modify command, parameters will be tuned such that the real-space error and the kspace error are equal. This will result in simulations

that are either inaccurate or slow, both of which is not desirable. For selecting parameters for the pppm/disp that provide fast and accurate simulations, there are two approaches, which both have their up- and downsides.

The first approach is to set desired real-space an kspace accuracies via the *kspace_modify force/disp/real* and *kspace_modify force/disp/kspace* commands. Note that the accuracies have to be specified in force units and are thus dependent on the chosen unit settings. For real units, 0.0001 and 0.002 seem to provide reasonable accurate and efficient computations for the real-space and kspace accuracies. 0.002 and 0.05 work well for most systems using lj units. PPPM parameters will be generated based on the desired accuracies. The upside of this approach is that it usually provides a good set of parameters and will work for both the *kspace_modify diff ad* and *kspace_modify diff ik* options. The downside of the method is that setting the PPPM parameters will take some time during the initialization of the simulation.

The second approach is to set the parameters for the pppm/disp explicitly using the *kspace_modify mesh/disp*, *kspace_modify order/disp*, and *kspace_modify gewald/disp* commands. This approach requires a more experienced user who understands well the impact of the choice of parameters on the simulation accuracy and performance. This approach provides a fast initialization of the simulation. However, it is sensitive to errors: A combination of parameters that will perform well for one system might result in far-from-optimal conditions for other simulations. For example, parameters that provide accurate and fast computations for all-atomistic force fields can provide insufficient accuracy or united-atomistic force fields (which is related to that the latter typically have larger dispersion coefficients).

To avoid inaccurate or inefficient simulations, the pppm/disp stops simulations with an error message if no action is taken to control the PPPM parameters. If the automatic parameter generation is desired and real-space and kspace accuracies are desired to be equal, this error message can be suppressed using the *kspace_modify disp/auto yes* command.

A reasonable approach that combines the upsides of both methods is to make the first run using the *kspace_modify force/disp/real* and *kspace_modify force/disp/kspace* commands, write down the PPPM parameters from the output, and specify these parameters using the second approach in subsequent runs (which have the same composition, force field, and approximately the same volume).

Concerning the performance of the pppm/disp there are two more things to consider. The first is that when using the pppm/disp, the cutoff parameter does no longer affect the accuracy of the simulation (subject to that gewald/disp is adjusted when changing the cutoff). The performance can thus be increased by examining different values for the cutoff parameter. A lower bound for the cutoff is only set by the truncation error of the repulsive term of pair potentials.

The second is that the mixing rule of the pair style has an impact on the computation time when using the pppm/disp. Fastest computations are achieved when using the geometric mixing rule. Using the arithmetic mixing rule substantially increases the computational cost. The computational overhead can be reduced using the *kspace_modify mix/disp geom* and *kspace_modify splittol* commands. The first command simply enforces geometric mixing of the dispersion coefficients in kspace computations. This introduces some error in the computations but will also significantly speed-up the simulations. The second keyword sets the accuracy with which the dispersion coefficients are approximated using a matrix factorization approach. This may result in better accuracy then using the first command, but will usually also not provide an equally good increase of efficiency.

Finally, pppm/disp can also be used when no mixing rules apply. This can be achieved using the *kspace_modify mix/disp none* command. Note that the code does not check automatically whether any mixing rule is fulfilled. If mixing rules do not apply, the user will have to specify this command explicitly.

10.2.9 Convert bulk system to slab

A regularly encountered simulation problem is how to convert a bulk system that has been run for a while to equilibrate into a slab system with some vacuum space and free surfaces. The challenge here is that one cannot just change the box dimensions with the *change_box command* or edit the box boundaries in a data file because some atoms will have non-zero image flags from diffusing around.

Changing the box dimensions results in an undesired displacement of those atoms, since the image flags indicate how many times the box length in x-, y-, or z-direction needs to be added or subtracted to get the "unwrapped" coordinates. By changing the box dimension this distance is changed and thus those atoms move unphysically relative to their

neighbors with zero image flags. Setting image flags forcibly to zero creates problems because that could break apart molecules by having one atom of a bond on the top of the system and the other at the bottom.

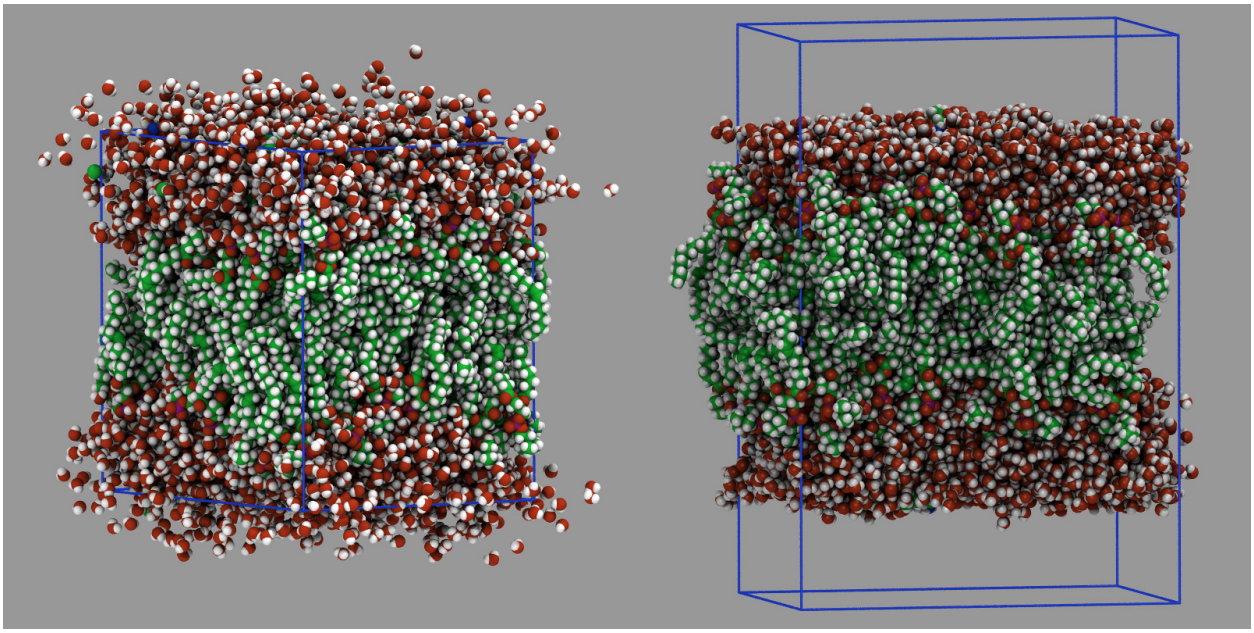

Fig. 1: Snapshots of the bulk Rhodopsin in lipid layer and water system (right) and the generated slab geometry (left)

Disclaimer

The following workflow will work for many bulk systems, but not all. Some systems cannot be converted (e.g. polymers with bonds to the same molecule across periodic boundaries, sometimes called "infinite polymers"). The amount of vacuum that needs to be added depends on the length of the molecules where the system is split (the example here splits where there is water with short molecules). In some cases, the system may need to be re-centered in the box first using the *displace_atoms command*. Also, the time spent on strong thermalization and equilibration will depend on the specific system and its thermodynamic conditions.

Below is a suggested workflow using the *Rhodopsin benchmark input* for demonstration. The figure shows the state *before* the procedure on the left (with unwrapped atoms that have diffused out of the box) and *after* on the right (with the vacuum added above and below). The procedure is implemented by modifying a copy of the in.rhodo input file. The first lines up to and including the *read_data command* remain unchanged. Then we insert the following lines to add vacuum to the z direction above and below the system:

```
variable       delta index 10.0
reset_atoms    image all
write_dump     all custom rhodo-unwrap.lammpstrj id xu yu zu
change_box     all z final $(zlo-2.0*v_delta) $(zhi+2.0*v_delta) &
               boundary p p f
read_dump      rhodo-unwrap.lammpstrj 0 x y z box no replace yes
kspace_modify  slab 3.0
```

Specifically, the *variable delta* (set to 10.0) represents a distance that determines the amount of vacuum added: we add twice its value in each direction to the z-dimension; thus in total 40Å get added. The *reset_atoms image all* command shall reset any image flags to become either 0 or ± 1 and thus have the minimum distance from the center of the simulation box, but the correct relative distance for bonded atoms.

The *write_dump command* then writes out the resulting *unwrapped* coordinates of the system. After expanding the box, coordinates that were outside the box should now be inside and the unwrapped coordinates will become "wrapped", while atoms outside the periodic boundaries will be wrapped back into the box and their image flags in those directions restored.

The *change_box command* adds the desired distance to the low and high box boundary in z-direction and then changes the *boundary to "p p f"* which will force the image flags in z-direction to zero and create an undesired displacement for the atoms with non-zero image flags.

With the *read_dump command* we read back and replace partially incorrect coordinates with the previously saved, unwrapped coordinates. It is important to ignore the box dimensions stored in the dump file. We want to preserve the expanded box. Finally, we turn on the slab correction for the PPPM long-range solver with the *kspace_modify command* as required when using a long range Coulomb solver for non-periodic z-dimension.

Next we replace the *fix npt command* with:

```
fix           2 nvt temp 300.0 300.0 10.0
```

We now have an open system and thus the adjustment of the cell in z-direction is no longer required. Since splitting the bulk water region where the vacuum is inserted, creates surface atoms with high potential energy, we reduce the thermostat time constant from 100.0 to 10.0 to remove excess kinetic energy resulting from that change faster.

Also the high potential energy of the surface atoms can cause that some of them are ejected from the slab. In order to suppress that, we add soft harmonic walls to push back any atoms that want to leave the slab. To determine the position of the wall, we first need to to determine the extent of the atoms in z-direction and then place the harmonic walls based on that information:

```
compute         zmin all reduce min z
compute         zmax all reduce max z
thermo_style    custom zlo c_zmin zhi c_zmax
run             0 post no
fix             3 all wall/harmonic zhi $(c_zmax+v_delta) 10.0 0.0 ${delta} &
                                zlo $(c_zmin-v_delta) 10.0 0.0 ${delta}
```

The two *compute reduce* command determine the minimum and maximum z-coordinate across all atoms. In order to trigger the execution of the compute commands we need to "consume" them. This is done with the *thermo_style custom* command followed by the *run 0* command. This avoids and error accessing the min/max values determined by the compute commands to compute the location of the wall in lower and upper direction. This uses the previously defined *delta* variable to determine the distance of the wall from the extent of the system and the cutoff for the wall interaction. This way only atoms that move beyond the min/max values in z-direction will experience a restoring force, nudging them back to the slab. The force constant of $10.0 \frac{\text{kcal/mol}}{\text{Å}}$ was determined empirically.

Adding these "restoring" soft walls assist in making the free surfaces above and below the slab flat, instead of having rugged or ondulated surfaces. The impact of the walls can be changed by adjusting the force constant, cutoff, and position of the wall.

Finally, we replace the *run 100* of the original input with:

```
run             1000 post no

unfix           3
fix             2 all nvt temp 300.0 300.0 100.0
run             1000 post no

write_data      data.rhodo-slab
```

This runs the system converted to a slab first for 1000 MD steps using the walls and stronger Nose-Hoover thermostat.

Then the walls are removed with *unfix 3* and the thermostat time constant reset to 100.0 and the system run for another 1000 steps. Finally the resulting slab geometry is written to a new data file data.rhodo-slab with a *write_data command*. The number of MD steps required to reach a proper equilibrium state is very likely larger. The number of 1000 steps (corresponding to 2 picoseconds) was chosen for demonstration purposes, so that the procedure can be easily and quickly tested.

10.3 Analysis howto

10.3.1 Output from LAMMPS (thermo, dumps, computes, fixes, variables)

There are four basic forms of LAMMPS output:

- *Thermodynamic output*, which is a list of quantities printed every few timesteps to the screen and logfile.
- *Dump files*, which contain snapshots of atoms and various per-atom values and are written at a specified frequency.
- Certain fixes can output user-specified quantities to files: *fix ave/time* for time averaging, *fix ave/chunk* for spatial or other averaging, and *fix print* for single-line output of *variables*. Fix print can also output to the screen.
- *Restart files*.

A simulation prints one set of thermodynamic output and (optionally) restart files. It can generate any number of dump files and fix output files, depending on what *dump* and *fix* commands you specify.

As discussed below, LAMMPS gives you a variety of ways to determine what quantities are calculated and printed when the thermodynamics, dump, or fix commands listed above perform output. Throughout this discussion, note that users can also *add their own computes and fixes to LAMMPS* which can generate values that can then be output with these commands.

The following subsections discuss different LAMMPS commands related to output and the kind of data they operate on and produce:

- *Global/per-atom/local/per-grid data*
- *Scalar/vector/array data*
- *Disambiguation*
- *Thermodynamic output*
- *Dump file output*
- *Fixes that write output files*
- *Computes that process output quantities*
- *Fixes that process output quantities*
- *Computes that generate values to output*
- *Fixes that generate values to output*
- *Variables that generate values to output*
- *Summary table of output options and data flow between commands*

Global/per-atom/local/per-grid data

Various output-related commands work with four different "styles" of data: global, per-atom, local, and per-grid. A global datum is one or more system-wide values, e.g. the temperature of the system. A per-atom datum is one or more values per atom, e.g. the kinetic energy of each atom. Local datums are calculated by each processor based on the atoms it owns, and there may be zero or more per atom, e.g. a list of bond distances.

A per-grid datum is one or more values per grid cell, for a grid which overlays the simulation domain. Similar to atoms and per-atom data, the grid cells and the data they store are distributed across processors; each processor owns the grid cells whose center points fall within its subdomain.

Scalar/vector/array data

Global, per-atom, local, and per-grid datums can come in three "kinds": a single scalar value, a vector of values, or a 2d array of values. More specifically these are the valid kinds for each style:

- global scalar
- global vector
- global array
- per-atom vector
- per-atom array
- local vector
- local array
- per-grid vector
- per-grid array

A per-atom vector means a single value per atom; the "vector" is the length of the number of atoms. A per-atom array means multiple values per atom. Similarly a local vector or array means one or multiple values per entity (e.g. per bond in the system). And a per-grid vector or array means one or multiple values per grid cell.

The doc page for a compute or fix or variable that generates data will specify both the styles and kinds of data it produces, e.g. a per-atom vector. Note that a compute or fix may generate multiple styles and kinds of output. However, for per-atom data only a vector or array is output, never both. Likewise for per-local and per-grid data. An example of a fix which generates multiple styles and kinds of data is the *fix mdi/qm* command. It outputs a global scalar, global vector, and per-atom array for the quantum mechanical energy and virial of the system and forces on each atom.

By contrast, different variable styles generate only a single kind of data: a global scalar for an equal-style variable, global vector for a vector-style variable, and a per-atom vector for an atom-style variable.

When data is accessed by another command, as in many of the output commands discussed below, it can be referenced via the following bracket notation, where ID in this case is the ID of a compute. The leading "c_" would be replaced by "f_" for a fix, or "v_" for a variable (and ID would be the name of the variable):

c_ID	entire scalar, vector, or array
c_ID[I]	one element of vector, one column of array
c_ID[I][J]	one element of array

Note that using one bracket reduces the dimension of the data once (vector -> scalar, array -> vector). Using two brackets reduces the dimension twice (array -> scalar). Thus a command that uses scalar values as input can also conceptually operate on an element of a vector or array.

Per-grid vectors or arrays are accessed similarly, except that the ID for the compute or fix includes a grid name and a data name. This is because a fix or compute can create multiple grids (of different sizes) and multiple sets of data (for each grid). The fix or compute defines names for each grid and for each data set, so that all of them can be accessed by other commands. See the *Howto grid* doc page for more details.

Disambiguation

When a compute or fix produces data in multiple styles, e.g. global and per-atom, a reference to the data can sometimes be ambiguous. Usually the context in which the input script references the data determines which style is meant.

For example, if a compute outputs a global vector and a per-atom array, an element of the global vector will be accessed by using c_ID[I] in *thermodynamic output*, while a column of the per-atom array will be accessed by using c_ID[I] in a *dump custom* command.

However, if a *atom-style variable* references c_ID[I], then it could be intended to refer to a single element of the global vector or a column of the per-atom array. The doc page for any command that has a potential ambiguity (variables are the most common) will explain how to resolve the ambiguity.

In this case, an atom-style variables references per-atom data if it exists. If access to an element of a global vector is needed (as in this example), an equal-style variable which references the value can be defined and used in the atom-style variable formula instead.

Similarly, *thermodynamic output* can only reference global data from a compute or fix. But you can indirectly access per-atom data as follows. The reference c_ID[245][2] for the ID of a *compute displace/atom* command, refers to the y-component of displacement for the atom with ID 245. While you cannot use that reference directly in the *thermo_style* command, you can use it an equal-style variable formula, and then reference the variable in thermodynamic output.

Thermodynamic output

The frequency and format of thermodynamic output is set by the *thermo*, *thermo_style*, and *thermo_modify* commands. The *thermo_style* command also specifies what values are calculated and written out. Pre-defined keywords can be specified (e.g. press, etotal, etc). Three additional kinds of keywords can also be specified (c_ID, f_ID, v_name), where a *compute* or *fix* or *variable* provides the value to be output. In each case, the compute, fix, or variable must generate global values for input to the *thermo_style custom* command.

Note that thermodynamic output values can be "extensive" or "intensive". The former scale with the number of atoms in the system (e.g. total energy), the latter do not (e.g. temperature). The setting for *thermo_modify norm* determines whether extensive quantities are normalized or not. Computes and fixes produce either extensive or intensive values; see their individual doc pages for details. *Equal-style variables* produce only intensive values; you can include a division by "natoms" in the formula if desired, to make an extensive calculation produce an intensive result.

Dump file output

Dump file output is specified by the *dump* and *dump_modify* commands. There are several pre-defined formats (dump atom, dump xtc, etc).

There is also a *dump custom* format where the user specifies what values are output with each atom. Pre-defined atom attributes can be specified (id, x, fx, etc). Three additional kinds of keywords can also be specified (c_ID, f_ID, v_name), where a *compute* or *fix* or *variable* provides the values to be output. In each case, the compute, fix, or variable must generate per-atom values for input to the *dump custom* command.

There is also a *dump local* format where the user specifies what local values to output. A pre-defined index keyword can be specified to enumerate the local values. Two additional kinds of keywords can also be specified (c_ID, f_ID), where a *compute* or *fix* or *variable* provides the values to be output. In each case, the compute or fix must generate local values for input to the *dump local* command.

There is also a *dump grid* format where the user specifies what per-grid values to output from computes or fixes that generate per-grid data.

Fixes that write output files

Several fixes take various quantities as input and can write output files: *fix ave/time*, *fix ave/chunk*, *fix ave/histo*, *fix ave/correlate*, and *fix print*.

The *fix ave/time* command enables direct output to a file and/or time-averaging of global scalars or vectors. The user specifies one or more quantities as input. These can be global *compute* values, global *fix* values, or *variables* of any style except the atom style which produces per-atom values. Since a variable can refer to keywords used by the *thermo_style custom* command (like temp or press) and individual per-atom values, a wide variety of quantities can be time averaged and/or output in this way. If the inputs are one or more scalar values, then the fix generate a global scalar or vector of output. If the inputs are one or more vector values, then the fix generates a global vector or array of output. The time-averaged output of this fix can also be used as input to other output commands.

The *fix ave/chunk* command enables direct output to a file of chunk-averaged per-atom quantities like those output in dump files. Chunks can represent spatial bins or other collections of atoms, e.g. individual molecules. The per-atom quantities can be atom density (mass or number) or atom attributes such as position, velocity, force. They can also be per-atom quantities calculated by a *compute*, by a *fix*, or by an atom-style *variable*. The chunk-averaged output of this fix is global and can also be used as input to other output commands.

Note that the *fix ave/grid* command can also average the same per-atom quantities within spatial bins, but it does this for a distributed grid whose grid cells are owned by different processors. It outputs per-grid data, not global data, so it is more efficient for large numbers of averaging bins.

The *fix ave/histo* command enables direct output to a file of histogrammed quantities, which can be global or per-atom or local quantities. The histogram output of this fix can also be used as input to other output commands.

The *fix ave/correlate* command enables direct output to a file of time-correlated quantities, which can be global values. The correlation matrix output of this fix can also be used as input to other output commands.

The *fix print* command can generate a line of output written to the screen and log file or to a separate file, periodically during a running simulation. The line can contain one or more *variable* values for any style variable except the vector or atom styles). As explained above, variables themselves can contain references to global values generated by *thermodynamic keywords*, *computes*, *fixes*, or other *variables*, or to per-atom values for a specific atom. Thus the *fix print* command is a means to output a wide variety of quantities separate from normal thermodynamic or dump file output.

Computes that process output quantities

The *compute reduce* and *compute reduce/region* commands take one or more per-atom or local vector quantities as inputs and "reduce" them (sum, min, max, ave) to scalar quantities. These are produced as output values which can be used as input to other output commands.

The *compute slice* command take one or more global vector or array quantities as inputs and extracts a subset of their values to create a new vector or array. These are produced as output values which can be used as input to other output commands.

The *compute property/atom* command takes a list of one or more pre-defined atom attributes (id, x, fx, etc) and stores the values in a per-atom vector or array. These are produced as output values which can be used as input to other output commands. The list of atom attributes is the same as for the *dump custom* command.

The *compute property/local* command takes a list of one or more pre-defined local attributes (bond info, angle info, etc) and stores the values in a local vector or array. These are produced as output values which can be used as input to other output commands.

The *compute property/grid* command takes a list of one or more pre-defined per-grid attributes (id, grid cell coords, etc) and stores the values in a per-grid vector or array. These are produced as output values which can be used as input to the *dump grid* command.

The *compute property/chunk* command takes a list of one or more pre-defined chunk attributes (id, count, coords for spatial bins) and stores the values in a global vector or array. These are produced as output values which can be used as input to other output commands.

Fixes that process output quantities

The *fix vector* command can create global vectors as output from global scalars as input, accumulating them one element at a time.

The *fix ave/atom* command performs time-averaging of per-atom vectors. The per-atom quantities can be atom attributes such as position, velocity, force. They can also be per-atom quantities calculated by a *compute*, by a *fix*, or by an atom-style *variable*. The time-averaged per-atom output of this fix can be used as input to other output commands.

The *fix store/state* command can archive one or more per-atom attributes at a particular time, so that the old values can be used in a future calculation or output. The list of atom attributes is the same as for the *dump custom* command, including per-atom quantities calculated by a *compute*, by a *fix*, or by an atom-style *variable*. The output of this fix can be used as input to other output commands.

The *fix ave/grid* command performs time-averaging of either per-atom or per-grid data.

For per-atom data it performs averaging for the atoms within each grid cell, similar to the *fix ave/chunk* command when its chunks are defined as regular 2d or 3d bins. The per-atom quantities can be atom density (mass or number) or atom attributes such as position, velocity, force. They can also be per-atom quantities calculated by a *compute*, by a *fix*, or by an atom-style *variable*.

The chief difference between the *fix ave/grid* and *fix ave/chunk* commands when used in this context is that the former uses a distributed grid, while the latter uses a global grid. Distributed means that each processor owns the subset of grid cells within its subdomain. Global means that each processor owns a copy of the entire grid. The *fix ave/grid* command is thus more efficient for large grids.

For per-grid data, the *fix ave/grid* command takes inputs for grid data produced by other computes or fixes and averages the values for each grid point over time.

Computes that generate values to output

Every *compute* in LAMMPS produces either global or per-atom or local or per-grid values. The values can be scalars or vectors or arrays of data. These values can be output using the other commands described in this section. The page for each compute command describes what it produces. Computes that produce per-atom or local or per-grid values have the word "atom" or "local" or "grid as the last word in their style name. Computes without the word "atom" or "local" or "grid" produce global values.

Fixes that generate values to output

Some *fixes* in LAMMPS produces either global or per-atom or local or per-grid values which can be accessed by other commands. The values can be scalars or vectors or arrays of data. These values can be output using the other commands described in this section. The page for each fix command tells whether it produces any output quantities and describes them.

Variables that generate values to output

Variables defined in an input script can store one or more strings. But equal-style, vector-style, and atom-style or atomfile-style variables generate a global scalar value, global vector or values, or a per-atom vector, respectively, when accessed. The formulas used to define these variables can contain references to the thermodynamic keywords and to global and per-atom data generated by computes, fixes, and other variables. The values generated by variables can be used as input to and thus output by the other commands described in this section.

Per-grid variables have not (yet) been implemented.

Summary table of output options and data flow between commands

This table summarizes the various commands that can be used for generating output from LAMMPS. Each command produces output data of some kind and/or writes data to a file. Most of the commands can take data from other commands as input. Thus you can link many of these commands together in pipeline form, where data produced by one command is used as input to another command and eventually written to the screen or to a file. Note that to hook two commands together the output and input data types must match, e.g. global/per-atom/local data and scalar/vector/array data.

Also note that, as described above, when a command takes a scalar as input, that could also be an element of a vector or array. Likewise a vector input could be a column of an array.

Command	Input	Output
thermo_style custom	global scalars	screen, log file
dump custom	per-atom vectors	dump file
dump local	local vectors	dump file
dump grid	per-grid vectors	dump file
fix print	global scalar from variable	screen, file
print	global scalar from variable	screen
computes	N/A	global/per-atom/local/per-grid scalar/vector/array
fixes	N/A	global/per-atom/local/per-grid scalar/vector/array
variables	global scalars and vectors, per-atom vectors	global scalar and vector, per-atom vector
compute reduce	per-atom/local vectors	global scalar/vector
compute slice	global vectors/arrays	global vector/array
compute property/atom	N/A	per-atom vector/array
compute property/local	N/A	local vector/array
compute property/grid	N/A	per-grid vector/array
compute property/chunk	N/A	global vector/array
fix vector	global scalars	global vector
fix ave/atom	per-atom vectors	per-atom vector/array
fix ave/time	global scalars/vectors	global scalar/vector/array, file
fix ave/chunk	per-atom vectors	global array, file
fix ave/grid	per-atom vectors or per-grid vectors	per-grid vector/array
fix ave/histo	global/per-atom/local scalars and vectors	global array, file
fix ave/correlate	global scalars	global array, file
fix store/state	per-atom vectors	per-atom vector/array

10.3.2 Use chunks to calculate system properties

In LAMMPS, "chunks" are collections of atoms, as defined by the *compute chunk/atom* command, which assigns each atom to a chunk ID (or to no chunk at all). The number of chunks and the assignment of chunk IDs to atoms can be static or change over time. Examples of "chunks" are molecules or spatial bins or atoms with similar values (e.g. coordination number or potential energy).

The per-atom chunk IDs can be used as input to two other kinds of commands, to calculate various properties of a system:

- *fix ave/chunk*
- any of the *compute */chunk* commands

Here a brief overview for each of the 4 kinds of chunk-related commands is provided. Then some examples are given of how to compute different properties with chunk commands.

Compute chunk/atom command:

This compute can assign atoms to chunks of various styles. Only atoms in the specified group and optional specified region are assigned to a chunk. Here are some possible chunk definitions:

atoms in same molecule	chunk ID = molecule ID
atoms of same atom type	chunk ID = atom type
all atoms with same atom property (charge, radius, etc)	chunk ID = output of compute property/atom
atoms in same cluster	chunk ID = output of *compute cluster/atom* command
atoms in same spatial bin	chunk ID = bin ID
atoms in same rigid body	chunk ID = molecule ID used to define rigid bodies
atoms with similar potential energy	chunk ID = output of *compute pe/atom*
atoms with same local defect structure	chunk ID = output of *compute centro/atom* or *compute coord/atom* command

Note that chunk IDs are integer values, so for atom properties or computes that produce a floating point value, they will be truncated to an integer. You could also use the compute in a variable that scales the floating point value to spread it across multiple integers.

Spatial bins can be of various kinds, e.g. 1d bins = slabs, 2d bins = pencils, 3d bins = boxes, spherical bins, cylindrical bins.

This compute also calculates the number of chunks *Nchunk*, which is used by other commands to tally per-chunk data. *Nchunk* can be a static value or change over time (e.g. the number of clusters). The chunk ID for an individual atom can also be static (e.g. a molecule ID), or dynamic (e.g. what spatial bin an atom is in as it moves).

Note that this compute allows the per-atom output of other *computes*, *fixes*, and *variables* to be used to define chunk IDs for each atom. This means you can write your own compute or fix to output a per-atom quantity to use as chunk ID. See the *Modify* doc pages for info on how to do this. You can also define a *per-atom variable* in the input script that uses a formula to generate a chunk ID for each atom.

Fix ave/chunk command:

This fix takes the ID of a *compute chunk/atom* command as input. For each chunk, it then sums one or more specified per-atom values over the atoms in each chunk. The per-atom values can be any atom property, such as velocity, force, charge, potential energy, kinetic energy, stress, etc. Additional keywords are defined for per-chunk properties like density and temperature. More generally any per-atom value generated by other *computes*, *fixes*, and *per-atom variables*, can be summed over atoms in each chunk.

Similar to other averaging fixes, this fix allows the summed per-chunk values to be time-averaged in various ways, and output to a file. The fix produces a global array as output with one row of values per chunk.

Compute */chunk commands:

The following computes operate on chunks of atoms to produce per-chunk values. Any compute whose style name ends in "/chunk" is in this category:

- *compute com/chunk*
- *compute gyration/chunk*
- *compute inertia/chunk*
- *compute msd/chunk*

- *compute property/chunk*
- *compute temp/chunk*
- *compute torque/chunk*
- *compute vcm/chunk*

They each take the ID of a *compute chunk/atom* command as input. As their names indicate, they calculate the center-of-mass, radius of gyration, moments of inertia, mean-squared displacement, temperature, torque, and velocity of center-of-mass for each chunk of atoms. The *compute property/chunk* command can tally the count of atoms in each chunk and extract other per-chunk properties.

The reason these various calculations are not part of the *fix ave/chunk command*, is that each requires a more complicated operation than simply summing and averaging over per-atom values in each chunk. For example, many of them require calculation of a center of mass, which requires summing mass*position over the atoms and then dividing by summed mass.

All of these computes produce a global vector or global array as output, with one or more values per chunk. The output can be used in various ways:

- As input to the *fix ave/time* command, which can write the values to a file and optionally time average them.
- As input to the *fix ave/histo* command to histogram values across chunks. E.g. a histogram of cluster sizes or molecule diffusion rates.
- As input to special functions of *equal-style variables*, like sum() and max() and ave(). E.g. to find the largest cluster or fastest diffusing molecule or average radius-of-gyration of a set of molecules (chunks).

Other chunk commands:

- *compute chunk/spread/atom*
- *compute reduce/chunk*

The *compute chunk/spread/atom* command spreads per-chunk values to each atom in the chunk, producing per-atom values as its output. This can be useful for outputting per-chunk values to a per-atom *dump file*. Or for using an atom's associated chunk value in an *atom-style variable*. Or as input to the *fix ave/chunk* command to spatially average per-chunk values calculated by a per-chunk compute.

The *compute reduce/chunk* command reduces a peratom value across the atoms in each chunk to produce a value per chunk. When used with the *compute chunk/spread/atom* command it can create peratom values that induce a new set of chunks with a second *compute chunk/atom* command.

Example calculations with chunks

Here are examples using chunk commands to calculate various properties:

1. Average velocity in each of 1000 2d spatial bins:

```
compute cc1 all chunk/atom bin/2d x 0.0 0.1 y lower 0.01 units reduced
fix 1 all ave/chunk 100 10 1000 cc1 vx vy file tmp.out
```

2. Temperature in each spatial bin, after subtracting a flow velocity:

```
compute cc1 all chunk/atom bin/2d x 0.0 0.1 y lower 0.1 units reduced
compute vbias all temp/profile 1 0 0 y 10
fix 1 all ave/chunk 100 10 1000 cc1 temp bias vbias file tmp.out
```

3. Center of mass of each molecule:

```
compute cc1 all chunk/atom molecule
compute myChunk all com/chunk cc1
fix 1 all ave/time 100 1 100 c_myChunk[*] file tmp.out mode vector
```

4. Total force on each molecule and ave/max across all molecules:

```
compute cc1 all chunk/atom molecule
fix 1 all ave/chunk 1000 1 1000 cc1 fx fy fz file tmp.out
variable xave equal ave(f_1[2])
variable xmax equal max(f_1[2])
thermo 1000
thermo_style custom step temp v_xave v_xmax
```

5. Histogram of cluster sizes:

```
compute cluster all cluster/atom 1.0
compute cc1 all chunk/atom c_cluster compress yes
compute size all property/chunk cc1 count
fix 1 all ave/histo 100 1 100 0 20 20 c_size mode vector ave running beyond ignore file tmp.histo
```

6. An example for using a per-chunk value to apply per-atom forces to compress individual polymer chains (molecules) in a mixture, is explained on the *compute chunk/spread/atom* command doc page.

7. An example for using one set of per-chunk values for molecule chunks, to create a second set of micelle-scale chunks (clustered molecules, due to hydrophobicity), is explained on the *compute reduce/chunk* command doc page.

8. An example for using one set of per-chunk values (dipole moment vectors) for molecule chunks, spreading the values to each atom in each chunk, then defining a second set of chunks as spatial bins, and using the *fix ave/chunk* command to calculate an average dipole moment vector for each bin. This example is explained on the *compute chunk/spread/atom* command doc page.

10.3.3 Using distributed grids

Added in version 22Dec2022.

LAMMPS has internal capabilities to create uniformly spaced grids which overlay the simulation domain. For 2d and 3d simulations these are 2d and 3d grids respectively. Conceptually a grid can be thought of as a collection of grid cells. Each grid cell can store one or more values (data).

The grid cells and data they store are distributed across processors. Each processor owns the grid cells (and data) whose center points lie within the spatial subdomain of the processor. If needed for its computations, a processor may also store ghost grid cells with their data.

Distributed grids can overlay orthogonal or triclinic simulation boxes; see the *Howto triclinic* doc page for an explanation of the latter. For a triclinic box, the grid cell shape conforms to the shape of the simulation domain, e.g. parallelograms instead of rectangles in 2d.

If the box size or shape changes during a simulation, the grid changes with it, so that it always overlays the entire simulation domain. For non-periodic dimensions, the grid size in that dimension matches the box size, as set by the *boundary* command for fixed or shrink-wrapped boundaries.

If load-balancing is invoked by the *balance* or *fix balance* commands, then the subdomain owned by a processor can change which may also change which grid cells they own.

Post-processing and visualization of grid cell data can be enabled by the *dump grid*, *dump grid/vtk*, and *dump image* commands. The latter has an optional *grid* keyword. The OVITO visualization tool also plans (as of Nov 2022) to add support for visualizing grid cell data (along with atoms) using *dump grid* output files as input.

Note

For developers, distributed grids are implemented within the code via two classes: Grid2d and Grid3d. These partition the grid across processors and have methods which allow forward and reverse communication of ghost grid data as well as load balancing. If you write a new compute or fix which needs a distributed grid, these are the classes to look at. A new pair style could use a distributed grid by having a fix define it. Please see the section on *using distributed grids within style classes* for a detailed description.

These are the commands which currently define or use distributed grids:

- *fix ttm/grid* - store electron temperature on grid
- *fix ave/grid* - time average per-atom or per-grid values
- *compute property/grid* - generate grid IDs and coords
- *dump grid* - output per-grid values in LAMMPS format
- *dump grid/vtk* - output per-grid values in VTK format
- *dump image grid* - include colored grid in output images
- *pair_style amoeba* - FFT grids
- *kspace_style pppm* (and variants) - FFT grids
- *kspace_style msm* (and variants) - MSM grids

The grids used by the *kspace_style* can not be referenced by an input script. However the grids and data created and used by the other commands can be.

A compute or fix command may create one or more grids (of different sizes). Each grid can store one or more data fields. A data field can be a single value per grid point (per-grid vector) or multiple values per grid point (per-grid array). See the *Howto output* doc page for an explanation of how per-grid data can be generated by some commands and used by other commands.

A command accesses grid data from a compute or fix using a *grid reference* with the following syntax:

- c_ID:gname:dname
- c_ID:gname:dname[I]
- f_ID:gname:dname
- f_ID:gname:dname[I]

The prefix "c_" or "f_" refers to the ID of the compute or fix; gname is the name of the grid, which is assigned by the compute or fix; dname is the name of the data field, which is also assigned by the compute or fix.

If the data field is a per-grid vector (one value per grid point), then no brackets are used to access the values. If the data field is a per-grid array (multiple values per grid point), then brackets are used to specify the column I of the array. I ranges from 1 to Ncol inclusive, where Ncol is the number of columns in the array and is defined by the compute or fix.

Currently, there are no per-grid variables implemented in LAMMPS. We may add this feature at some point.

10.3.4 Calculate temperature

Temperature is computed as kinetic energy divided by some number of degrees of freedom (and the Boltzmann constant). Since kinetic energy is a function of particle velocity, there is often a need to distinguish between a particle's

advection velocity (due to some aggregate motion of particles) and its thermal velocity. The sum of the two is the particle's total velocity, but the latter is often what is wanted to compute a temperature.

LAMMPS has several options for computing temperatures, any of which can be used in *thermostatting* and *barostatting*. These *compute commands* calculate temperature:

- *compute temp*
- *compute temp/sphere*
- *compute temp/asphere*
- *compute temp/com*
- *compute temp/deform*
- *compute temp/partial*
- *compute temp/profile*
- *compute temp/ramp*
- *compute temp/region*

All but the first 3 calculate velocity biases directly (e.g. advection velocities) that are removed when computing the thermal temperature. *Compute temp/sphere* and *compute temp/asphere* compute kinetic energy for finite-size particles that includes rotational degrees of freedom. They both allow for velocity biases indirectly, via an optional extra argument which is another temperature compute that subtracts a velocity bias. This allows the translational velocity of spherical or aspherical particles to be adjusted in prescribed ways.

10.3.5 Calculate elastic constants

Elastic constants characterize the stiffness of a material. The formal definition is provided by the linear relation that holds between the stress and strain tensors in the limit of infinitesimal deformation. In tensor notation, this is expressed as

$$s_{ij} = C_{ijkl} e_{kl}$$

where the repeated indices imply summation. s_{ij} are the elements of the symmetric stress tensor. e_{kl} are the elements of the symmetric strain tensor. C_{ijkl} are the elements of the fourth rank tensor of elastic constants. In three dimensions, this tensor has $3^4 = 81$ elements. Using Voigt notation, the tensor can be written as a 6x6 matrix, where C_{ij} is now the derivative of s_i w.r.t. e_j. Because s_i is itself a derivative w.r.t. e_i, it follows that C_{ij} is also symmetric, with at most $\frac{7 \times 6}{2} = 21$ distinct elements.

At zero temperature, it is easy to estimate these derivatives by deforming the simulation box in one of the six directions using the *change_box* command and measuring the change in the stress tensor. A general-purpose script that does this is given in the examples/ELASTIC directory described on the *Examples* doc page.

Calculating elastic constants at finite temperature is more challenging, because it is necessary to run a simulation that performs time averages of differential properties. There are at least 3 ways to do this in LAMMPS. The most reliable way to do this is by exploiting the relationship between elastic constants, stress fluctuations, and the Born matrix, the second derivatives of energy w.r.t. strain *(Ray)*. The Born matrix calculation has been enabled by the *compute born/matrix* command, which works for any bonded or non-bonded potential in LAMMPS. The most expensive part of the calculation is the sampling of the stress fluctuations. Several examples of this method are provided in the examples/ELASTIC_T/BORN_MATRIX directory described on the *Examples* doc page.

A second way is to measure the change in average stress tensor in an NVT simulations when the cell volume undergoes a finite deformation. In order to balance the systematic and statistical errors in this method, the magnitude of the deformation must be chosen judiciously, and care must be taken to fully equilibrate the deformed cell before sampling the stress tensor. An example of this method is provided in the examples/ELASTIC_T/DEFORMATION directory described on the *Examples* doc page.

Another approach is to sample the triclinic cell fluctuations that occur in an NPT simulation. This method can also be slow to converge and requires careful post-processing *(Shinoda)*. We do not provide an example of this method.

A nice review of the advantages and disadvantages of all of these methods is provided in the paper by Clavier et al. *(Clavier)*.

(Shinoda) Shinoda, Shiga, and Mikami, Phys Rev B, 69, 134103 (2004).

(Clavier) G. Clavier, N. Desbiens, E. Bourasseau, V. Lachet, N. Brusselle-Dupend and B. Rousseau, Mol Sim, 43, 1413 (2017).

10.3.6 Calculate thermal conductivity

The thermal conductivity κ of a material can be measured in at least 4 ways using various options in LAMMPS. See the examples/KAPPA directory for scripts that implement the 4 methods discussed here for a simple Lennard-Jones fluid model. Also, see the *Howto viscosity* page for an analogous discussion for viscosity.

The thermal conductivity tensor κ is a measure of the propensity of a material to transmit heat energy in a diffusive manner as given by Fourier's law

$$J = -\kappa \cdot \text{grad}(T)$$

where J is the heat flux in units of energy per area per time and grad(T) is the spatial gradient of temperature. The thermal conductivity thus has units of energy per distance per time per degree K and is often approximated as an isotropic quantity, i.e. as a scalar.

The first method is to setup two thermostatted regions at opposite ends of a simulation box, or one in the middle and one at the end of a periodic box. By holding the two regions at different temperatures with a *thermostatting fix*, the energy added to the hot region should equal the energy subtracted from the cold region and be proportional to the heat flux moving between the regions. See the papers by *Ikeshoji and Hafskjold* and *Wirnsberger et al* for details of this idea. Note that thermostatting fixes such as *fix nvt*, *fix langevin*, and *fix temp/rescale* store the cumulative energy they add/subtract.

Alternatively, as a second method, the *fix heat* or *fix ehex* commands can be used in place of thermostats on each of two regions to add/subtract specified amounts of energy to both regions. In both cases, the resulting temperatures of the two regions can be monitored with the "compute temp/region" command and the temperature profile of the intermediate region can be monitored with the *fix ave/chunk* and *compute ke/atom* commands.

The third method is to perform a reverse non-equilibrium MD simulation using the *fix thermal/conductivity* command which implements the rNEMD algorithm of Muller-Plathe. Kinetic energy is swapped between atoms in two different layers of the simulation box. This induces a temperature gradient between the two layers which can be monitored with the *fix ave/chunk* and *compute ke/atom* commands. The fix tallies the cumulative energy transfer that it performs. See the *fix thermal/conductivity* command for details.

The fourth method is based on the Green-Kubo (GK) formula which relates the ensemble average of the auto-correlation of the heat flux to κ. The heat flux can be calculated from the fluctuations of per-atom potential and kinetic energies and per-atom stress tensor in a steady-state equilibrated simulation. This is in contrast to the two preceding non-equilibrium methods, where energy flows continuously between hot and cold regions of the simulation box.

The *compute heat/flux* command can calculate the needed heat flux and describes how to implement the Green_Kubo formalism using additional LAMMPS commands, such as the *fix ave/correlate* command to calculate the needed auto-correlation. See the page for the *compute heat/flux* command for an example input script that calculates the thermal conductivity of solid Ar via the GK formalism.

(Ikeshoji) Ikeshoji and Hafskjold, Molecular Physics, 81, 251-261 (1994).

(Wirnsberger) Wirnsberger, Frenkel, and Dellago, J Chem Phys, 143, 124104 (2015).

10.3.7 Calculate viscosity

The shear viscosity η of a fluid can be measured in at least 6 ways using various options in LAMMPS. See the examples/VISCOSITY directory for scripts that implement the 5 methods discussed here for a simple Lennard-Jones fluid model and 1 method for SPC/E water model. Also, see the *page on calculating thermal conductivity* for an analogous discussion for thermal conductivity.

η is a measure of the propensity of a fluid to transmit momentum in a direction perpendicular to the direction of velocity or momentum flow. Alternatively it is the resistance the fluid has to being sheared. It is given by

$$J = -\eta \cdot \text{grad}(V_{\text{stream}})$$

where J is the momentum flux in units of momentum per area per time. and grad(V_{stream}) is the spatial gradient of the velocity of the fluid moving in another direction, normal to the area through which the momentum flows. Viscosity thus has units of pressure-time.

The first method is to perform a non-equilibrium MD (NEMD) simulation by shearing the simulation box via the *fix deform* command, and using the *fix nvt/sllod* command to thermostat the fluid via the SLLOD equations of motion. Alternatively, as a second method, one or more moving walls can be used to shear the fluid in between them, again with some kind of thermostat that modifies only the thermal (non-shearing) components of velocity to prevent the fluid from heating up.

Note

A recent (2017) book by *(Daivis and Todd)* discusses use of the SLLOD method and non-equilibrium MD (NEMD) thermostatting generally, for both simple and complex fluids, e.g. molecular systems. The latter can be tricky to do correctly.

In both cases, the velocity profile setup in the fluid by this procedure can be monitored by the *fix ave/chunk* command, which determines grad(V_{stream}) in the equation above. E.g. the derivative in the y-direction of the V_x component of fluid motion or grad(V_{stream}) = $\frac{dV_x}{dy}$. The P_{xy} off-diagonal component of the pressure or stress tensor, as calculated by the *compute pressure* command, can also be monitored, which is the J term in the equation above. See the *Howto nemd* page for details on NEMD simulations.

The third method is to perform a reverse non-equilibrium MD simulation using the *fix viscosity* command which implements the rNEMD algorithm of Muller-Plathe. Momentum in one dimension is swapped between atoms in two different layers of the simulation box in a different dimension. This induces a velocity gradient which can be monitored with the *fix ave/chunk* command. The fix tallies the cumulative momentum transfer that it performs. See the *fix viscosity* command for details.

The fourth method is based on the Green-Kubo (GK) formula which relates the ensemble average of the auto-correlation of the stress/pressure tensor to η. This can be done in a fully equilibrated simulation which is in contrast to the two preceding non-equilibrium methods, where momentum flows continuously through the simulation box.

Here is an example input script that calculates the viscosity of liquid Ar via the GK formalism:

```
# Sample LAMMPS input script for viscosity of liquid Ar

units       real
variable    T equal 200.0       # run temperature

variable     ndens equal count(all)/vol
print        "average viscosity: $v [Pa.s] @ $T K, ${ndens} atoms/A^3"
```

The fifth method is related to the above Green-Kubo method, but uses the Einstein formulation, analogous to the

Einstein mean-square-displacement formulation for self-diffusivity. The time-integrated momentum fluxes play the role of Cartesian coordinates, whose mean-square displacement increases linearly with time at sufficiently long times.

The sixth is the periodic perturbation method, which is also a non-equilibrium MD method. However, instead of measuring the momentum flux in response to an applied velocity gradient, it measures the velocity profile in response to applied stress. A cosine-shaped periodic acceleration is added to the system via the *fix accelerate/cos* command, and the *compute viscosity/cos* command is used to monitor the generated velocity profile and remove the velocity bias before thermostatting.

Note

An article by *(Hess)* discussed the accuracy and efficiency of these methods.

10.3.8 Calculate diffusion coefficients

The diffusion coefficient *D* of a material can be measured in at least 2 ways using various options in LAMMPS. See the examples/DIFFUSE directory for scripts that implement the 2 methods discussed here for a simple Lennard-Jones fluid model.

The first method is to measure the mean-squared displacement (MSD) of the system, via the *compute msd* command. The slope of the MSD versus time is proportional to the diffusion coefficient. The instantaneous MSD values can be accumulated in a vector via the *fix vector* command, and a line fit to the vector to compute its slope via the *variable slope* function, and thus extract *D*.

The second method is to measure the velocity auto-correlation function (VACF) of the system, via the *compute vacf* command. The time-integral of the VACF is proportional to the diffusion coefficient. The instantaneous VACF values can be accumulated in a vector via the *fix vector* command, and time integrated via the *variable trap* function, and thus extract *D*.

10.3.9 Output structured data from LAMMPS

LAMMPS can output structured data with the *print* and *fix print* command. This gives you flexibility since you can build custom data formats that contain system properties, thermo data, and variables values. This output can be directed to the screen and/or to a file for post processing.

Writing the current system state, thermo data, variable values

Use the *print* command to output the current system state, which can include system properties, thermo data and variable values.

YAML

```
print """---
timestep: $(step)
pe: $(pe)
ke: $(ke)
..."""" file current_state.yaml screen no
```

Listing 1: current_state.yaml

```
---
timestep: 250
pe: -4.7774327356321810711
ke: 2.4962152903997174569
```

JSON

```
print """{
  "timestep": $(step),
  "pe": $(pe),
  "ke": $(ke)
}""" file current_state.json screen no
```

Listing 2: current_state.json

```
{
  "timestep": 250,
  "pe": -4.7774327356321810711,
  "ke": 2.4962152903997174569
}
```

YAML format thermo_style or dump_style output

Extracting data from log file

Added in version 24Mar2022.

LAMMPS supports the thermo style "yaml" and for "custom" style thermodynamic output the format can be changed to YAML with *thermo_modify line yaml*. This will produce a block of output in a compact YAML format - one "document" per run - of the following style:

```
---
keywords: ['Step', 'Temp', 'E_pair', 'E_mol', 'TotEng', 'Press', ]
data:
  - [100, 0.757453103239935, -5.7585054860159, 0, -4.62236133677021, 0.207261053624721, ]
  - [110, 0.759322359337036, -5.7614668389562, 0, -4.62251889318624, 0.194314975399602, ]
  - [120, 0.759372342462676, -5.76149365656489, 0, -4.62247073844943, 0.191600048851267, ]
  - [130, 0.756833027516501, -5.75777334823494, 0, -4.62255928350835, 0.208792327853067, ]
...
```

This data can be extracted and parsed from a log file using python with:

```
import re, yaml
try:
    from yaml import CSafeLoader as Loader
except ImportError:
    from yaml import SafeLoader as Loader

docs = ""
with open("log.lammps") as f:
```

(continues on next page)

(continued from previous page)

```
    for line in f:
        m = re.search(r"^(keywords:.*$|data:$|---$|\.\.\.$|  - \[.*\]$)", line)
        if m: docs += m.group(0) + '\n'

thermo = list(yaml.load_all(docs, Loader=Loader))

print("Number of runs: ", len(thermo))
print(thermo[1]['keywords'][4], ' = ', thermo[1]['data'][2][4])
```

After loading the YAML data, *thermo* is a list containing a dictionary for each "run" where the tag "keywords" maps to the list of thermo header strings and the tag "data" has a list of lists where the outer list represents the lines of output and the inner list the values of the columns matching the header keywords for that step. The second print() command for example will print the header string for the fifth keyword of the second run and the corresponding value for the third output line of that run:

```
Number of runs:  2

Extracting data from dump file

Added in version 4May2022.

YAML format output has been added to multiple commands in LAMMPS, for example *dump yaml* or *fix ave/time* Depending on the kind of data being written, organization of the data or the specific syntax used may change, but the principles are very similar and all files should be readable with a suitable YAML parser. A simple example for this is given below:

```
import yaml
try:
    from yaml import CSafeLoader as YamlLoader
except ImportError:
    from yaml import SafeLoader as YamlLoader

timesteps = []
with open("dump.yaml", "r") as f:
    data = yaml.load_all(f, Loader=YamlLoader)

    for d in data:
        print('Processing timestep %d' % d['timestep'])
        timesteps.append(d)

print('Read %d timesteps from yaml dump' % len(timesteps))
print('Second timestep: ', timesteps[1]['timestep'])
print('Box info: x: ' , timesteps[1]['box'][0], ' y:', timesteps[1]['box'][1], ' z:',timesteps[1]['box'][2])
print('First 5 per-atom columns: ', timesteps[1]['keywords'][0:5])
print('Corresponding 10th atom data: ', timesteps[1]['data'][9][0:5])
```

The corresponding output for a YAML dump command added to the "melt" example is:

```
Processing timestep 0
Processing timestep 50
Processing timestep 100
Processing timestep 150
```

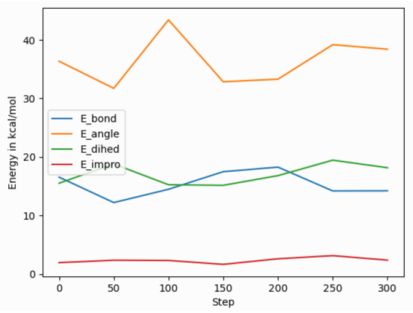
(continues on next page)

(continued from previous page)

```
Processing timestep 200
Processing timestep 250
Read 6 timesteps from yaml dump
Second timestep:  50
Box info: x:  [0, 16.795961913825074]  y: [0, 16.795961913825074]  z: [0, 16.795961913825074]
First 5 per-atom columns:  ['id', 'type', 'x', 'y', 'z']
Corresponding 10th atom data:  [10, 1, 4.43828, 0.968481, 0.108555]
```

Processing scalar data with Python

After reading and parsing the YAML format data, it can be easily imported for further processing and visualization with the pandas and matplotlib Python modules. Because of the organization of the data in the YAML format thermo output, it needs to be told to process only the 'data' part of the imported data to create a pandas data frame, and one needs to set the column names from the 'keywords' entry. The following Python script code example demonstrates this, and creates the image shown on the right of a simple plot of various bonded energy contributions versus the timestep from a run of the 'peptide' example input after changing the *thermo style* to 'yaml'. The properties to be used for x and y values can be conveniently selected through the keywords. Please note that those keywords can be changed to custom strings with the *thermo_modify colname* command.



```
import re, yaml
import pandas as pd
import matplotlib.pyplot as plt

try:
    from yaml import CSafeLoader as Loader
except ImportError:
    from yaml import SafeLoader as Loader

docs = ""
with open("log.lammps") as f:
    for line in f:
        m = re.search(r"^(keywords:.*$|data:$|---$|\.\.\.$|  - \[.*\]$)", line)
        if m: docs += m.group(0) + '\n'

thermo = list(yaml.load_all(docs, Loader=Loader))

df = pd.DataFrame(data=thermo[0]['data'], columns=thermo[0]['keywords'])
fig = df.plot(x='Step', y=['E_bond', 'E_angle', 'E_dihed', 'E_impro'], ylabel='Energy in kcal/mol')
plt.savefig('thermo_bondeng.png')
```

Processing vector data with Python

Global *vector* data as produced by *fix ave/time* uses a slightly different organization of the data. You still have the dictionary keys 'keywords' and 'data' for the column headers and the data. But the data is a dictionary indexed by the time step and for each step there are multiple rows of values each with a list of the averaged properties. This requires a slightly different processing, since the entire data cannot be directly imported into a single pandas DataFrame class instance. The following Python script example demonstrates how to read such data. The result will combine the data for the different steps into one large "multi-index" table. The pandas IndexSlice class can then be used to select data

from this combined data frame.

```
import yaml
import pandas as pd

try:
    from yaml import CSafeLoader as Loader
except ImportError:
    from yaml import SafeLoader as Loader

with open("ave.yaml") as f:
    ave = yaml.load(f, Loader=Loader)

keys = ave['keywords']
df = {}
for k in ave['data'].keys():
    df[k] = pd.DataFrame(data=ave['data'][k], columns=keys)

# create multi-index data frame
df = pd.concat(df)

# output only the first 3 value for steps 200 to 300 of the column Pressure
idx = pd.IndexSlice
print(df['Pressure'].loc[idx[200:300, 0:2]])
```

Processing scalar data with Perl

The ease of processing YAML data is not limited to Python. Here is an example for extracting and processing a LAMMPS log file with Perl instead.

```
use YAML::XS;

open(LOG, "log.lammps") or die("could not open log.lammps: $!");
my $file = "";
while(my $line = <LOG>) {
    if ($line =~ /^(keywords:.*$|data:$|---$|\.\.\.$|  - \[.*\]$)/) {
        $file .= $line;
    }
}
close(LOG);

# convert YAML to perl as nested hash and array references
my $thermo = Load $file;

# convert references to real arrays
my @keywords = @{$thermo->{'keywords'}};
my @data = @{$thermo->{'data'}};

# print first two columns
print("$keywords[0] $keywords[1]\n");
foreach (@data) {
    print("${$_}[0]  ${$_}[1]\n");
}
```

Writing continuous data during a simulation

The *fix print* command allows you to output an arbitrary string at defined times during a simulation run.

YAML

```
fix extra all print 50 """
- timestep: $(step)
  pe: $(pe)
  ke: $(ke)""" file output.yaml screen no
```

Listing 3: output.yaml

```
# Fix print output for fix extra
- timestep: 0
  pe: -6.77336805325924729
  ke: 4.4988750000000026219

- timestep: 50
  pe: -4.8082494418323200591
  ke: 2.5257981827119797558

- timestep: 100
  pe: -4.7875608875581505686
  ke: 2.5062598821985102582

- timestep: 150
  pe: -4.7471033686005483787
  ke: 2.466095925545450207

- timestep: 200
  pe: -4.7509052858544134068
  ke: 2.4701136792591693592

- timestep: 250
  pe: -4.7774327356321810711
  ke: 2.4962152903997174569
```

Post-processing of YAML files can be easily be done with Python and other scripting languages. In case of Python the *yaml* package allows you to load the data files and obtain a list of dictionaries.

```
import yaml

with open("output.yaml") as f:
   data = yaml.load(f, Loader=yaml.FullLoader)

print(data)
```

```
[{'timestep': 0, 'pe': -6.773368053259247, 'ke': 4.498875000000003},
 {'timestep': 50, 'pe': -4.80824944183232, 'ke': 2.5257981827119798},
 {'timestep': 100, 'pe': -4.787560887558151, 'ke': 2.5062598821985103},
 {'timestep': 150, 'pe': -4.747103368600548, 'ke': 2.46609592554545},
 {'timestep': 200, 'pe': -4.750905285854413, 'ke': 2.4701136792591694},
 {'timestep': 250, 'pe': -4.777432735632181, 'ke': 2.4962152903997175}]
```

Line Delimited JSON (LD-JSON)

The JSON format itself is very strict when it comes to delimiters. For continuous output/streaming data it is beneficial use the *line delimited JSON* format. Each line represents one JSON object.

```
fix extra all print 50 """{"timestep": $(step), "pe": $(pe), "ke": $(ke)}""" &
   title "" file output.json screen no
```

Listing 4: output.json

```
{"timestep": 0, "pe": -6.77336805325924729, "ke": 4.4988750000000026219}
{"timestep": 50, "pe": -4.8082494418323200591, "ke": 2.5257981827119797558}
{"timestep": 100, "pe": -4.7875608875581505686, "ke": 2.5062598821985102582}
{"timestep": 150, "pe": -4.7471033686005483787, "ke": 2.466095925545450207}
{"timestep": 200, "pe": -4.7509052858544134068, "ke": 2.4701136792591693592}
{"timestep": 250, "pe": -4.7774327356321810711, "ke": 2.4962152903997174569}
```

One simple way to load this data into a Python script is to use the *pandas* package. It can directly load these files into a data frame:

```
import pandas as pd

data = pd.read_json('output.json', lines=True)
print(data)
```

```
   timestep        pe        ke
0         0 -6.773368  4.498875
1        50 -4.808249  2.525798
2       100 -4.787561  2.506260
3       150 -4.747103  2.466096
4       200 -4.750905  2.470114
5       250 -4.777433  2.496215
```

10.4 Force fields howto

10.4.1 Some general force field considerations

A compact summary of the concepts, definitions, and properties of force fields with explicit bonded interactions (like the ones discussed in this HowTo) is given in *(Gissinger)*.

A force field has 2 parts: the formulas that define its potential functions and the coefficients used for a particular system. To assign parameters it is first required to assign atom types. Those are not only based on the elements, but also on the chemical environment due to the atoms bound to them. This often follows the chemical concept of *functional groups*. Example: a carbon atom bound with a single bond to a single OH-group (alcohol) would be a different atom type than a carbon atom bound to a methyl CH3 group (aliphatic carbon). The atom types usually then determine the non-bonded Lennard-Jones parameters and the parameters for bonds, angles, dihedrals, and impropers. On top of that, partial charges have to be applied. Those are usually independent of the atom types and are determined either for groups of atoms called residues with some fitting procedure based on quantum mechanical calculations, or based on some increment system that add or subtract increments from the partial charge of an atom based on the types of the neighboring atoms.

Force fields differ in the strategies they employ to determine the parameters and charge distribution in how generic or specific they are which in turn has an impact on the accuracy (compare for example CGenFF to CHARMM and GAFF to Amber). Because of the different strategies, it is not a good idea to use a mix of parameters from different force field

families (like CHARMM, Amber, or GROMOS) and that extends to the parameters for the solvent, especially water. The publication describing the parameterization of a force field will describe which water model to use. Changing the water model usually leads to overall worse results (even if it may improve on the water itself).

In addition, one has to consider that *families* of force fields like CHARMM, Amber, OPLS, or GROMOS have evolved over time and thus provide different *revisions* of the force field parameters. These often corresponds to changes in the functional form or the parameterization strategies. This may also result in changes required for simulation settings like the preferred cutoff or how Coulomb interactions are computed (cutoff, smoothed/shifted cutoff, or long-range with Ewald summation or equivalent). Unless explicitly stated in the publication describing the force field, the Coulomb interaction cannot be chosen at will but must match the revision of the force field. That said, liberties may be taken during the initial equilibration of a system to speed up the process, but not for production simulations.

(Gissinger) J. R. Gissinger, I. Nikiforov, Y. Afshar, B. Waters, M. Choi, D. S. Karls, A. Stukowski, W. Im, H. Heinz, A. Kohlmeyer, and E. B. Tadmor, J Phys Chem B, 128, 3282-3297 (2024).

10.4.2 CHARMM, AMBER, COMPASS, DREIDING, and OPLS force fields

Here we only discuss formulas implemented in LAMMPS that correspond to formulas commonly used in the CHARMM, AMBER, COMPASS, and DREIDING force fields. Setting coefficients is done either from special sections in an input data file via the *read_data* command or in the input script with commands like *pair_coeff* or *bond_coeff* and so on. See the *Tools* doc page for additional tools that can use CHARMM, AMBER, or Materials Studio generated files to assign force field coefficients and convert their output into LAMMPS input. LAMMPS input scripts can also be generated by charmm-gui.org.

CHARMM and AMBER

The CHARMM force field *(MacKerell)* and AMBER force field *(Cornell)* have potential energy function of the form

$$V = \sum_{bonds} E_b + \sum_{angles} E_a + \overbrace{\sum_{dihedral} E_d}^{\substack{\text{charmm}\\ \text{charmmfsw}}} + \sum_{impropers} E_i$$

$$+ \underbrace{\sum_{pairs} (E_{LJ} + E_{coul})}_{\substack{\text{lj/charmm/coul/charmm}\\ \text{lj/charmm/coul/charmm/implicit}\\ \text{lj/charmm/coul/long}\\ \text{lj/charmm/coul/msm}\\ \text{lj/charmmfsw/coul/charmmfsh}\\ \text{lj/charmmfsw/coul/long}}} + \sum_{special} E_s + \sum_{residues} \text{CMAP}(\phi,\psi)$$

The terms are computed by bond styles (relationship between two atoms), angle styles (between 3 atoms) , dihedral/improper styles (between 4 atoms), pair styles (non-covalently bonded pair interactions) and special bonds. The CMAP term (see *fix cmap* command for details) corrects for pairs of dihedral angles ("Correction MAP") to significantly improve the structural and dynamic properties of proteins in crystalline and solution environments *(Brooks)*. The AMBER force field does not include the CMAP term.

The interaction styles listed below compute force field formulas that are consistent with common options in CHARMM or AMBER. See each command's documentation for the formula it computes.

- *bond_style* harmonic
- *angle_style* charmm
- *dihedral_style* charmmfsh
- *dihedral_style* charmm
- *pair_style* lj/charmmfsw/coul/charmmfsh

- *pair_style* lj/charmmfsw/coul/long
- *pair_style* lj/charmm/coul/charmm
- *pair_style* lj/charmm/coul/charmm/implicit
- *pair_style* lj/charmm/coul/long
- *special_bonds* charmm
- *special_bonds* amber

The pair styles compute Lennard Jones (LJ) and Coulombic interactions with additional switching or shifting functions that ramp the energy and/or force smoothly to zero between an inner (a) and outer (b) cutoff. The older styles with *charmm* (not *charmmfsw* or *charmmfsh*) in their name compute the LJ and Coulombic interactions with an energy switching function (esw) $S(r)$ which ramps the energy smoothly to zero between the inner and outer cutoff. This can cause irregularities in pairwise forces (due to the discontinuous second derivative of energy at the boundaries of the switching region), which in some cases can result in complications in energy minimization and detectable artifacts in MD simulations.

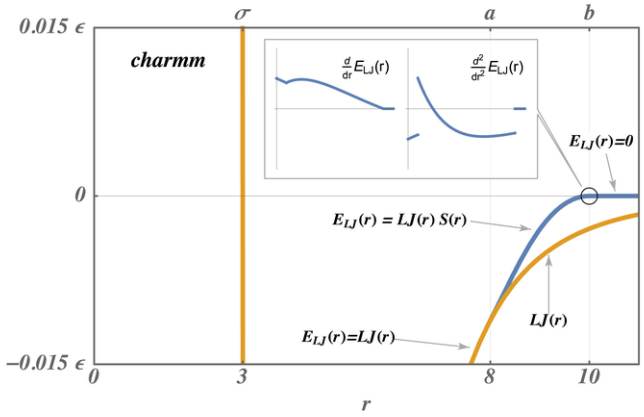
$$LJ(r) = 4\varepsilon \left[\left(\frac{\sigma}{r}\right)^{12} - \left(\frac{\sigma}{r}\right)^{6} \right]$$

$$C(r) = \frac{Cq_iq_j}{\varepsilon r}$$

$$S(r) = \frac{\left(b^2 - r^2\right)^2 \left(b^2 + 2r^2 - 3a^2\right)}{\left(b^2 - a^2\right)^3}$$

$$E_{LJ}(r) = \begin{cases} LJ(r), & r \le a \\ LJ(r)S(r), & a < r \le b \\ 0, & r > b \end{cases}$$

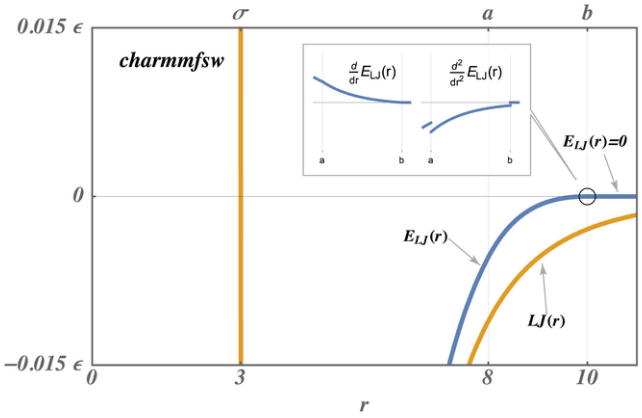
$$E_{coul}(r) = \begin{cases} C(r), & r \le a \\ C(r)S(r), & a < r \le b \\ 0, & r > b \end{cases}$$



The newer styles with *charmmfsw* or *charmmfsh* in their name replace energy switching with force switching (fsw) for LJ interactions and force shifting (fsh) functions for Coulombic interactions *(Steinbach)*

$$E_{LJ}(r) = \begin{cases} 4\varepsilon\sigma^6 \left(\dfrac{\sigma^6 - r^6}{r^{12}} - \dfrac{\sigma^6}{a^6 b^6} + \dfrac{1}{a^3 b^3} \right) & r \le a \\ \dfrac{4\varepsilon\sigma^6 \left(\sigma^6 \left(b^6 - r^6\right)^2 - b^3 r^6 \left(a^3 + b^3\right) \left(b^3 - r^3\right)^2 \right)}{b^6 r^{12} \left(b^6 - a^6\right)} & a < r \le b \\ 0, & r > b \end{cases}$$

$$E_{coul}(r) = \begin{cases} C(r) \dfrac{(b-r)^2}{rb^2}, & r \le b \\ 0, & r > b \end{cases}$$



These styles are used by LAMMPS input scripts generated by https://charmm-gui.org/ *(Brooks)*.

Note

For CHARMM, newer *charmmfsw* or *charmmfsh* styles were released in March 2017. We recommend they be used instead of the older *charmm* styles. See discussion of the differences on the *pair charmm* and *dihedral charmm* doc pages.

Note

The TIP3P water model is strongly recommended for use with the CHARMM force field. In fact, "using the SPC model with CHARMM parameters is a bad idea" and "to enable TIP4P style water in CHARMM, you would have to write a new pair style" . LAMMPS input scripts generated by Solution Builder on https://charmm-gui.org use TIP3P molecules for solvation. Any other water model can and probably will lead to false conclusions.

COMPASS

COMPASS is a general force field for atomistic simulation of common organic molecules, inorganic small molecules, and polymers which was developed using ab initio and empirical parameterization techniques *(Sun)*. See the *Tools* page for the msi2lmp tool for creating LAMMPS template input and data files from BIOVIA's Materials Studio files. Please note that the msi2lmp tool is very old and largely unmaintained, so it does not support all features of Materials Studio provided force field files, especially additions during the last decade. You should watch the output carefully and compare results, where possible. See *(Sun)* for a description of the COMPASS force field.

These interaction styles listed below compute force field formulas that are consistent with the COMPASS force field. See each command's documentation for the formula it computes.

- *bond_style* class2
- *angle_style* class2
- *dihedral_style* class2
- *improper_style* class2
- *pair_style* lj/class2
- *pair_style* lj/class2/coul/cut
- *pair_style* lj/class2/coul/long
- *special_bonds* lj/coul 0 0 1

DREIDING

DREIDING is a generic force field developed by the Goddard group at Caltech and is useful for predicting structures and dynamics of organic, biological and main-group inorganic molecules. The philosophy in DREIDING is to use general force constants and geometry parameters based on simple hybridization considerations, rather than individual force constants and geometric parameters that depend on the particular combinations of atoms involved in the bond, angle, or torsion terms. DREIDING has an *explicit hydrogen bond term* to describe interactions involving a hydrogen atom on very electronegative atoms (N, O, F). Unlike CHARMM or AMBER, the DREIDING force field has not been parameterized for considering solvents (like water) and has no rules for assigning (partial) charges. That will seriously limit its accuracy when used for simulating systems where those matter.

See *(Mayo)* for a description of the DREIDING force field

The interaction styles listed below compute force field formulas that are consistent with the DREIDING force field. See each command's documentation for the formula it computes.

- *bond_style* harmonic
- *bond_style* morse
- *angle_style* cosine/squared
- *angle_style* harmonic
- *angle_style* cosine
- *angle_style* cosine/periodic
- *dihedral_style* charmm
- *improper_style* umbrella
- *pair_style* buck
- *pair_style* buck/coul/cut
- *pair_style* buck/coul/long
- *pair_style* lj/cut
- *pair_style* lj/cut/coul/cut
- *pair_style* lj/cut/coul/long
- *pair_style* hbond/dreiding/lj
- *pair_style* hbond/dreiding/morse
- *special_bonds* dreiding

OPLS

OPLS (Optimized Potentials for Liquid Simulations) is a general force field for atomistic simulation of organic molecules in solvent. It was developed by the Jorgensen group at Purdue University and later at Yale University. Multiple versions of the OPLS parameters exist for united atom representations (OPLS-UA) and for all-atom representations (OPLS-AA).

This force field is based on atom types mapped to specific functional groups in organic and biological molecules. Each atom includes a static, partial atomic charge reflecting the oxidation state of the element derived from its bonded neighbors *(Jorgensen)* and computed based on increments determined by the atom type of the atoms bond to it.

The interaction styles listed below compute force field formulas that are fully or in part consistent with the OPLS style force fields. See each command's documentation for the formula it computes. Some are only compatible with a subset of OPLS interactions.

- *bond_style* harmonic
- *angle_style* harmonic
- *dihedral_style* opls
- *improper_style* cvff
- *improper_style* fourier
- *improper_style* harmonic
- *pair_style* lj/cut/coul/cut
- *pair_style* lj/cut/coul/long
- *pair_modify* geometric
- *special_bonds* lj/coul 0.0 0.0 0.5

10.4.3 AMOEBA and HIPPO force fields

The AMOEBA and HIPPO polarizable force fields were developed by Jay Ponder's group at the U Washington at St Louis. The LAMMPS implementation is based on Fortran 90 code provided by the Ponder group in their Tinker MD software.

The current implementation (July 2022) of AMOEBA in LAMMPS matches the version discussed in *(Ponder)*, *(Ren)*, and *(Shi)*. Likewise the current implementation of HIPPO in LAMMPS matches the version discussed in *(Rackers)*.

These force fields can be used when polarization effects are desired in simulations of water, organic molecules, and biomolecules including proteins, provided that parameterizations (Tinker PRM force field files) are available for the systems you are interested in. Files in the LAMMPS potentials directory with a "amoeba" or "hippo" suffix can be

used. The Tinker distribution and website have additional force field files as well: https://github.com/TinkerTools/tinker/tree/release/params.

Note that currently, HIPPO can only be used for water systems, but HIPPO files for a variety of small organic and biomolecules are in preparation by the Ponder group. Those force field files will be included in the LAMMPS distribution when available.

To use the AMOEBA or HIPPO force fields, a simulation must be 3d, and fully periodic or fully non-periodic, and use an orthogonal (not triclinic) simulation box.

The AMOEBA and HIPPO force fields contain the following terms in their energy (U) computation. Further details for AMOEBA equations are in *(Ponder)*, further details for the HIPPO equations are in *(Rackers)*.

$$
\begin{aligned}
U &= U_{intermolecular} + U_{intramolecular} \\
U_{intermolecular} &= U_{hal} + U_{repulsion} + U_{dispersion} + U_{multipole} + U_{polar} + U_{qxfer} \\
U_{intramolecular} &= U_{bond} + U_{angle} + U_{torsion} + U_{oop} + U_{b\theta} + U_{UB} + U_{pitorsion} + U_{bitorsion}
\end{aligned}
$$

For intermolecular terms, the AMOEBA force field includes only the U_{hal}, $U_{multipole}$, U_{polar} terms. The HIPPO force field includes all but the U_{hal} term. In LAMMPS, these are all computed by the *pair_style amoeba or hippo* command. Note that the $U_{multipole}$ and U_{polar} terms in this formula are not the same for the AMOEBA and HIPPO force fields.

For intramolecular terms, the U_{bond}, U_{angle}, $U_{torsion}$, U_{oop} terms are computed by the *bond_style class2 angle_style amoeba*, *dihedral_style fourier*, and *improper_style amoeba* commands respectively. The *angle_style amoeba* command includes the $U_{b\theta}$ bond-angle cross term, and the U_{UB} term for a Urey-Bradley bond contribution between the I,K atoms in the IJK angle.

The $U_{pitorsion}$ term is computed by the *fix amoeba/pitorsion* command. It computes 6-body interaction between a pair of bonded atoms which each have 2 additional bond partners.

The $U_{bitorsion}$ term is computed by the *fix amoeba/bitorsion* command. It computes 5-body interaction between two 4-body torsions (dihedrals) which overlap, having 3 atoms in common.

These command doc pages have additional details on the terms they compute:

- *pair_style amoeba or hippo*
- *bond_style class2*
- *angle_style amoeba*
- *dihedral_style fourier*
- *improper_style amoeba*
- *fix amoeba/pitorsion*
- *fix amoeba/bitorsion*

To use the AMOEBA or HIPPO force fields in LAMMPS, use commands like the following appropriately in your input script. The only change needed for AMOEBA vs HIPPO simulation is for the *pair_style* and *pair_coeff* commands, as shown below. See examples/amoeba for example input scripts for both AMOEBA and HIPPO.

```
units           real                # required
atom_style      amoeba
bond_style      class2                # CLASS2 package
angle_style     amoeba
dihedral_style  fourier               # EXTRA-MOLECULE package
```

(continues on next page)

(continued from previous page)

```
improper_style     amoeba
                                    # required per-atom data
fix              amtype all property/atom i_amtype ghost yes
fix              extra all property/atom &
                 i_amgroup i_ired i_xaxis i_yaxis i_zaxis d_pval ghost yes
fix              polaxe all property/atom i_polaxe

fix              pit all amoeba/pitorsion       # PiTorsion terms in FF
fix_modify         pit energy yes
                                    # Bitorsion terms in FF
fix              bit all amoeba/bitorsion bitorsion.ubiquitin.data
fix_modify         bit energy yes

read_data          data.ubiquitin fix amtype NULL "Tinker Types" &
                 fix pit "pitorsion types" "PiTorsion Coeffs" &
                 fix pit pitorsions PiTorsions &
                 fix bit bitorsions BiTorsions

pair_style         amoeba                      # AMOEBA FF
pair_coeff         * * amoeba_ubiquitin.prm amoeba_ubiquitin.key

pair_style         hippo                     # HIPPO FF
pair_coeff         * * hippo_water.prm hippo_water.key

special_bonds      lj/coul 0.5 0.5 0.5 one/five yes     # 1-5 neighbors
```

The data file read by the *read_data* command should be created by the tools/tinker/tinker2lmp.py conversion program described below. It will create a section in the data file with the header "Tinker Types". A *fix property/atom* command for the data must be specified before the read_data command. In the example above the fix ID is *amtype*.

Similarly, if the system you are simulating defines AMOEBA/HIPPO pitorsion or bitorsion interactions, there will be entries in the data file for those interactions. They require a *fix amoeba/pitortion* and *fix amoeba/bitorsion* command be defined. In the example above, the IDs for these two fixes are *pit* and *bit*.

Of course, if the system being modeled does not have one or more of the following – bond, angle, dihedral, improper, pitorsion, bitorsion interactions – then the corresponding style and fix commands above do not need to be used. See the example scripts in examples/amoeba for water systems as examples; they are simpler than what is listed above.

The two *fix property/atom* commands with IDs (in the example above) *extra* and *polaxe* are also needed to define internal per-atom quantities used by the AMOEBA and HIPPO force fields.

The *pair_coeff* command used for either the AMOEBA or HIPPO force field takes two arguments for Tinker force field files, namely a PRM and KEY file. The keyfile can be specified as NULL and default values for a various settings will be used. Note that these 2 files are meant to allow use of native Tinker files as-is. However LAMMPS does not support all the options which can be included in a Tinker PRM or KEY file. See specifics below.

A *special_bonds* command with the *one/five* option is required, since the AMOEBA/HIPPO force fields define weighting factors for not only 1-2, 1-3, 1-4 interactions, but also 1-5 interactions. This command will trigger a per-atom list of 1-5 neighbors to be generated. The AMOEBA and HIPPO force fields define their own custom weighting factors for all the 1-2, 1-3, 1-4, 1-5 terms which in the Tinker PRM and KEY files; they can be different for different terms in the force field.

In addition to the list above, these command doc pages have additional details:

- *atom_style amoeba*
- *fix property/atom*

- *special_bonds*

Tinker PRM and KEY files

A Tinker PRM file is composed of sections, each of which has multiple lines. This is the list of PRM sections LAMMPS knows how to parse and use. Any other sections are skipped:

- Angle Bending Parameters
- Atom Type Definitions
- Atomic Multipole Parameters
- Bond Stretching Parameters
- Charge Penetration Parameters
- Charge Transfer Parameters
- Dipole Polarizability Parameters
- Dispersion Parameters
- Force Field Definition
- Literature References
- Out-of-Plane Bend Parameters
- Pauli Repulsion Parameters
- Pi-Torsion Parameters
- Stretch-Bend Parameters
- Torsion-Torsion Parameters
- Torsional Parameters
- Urey-Bradley Parameters
- Van der Waals Pair Parameters
- Van der Waals Parameters

A Tinker KEY file is composed of lines, each of which has a keyword followed by zero or more parameters. This is the list of keywords LAMMPS knows how to parse and use in the same manner Tinker does. Any other keywords are skipped. The value in parenthesis is the default value for the keyword if it is not specified, or if the keyfile in the *pair_coeff* command is specified as NULL:

- a-axis (0.0)
- b-axis (0.0)
- c-axis (0.0)
- ctrn-cutoff (6.0)
- ctrn-taper (0.9 * ctrn-cutoff)
- cutoff
- delta-halgren (0.07)
- dewald (no long-range dispersion unless specified)
- dewald-alpha (0.4)

- dewald-cutoff (7.0)
- dispersion-cutoff (9.0)
- dispersion-taper (9.0 * dispersion-cutoff)
- dpme-grid
- dpme-order (4)
- ewald (no long-range electrostatics unless specified)
- ewald-alpha (0.4)
- ewald-cutoff (7.0)
- gamma-halgren (0.12)
- mpole-cutoff (9.0)
- mpole-taper (0.65 * mpole-cutoff)
- pcg-guess (enabled by default)
- pcg-noguess (disable pcg-guess if specified)
- pcg-noprecond (disable pcg-precond if specified)
- pcg-peek (1.0)
- pcg-precond (enabled by default)
- pewald-alpha (0.4)
- pme-grid
- pme-order (5)
- polar-eps (1.0e-6)
- polar-iter (100)
- polar-predict (no prediction operation unless specified)
- ppme-order (5)
- repulsion-cutoff (6.0)
- repulsion-taper (0.9 * repulsion-cutoff)
- taper
- usolve-cutoff (4.5)
- usolve-diag (2.0)
- vdw-cutoff (9.0)
- vdw-taper (0.9 * vdw-cutoff)

Tinker2lmp.py tool

This conversion tool is found in the tools/tinker directory. As shown in examples/amoeba/README, these commands produce the data files found in examples/amoeba, and also illustrate all the options available to use with the tinker2lmp.py script:

```
python tinker2lmp.py -xyz water_dimer.xyz -amoeba amoeba_water.prm -data data.water_dimer.
↪amoeba                # AMOEBA non-periodic system
python tinker2lmp.py -xyz water_dimer.xyz -hippo hippo_water.prm -data data.water_dimer.hippo
↪             # HIPPO non-periodic system
python tinker2lmp.py -xyz water_box.xyz -amoeba amoeba_water.prm -data data.water_box.amoeba -
↪pbc 18.643 18.643 18.643    # AMOEBA periodic system
python tinker2lmp.py -xyz water_box.xyz -hippo hippo_water.prm -data data.water_box.hippo -pbc 18.
↪643 18.643 18.643       # HIPPO periodic system
python tinker2lmp.py -xyz ubiquitin.xyz -amoeba amoeba_ubiquitin.prm -data data.ubiquitin.new -pbc
↪54.99 41.91 41.91 -bitorsion bitorsion.ubiquitin.data.new   # system with bitorsions
```

Switches and their arguments may be specified in any order.

The -xyz switch is required and specifies an input XYZ file as an argument. The format of this file is an extended XYZ format defined and used by Tinker for its input. Example *.xyz files are in the examples/amoeba directory. The file lists the atoms in the system. Each atom has the following information: Tinker species name (ignored by LAMMPS), xyz coordinates, Tinker numeric type, and a list of atom IDs the atom is bonded to.

Here is more information about the extended XYZ format defined and used by Tinker, and links to programs that convert standard PDB files to the extended XYZ format:

- https://dasher.wustl.edu/tinker/distribution/doc/sphinx/tinker/_build/html/text/file-types.html
- https://openbabel.org/docs/FileFormats/Tinker_XYZ_format.html
- https://github.com/emleddin/pdbxyz-xyzpdb
- https://github.com/TinkerTools/tinker/blob/release/source/pdbxyz.f

The -amoeba or -hippo switch is required. It specifies an input AMOEBA or HIPPO PRM force field file as an argument. This should be the same file used by the *pair_style* command in the input script.

The -data switch is required. It specifies an output file name for the LAMMPS data file that will be produced.

For periodic systems, the -pbc switch is required. It specifies the periodic box size for each dimension (x,y,z). For a Tinker simulation these are specified in the KEY file.

The -bitorsion switch is only needed if the system contains Tinker bitorsion interactions. The data for each type of bitorsion interaction will be written to the specified file, and read by the *fix amoeba/bitorsion* command. The data includes 2d arrays of values to which splines are fit, and thus is not compatible with the LAMMPS data file format.

10.4.4 TIP3P water model

The TIP3P water model as implemented in CHARMM *(MacKerell)* specifies a 3-site rigid water molecule with charges and Lennard-Jones parameters assigned to each of the three atoms.

One suitable pair style with cutoff Coulomb would for instance be:

- *pair_style lj/cut/coul/cut*

These commands are examples for a long-range Coulomb model:

- *pair_style lj/cut/coul/long*
- *pair_style lj/cut/coul/long/soft*
- *kspace_style pppm*
- *pair_style lj/long/coul/long*
- *kspace_style pppm/disp*

And these pair styles are compatible with the CHARMM force field:

- *pair_style lj/charmm/coul/charmm*
- *pair_style lj/charmm/coul/long*
- *pair_style lj/charmmfsw/coul/long*

In LAMMPS the *fix shake or fix rattle* command can be used to hold the two O-H bonds and the H-O-H angle rigid. A bond style of *harmonic* and an angle style of *harmonic* or *charmm* should also be used. In case of rigid bonds also bond style *zero* and angle style *zero* can be used.

The table below lists the force field parameters (in real *units*) to for the water molecule atoms to run a rigid or flexible TIP3P-CHARMM model with a cutoff, the original 1983 TIP3P model *(Jorgensen)*, or a TIP3P model with parameters optimized for a long-range Coulomb solver (e.g. Ewald or PPPM in LAMMPS) *(Price)*. The K values can be used if a flexible TIP3P model (without fix shake) is desired, for rigid bonds/angles they are ignored.

Parameter	TIP3P-CHARMM	TIP3P (original)	TIP3P (Ewald)
O mass (amu)	15.9994	15.9994	15.9994
H mass (amu)	1.008	1.008	1.008
O charge (e)	-0.834	-0.834	-0.834
H charge (e)	0.417	0.417	0.417
LJ ε of OO (kcal/mole)	0.1521	0.1521	0.1020
LJ σ of OO (Å)	3.1507	3.1507	3.188
LJ ε of HH (kcal/mole)	0.0460	0.0	0.0
LJ σ of HH (Å)	0.4	1.0	1.0
LJ ε of OH (kcal/mole)	0.0836	0.0	0.0
LJ σ of OH (Å)	1.7753	1.0	1.0
K of OH bond (kcal/mole/Å^2)	450	450	450
r_0 of OH bond (Å)	0.9572	0.9572	0.9572
K of HOH angle (kcal/mole)	55.0	55.0	55.0
θ_0 of HOH angle	104.52°	104.52°	104.52°

Below is the code for a LAMMPS input file and a molecule file (tip3p.mol) of TIP3P water for use with the *molecule command* demonstrating how to set up a small bulk water system for TIP3P with rigid bonds. For simplicity and speed the example uses a cutoff Coulomb. Most production simulations require long-range Coulomb instead.

10.4.5 TIP4P and OPC water models

The four-point TIP4P rigid water model extends the traditional *three-point TIP3P* model by adding an additional site M, usually massless, where the charge associated with the oxygen atom is placed. This site M is located at a fixed distance away from the oxygen along the bisector of the HOH bond angle. A bond style of *harmonic* and an angle style of *harmonic* or *charmm* should also be used. In case of rigid bonds also bond style *zero* and angle style *zero* can be

used. Very similar to the TIP4P model is the OPC water model. It can be realized the same way as TIP4P but has different geometry and force field parameters.

There are two ways to implement TIP4P-like water in LAMMPS:

1. Use a specially written pair style that uses the *TIP3P geometry* without the point M. The point M location is then implicitly derived from the other atoms or each water molecule and used during the force computation. The forces on M are then projected on the oxygen and the two hydrogen atoms. This is computationally very efficient, but the charge distribution in space is only correct within the tip4p labeled styles. So all other computations using charges will "see" the negative charge incorrectly located on the oxygen atom unless they are specially written for using the TIP4P geometry internally as well, e.g. *compute dipole/tip4p*, *fix efield/tip4p*, or *kspace_style pppm/tip4p*.

   This can be done with the following pair styles for Coulomb with a cutoff:

   - *pair_style tip4p/cut*
   - *pair_style lj/cut/tip4p/cut*

   or these commands for a long-range Coulomb treatment:

   - *pair_style tip4p/long*
   - *pair_style lj/cut/tip4p/long*
   - *pair_style lj/long/tip4p/long*
   - *pair_style tip4p/long/soft*
   - *pair_style lj/cut/tip4p/long/soft*
   - *kspace_style pppm/tip4p*
   - *kspace_style pppm/disp/tip4p*

   The bond lengths and bond angles should be held fixed using the *fix shake* or *fix rattle* command, unless a parameterization for a flexible TIP4P model is used. The parameter sets listed below are all for rigid TIP4P model variants and thus the bond and angle force constants are not used and can be set to any legal value; only equilibrium length and angle are used.

2. Use an *explicit 4 point TIP4P geometry* where the oxygen atom carries no charge and the M point no Lennard-Jones interactions. Since *fix shake* or *fix rattle* may not be applied to this kind of geometry, *fix rigid or fix rigid/small* or its thermostatted variants are required to maintain a rigid geometry. This avoids some of the issues with respect to analysis and non-tip4p styles, but it is a more costly force computation (more atoms in the same volume and thus more neighbors in the neighbor lists) and requires a much shorter timestep for stable integration of the rigid body motion. Since no bonds or angles are required, they do not need to be defined and atom style charge would be sufficient for a bulk TIP4P water system. In order to avoid that LAMMPS produces an error due to the massless M site a tiny non-zero mass needs to be assigned.

The table below lists the force field parameters (in real *units*) to for a selection of popular variants of the TIP4P model. There is the rigid TIP4P model with a cutoff *(Jorgensen)*, the TIP4/Ice model *(Abascal1)*, the TIP4P/2005 model *(Abascal2)* and a version of TIP4P parameters adjusted for use with a long-range Coulombic solver (e.g. Ewald or PPPM in LAMMPS). Note that for implicit TIP4P models the OM distance is specified in the *pair_style* command, not as part of the pair coefficients. Also parameters for the OPC model (*Izadi*) are provided.

Parameter	TIP4P (original)	TIP4P/Ice	TIP4P/2005	TIP4P (Ewald)	OPC
O mass (amu)	15.9994	15.9994	15.9994	15.9994	15.9994
H mass (amu)	1.008	1.008	1.008	1.008	1.008
O or M charge (e)	-1.040	-1.1794	-1.1128	-1.04844	-1.3582
H charge (e)	0.520	0.5897	0.5564	0.52422	0.6791
LJ ε of OO (kcal/mole)	0.1550	0.21084	0.1852	0.16275	0.21280
LJ σ of OO (Å)	3.1536	3.1668	3.1589	3.16435	3.1660
LJ ε of HH, MM, OH, OM, HM (kcal/mole)	0.0	0.0	0.0	0.0	0.0
LJ σ of HH, MM, OH, OM, HM (Å)	1.0	1.0	1.0	1.0	1.0
r_0 of OH bond (Å)	0.9572	0.9572	0.9572	0.9572	0.8724
θ_0 of HOH angle	104.52°	104.52°	104.52°	104.52°	103.60°
OM distance (Å)	0.15	0.1577	0.1546	0.1250	0.1594

Note that the when using a TIP4P pair style, the neighbor list cutoff for Coulomb interactions is effectively extended by a distance 2 * (OM distance), to account for the offset distance of the fictitious charges on O atoms in water molecules. Thus, it is typically best in an efficiency sense to use a LJ cutoff >= Coulomb cutoff + 2*(OM distance), to shrink the size of the neighbor list. This leads to slightly larger cost for the long-range calculation, so you can test the trade-off for your model. The OM distance and the LJ and Coulombic cutoffs are set in the *pair_style lj/cut/tip4p/long* command.

Below is the code for a LAMMPS input file using the implicit method and the *TIP3P molecule file*. Because the TIP4P charges are different from TIP3P they need to be reset (or the molecule file changed). For simplicity and speed the example uses a cutoff Coulomb. Most production simulations require long-range Coulomb instead.

```

Below is the code for a LAMMPS input file using the explicit method and a TIP4P molecule file. Because of using *fix rigid/small* no bonds need to be defined and thus no extra storage needs to be reserved for them, but we need to either switch to atom style full or use *fix property/atom mol* so that fix rigid/small can identify rigid bodies by their molecule ID. Also a *neigh_modify exclude* command is added to exclude computing intramolecular non-bonded interactions, since those are removed by the rigid fix anyway:

10.4.6 TIP5P water model

The five-point TIP5P rigid water model extends the *three-point TIP3P model* by adding two additional sites L, usually massless, where the charge associated with the oxygen atom is placed. These sites L are located at a fixed distance away from the oxygen atom, forming a tetrahedral angle that is rotated by 90 degrees from the HOH plane. Those sites thus somewhat approximate lone pairs of the oxygen and consequently improve the water structure to become even more "tetrahedral" in comparison to the *four-point TIP4P model*.

A suitable pair style with cutoff Coulomb would be:

- *pair_style lj/cut/coul/cut*

or these commands for a long-range model:

- *pair_style lj/cut/coul/long*
- *pair_style lj/cut/coul/long/soft*
- *kspace_style pppm*
- *kspace_style pppm/disp*

A TIP5P model *must* be run using a *rigid fix* since there is no other option to keep this kind of structure rigid in LAMMPS. In order to avoid that LAMMPS produces an error due to the massless L sites, those need to be assigned a tiny non-zero mass.

The table below lists the force field parameters (in real *units*) to for a the TIP5P model with a cutoff *(Mahoney)* and the TIP5P-E model *(Rick)* for use with a long-range Coulombic solver (e.g. Ewald or PPPM in LAMMPS).

Parameter	TIP5P	TIP5P-E
O mass (amu)	15.9994	15.9994
H mass (amu)	1.008	1.008
O charge (e)	0.0	0.0
L charge (e)	-0.241	-0.241
H charge (e)	0.241	0.241
LJ ε of OO (kcal/mole)	0.1600	0.1780
LJ σ of OO (Å)	3.1200	3.0970
LJ ε of HH, LL, OH, OL, HL (kcal/mole)	0.0	0.0
LJ σ of HH, LL, OH, OL, HL (Å)	1.0	1.0
r_0 of OH bond (Å)	0.9572	0.9572
θ_0 of HOH angle	104.52°	104.52°
OL distance (Å)	0.70	0.70
θ_0 of LOL angle	109.47°	109.47°

Below is the code for a LAMMPS input file for setting up a simulation of TIP5P water with a molecule file. Because of using *fix rigid/small* no bonds need to be defined and thus no extra storage needs to be reserved for them, but we need to either switch to atom style full or use *fix property/atom mol* so that fix rigid/small can identify rigid bodies by their molecule ID. Also a *neigh_modify exclude* command is added to exclude computing intramolecular non-bonded interactions, since those are removed by the rigid fix anyway. For simplicity and speed the example uses a cutoff Coulomb. Most production simulations require long-range Coulomb instead.

10.4.7 SPC and SPC/E water model

The SPC water model specifies a 3-site rigid water molecule with charges and Lennard-Jones parameters assigned to each of the three atoms. In LAMMPS the *fix shake* command can be used to hold the two O-H bonds and the H-O-H angle rigid. A bond style of *harmonic* and an angle style of *harmonic* or *charmm* should also be used.

One suitable pair style with cutoff Coulomb would for instance be:

- *pair_style lj/cut/coul/cut*

These commands are examples for a long-range Coulomb model:

- *pair_style lj/cut/coul/long*
- *pair_style lj/cut/coul/long/soft*
- *kspace_style pppm*
- *pair_style lj/long/coul/long*
- *kspace_style pppm/disp*

These are the additional parameters (in real units) to set for O and H atoms and the water molecule to run a rigid SPC model.

O mass = 15.9994
H mass = 1.008
O charge = -0.820
H charge = 0.410
LJ ε of OO = 0.1553
LJ σ of OO = 3.166
LJ ε, σ of OH, HH = 0.0
r_0 of OH bond = 1.0
θ_0 of HOH angle = 109.47°

Note that as originally proposed, the SPC model was run with a 9 Angstrom cutoff for both LJ and Coulomb terms. It can also be used with long-range electrostatic solvers (e.g. Ewald or PPPM in LAMMPS) without changing any of the parameters above, although it becomes a different model in that mode of usage.

The SPC/E (extended) water model is the same, except the partial charge assignments change:

O charge = -0.8476
H charge = 0.4238

See the *(Berendsen2)* reference for more details on both the SPC and SPC/E models.

Below is the code for a LAMMPS input file and a molecule file (spce.mol) of SPC/E water for use with the *molecule command* demonstrating how to set up a small bulk water system for SPC/E with rigid bonds. For simplicity and speed the example uses a cutoff Coulomb. Most production simulations require long-range Coulomb instead.

10.5 Packages howto

10.5.1 Finite-size spherical and aspherical particles

Typical MD models treat atoms or particles as point masses. Sometimes it is desirable to have a model with finite-size particles such as spheroids or ellipsoids or generalized aspherical bodies. The difference is that such particles have a moment of inertia, rotational energy, and angular momentum. Rotation is induced by torque coming from interactions with other particles.

LAMMPS has several options for running simulations with these kinds of particles. The following aspects are discussed in turn:

- atom styles
- pair potentials
- time integration
- computes, thermodynamics, and dump output
- rigid bodies composed of finite-size particles

Example input scripts for these kinds of models are in the body, colloid, dipole, ellipse, line, peri, pour, and tri directories of the *examples directory* in the LAMMPS distribution.

Atom styles

There are several *atom styles* that allow for definition of finite-size particles: sphere, dipole, ellipsoid, line, tri, peri, and body.

The sphere style defines particles that are spheroids and each particle can have a unique diameter and mass (or density). These particles store an angular velocity (omega) and can be acted upon by torque. The "set" command can be used to modify the diameter and mass of individual particles, after then are created.

The dipole style does not actually define finite-size particles, but is often used in conjunction with spherical particles, via a command like

```
atom_style hybrid sphere dipole
```

This is because when dipoles interact with each other, they induce torques, and a particle must be finite-size (i.e. have a moment of inertia) in order to respond and rotate. See the *atom_style dipole* command for details. The "set" command can be used to modify the orientation and length of the dipole moment of individual particles, after then are created.

The ellipsoid style defines particles that are ellipsoids and thus can be aspherical. Each particle has a shape, specified by 3 diameters, and mass (or density). These particles store an angular momentum and their orientation (quaternion), and can be acted upon by torque. They do not store an angular velocity (omega), which can be in a different direction than angular momentum, rather they compute it as needed. The "set" command can be used to modify the diameter, orientation, and mass of individual particles, after then are created. It also has a brief explanation of what quaternions are.

The line style defines line segment particles with two end points and a mass (or density). They can be used in 2d simulations, and they can be joined together to form rigid bodies which represent arbitrary polygons.

The tri style defines triangular particles with three corner points and a mass (or density). They can be used in 3d simulations, and they can be joined together to form rigid bodies which represent arbitrary particles with a triangulated surface.

The peri style is used with *Peridynamic models* and defines particles as having a volume, that is used internally in the *pair_style peri* potentials.

The body style allows for definition of particles which can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc. The body style is discussed in more detail on the *Howto body* doc page.

Note that if one of these atom styles is used (or multiple styles via the *atom_style hybrid* command), not all particles in the system are required to be finite-size or aspherical.

For example, in the ellipsoid style, if the 3 shape parameters are set to the same value, the particle will be a sphere rather than an ellipsoid. If the 3 shape parameters are all set to 0.0 or if the diameter is set to 0.0, it will be a point particle. In the line or tri style, if the lineflag or triflag is specified as 0, then it will be a point particle.

Some of the pair styles used to compute pairwise interactions between finite-size particles also compute the correct interaction with point particles as well, e.g. the interaction between a point particle and a finite-size particle or between two point particles. If necessary, *pair_style hybrid* can be used to ensure the correct interactions are computed for the appropriate style of interactions. Likewise, using groups to partition particles (ellipsoids versus spheres versus point particles) will allow you to use the appropriate time integrators and temperature computations for each class of particles. See the doc pages for various commands for details.

Also note that for *2d simulations*, atom styles sphere and ellipsoid still use 3d particles, rather than as circular disks or ellipses. This means they have the same moment of inertia as the 3d object. When temperature is computed, the correct degrees of freedom are used for rotation in a 2d versus 3d system.

Pair potentials

When a system with finite-size particles is defined, the particles will only rotate and experience torque if the force field computes such interactions. These are the various *pair styles* that generate torque:

- *pair_style gran/history*
- *pair_style gran/hertz*
- *pair_style gran/no_history*
- *pair_style dipole/cut*
- *pair_style gayberne*
- *pair_style resquared*
- *pair_style brownian*
- *pair_style lubricate*
- *pair_style line/lj*
- *pair_style tri/lj*
- *pair_style body/nparticle*

The granular pair styles are used with spherical particles. The dipole pair style is used with the dipole atom style, which could be applied to spherical or ellipsoidal particles. The GayBerne and REsquared potentials require ellipsoidal particles, though they will also work if the 3 shape parameters are the same (a sphere). The Brownian and lubrication potentials are used with spherical particles. The line, tri, and body potentials are used with line segment, triangular, and body particles respectively.

Time integration

There are several fixes that perform time integration on finite-size spherical particles, meaning the integrators update the rotational orientation and angular velocity or angular momentum of the particles:

- *fix nve/sphere*
- *fix nvt/sphere*

- *fix npt/sphere*

Likewise, there are 3 fixes that perform time integration on ellipsoidal particles:

- *fix nve/asphere*
- *fix nvt/asphere*
- *fix npt/asphere*

The advantage of these fixes is that those which thermostat the particles include the rotational degrees of freedom in the temperature calculation and thermostatting. The *fix langevin* command can also be used with its *omgea* or *angmom* options to thermostat the rotational degrees of freedom for spherical or ellipsoidal particles. Other thermostatting fixes only operate on the translational kinetic energy of finite-size particles.

These fixes perform constant NVE time integration on line segment, triangular, and body particles:

- *fix nve/line*
- *fix nve/tri*
- *fix nve/body*

Note that for mixtures of point and finite-size particles, these integration fixes can only be used with *groups* which contain finite-size particles.

Computes, thermodynamics, and dump output

There are several computes that calculate the temperature or rotational energy of spherical or ellipsoidal particles:

- *compute temp/sphere*
- *compute temp/asphere*
- *compute erotate/sphere*
- *compute erotate/asphere*

These include rotational degrees of freedom in their computation. If you wish the thermodynamic output of temperature or pressure to use one of these computes (e.g. for a system entirely composed of finite-size particles), then the compute can be defined and the *thermo_modify* command used. Note that by default thermodynamic quantities will be calculated with a temperature that only includes translational degrees of freedom. See the *thermo_style* command for details.

These commands can be used to output various attributes of finite-size particles:

- *dump custom*
- *compute property/atom*
- *dump local*
- *compute body/local*

Attributes include the dipole moment, the angular velocity, the angular momentum, the quaternion, the torque, the end-point and corner-point coordinates (for line and tri particles), and sub-particle attributes of body particles.

Rigid bodies composed of finite-size particles

The *fix rigid* command treats a collection of particles as a rigid body, computes its inertia tensor, sums the total force and torque on the rigid body each timestep due to forces on its constituent particles, and integrates the motion of the rigid body.

If any of the constituent particles of a rigid body are finite-size particles (spheres or ellipsoids or line segments or triangles), then their contribution to the inertia tensor of the body is different than if they were point particles. This means the rotational dynamics of the rigid body will be different. Thus a model of a dimer is different if the dimer

consists of two point masses versus two spheroids, even if the two particles have the same mass. Finite-size particles that experience torque due to their interaction with other particles will also impart that torque to a rigid body they are part of.

See the "fix rigid" command for example of complex rigid-body models it is possible to define in LAMMPS.

Note that the *fix shake* command can also be used to treat 2, 3, or 4 particles as a rigid body, but it always assumes the particles are point masses.

Also note that body particles cannot be modeled with the *fix rigid* command. Body particles are treated by LAMMPS as single particles, though they can store internal state, such as a list of sub-particles. Individual body particles are typically treated as rigid bodies, and their motion integrated with a command like *fix nve/body*. Interactions between pairs of body particles are computed via a command like *pair_style body/nparticle*.

10.5.2 Granular models

Granular system are composed of spherical particles with a diameter, as opposed to point particles. This means they have an angular velocity and torque can be imparted to them to cause them to rotate.

To run a simulation of a granular model, you will want to use the following commands:

- *atom_style sphere*
- *fix nve/sphere*
- *fix gravity*

This compute

- *compute erotate/sphere*

calculates rotational kinetic energy which can be *output with thermodynamic info*. The compute

- *compute fabric*

calculates various versions of the fabric tensor for granular and non-granular pair styles.

Use one of these 4 pair potentials, which compute forces and torques between interacting pairs of particles:

- *pair_style gran/history*
- *pair_style gran/no_history*
- *pair_style gran/hertzian*
- *pair_style granular*

These commands implement fix options specific to granular systems:

- *fix freeze*
- *fix pour*
- *fix viscous*
- *fix wall/gran*
- *fix wall/gran/region*

The fix style *freeze* zeroes both the force and torque of frozen atoms, and should be used for granular system instead of the fix style *setforce*.

To model heat conduction, one must add the temperature and heatflow atom variables with:

- *fix property/atom*

a temperature integration fix

- *fix heat/flow*

and a heat conduction option defined in both

- *pair_style granular*
- *fix wall/gran*

For computational efficiency, you can eliminate needless pairwise computations between frozen atoms by using this command:

- *neigh_modify* exclude

Note

By default, for 2d systems, granular particles are still modeled as 3d spheres, not 2d discs (circles), meaning their moment of inertia will be the same as in 3d. If you wish to model granular particles in 2d as 2d discs, see the note on this topic on the *Howto 2d* doc page, where 2d simulations are discussed.

To add custom granular contact models, see the *modifying granular sub-models page*.

10.5.3 Body particles

Overview:

In LAMMPS, body particles are generalized finite-size particles. Individual body particles can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc. Note that other kinds of finite-size spherical and aspherical particles are also supported by LAMMPS, such as spheres, ellipsoids, line segments, and triangles, but they are simpler entities than body particles. See the *Howto spherical* page for a general overview of all these particle types.

Body particles are used via the *atom_style body* command. It takes a body style as an argument. The current body styles supported by LAMMPS are as follows. The name in the first column is used as the *bstyle* argument for the *atom_style body* command.

nparticle	rigid body with N sub-particles
rounded/polygon	2d polygons with N vertices
rounded/polyhedron	3d polyhedra with N vertices, E edges and F faces

The body style determines what attributes are stored for each body and thus how they can be used to compute pairwise body/body or bond/non-body (point particle) interactions. More details of each style are described below.

More styles may be added in the future. See the *page on creating new body styles* for details on how to add a new body style to the code.

When to use body particles:

You should not use body particles to model a rigid body made of simpler particles (e.g. point, sphere, ellipsoid, line segment, triangular particles), if the interaction between pairs of rigid bodies is just the summation of pairwise interactions between the simpler particles. LAMMPS already supports this kind of model via the *fix rigid* command. Any of the numerous pair styles that compute interactions between simpler particles can be used. The *fix rigid* command time integrates the motion of the rigid bodies. All of the standard LAMMPS commands for thermostatting, adding constraints, performing output, etc will operate as expected on the simple particles.

By contrast, when body particles are used, LAMMPS treats an entire body as a single particle for purposes of computing pairwise interactions, building neighbor lists, migrating particles between processors, output of particles to a dump file,

etc. This means that interactions between pairs of bodies or between a body and non-body (point) particle need to be encoded in an appropriate pair style. If such a pair style were to mimic the *fix rigid* model, it would need to loop over the entire collection of interactions between pairs of simple particles within the two bodies, each time a single body/body interaction was computed.

Thus it only makes sense to use body particles and develop such a pair style, when particle/particle interactions are more complex than what the *fix rigid* command can already calculate. For example, consider particles with one or more of the following attributes:

- represented by a surface mesh
- represented by a collection of geometric entities (e.g. planes + spheres)
- deformable
- internal stress that induces fragmentation

For these models, the interaction between pairs of particles is likely to be more complex than the summation of simple pairwise interactions. An example is contact or frictional forces between particles with planar surfaces that inter-penetrate. Likewise, the body particle may store internal state, such as a stress tensor used to compute a fracture criterion.

These are additional LAMMPS commands that can be used with body particles of different styles

fix nve/body	integrate motion of a body particle in NVE ensemble
fix nvt/body	ditto for NVT ensemble
fix npt/body	ditto for NPT ensemble
fix nph/body	ditto for NPH ensemble
compute body/local	store sub-particle attributes of a body particle
compute temp/body	compute temperature of body particles
dump local	output sub-particle attributes of a body particle
dump image	output body particle attributes as an image

The pair styles currently defined for use with specific body styles are listed in the sections below.

Note that for all the body styles, if the data file defines a general triclinic box, then the orientation of the body particle and its corresponding 6 moments of inertia and other orientation-dependent values should reflect the fact the body is defined withing a general triclinic box with edge vectors **A**,**B**,**C**. LAMMPS will rotate the box to convert it to a restricted triclinic box. This operation will also rotate the orientation of the body particles. See the *Howto triclinic* doc page for more details. The sections below highlight the orientation-dependent values specific to each body style.

Specifics of body style nparticle:

The *nparticle* body style represents body particles as a rigid body with a variable number N of sub-particles. It is provided as a vanilla, prototypical example of a body particle, although as mentioned above, the *fix rigid* command already duplicates its functionality.

The atom_style body command for this body style takes two additional arguments:

```
atom_style body nparticle Nmin Nmax
Nmin = minimum # of sub-particles in any body in the system
Nmax = maximum # of sub-particles in any body in the system
```

The Nmin and Nmax arguments are used to bound the size of data structures used internally by each particle.

When the *read_data* command reads a data file for this body style, the following information must be provided for each entry in the *Bodies* section of the data file:

```
atom-ID 1 M
N
ixx iyy izz ixy ixz iyz
x1 y1 z1
...
xN yN zN
```

where M = 6 + 3*N, and N is the number of sub-particles in the body particle.

The integer line has a single value N. The floating point line(s) list 6 moments of inertia followed by the coordinates of the N sub-particles (x1 to zN) as 3N values. These values can be listed on as many lines as you wish; see the *read_data* command for more details.

The 6 moments of inertia (ixx,iyy,izz,ixy,ixz,iyz) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box XYZ axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally.

The coordinates of each sub-particle are specified as its x,y,z displacement from the center-of-mass of the body particle. The center-of-mass position of the particle is specified by the x,y,z values in the *Atoms* section of the data file, as is the total mass of the body particle.

Note that if the data file defines a general triclinic simulation box, these sub-particle displacements are orientation-dependent and, as mentioned above, should reflect the body particle's orientation within the general triclinic box.

The *pair_style body/nparticle* command can be used with this body style to compute body/body and body/non-body interactions.

Specifics of body style rounded/polygon:

The *rounded/polygon* body style represents body particles as a 2d polygon with a variable number of N vertices. This style can only be used for 2d models; see the *boundary* command. See the *pair_style body/rounded/polygon* page for a diagram of two squares with rounded circles at the vertices. Special cases for N = 1 (circle) and N = 2 (rod with rounded ends) can also be specified.

One use of this body style is for 2d discrete element models, as described in *Fraige*.

Similar to body style *nparticle*, the atom_style body command for this body style takes two additional arguments:

```
atom_style body rounded/polygon Nmin Nmax
Nmin = minimum # of vertices in any body in the system
Nmax = maximum # of vertices in any body in the system
```

The Nmin and Nmax arguments are used to bound the size of data structures used internally by each particle.

When the *read_data* command reads a data file for this body style, the following information must be provided for each body in the *Bodies* section of the data file:

```
atom-ID 1 M
N
ixx iyy izz ixy ixz iyz
x1 y1 z1
...
xN yN zN
diameter
```

where M = 6 + 3*N + 1, and N is the number of vertices in the body particle.

The integer line has a single value N. The floating point line(s) list 6 moments of inertia, followed by the coordinates of the N vertices (x1 to zN) as 3N values (with z = 0.0 for each), followed by a diameter value = the rounded diameter of the circle that surrounds each vertex. The diameter value can be different for each body particle. These floating-point values can be listed on as many lines as you wish; see the *read_data* command for more details.

Note

It is important that the vertices for each polygonal body particle be listed in order around its perimeter, so that edges can be inferred. LAMMPS does not check that this is the case.

The 6 moments of inertia (ixx,iyy,izz,ixy,ixz,iyz) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box XYZ axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally.

The coordinates of each vertex are specified as its x,y,z displacement from the center-of-mass of the body particle. The center-of-mass position of the particle is specified by the x,y,z values in the *Atoms* section of the data file.

For example, the following information would specify a square particle whose edge length is sqrt(2) and rounded diameter is 1.0. The orientation of the square is aligned with the xy coordinate axes which is consistent with the 6 moments of inertia: ixx iyy izz ixy ixz iyz = 1 1 4 0 0 0. Note that only Izz matters in 2D simulations.

```
3 1 19
4
1 1 4 0 0 0
-0.7071 -0.7071 0
-0.7071 0.7071 0
0.7071 0.7071 0
0.7071 -0.7071 0
1.0
```

A rod in 2D, whose length is 4.0, mass 1.0, rounded at two ends by circles of diameter 0.5, is specified as follows:

```
1 1 13
2
1 1 1.33333 0 0 0
-2 0 0
2 0 0
0.5
```

A disk, whose diameter is 3.0, mass 1.0, is specified as follows:

```
1 1 10
1
1 1 4.5 0 0 0
0 0 0
3.0
```

Note that if the data file defines a general triclinic simulation box, these polygon vertex displacements are orientation-dependent and, as mentioned above, should reflect the body particle's orientation within the general triclinic box.

The *pair_style body/rounded/polygon* command can be used with this body style to compute body/body interactions. The *fix wall/body/polygon* command can be used with this body style to compute the interaction of body particles with a wall.

Specifics of body style rounded/polyhedron:

The *rounded/polyhedron* body style represents body particles as a 3d polyhedron with a variable number of N vertices, E edges and F faces. This style can only be used for 3d models; see the *boundary* command. See the "pair_style body/rounded/polygon" page for a diagram of a two 2d squares with rounded circles at the vertices. A 3d cube with rounded spheres at the 8 vertices and 12 rounded edges would be similar. Special cases for N = 1 (sphere) and N = 2 (rod with rounded ends) can also be specified.

This body style is for 3d discrete element models, as described in *Wang*.

Similar to body style *rounded/polygon*, the atom_style body command for this body style takes two additional arguments:

```
atom_style body rounded/polyhedron Nmin Nmax
Nmin = minimum # of vertices in any body in the system
Nmax = maximum # of vertices in any body in the system
```

The Nmin and Nmax arguments are used to bound the size of data structures used internally by each particle.

When the *read_data* command reads a data file for this body style, the following information must be provided for each entry in the *Bodies* section of the data file:

```
atom-ID 3 M
N E F
ixx iyy izz ixy ixz iyz
x1 y1 z1
...
xN yN zN
0 1
1 2
2 3
...
0 1 2 -1
0 2 3 -1
...
1 2 3 4
diameter
```

where M = 6 + 3*N + 2*E + 4*F + 1, and N is the number of vertices in the body particle, E = number of edges, F = number of faces. For N = 1 or 2, the format is simpler. E and F are ignored and no edges or faces are listed, so that M = 6 + 3*N + 1.

The integer line has three values: number of vertices (N), number of edges (E) and number of faces (F). The floating point line(s) list 6 moments of inertia followed by the coordinates of the N vertices (x1 to zN) as 3N values, followed by 2E vertex indices corresponding to the end points of the E edges, then 4*F vertex indices defining F faces. The last value is the diameter value = the rounded diameter of the sphere that surrounds each vertex. The diameter value can be different for each body particle. These floating-point values can be listed on as many lines as you wish; see the *read_data* command for more details.

Note that vertices are numbered from 0 to N-1 inclusive. The order of the 2 vertices in each edge does not matter. Faces can be triangles or quadrilaterals. In both cases 4 vertices must be specified. For a triangle the 4th vertex is -1. The 4 vertices within each triangle or quadrilateral face should be ordered by the right-hand rule so that the normal vector of the face points outwards from the center of mass. For polyhedron with faces with more than 4 vertices, you should split the complex face into multiple simple faces, each of which is a triangle or quadrilateral.

Note

If a face is a quadrilateral then its 4 vertices must be co-planar. LAMMPS does not check that this is the case. If

you have a quad-face of a polyhedron that is not planar (e.g. a cube whose vertices have been randomly displaced), then you should represent the single quad face as two triangle faces instead.

The 6 moments of inertia (ixx,iyy,izz,ixy,ixz,iyz) should be the values consistent with the current orientation of the rigid body around its center of mass. The values are with respect to the simulation box XYZ axes, not with respect to the principal axes of the rigid body itself. LAMMPS performs the latter calculation internally.

The coordinates of each vertex are specified as its x,y,z displacement from the center-of-mass of the body particle. The center-of-mass position of the particle is specified by the x,y,z values in the *Atoms* section of the data file.

For example, the following information would specify a cubic particle whose edge length is 2.0 and rounded diameter is 0.5. The orientation of the cube is aligned with the xyz coordinate axes which is consistent with the 6 moments of inertia: ixx iyy izz ixy ixz iyz = 0.667 0.667 0.667 0 0 0.

```
1 3 79
8 12 6
0.667 0.667 0.667 0 0 0
1 1 1
1 -1 1
-1 -1 1
-1 1 1
1 1 -1
1 -1 -1
-1 -1 -1
-1 1 -1
0 1
1 2
2 3
3 0
4 5
5 6
6 7
7 4
0 4
1 5
2 6
3 7
0 1 2 3
4 5 6 7
0 1 5 4
1 2 6 5
2 3 7 6
3 0 4 7
0.5
```

A rod in 3D, whose length is 4.0, mass 1.0 and rounded at two ends by circles of diameter 0.5, is specified as follows:

```
1 3 13
2 1 1
0 1.33333 1.33333 0 0 0
-2 0 0
2 0 0
0.5
```

A sphere whose diameter is 3.0 and mass 1.0, is specified as follows:

```
1 3 10
1 1 1
0.9 0.9 0.9 0 0 0
0 0 0
3.0
```

The number of edges and faces for a rod or sphere must be listed, but is ignored.

Note that if the data file defines a general triclinic simulation box, these polyhedron vertex displacements are orientation-dependent and, as mentioned above, should reflect the body particle's orientation within the general triclinic box.

The *pair_style body/rounded/polhedron* command can be used with this body style to compute body/body interactions. The *fix wall/body/polyhedron* command can be used with this body style to compute the interaction of body particles with a wall.

Output specifics for all body styles:

For the *compute body/local* and *dump local* commands, all 3 of the body styles described on his page produces one datum for each of the N vertices (of sub-particles) in a body particle. The datum has 3 values:

```
1 = x position of vertex (or sub-particle)
2 = y position of vertex
3 = z position of vertex
```

These values are the current position of the vertex within the simulation domain, not a displacement from the center-of-mass (COM) of the body particle itself. These values are calculated using the current COM and orientation of the body particle.

The *dump image* command and its *body* keyword can be used to render body particles.

For the *nparticle* body style, each body is drawn as a collection of spheres, one for each sub-particle. The size of each sphere is determined by the *bflag1* parameter for the *body* keyword. The *bflag2* argument is ignored.

For the *rounded/polygon* body style, each body is drawn as a polygon with N line segments. For the *rounded/polyhedron* body style, each face of each body is drawn as a polygon with N line segments. The drawn diameter of each line segment is determined by the *bflag1* parameter for the *body* keyword. The *bflag2* argument is ignored.

Note that for both the *rounded/polygon* and *rounded/polyhedron* styles, line segments are drawn between the pairs of vertices. Depending on the diameters of the line segments this may be slightly different than the physical extent of the body as calculated by the *pair_style rounded/polygon* or *pair_style rounded/polyhedron* commands. Conceptually, the pair styles define the surface of a 2d or 3d body by lines or planes that are tangent to the finite-size spheres of specified diameter which are placed on each vertex position.

10.5.4 Bonded particle models

The BPM package implements bonded particle models which can be used to simulate mesoscale solids. Solids are constructed as a collection of particles, which each represent a coarse-grained region of space much larger than the atomistic scale. Particles within a solid region are then connected by a network of bonds to model solid elasticity. There are many names for methods that are based on similar (or equivalent) capabilities to those in this package, including, but not limited to, cohesive beam models, bonded DEMs, lattice spring models, mass spring models, and lattice particle methods.

Unlike traditional bonds in molecular dynamics, the equilibrium bond length can vary between bonds. Bonds store the reference state. This includes setting the equilibrium length equal to the initial distance between the two particles, but can also include data on the bond orientation for rotational models. This produces a stress-free initial state. Furthermore, bonds are allowed to break under large strains, producing fracture. The examples/bpm directory has sample input scripts for simulations of the fragmentation of an impacted plate and the pouring of extended, elastic bodies. See *(Clemmer)* for more general information on the approach and the LAMMPS implementation. Example movies illustrating some of these capabilities are found at https://www.lammps.org/movies.html#bpmpackage.

Bonds can be created using a *read data* or *create bonds* command. Alternatively, a *molecule* template with bonds can be used with *fix deposit* or *fix pour* to create solid grains.

In this implementation, bonds store their reference state when they are first computed in the setup of the first simulation run. Data is then preserved across run commands and is written to *binary restart files* such that restarting the system will not reset the reference state of a bond. Bonds that are created midway into a run, such as those created by pouring grains using *fix pour*, are initialized on that timestep.

Currently, there are three types of bonds included in the BPM package. The first bond style, *bond bpm/spring*, only applies pairwise, central body forces. Point particles must have *bond atom style* and may be thought of as nodes in a spring network. An optional multibody term can be used to adjust the network's Poisson's ratio. The *bpm/spring/plastic* bond style is similar except it adds a plastic yield strain. Alternatively, the third bond style, *bond bpm/rotational*, resolves tangential forces and torques arising with the shearing, bending, and twisting of the bond due to rotation or displacement of particles. Particles are similar to those used in the *granular package*, *atom style sphere*. However, they must also track the current orientation of particles and store bonds, and therefore use a *bpm/sphere atom style*. This also requires a unique integrator *fix nve/bpm/sphere* which numerically integrates orientation similar to *fix nve/asphere*.

In addition to bond styles, a new pair style *pair bpm/spring* was added to accompany the bpm/spring bond style. By default, this pair style is simply a hookean repulsion with similar velocity damping as its sister bond style, but optional arguments can be used to modify the force.

Bond data can be output using a combination of standard LAMMPS commands. A list of IDs for bonded atoms can be generated using the *compute property/local* command. Various properties of bonds can be computed using the *compute bond/local* command. This command allows one to access data saved to the bond's history, such as the reference length of the bond. More information on bond history data can be found on the documentation pages for the specific BPM bond styles. Finally, this data can be output using a *dump local* command. As one may output many columns from the same compute, the *dump modify colname* option may be used to provide more helpful column names. An example of this procedure is found in /examples/bpm/pour/. External software, such as OVITO, can read these dump files to render bond data.

As bonds can potentially be broken between neighbor list builds, BPM bond styles may place restrictions on the *special_bonds* command. There are three possible scenarios which determine how pair interactions between bonded particles and special bond weights work.

The first option is the simplest. If bonds cannot break, then one can use any special bond settings to control pair forces. Namely, this is accomplished by setting the *break* keyword to *no*. Note that a zero coul weight for 1-2 bonds can be used to exclude bonded atoms from the neighbor list builds

```
special_bonds lj 0 1 1 coul 0 1 1
```

This can be useful for post-processing, or to determine pair interaction properties between distinct bonded particles.

If bonds can break, the second scenario is if pair forces are overlaid on top of bond forces such that atoms can simultaneously exchange both types of forces. This is accomplished by setting the *overlay/pair* keyword present in all bpm bond styles to *yes*. This case requires the following special bond settings

```
special_bonds lj/coul 1 1 1
```

Note that this scenario does not update special bond lists when bonds break, hence why fractional weights are not allowed. Whether or not two particles are bonded has no bearing on pair forces.

In the third scenario, bonds can break but pair forces are disabled between bonded particles. This is the default behavior of BPM bond styles. Unlike *bond quartic*, pair forces are not removed by subtracting pair forces during the bond computation, but rather by dynamically updating the 1-2 special bond list. To do this, LAMMPS requires *newton* bond off such that all processors containing an atom know when a bond breaks. Additionally, one must use the following special bond settings

```
special_bonds lj 0 1 1 coul 1 1 1
```

These settings accomplish two goals. First, they turn off 1-3 and 1-4 special bond lists, which are not currently supported for breakable BPMs. As BPMs often have dense bond networks, generating/updating 1-3 and 1-4 special bond lists can be expensive. By setting the lj weight for 1-2 bonds to zero, this turns off pairwise interactions. Even though there are no charges in BPM models, setting a nonzero coul weight for 1-2 bonds ensures all bonded neighbors are still included in the neighbor list in case bonds break between neighbor list builds.

To monitor the fracture of bonds in the system, all BPM bond styles have the ability to record instances of bond breakage to output using the *dump local* command. Since one may frequently output a list of broken bonds and the time they broke, the *dump modify* option *header no* may be useful to avoid repeatedly printing the header of the dump file. An example of this procedure is found in /examples/bpm/impact/. Additionally, one can use *compute nbond/atom* to tally the current number of bonds per atom.

See the *Howto* page on broken bonds for more information.

While LAMMPS has many utilities to create and delete bonds, *only* the following are currently compatible with BPM bond styles:

- *create_bonds*
- *delete_bonds*
- *fix bond/create*
- *fix bond/break*
- *fix bond/swap*

Note

The *create_bonds* command requires certain *special_bonds* settings. To subtract pair interactions, one will need to switch between different *special_bonds* settings in the input script. An example is found in examples/bpm/impact.

(Clemmer) Clemmer, Monti, Lechman, Soft Matter, 20, 1702 (2024).

10.5.5 Polarizable models

In polarizable force fields the charge distributions in molecules and materials respond to their electrostatic environments. Polarizable systems can be simulated in LAMMPS using three methods:

- the fluctuating charge method, implemented in the *QEQ* package,

- the adiabatic core-shell method, implemented in the *CORESHELL* package,
- the thermalized Drude dipole method, implemented in the *DRUDE* package.

The fluctuating charge method calculates instantaneous charges on interacting atoms based on the electronegativity equalization principle. It is implemented in the *fix qeq* which is available in several variants. It is a relatively efficient technique since no additional particles are introduced. This method allows for charge transfer between molecules or atom groups. However, because the charges are located at the interaction sites, off-plane components of polarization cannot be represented in planar molecules or atom groups.

The two other methods share the same basic idea: polarizable atoms are split into one core atom and one satellite particle (called shell or Drude particle) attached to it by a harmonic spring. Both atoms bear a charge and they represent collectively an induced electric dipole. These techniques are computationally more expensive than the QEq method because of additional particles and bonds. These two charge-on-spring methods differ in certain features, with the core-shell model being normally used for ionic/crystalline materials, whereas the so-called Drude model is normally used for molecular systems and fluid states.

The core-shell model is applicable to crystalline materials where the high symmetry around each site leads to stable trajectories of the core-shell pairs. However, bonded atoms in molecules can be so close that a core would interact too strongly or even capture the Drude particle of a neighbor. The Drude dipole model is relatively more complex in order to remedy this and other issues. Specifically, the Drude model includes specific thermostatting of the core-Drude pairs and short-range damping of the induced dipoles.

The three polarization methods can be implemented through a self-consistent calculation of charges or induced dipoles at each timestep. In the fluctuating charge scheme this is done by the matrix inversion method in *fix qeq/point*, but for core-shell or Drude-dipoles the relaxed-dipoles technique would require an slow iterative procedure. These self-consistent solutions yield accurate trajectories since the additional degrees of freedom representing polarization are massless. An alternative is to attribute a mass to the additional degrees of freedom and perform time integration using an extended Lagrangian technique. For the fluctuating charge scheme this is done by *fix qeq/dynamic*, and for the charge-on-spring models by the methods outlined in the next two sections. The assignment of masses to the additional degrees of freedom can lead to unphysical trajectories if care is not exerted in choosing the parameters of the polarizable models and the simulation conditions.

In the core-shell model the vibration of the shells is kept faster than the ionic vibrations to mimic the fast response of the polarizable electrons. But in molecular systems thermalizing the core-Drude pairs at temperatures comparable to the rest of the simulation leads to several problems (kinetic energy transfer, too short a timestep, etc.) In order to avoid these problems the relative motion of the Drude particles with respect to their cores is kept "cold" so the vibration of the core-Drude pairs is very slow, approaching the self-consistent regime. In both models the temperature is regulated using the velocities of the center of mass of core+shell (or Drude) pairs, but in the Drude model the actual relative core-Drude particle motion is thermostatted separately as well.

10.5.6 Adiabatic core/shell model

The adiabatic core-shell model by *Mitchell and Fincham* is a simple method for adding polarizability to a system. In order to mimic the electron shell of an ion, a satellite particle is attached to it. This way the ions are split into a core and a shell where the latter is meant to react to the electrostatic environment inducing polarizability. See the *Howto polarizable* page for a discussion of all the polarizable models available in LAMMPS.

Technically, shells are attached to the cores by a spring force f = k*r where k is a parameterized spring constant and r is the distance between the core and the shell. The charges of the core and the shell add up to the ion charge, thus q(ion) = q(core) + q(shell). This setup introduces the ion polarizability (alpha) given by alpha = q(shell)^2 / k. In a similar fashion the mass of the ion is distributed on the core and the shell with the core having the larger mass.

To run this model in LAMMPS, *atom_style full* can be used since atom charge and bonds are needed. Each kind of core/shell pair requires two atom types and a bond type. The core and shell of a core/shell pair should be bonded to each other with a harmonic bond that provides the spring force. For example, a data file for NaCl, as found in examples/coreshell, has this format:

```
432   atoms  # core and shell atoms
216   bonds  # number of core/shell springs

4     atom types  # 2 cores and 2 shells for Na and Cl
2     bond types

0.0 24.09597 xlo xhi
0.0 24.09597 ylo yhi
0.0 24.09597 zlo zhi

Masses       # core/shell mass ratio = 0.1

1 20.690784  # Na core
2 31.90500   # Cl core
3 2.298976   # Na shell
4 3.54500    # Cl shell

Atoms

1    1    2   1.5005    0.00000000   0.00000000   0.00000000 # core of core/shell pair 1
2    1    4  -2.5005    0.00000000   0.00000000   0.00000000 # shell of core/shell pair 1
3    2    1   1.5056    4.01599500   4.01599500   4.01599500 # core of core/shell pair 2
4    2    3  -0.5056    4.01599500   4.01599500   4.01599500 # shell of core/shell pair 2
(...)

Bonds   # Bond topology for spring forces

1     2     1     2   # spring for core/shell pair 1
2     2     3     4   # spring for core/shell pair 2
(...)
```

Non-Coulombic (e.g. Lennard-Jones) pairwise interactions are only defined between the shells. Coulombic interactions are defined between all cores and shells. If desired, additional bonds can be specified between cores.

The *special_bonds* command should be used to turn-off the Coulombic interaction within core/shell pairs, since that interaction is set by the bond spring. This is done using the *special_bonds* command with a 1-2 weight = 0.0, which is the default value. It needs to be considered whether one has to adjust the *special_bonds* weighting according to the molecular topology since the interactions of the shells are bypassed over an extra bond.

Note that this core/shell implementation does not require all ions to be polarized. One can mix core/shell pairs and ions without a satellite particle if desired.

Since the core/shell model permits distances of r = 0.0 between the core and shell, a pair style with a "cs" suffix needs to be used to implement a valid long-range Coulombic correction. Several such pair styles are provided in the CORESHELL package. See *this page* for details. All of the core/shell enabled pair styles require the use of a long-range Coulombic solver, as specified by the *kspace_style* command. Either the PPPM or Ewald solvers can be used.

For the NaCL example problem, these pair style and bond style settings are used:

```
pair_style      born/coul/long/cs 20.0 20.0
pair_coeff      * *      0.0 1.000   0.00  0.00   0.00
pair_coeff      3 3    487.0 0.23768 0.00  1.05   0.50 #Na-Na
pair_coeff      3 4 145134.0 0.23768 0.00  6.99   8.70 #Na-Cl
pair_coeff      4 4 405774.0 0.23768 0.00 72.40 145.40 #Cl-Cl
```

(continues on next page)

(continued from previous page)

```
bond_style      harmonic
bond_coeff      1 63.014 0.0
bond_coeff      2 25.724 0.0
```

When running dynamics with the adiabatic core/shell model, the following issues should be considered. The relative motion of the core and shell particles corresponds to the polarization, hereby an instantaneous relaxation of the shells is approximated and a fast core/shell spring frequency ensures a nearly constant internal kinetic energy during the simulation. Thermostats can alter this polarization behavior, by scaling the internal kinetic energy, meaning the shell will not react freely to its electrostatic environment. Therefore it is typically desirable to decouple the relative motion of the core/shell pair, which is an imaginary degree of freedom, from the real physical system. To do that, the *compute temp/cs* command can be used, in conjunction with any of the thermostat fixes, such as *fix nvt* or *fix langevin*. This compute uses the center-of-mass velocity of the core/shell pairs to calculate a temperature, and ensures that velocity is what is rescaled for thermostatting purposes. This compute also works for a system with both core/shell pairs and non-polarized ions (ions without an attached satellite particle). The *compute temp/cs* command requires input of two groups, one for the core atoms, another for the shell atoms. Non-polarized ions which might also be included in the treated system should not be included into either of these groups, they are taken into account by the *group-ID* (second argument) of the compute. The groups can be defined using the *group *type** command. Note that to perform thermostatting using this definition of temperature, the *fix modify temp* command should be used to assign the compute to the thermostat fix. Likewise the *thermo_modify temp* command can be used to make this temperature be output for the overall system.

For the NaCl example, this can be done as follows:

```
group cores type 1 2
group shells type 3 4
compute CSequ all temp/cs cores shells
fix thermoberendsen all temp/berendsen 1427 1427 0.4    # thermostat for the true physical system
fix thermostatequ all nve                               # integrator as needed for the berendsen thermostat
fix_modify thermoberendsen temp CSequ
thermo_modify temp CSequ                                # output of center-of-mass derived temperature
```

The pressure for the core/shell system is computed via the regular LAMMPS convention by *treating the cores and shells as individual particles*. For the thermo output of the pressure as well as for the application of a barostat, it is necessary to use an additional *pressure* compute based on the default *temperature* and specifying it as a second argument in *fix modify* and *thermo_modify* resulting in:

```
(...)
compute CSequ all temp/cs cores shells
compute thermo_press_lmp all pressure thermo_temp       # pressure for individual particles
thermo_modify temp CSequ press thermo_press_lmp         # modify thermo to regular pressure
fix press_bar all npt temp 300 300 0.04 iso 0 0 0.4
fix_modify press_bar temp CSequ press thermo_press_lmp  # pressure modification for correct kinetic␣
↪scalar
```

If *compute temp/cs* is used, the decoupled relative motion of the core and the shell should in theory be stable. However numerical fluctuation can introduce a small momentum to the system, which is noticeable over long trajectories. Therefore it is recommendable to use the *fix momentum* command in combination with *compute temp/cs* when equilibrating the system to prevent any drift.

When initializing the velocities of a system with core/shell pairs, it is also desirable to not introduce energy into the relative motion of the core/shell particles, but only assign a center-of-mass velocity to the pairs. This can be done by using the *bias* keyword of the *velocity create* command and assigning the *compute temp/cs* command to the *temp* keyword of the *velocity* command, e.g.

```
velocity all create 1427 134 bias yes temp CSequ
velocity all scale 1427 temp CSequ
```

To maintain the correct polarizability of the core/shell pairs, the kinetic energy of the internal motion shall remain nearly constant. Therefore the choice of spring force and mass ratio need to ensure much faster relative motion of the two atoms within the core/shell pair than their center-of-mass velocity. This allows the shells to effectively react instantaneously to the electrostatic environment and limits energy transfer to or from the core/shell oscillators. This fast movement also dictates the timestep that can be used.

The primary literature of the adiabatic core/shell model suggests that the fast relative motion of the core/shell pairs only allows negligible energy transfer to the environment. The mentioned energy transfer will typically lead to a small drift in total energy over time. This internal energy can be monitored using the *compute chunk/atom* and *compute temp/chunk* commands. The internal kinetic energies of each core/shell pair can then be summed using the sum() special function of the *variable* command. Or they can be time/averaged and output using the *fix ave/time* command. To use these commands, each core/shell pair must be defined as a "chunk". If each core/shell pair is defined as its own molecule, the molecule ID can be used to define the chunks. If cores are bonded to each other to form larger molecules, the chunks can be identified by the *fix property/atom* via assigning a core/shell ID to each atom using a special field in the data file read by the *read_data* command. This field can then be accessed by the *compute property/atom* command, to use as input to the *compute chunk/atom* command to define the core/shell pairs as chunks.

For example if core/shell pairs are the only molecules:

```
read_data NaCl_CS_x0.1_prop.data
compute prop all property/atom molecule
compute cs_chunk all chunk/atom c_prop
compute cstherm all temp/chunk cs_chunk temp internal com yes cdof 3.0     # note the chosen degrees␣
↪of freedom for the core/shell pairs
fix ave_chunk all ave/time 10 1 10 c_cstherm file chunk.dump mode vector
```

For example if core/shell pairs and other molecules are present:

```
fix csinfo all property/atom i_CSID                    # property/atom command
read_data NaCl_CS_x0.1_prop.data fix csinfo NULL CS-Info  # atom property added in the data-file
compute prop all property/atom i_CSID
(...)
```

The additional section in the date file would be formatted like this:

```
CS-Info       # header of additional section

1  1          # column 1 = atom ID, column 2 = core/shell ID
2  1
3  2
4  2
5  3
6  3
7  4
8  4
(...)
```

10.5.7 Drude induced dipoles

The thermalized Drude model represents induced dipoles by a pair of charges (the core atom and the Drude particle) connected by a harmonic spring. See the *Howto polarizable* doc page for a discussion of all the polarizable models available in LAMMPS.

The Drude model has a number of features aimed at its use in molecular systems (*Lamoureux and Roux*):

- Thermostatting of the additional degrees of freedom associated with the induced dipoles at very low temperature, in terms of the reduced coordinates of the Drude particles with respect to their cores. This makes the trajectory close to that of relaxed induced dipoles.
- Consistent definition of 1-2 to 1-4 neighbors. A core-Drude particle pair represents a single (polarizable) atom, so the special screening factors in a covalent structure should be the same for the core and the Drude particle. Drude particles have to inherit the 1-2, 1-3, 1-4 special neighbor relations from their respective cores.
- Stabilization of the interactions between induced dipoles. Drude dipoles on covalently bonded atoms interact too strongly due to the short distances, so an atom may capture the Drude particle of a neighbor, or the induced dipoles within the same molecule may align too much. To avoid this, damping at short range can be done by Thole functions (for which there are physical grounds). This Thole damping is applied to the point charges composing the induced dipole (the charge of the Drude particle and the opposite charge on the core, not to the total charge of the core atom).

A detailed tutorial covering the usage of Drude induced dipoles in LAMMPS is on the *here*.

As with the core-shell model, the cores and Drude particles should appear in the data file as standard atoms. The same holds for the springs between them, which are described by standard harmonic bonds. The nature of the atoms (core, Drude particle or non-polarizable) is specified via the *fix drude* command. The special list of neighbors is automatically refactored to account for the equivalence of core and Drude particles as regards special 1-2 to 1-4 screening. It may be necessary to use the *extra/special/per/atom* keyword of the *read_data* command. If using *fix shake*, make sure no Drude particle is in this fix group.

There are three ways to thermostat the Drude particles at a low temperature: use either *fix langevin/drude* for a Langevin thermostat, or *fix drude/transform/** for a Nose-Hoover thermostat, or *fix tgnvt/drude* for a temperature-grouped Nose-Hoover thermostat. The first and third require use of the command *comm_modify vel yes*. The second requires two separate integration fixes like *nvt* or *npt*. The correct temperatures of the reduced degrees of freedom can be calculated using the *compute temp/drude*. This requires also to use the command *comm_modify vel yes*.

Short-range damping of the induced dipole interactions can be achieved using Thole functions through the *pair style thole* in *pair_style hybrid/overlay* with a Coulomb pair style. It may be useful to use *coul/long/cs* or similar from the CORESHELL package if the core and Drude particle come too close, which can cause numerical issues.

10.5.8 Tutorial for Thermalized Drude oscillators in LAMMPS

This tutorial explains how to use Drude oscillators in LAMMPS to simulate polarizable systems using the DRUDE package. As an illustration, the input files for a simulation of 250 phenol molecules are documented. First of all, LAMMPS has to be compiled with the DRUDE package activated. Then, the data file and input scripts have to be modified to include the Drude dipoles and how to handle them.

Example input scripts available: examples/PACKAGES/drude

Overview of Drude induced dipoles

Polarizable atoms acquire an induced electric dipole moment under the action of an external electric field, for example the electric field created by the surrounding particles. Drude oscillators represent these dipoles by two fixed charges:

the core (DC) and the Drude particle (DP) bound by a harmonic potential. The Drude particle can be thought of as the electron cloud whose center can be displaced from the position of the corresponding nucleus.

The sum of the masses of a core-Drude pair should be the mass of the initial (unsplit) atom, $m_C + m_D = m$. The sum of their charges should be the charge of the initial (unsplit) atom, $q_C + q_D = q$. A harmonic potential between the core and Drude partners should be present, with force constant k_D and an equilibrium distance of zero. The (half-)stiffness of the *harmonic bond* $K_D = k_D/2$ and the Drude charge q_D are related to the atom polarizability α by

$$K_D = \frac{1}{2}\frac{q_D^2}{\alpha}$$

Ideally, the mass of the Drude particle should be small, and the stiffness of the harmonic bond should be large, so that the Drude particle remains close to the core. The values of Drude mass, Drude charge, and force constant can be chosen following different strategies, as in the following examples of polarizable force fields:

- *Lamoureux and Roux* suggest adopting a global half-stiffness, K_D = 500 kcal/(mol Ang ^{2}) - which corresponds to a force constant k_D = 4184 kJ/(mol Ang ^{2}) - for all types of core-Drude bond, a global mass m_D = 0.4 g/mol (or u) for all types of Drude particles, and to calculate the Drude charges for individual atom types from the atom polarizabilities using equation (1). This choice is followed in the polarizable CHARMM force field.
- Alternately *Schroeder and Steinhauser* suggest adopting a global charge q_D = -1.0e and a global mass m_D = 0.1 g/mol (or u) for all Drude particles, and to calculate the force constant for each type of core-Drude bond from equation (1). The timesteps used by these authors are between 0.5 and 2 fs, with the degrees of freedom of the Drude oscillators kept cold at 1 K.
- In both these force fields hydrogen atoms are treated as non-polarizable.

The motion of of the Drude particles can be calculated by minimizing the energy of the induced dipoles at each timestep, by an iterative, self-consistent procedure. The Drude particles can be massless and therefore do not contribute to the kinetic energy. However, the relaxed method is computational slow. An extended-lagrangian method can be used to calculate the positions of the Drude particles, but this requires them to have mass. It is important in this case to decouple the degrees of freedom associated with the Drude oscillators from those of the normal atoms. Thermalizing the Drude dipoles at temperatures comparable to the rest of the simulation leads to several problems (kinetic energy transfer, very short timestep, etc.), which can be remedied by the "cold Drude" technique (*Lamoureux and Roux*).

Two closely related models are used to represent polarization through "charges on a spring": the core-shell model and the Drude model. Although the basic idea is the same, the core-shell model is normally used for ionic/crystalline materials, whereas the Drude model is normally used for molecular systems and fluid states. In ionic crystals the symmetry around each ion and the distance between them are such that the core-shell model is sufficiently stable. But to be applicable to molecular/covalent systems the Drude model includes two important features:

1. The possibility to thermostat the additional degrees of freedom associated with the induced dipoles at very low temperature, in terms of the reduced coordinates of the Drude particles with respect to their cores. This makes the trajectory close to that of relaxed induced dipoles.
2. The Drude dipoles on covalently bonded atoms interact too strongly due to the short distances, so an atom may capture the Drude particle (shell) of a neighbor, or the induced dipoles within the same molecule may align too much. To avoid this, damping at short of the interactions between the point charges composing the induced dipole can be done by *Thole* functions.

Preparation of the data file

The data file is similar to a standard LAMMPS data file for *atom_style full*. The DPs and the *harmonic bonds* connecting them to their DC should appear in the data file as normal atoms and bonds.

You can use the *polarizer* tool (Python script distributed with the DRUDE package) to convert a non-polarizable data file (here *data.102494.lmp*) to a polarizable data file (*data-p.lmp*)

```
polarizer -q -f phenol.dff data.102494.lmp data-p.lmp
```

This will automatically insert the new atoms and bonds. The masses and charges of DCs and DPs are computed from *phenol.dff*, as well as the DC-DP bond constants. The file *phenol.dff* contains the polarizabilities of the atom types and the mass of the Drude particles, for instance:

```
# units: kJ/mol, A, deg
# kforce is in the form k/2 r_D^2
# type  m_D/u   q_D/e    k_D   alpha/A3  thole
OH      0.4    -1.0    4184.0  0.63     0.67
CA      0.4    -1.0    4184.0  1.36     2.51
CAI     0.4    -1.0    4184.0  1.09     2.51
```

The hydrogen atoms are absent from this file, so they will be treated as non-polarizable atoms. In the non-polarizable data file *data.102494.lmp*, atom names corresponding to the atom type numbers have to be specified as comments at the end of lines of the *Masses* section. You probably need to edit it to add these names. It should look like

```
Masses

1 12.011 # CAI
2 12.011 # CA
3 15.999 # OH
4 1.008  # HA
5 1.008  # HO
```

Basic input file

The atom style should be set to (or derive from) *full*, so that you can define atomic charges and molecular bonds, angles, dihedrals…

The *polarizer* tool also outputs certain lines related to the input script (the use of these lines will be explained below). In order for LAMMPS to recognize that you are using Drude oscillators, you should use the fix *drude*. The command is

```
fix DRUDE all drude C C C N N D D D
```

The N, C, D following the *drude* keyword have the following meaning: There is one tag for each atom type. This tag is C for DCs, D for DPs and N for non-polarizable atoms. Here the atom types 1 to 3 (C and O atoms) are DC, atom types 4 and 5 (H atoms) are non-polarizable and the atom types 6 to 8 are the newly created DPs.

By recognizing the fix *drude*, LAMMPS will find and store matching DC-DP pairs and will treat DP as equivalent to their DC in the *special bonds* relations. It may be necessary to extend the space for storing such special relations. In this case extra space should be reserved by using the *extra/special/per/atom* keyword of either the *read_data* or *create_box* command. With our phenol, there is 1 more special neighbor for which space is required. Otherwise LAMMPS crashes and gives the required value.

```
read_data data-p.lmp extra/special/per/atom 1
```

Let us assume we want to run a simple NVT simulation at 300 K. Note that Drude oscillators need to be thermalized at a low temperature in order to approximate a self-consistent field (SCF), therefore it is not possible to simulate an NVE ensemble with this package. Since dipoles are approximated by a charged DC-DP pair, the *pair_style* must include Coulomb interactions, for instance *lj/cut/coul/long* with *kspace_style pppm*. For example, with a cutoff of 10. and a precision 1.e-4:

```
pair_style lj/cut/coul/long 10.0
kspace_style pppm 1.0e-4
```

As compared to the non-polarizable input file, *pair_coeff* lines need to be added for the DPs. Since the DPs have no Lennard-Jones interactions, their ε is 0. so the only *pair_coeff* line that needs to be added is

```
pair_coeff * 6* 0.0 0.0 # All-DPs
```

Now for the thermalization, the simplest choice is to use the *fix langevin/drude*.

```
fix LANG all langevin/drude 300. 100 12435 1. 20 13977
```

This applies a Langevin thermostat at temperature 300. to the centers of mass of the DC-DP pairs, with relaxation time 100 and with random seed 12345. This fix applies also a Langevin thermostat at temperature 1. to the relative motion of the DPs around their DCs, with relaxation time 20 and random seed 13977. Only the DCs and non-polarizable atoms need to be in this fix's group. LAMMPS will thermostat the DPs together with their DC. For this, ghost atoms need to know their velocities. Thus you need to add the following command:

```
comm_modify vel yes
```

In order to avoid that the center of mass of the whole system drifts due to the random forces of the Langevin thermostat on DCs, you can add the *zero yes* option at the end of the fix line.

If the fix *shake* is used to constrain the C-H bonds, it should be invoked after the fix *langevin/drude* for more accuracy.

```
fix SHAKE ATOMS shake 0.0001 20 0 t 4 5
```

Note

The group of the fix *shake* must not include the DPs. If the group *ATOMS* is defined by non-DPs atom types, you could use

Since the fix *langevin/drude* does not perform time integration (just modification of forces but no position/velocity updates), the fix *nve* should be used in conjunction.

```
fix NVE all nve
```

To avoid the flying ice cube artifact, where the atoms progressively freeze and the center of mass of the whole system drifts faster and faster, the *fix momentum* can be used. For instance:

```
fix MOMENTUM all momentum 100 linear 1 1 1
```

Finally, do not forget to update the atom type elements if you use them in a *dump_modify* ... *element* ... command, by adding the element type of the DPs. Here for instance

```
dump DUMP all custom 10 dump.lammpstrj id mol type element x y z ix iy iz
dump_modify DUMP element C C O H H D D D
```

The input file should now be ready for use!

You will notice that the global temperature *thermo_temp* computed by LAMMPS is not 300. K as wanted. This is because LAMMPS treats DPs as standard atoms in his default compute. If you want to output the temperatures of the DC-DP pair centers of mass and of the DPs relative to their DCs, you should use the *compute temp_drude*

```
compute TDRUDE all temp/drude
```

And then output the correct temperatures of the Drude oscillators using *thermo_style custom* with respectively *c_TDRUDE[1]* and *c_TDRUDE[2]*. These should be close to 300.0 and 1.0 on average.

```
thermo_style custom step temp c_TDRUDE[1] c_TDRUDE[2]
```

Thole screening

Dipolar interactions represented by point charges on springs may not be stable, for example if the atomic polarizability is too high for instance, a DP can escape from its DC and be captured by another DC, which makes the force and energy diverge and the simulation crash. Even without reaching this extreme case, the correlation between nearby dipoles on the same molecule may be exaggerated. Often, special bond relations prevent bonded neighboring atoms to see the charge of each other's DP, so that the problem does not always appear. It is possible to use screened dipole-dipole interactions by using the **pair_style thole**. This is implemented as a correction to the Coulomb pair_styles, which dampens at short distance the interactions between the charges representing the induced dipoles. It is to be used as *hybrid/overlay* with any standard *coul* pair style. In our example, we would use

```
pair_style hybrid/overlay lj/cut/coul/long 10.0 thole 2.6 10.0
```

This tells LAMMPS that we are using two pair_styles. The first one is as above (*lj/cut/coul/long 10.0*). The second one is a *thole* pair_style with default screening factor 2.6 (*Noskov*) and cutoff 10.0.

Since *hybrid/overlay* does not support mixing rules, the interaction coefficients of all the pairs of atom types with i < j should be explicitly defined. The output of the *polarizer* script can be used to complete the *pair_coeff* section of the input file. In our example, this will look like:

```
pair_coeff   1   1 lj/cut/coul/long   0.0700   3.550
pair_coeff   1   2 lj/cut/coul/long   0.0700   3.550
pair_coeff   1   3 lj/cut/coul/long   0.1091   3.310
pair_coeff   1   4 lj/cut/coul/long   0.0458   2.985
pair_coeff   2   2 lj/cut/coul/long   0.0700   3.550
pair_coeff   2   3 lj/cut/coul/long   0.1091   3.310
pair_coeff   2   4 lj/cut/coul/long   0.0458   2.985
pair_coeff   3   3 lj/cut/coul/long   0.1700   3.070
pair_coeff   3   4 lj/cut/coul/long   0.0714   2.745
pair_coeff   4   4 lj/cut/coul/long   0.0300   2.420
pair_coeff   *   5 lj/cut/coul/long   0.0000   0.000
pair_coeff   *   6* lj/cut/coul/long   0.0000   0.000
pair_coeff   1   1 thole   1.090   2.510
pair_coeff   1   2 thole   1.218   2.510
pair_coeff   1   3 thole   0.829   1.590
pair_coeff   1   6 thole   1.090   2.510
pair_coeff   1   7 thole   1.218   2.510
pair_coeff   1   8 thole   0.829   1.590
pair_coeff   2   2 thole   1.360   2.510
pair_coeff   2   3 thole   0.926   1.590
pair_coeff   2   6 thole   1.218   2.510
pair_coeff   2   7 thole   1.360   2.510
pair_coeff   2   8 thole   0.926   1.590
pair_coeff   3   3 thole   0.630   0.670
pair_coeff   3   6 thole   0.829   1.590
pair_coeff   3   7 thole   0.926   1.590
```

(continues on next page)

(continued from previous page)

```
pair_coeff   3   8 thole  0.630  0.670
pair_coeff   6   6 thole  1.090  2.510
pair_coeff   6   7 thole  1.218  2.510
pair_coeff   6   8 thole  0.829  1.590
pair_coeff   7   7 thole  1.360  2.510
pair_coeff   7   8 thole  0.926  1.590
pair_coeff   8   8 thole  0.630  0.670
```

For the *thole* pair style the coefficients are

1. the atom polarizability in units of cubic length
2. the screening factor of the Thole function (optional, default value specified by the pair_style command)
3. the cutoff (optional, default value defined by the pair_style command)

The special neighbors have charge-charge and charge-dipole interactions screened by the *coul* factors of the *special_bonds* command (0.0, 0.0, and 0.5 in the example above). Without using the pair_style *thole*, dipole-dipole interactions are screened by the same factor. By using the pair_style *thole*, dipole-dipole interactions are screened by Thole's function, whatever their special relationship (except within each DC-DP pair of course). Consider for example 1-2 neighbors: using the pair_style *thole*, their dipoles will see each other (despite the *coul* factor being 0.) and the interactions between these dipoles will be damped by Thole's function.

Thermostats and barostats

Using a Nose-Hoover barostat with the *langevin/drude* thermostat is straightforward using fix *nph* instead of *nve*. For example:

```
fix NPH all nph iso 1. 1. 500
```

It is also possible to use a Nose-Hoover instead of a Langevin thermostat. This requires to use **fix drude/transform** just before and after the time integration fixes. The *fix drude/transform/direct* converts the atomic masses, positions, velocities and forces into a reduced representation, where the DCs transform into the centers of mass of the DC-DP pairs and the DPs transform into their relative position with respect to their DC. The *fix drude/transform/inverse* performs the reverse transformation. For a NVT simulation, with the DCs and atoms at 300 K and the DPs at 1 K relative to their DC one would use

```
fix DIRECT all drude/transform/direct
fix NVT1 ATOMS nvt temp 300. 300. 100
fix NVT2 DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

For our phenol example, the groups would be defined as

```
group ATOMS  type 1 2 3 4 5 # DCs and non-polarizable atoms
group CORES  type 1 2 3     # DCs
group DRUDES type 6 7 8     # DPs
```

Note that with the fixes *drude/transform*, it is not required to specify *comm_modify vel yes* because the fixes do it anyway (several times and for the forces also).

It is a bit more tricky to run a NPT simulation with Nose-Hoover barostat and thermostat. First, the volume should be integrated only once. So the fix for DCs and atoms should be *npt* while the fix for DPs should be *nvt* (or vice versa). Second, the *fix npt* computes a global pressure and thus a global temperature whatever the fix group. We do want the pressure to correspond to the whole system, but we want the temperature to correspond to the fix group only. We must

then use the *fix_modify* command for this. In the end, the block of instructions for thermostatting and barostatting will look like

```
compute TATOMS ATOMS temp
fix DIRECT all drude/transform/direct
fix NPT ATOMS npt temp 300. 300. 100 iso 1. 1. 500
fix_modify NPT temp TATOMS press thermo_press
fix NVT DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

Another option for thermalizing the Drude model is to use the temperature-grouped Nose-Hoover (TGNH) thermostat proposed by *(Son)*. This is implemented as *fix tgnvt/drude* and *fix tgnpt/drude*. It separates the kinetic energy into three contributions: the molecular center of mass (COM) motion, the motion of atoms or atom-Drude pairs relative to molecular COMs, and the relative motion of atom-Drude pairs. An independent Nose-Hoover chain is applied to each type of motion. When TGNH is used, the temperatures of molecular, atomic and Drude motion can be printed out with *thermo_style command* command.

NVT simulation with TGNH thermostat

```
comm_modify vel yes
fix TGNVT all tgnvt/drude temp 300. 300. 100 1. 20
thermo_style custom f_TGNVT[1] f_TGNVT[2] f_TGNVT[3]
```

NPT simulation with TGNH thermostat

```
comm_modify vel yes
fix TGNPT all tgnpt/drude temp 300. 300. 100 1. 20 iso 1. 1. 500
thermo_style custom f_TGNPT[1] f_TGNPT[2] f_TGNPT[3]
```

Rigid bodies

You may want to simulate molecules as rigid bodies (but polarizable). Common cases are water models such as *SWM4-NDP*, which is a kind of polarizable TIP4P water. The rigid bodies and the DPs should be integrated separately, even with the Langevin thermostat. Let us review the different thermostats and ensemble combinations.

NVT ensemble using Langevin thermostat:

```
comm_modify vel yes
fix LANG all langevin/drude 300. 100 12435 1. 20 13977
fix RIGID ATOMS rigid/nve/small molecule
fix NVE DRUDES nve
```

NVT ensemble using Nose-Hoover thermostat:

```
fix DIRECT all drude/transform/direct
fix RIGID ATOMS rigid/nvt/small molecule temp 300. 300. 100
fix NVT DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

NPT ensemble with Langevin thermostat:

```
comm_modify vel yes
fix LANG all langevin/drude 300. 100 12435 1. 20 13977
fix RIGID ATOMS rigid/nph/small molecule iso 1. 1. 500
fix NVE DRUDES nve
```

NPT ensemble using Nose-Hoover thermostat:

```
compute TATOM ATOMS temp
fix DIRECT all drude/transform/direct
fix RIGID ATOMS rigid/npt/small molecule temp 300. 300. 100 iso 1. 1. 500
fix_modify RIGID temp TATOM press thermo_press
fix NVT DRUDES nvt temp 1. 1. 20
fix INVERSE all drude/transform/inverse
```

10.5.9 Peridynamics with LAMMPS

This Howto is based on the Sandia report 2010-5549 by Michael L. Parks, Pablo Seleson, Steven J. Plimpton, Richard B. Lehoucq, and Stewart A. Silling.

Overview

Peridynamics is a nonlocal extension of classical continuum mechanics. The discrete peridynamic model has the same computational structure as a molecular dynamics model. This Howto provides a brief overview of the peridynamic model of a continuum, then discusses how the peridynamic model is discretized within LAMMPS as described in the original article *(Parks)*. An example problem with comments is also included.

Quick Start

The peridynamics styles are included in the optional *PERI package*. If your LAMMPS executable does not already include the PERI package, you can see the *build instructions for packages* for how to enable the package when compiling a custom version of LAMMPS from source.

Here is a minimal example for setting up a peridynamics simulation.

```
units          si
boundary       s s s
lattice        sc 0.0005
atom_style     peri
atom_modify    map array
neighbor       0.0010 bin
region         target cylinder y 0.0 0.0 0.0050 -0.0050 0.0 units box
create_box     1 target
create_atoms   1 region target

pair_style     peri/pmb
pair_coeff     * * 1.6863e22 0.0015001 0.0005 0.25
set            group all density 2200
set            group all volume 1.25e-10
velocity       all set 0.0 0.0 0.0 sum no units box
```

(continues on next page)

(continued from previous page)

```
fix          1 all nve
compute      1 all damage/atom
timestep     1.0e-7
```

Some notes on this input example:

- peridynamics simulations typically use SI *units*
- particles must be created on a *simple cubic lattice*
- using the *atom style peri* is required
- an *atom map* is required for indexing particles
- The *skin distance* used when computing neighbor lists should be defined appropriately for your choice of simulation parameters. The *skin* should be set to a value such that the peridynamic horizon plus the skin distance is larger than the maximum possible distance between two bonded particles (before their bond breaks). Here it is set to 0.001 meters.
- a *peridynamics pair style* is required. Available choices are currently: *peri/eps*, *peri/lps*, *peri/pmb*, and *peri/ves*. The model parameters are set with a *pair_coeff* command.
- the mass density and volume fraction for each particle must be defined. This is done with the two *set* commands for *density* and *volume*. For a simple cubic lattice, the volume of a particle should be equal to the cube of the lattice constant, here $V_i = \Delta x^3$.
- with the *velocity* command all particles are initially at rest
- a plain *velocity-Verlet time integrator* is used, which is algebraically equivalent to a centered difference in time, but numerically more stable
- you can compute the damage at the location of each particle with *compute damage/atom*
- finally, the timestep is set to 0.1 microseconds with the *timestep* command.

Peridynamic Model of a Continuum

The following is not a complete overview of peridynamics, but a discussion of only those details specific to the model we have implemented within LAMMPS. For more on the peridynamic theory, the reader is referred to *(Silling 2007)*. To begin, we define the notation we will use.

Basic Notation

Within the peridynamic literature, the following notational conventions are generally used. The position of a given point in the reference configuration is $\mathbf{x}$. Let $\mathbf{u}(\mathbf{x},t)$ and $\mathbf{y}(\mathbf{x},t)$ denote the displacement and position, respectively, of the point $\mathbf{x}$ at time t. Define the relative position and displacement vectors of two bonded points $\mathbf{x}$ and $\mathbf{x}'$ as $\xi = \mathbf{x}' - \mathbf{x}$ and $\eta = \mathbf{u}(\mathbf{x}',t) - \mathbf{u}(\mathbf{x},t)$, respectively. We note here that η is time-dependent, and that ξ is not. It follows that the relative position of the two bonded points in the current configuration can be written as $\xi + \eta = \mathbf{y}(\mathbf{x}',t) - \mathbf{y}(\mathbf{x},t)$.

Peridynamic models are frequently written using *states*, which we briefly describe here. For the purposes of our discussion, all states are operators that act on vectors in $\mathbb{R}^3$. For a more complete discussion of states, see *(Silling 2007)*. A *vector state* is an operator whose image is a vector, and may be viewed as a generalization of a second-rank tensor. Similarly, a *scalar state* is an operator whose image is a scalar. Of particular interest is the vector force state $\underline{\mathbf{T}}[\mathbf{x},t]\langle\mathbf{x}'-\mathbf{x}\rangle$, which is a mapping, having units of force per volume squared, of the vector $\mathbf{x}'-\mathbf{x}$ to the force vector state field. The vector state operator $\underline{\mathbf{T}}$ may itself be a function of $\mathbf{x}$ and t. The constitutive model is completely contained within $\underline{\mathbf{T}}$.

In the peridynamic theory, the deformation at a point depends collectively on all points interacting with that point. Using the notation of *(Silling 2007)*, we write the peridynamic equation of motion as

$$\rho(\mathbf{x})\ddot{\mathbf{u}}(\mathbf{x},t) = \int_{\mathcal{H}_\mathbf{x}} \left\{ \underline{\mathbf{T}}\left[\mathbf{x},t\right]\left\langle \mathbf{x}'-\mathbf{x}\right\rangle - \underline{\mathbf{T}}\left[\mathbf{x}',t\right]\left\langle \mathbf{x}-\mathbf{x}'\right\rangle \right\} dV_{\mathbf{x}'} + \mathbf{b}(\mathbf{x},t), \tag{1}$$

where ρ represents the mass density, $\underline{\mathbf{T}}$ the force vector state, and $\mathbf{b}$ an external body force density. A point $\mathbf{x}$ interacts with all the points $\mathbf{x}'$ within the neighborhood $\mathcal{H}_\mathbf{x}$, assumed to be a spherical region of radius $\delta > 0$ centered at $\mathbf{x}$. δ is called the *horizon*, and is analogous to the cutoff radius used in molecular dynamics. Conditions on $\underline{\mathbf{T}}$ for which *(1)* satisfies the balance of linear and angular momentum are given in *(Silling 2007)*.

We consider only force vector states that can be written as

$$\underline{\mathbf{T}} = \underline{t}\,\underline{\mathbf{M}},$$

with $\underline{t}$ a *scalar force state* and $\underline{\mathbf{M}}$ the *deformed direction vector state*, defined by

$$\underline{\mathbf{M}}\left\langle \xi\right\rangle = \begin{cases} \frac{\xi+\eta}{\|\xi+\eta\|} & \|\xi+\eta\| \neq 0 \\ 0 & \text{otherwise} \end{cases}. \tag{2}$$

Such force states correspond to so-called *ordinary* materials *(Silling 2007)*. These are the materials for which the force between any two interacting points $\mathbf{x}$ and $\mathbf{x}'$ acts along the line between the points.

Linear Peridynamic Solid (LPS) Model

We summarize the linear peridynamic solid (LPS) material model. For more on this model, the reader is referred to *(Silling 2007)*. This model is a nonlocal analogue to a classical linear elastic isotropic material. The elastic properties of a a classical linear elastic isotropic material are determined by (for example) the bulk and shear moduli. For the LPS model, the elastic properties are analogously determined by the bulk and shear moduli, along with the horizon δ.

The LPS model has a force scalar state

$$\underline{t} = \frac{3K\theta}{m}\underline{\omega}\,\underline{x} + \alpha\underline{\omega}\,\underline{e}^{\mathrm{d}}, \tag{3}$$

with K the bulk modulus and α related to the shear modulus G as

$$\alpha = \frac{15G}{m}.$$

The remaining components of the model are described as follows. Define the reference position scalar state $\underline{x}$ so that $\underline{x}\left\langle \xi\right\rangle = \|\xi\|$. Then, the weighted volume m is defined as

$$m\left[\mathbf{x}\right] = \int_{\mathcal{H}_\mathbf{x}} \underline{\omega}\left\langle \xi\right\rangle \underline{x}\left\langle \xi\right\rangle \underline{x}\left\langle \xi\right\rangle dV_\xi. \tag{4}$$

Let

$$\underline{e}\left[\mathbf{x},t\right]\left\langle \xi\right\rangle = \|\xi+\eta\| - \|\xi\|$$

be the extension scalar state, and

$$\theta\left[\mathbf{x},t\right] = \frac{3}{m\left[\mathbf{x}\right]}\int_{\mathcal{H}_\mathbf{x}} \underline{\omega}\left\langle \xi\right\rangle \underline{x}\left\langle \xi\right\rangle \underline{e}\left[\mathbf{x},t\right]\left\langle \xi\right\rangle dV_\xi$$

be the dilatation. The isotropic and deviatoric parts of the extension scalar state are defined, respectively, as

$$\underline{e}^{\mathrm{i}} = \frac{\theta\underline{x}}{3}, \qquad \underline{e}^{\mathrm{d}} = \underline{e} - \underline{e}^{\mathrm{i}},$$

where the arguments of the state functions and the vectors on which they operate are omitted for simplicity. We note that the LPS model is linear in the dilatation θ, and in the deviatoric part of the extension $\underline{e}^{\mathrm{d}}$.

Note

The weighted volume m is time-independent, and does not change as bonds break. It is computed with respect to the bond family defined at the reference (initial) configuration.

The non-negative scalar state $\underline{\omega}$ is an *influence function (Silling 2007)*. For more on influence functions, see *(Seleson 2010)*. If an influence function $\underline{\omega}$ depends only upon the scalar $\|\xi\|$, (i.e., $\underline{\omega}\langle\xi\rangle = \underline{\omega}\langle\|\xi\|\rangle$), then $\underline{\omega}$ is a spherical influence function. For a spherical influence function, the LPS model is isotropic *(Silling 2007)*.

Note

In the LAMMPS implementation of the LPS model, the influence function $\underline{\omega}\langle\|\xi\|\rangle = 1/\|\xi\|$ is used. However, the user can define their own influence function by altering the method "influence_function" in the file pair_peri_lps.cpp. The LAMMPS peridynamics code permits both spherical and non-spherical influence functions (e.g., isotropic and non-isotropic materials).

Prototype Microelastic Brittle (PMB) Model

We summarize the prototype microelastic brittle (PMB) material model. For more on this model, the reader is referred to *(Silling 2000)* and *(Silling 2005)*. This model is a special case of the LPS model; see *(Seleson 2010)* for the derivation. The elastic properties of the PMB model are determined by the bulk modulus K and the horizon δ.

The PMB model is expressed using the scalar force state field

$$\underline{t}[\mathbf{x},t]\langle\xi\rangle = \frac{1}{2} f\left(\eta,\xi\right), \qquad (5)$$

with f a scalar-valued function. We assume that f takes the form

$$f = cs,$$

where

$$c = \frac{18K}{\pi\delta^4}, \qquad (6)$$

with K the bulk modulus and δ the horizon, and s the bond stretch, defined as

$$s(t,\eta,\xi) = \frac{\|\eta+\xi\| - \|\xi\|}{\|\xi\|}.$$

Bond stretch is a unitless quantity, and identical to a one-dimensional definition of strain. As such, we see that a bond at its equilibrium length has stretch $s = 0$, and a bond at twice its equilibrium length has stretch $s = 1$. The constant c given above is appropriate for 3D models only. For more on the origins of the constant c, see *(Silling 2005)*. For the derivation of c for 1D and 2D models, see *(Emmrich)*.

Given *(5)*, *(1)* reduces to

$$\rho(\mathbf{x})\ddot{\mathbf{u}}(\mathbf{x},t) = \int_{\mathcal{H}_\mathbf{x}} \mathbf{f}\left(\eta,\xi\right) dV_\xi + \mathbf{b}(\mathbf{x},t), \qquad (7)$$

with

$$\mathbf{f}\left(\eta,\xi\right) = f\left(\eta,\xi\right)\frac{\xi+\eta}{\|\xi+\eta\|}.$$

Unlike the LPS model, the PMB model has a Poisson ratio of $\nu = 1/4$ in 3D, and $\nu = 1/3$ in 2D. This is reflected in the input for the PMB model, which requires only the bulk modulus of the material, whereas the LPS model requires both the bulk and shear moduli.

Damage

Bonds are made to break when they are stretched beyond a given limit. Once a bond fails, it is failed forever *(Silling)*. Further, new bonds are never created during the course of a simulation. We discuss only one criterion for bond breaking, called the *critical stretch* criterion.

Define μ to be the history-dependent scalar boolean function

$$\mu(t,\eta,\xi) = \left\{ \begin{array}{ll} 1 & \text{if } s(t',\eta,\xi) < \min\left(s_0(t',\eta,\xi), s_0(t',\eta',\xi')\right) \text{ for all } 0 \le t' \le t \\ 0 & \text{otherwise} \end{array} \right\}. \tag{8}$$

where $\eta' = \mathbf{u}(\mathbf{x}'',t) - \mathbf{u}(\mathbf{x}',t)$ and $\xi' = \mathbf{x}'' - \mathbf{x}'$. Here, $s_0(t,\eta,\xi)$ is a critical stretch defined as

$$s_0(t,\eta,\xi) = s_{00} - \alpha s_{\min}(t,\eta,\xi), \qquad s_{\min}(t) = \min_{\xi} s(t,\eta,\xi), \tag{9}$$

where s_{00} and α are material-dependent constants. The history function μ breaks bonds when the stretch s exceeds the critical stretch s_0.

Although $s_0(t,\eta,\xi)$ is expressed as a property of a particle, bond breaking must be a symmetric operation for all particle pairs sharing a bond. That is, particles $\mathbf{x}$ and $\mathbf{x}'$ must utilize the same test when deciding to break their common bond. This can be done by any method that treats the particles symmetrically. In the definition of μ above, we have chosen to take the minimum of the two s_0 values for particles $\mathbf{x}$ and $\mathbf{x}'$ when determining if the $\mathbf{x}$–$\mathbf{x}'$ bond should be broken.

Following *(Silling)*, we can define the damage at a point $\mathbf{x}$ as

$$\varphi(\mathbf{x},t) = 1 - \frac{\int_{\mathcal{H}_\mathbf{x}} \mu(t,\eta,\xi) dV_{\mathbf{x}'}}{\int_{\mathcal{H}_\mathbf{x}} dV_{\mathbf{x}'}}. \tag{10}$$

Discrete Peridynamic Model and LAMMPS Implementation

In LAMMPS, instead of *(1)*, we model this equation of motion:

$$\rho(\mathbf{x})\ddot{\mathbf{y}}(\mathbf{x},t) = \int_{\mathcal{H}_\mathbf{x}} \left\{ \underline{\mathbf{T}}\left[\mathbf{x},t\right] \langle \mathbf{x}' - \mathbf{x} \rangle - \underline{\mathbf{T}}\left[\mathbf{x}',t\right] \langle \mathbf{x} - \mathbf{x}' \rangle \right\} dV_{\mathbf{x}'} + \mathbf{b}(\mathbf{x},t),$$

where we explicitly track and store at each timestep the positions and not the displacements of the particles. We observe that $\ddot{\mathbf{y}}(\mathbf{x},t) = \ddot{\mathbf{x}} + \ddot{\mathbf{u}}(\mathbf{x},t) = \ddot{\mathbf{u}}(\mathbf{x},t)$, so that this is equivalent to *(1)*.

Spatial Discretization

The region defining a peridynamic material is discretized into particles forming a simple cubic lattice with lattice constant Δx, where each particle i is associated with some volume fraction V_i. For any particle i, let $\mathcal{F}_i$ denote the family of particles for which particle i shares a bond in the reference configuration. That is,

$$\mathcal{F}_i = \{p \mid \|\mathbf{x}_p - \mathbf{x}_i\| \le \delta\}. \tag{11}$$

The discretized equation of motion replaces *(1)* with

$$\rho \ddot{\mathbf{y}}_i^n = \sum_{p \in \mathcal{F}_i} \left\{ \underline{\mathbf{T}}\left[\mathbf{x}_i, t\right] \left\langle \mathbf{x}_p' - \mathbf{x}_i \right\rangle - \underline{\mathbf{T}}\left[\mathbf{x}_p, t\right] \left\langle \mathbf{x}_i - \mathbf{x}_p \right\rangle \right\} V_p + \mathbf{b}_i^n, \tag{12}$$

where n is the timestep number and subscripts denote the particle number.

Short-Range Forces

In the model discussed so far, particles interact only through their bond forces. A particle with no bonds becomes a free non-interacting particle. To account for contact forces, short-range forces are introduced *(Silling 2007)*. We add to the force in *(12)* the following force

$$\mathbf{f}_S(\mathbf{y}_p, \mathbf{y}_i) = \min\left\{0, \frac{c_S}{\delta}(\left\|\mathbf{y}_p - \mathbf{y}_i\right\| - d_{pi})\right\} \frac{\mathbf{y}_p - \mathbf{y}_i}{\left\|\mathbf{y}_p - \mathbf{y}_i\right\|}, \tag{13}$$

where d_{pi} is the short-range interaction distance between particles p and i, and c_S is a multiple of the constant c from *(6)*. Note that the short-range force is always repulsive, never attractive. In practice, we choose

$$c_S = 15\frac{18K}{\pi\delta^4}. \tag{14}$$

For the short-range interaction distance, we choose *(Silling 2007)*

$$d_{pi} = \min\left\{0.9\left\|\mathbf{x}_p - \mathbf{x}_i\right\|, 1.35(r_p + r_i)\right\}, \tag{15}$$

where r_i is called the *node radius* of particle i. Given a discrete lattice, we choose r_i to be half the lattice constant.

Note

For a simple cubic lattice, $\Delta x = \Delta y = \Delta z$.

Given this definition of d_{pi}, contact forces appear only when particles are under compression.

When accounting for short-range forces, it is convenient to define the short-range family of particles

$$\mathcal{F}_i^S = \{p \mid \left\|\mathbf{y}_p - \mathbf{y}_i\right\| \leq d_{pi}\}.$$

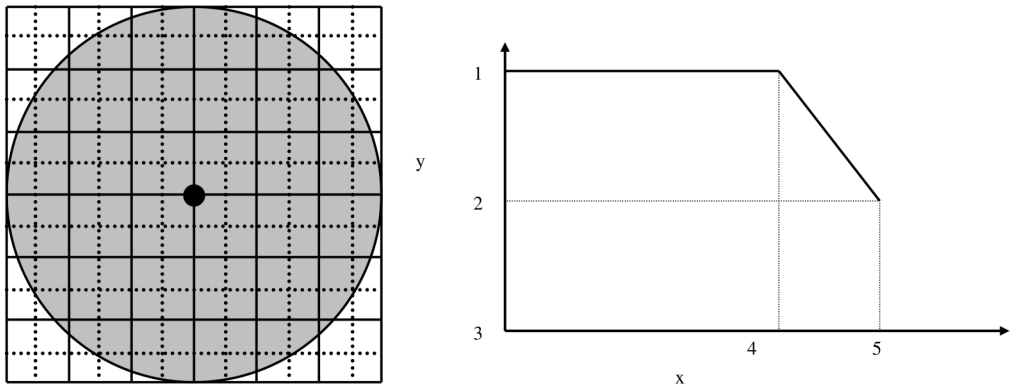
Modification to the Particle Volume

The right-hand side of *(12)* may be thought of as a midpoint quadrature of *(1)*. To slightly improve the accuracy of this quadrature, we discuss a modification to the particle volume used in *(12)*. In a situation where two particles share a bond with $\|\mathbf{x}_p - \mathbf{x}_i\| = \delta$, for example, we suppose that only approximately half the volume of each particle is "seen" by the other *(Silling 2007)*. When computing the force of each particle on the other we use $V_p/2$ rather than V_p in *(12)*. As such, we introduce a nodal volume scaling function for all bonded particles where $\delta - r_i \leq \|\mathbf{x}_p - \mathbf{x}_i\| \leq \delta$ (see the Figure below).

We choose to use a linear unitless nodal volume scaling function

$$\nu(\mathbf{x}_p - \mathbf{x}_i) = \left\{ \begin{array}{cc} -\frac{1}{2r_i}\left\|\mathbf{x}_p - \mathbf{x}_i\right\| + \left(\frac{\delta}{2r_i} + \frac{1}{2}\right) & \text{if } \delta - r_i \leq \left\|\mathbf{x}_p - \mathbf{x}_i\right\| \leq \delta \\ 1 & \text{if } \left\|\mathbf{x}_p - \mathbf{x}_i\right\| \leq \delta - r_i \\ 0 & \text{otherwise} \end{array} \right\}$$

If $\|\mathbf{x}_p - \mathbf{x}_i\| = \delta$, $\nu = 0.5$, and if $\|\mathbf{x}_p - \mathbf{x}_i\| = \delta - r_i$, $\nu = 1.0$, for example.



(a) Two-dimensional diagram showing particle on mesh (solid lines) with neighborhood $\mathcal{H}_{\mathbf{x}}$ as grey circular region. Dual mesh (dotted lines) shows boundaries of each particle.

(b) Plot of $\nu(\mathbf{x}_p - \mathbf{x}_i)$ vs. $\|\mathbf{x}_p - \mathbf{x}_i\|$.

Fig. 2: Diagram showing horizon of a particular particle, demonstrating that the volume associated with particles near the boundary of the horizon is not completely contained within the horizon.

Temporal Discretization

When discretizing time in LAMMPS, we use a velocity-Verlet scheme, where both the position and velocity of the particle are stored explicitly. The velocity-Verlet scheme is generally expressed in three steps. In *Algorithm 1*, ρ_i denotes the mass density of a particle and $\widetilde{\mathbf{f}}_i^n$ denotes the the net force density on particle i at timestep n. The LAMMPS command *fix nve* performs a velocity-Verlet integration.

Algorithm 1: Velocity Verlet

1: $\mathbf{v}_i^{n+1/2} = \mathbf{v}_i^n + \frac{\Delta t}{2\rho_i}\widetilde{\mathbf{f}}_i^n$
2: $\mathbf{y}_i^{n+1} = \mathbf{y}_i^n + \Delta t \mathbf{v}_i^{n+1/2}$
3: $\mathbf{v}_i^{n+1} = \mathbf{v}_i^{n+1/2} + \frac{\Delta t}{2\rho_i}\widetilde{\mathbf{f}}_i^{n+1}$

Breaking Bonds

During the course of simulation, it may be necessary to break bonds, as described in the *Damage section*. Bonds are recorded as broken in a simulation by removing them from the bond family $\mathcal{F}_i$ (see *(11)*).

A naive implementation would have us first loop over all bonds and compute s_{min} in *(9)*, then loop over all bonds again and break bonds with a stretch $s > s0$ as in *(8)*, and finally loop over all particles and compute forces for the next step of *Algorithm 1*. For reasons of computational efficiency, we will utilize the values of s_0 from the *previous* timestep when deciding to break a bond.

Note

For the first timestep, s_0 is initialized to ∞ for all nodes. This means that no bonds may be broken until the second timestep. As such, it is recommended that the first few timesteps of the peridynamic simulation not involve any

actions that might result in the breaking of bonds. As a practical example, the projectile in the *commented example below* is placed such that it does not impact the target brittle plate until several timesteps into the simulation.

LPS Pseudocode

A sketch of the LPS model implementation in the PERI package appears in *Algorithm 2*. This algorithm makes use of the routines in *Algorithm 3* and *Algorithm 4*.

Algorithm 2: LPS Peridynamic Model Pseudocode

Fix s_{00}, α, horizon δ, bulk modulus K, shear modulus G, timestep Δt, and generate initial lattice of particles with lattice constant Δx. Let there be N particles. Define constant c_S for repulsive short-range forces.
Initialize bonds between all particles $i \neq j$ where $\|\mathbf{x}_j - \mathbf{x}_i\| \leq \delta$
Initialize weighted volume m for all particles using *Algorithm 3*
Initialize $s_0 = \infty$ {*Initialize each entry to MAX_DOUBLE*}
while not done **do**
  Perform step 1 of *Algorithm 1*, updating velocities of all particles
  Perform step 2 of *Algorithm 1*, updating positions of all particles
  $\tilde{s}_0 = \infty$ {*Initialize each entry to MAX_DOUBLE*}
  for i = 1 to N **do**
    {Compute short-range forces}
    for all particles $j \in \mathcal{F}_i^S$ (the short-range family of nodes for particle i) **do**
      $r = \|\mathbf{y}_j - \mathbf{y}_i\|$
      $dr = \min\{0, r - d\}$ {*Short-range forces are only repulsive, never attractive*}
      $k = \frac{c_S}{\delta} V_k dr$ {c_S *defined in :ref: `(14) <pericS> `*}
      $\mathbf{f} = \mathbf{f} + k \frac{\mathbf{y}_j - \mathbf{y}_i}{\|\mathbf{y}_j - \mathbf{y}_i\|}$
    end for
  end for
  Compute the dilatation for each particle using *Algorithm 4*
  for i = 1 to N **do**
    {Compute bond forces}
    for all particles j sharing an unbroken bond with particle i **do**
      $e = \|\mathbf{y}_j - \mathbf{y}_i\| - \|\mathbf{x}_j - \mathbf{x}_i\|$
      $\omega_+ = \underline{\omega}\langle \mathbf{x}_j - \mathbf{x}_i \rangle$ {*Influence function evaluation*}
      $\omega_- = \underline{\omega}\langle \mathbf{x}_i - \mathbf{x}_j \rangle$ {*Influence function evaluation*}
      $\hat{f} = \left[(3K - 5G)\left(\frac{\theta(i)}{m(i)}\omega_+ + \frac{\theta(j)}{m(j)}\omega_-\right)\|\mathbf{x}_j - \mathbf{x}_i\| + 15G\left(\frac{\omega_+}{m(i)} + \frac{\omega_-}{m(j)}\right)e\right] v(\mathbf{x}_j - \mathbf{x}_i)V_j$
      $\mathbf{f} = \mathbf{f} + \hat{f}\frac{\mathbf{y}_j - \mathbf{y}_i}{\|\mathbf{y}_j - \mathbf{y}_i\|}$
      if $(dr/\|\mathbf{x}_j - \mathbf{x}_i\|) > \min(s_0(i), s_0(j))$ **then**
        Break i's bond with j {j *'s bond with i will be broken when this loop iterates on* j}
      end if
      $\tilde{s}_0(i) = \min(\tilde{s}_0(i), s_{00} - \alpha(dr/\|\mathbf{x}_j - \mathbf{x}_i\|))$

Perform step 3 of *Algorithm 1*, updating velocities of all particles
end while

Damage

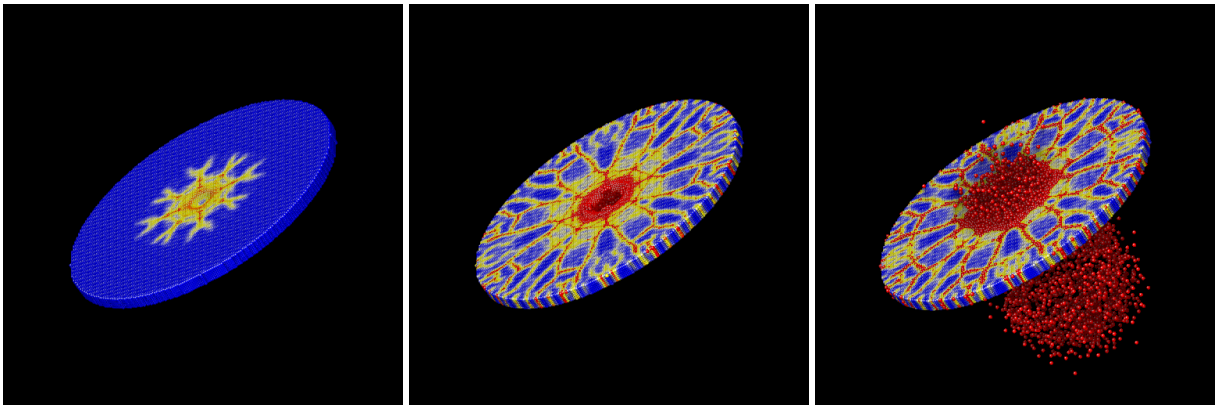
The damage associated with every particle (see *(10)*) can optionally be computed and output with a LAMMPS data dump. To do this, your input script must contain the command *compute damage/atom* This enables a LAMMPS per-atom compute to calculate the damage associated with each particle every time a LAMMPS *data dump* frame is written.

Visualizing Simulation Results

There are multiple ways to visualize the simulation results. Typically, you want to display the particles and color code them by the value computed with the *compute damage/atom* command.

This can be done, for example, by using the built-in visualizer of the *dump image or dump movie* command to create snapshot images or a movie. Below are example command for using dump image with the *example listed below* and a set of images created for steps 300, 600, and 2000 this way.

```
dump            D2 all image 100 dump.peri.*.png c_C1 type box no 0.0 view 30 60 zoom 1.5 up 0 0 -1 ␣
↪ssao yes 4539 0.6
dump_modify     D2 pad 5 adiam * 0.001 amap 0.0 1.0 ca 0.1 3 min blue 0.5 yellow max red
```



For interactive visualization, the Ovito is very convenient to use. Below are steps to create a visualization of the *same example from below* now using the generated trajectory in the dump.peri file.

- Launch Ovito
- File -> Load File -> dump.peri
- Select "-> Particle types" and under "Appearance" set "Display radius:" to 0.0005
- From the "Add modification:" drop down list select "Color coding"
- Under "Color coding" select from the "Color gradient" drop down list "Jet"
- Also under "Color coding" set "Start value:" to 0 and "End value:" to 1
- You can improve the image quality by adding the "Ambient occlusion" modification

Pitfalls

Parallel Scalability

LAMMPS operates in parallel in a *spatial-decomposition mode*, where each processor owns a spatial subdomain of the overall simulation domain and communicates with its neighboring processors via distributed-memory message passing (MPI) to acquire ghost atom information to allow forces on the atoms it owns to be computed. LAMMPS also uses Verlet neighbor lists which are recomputed every few timesteps as particles move. On these timesteps, particles also migrate to new processors as needed. LAMMPS decomposes the overall simulation domain so that spatial subdomains of nearly equal volume are assigned to each processor. When each subdomain contains nearly the same number of particles, this results in a reasonable load balance among all processors. As is more typical with some peridynamic simulations, some subdomains may contain many particles while other subdomains contain few particles, resulting in a load imbalance that impacts parallel scalability.

Setting the "skin" distance

The *neighbor* command with LAMMPS is used to set the so-called "skin" distance used when building neighbor lists. All atom pairs within a cutoff distance equal to the horizon δ plus the skin distance are stored in the list. Unexpected crashes in LAMMPS may be due to too small a skin distance. The skin should be set to a value such that δ plus the skin distance is larger than the maximum possible distance between two bonded particles. For example, if s_{00} is increased, the skin distance may also need to be increased.

"Lost" particles

All particles are contained within the "simulation box" of LAMMPS. The boundaries of this box may change with time, or not, depending on how the LAMMPS *boundary* command has been set. If a particle drifts outside the simulation box during the course of a simulation, it is called *lost*.

As an option of the *themo_modify* command of LAMMPS, the lost keyword determines whether LAMMPS checks for lost atoms each time it computes thermodynamics and what it does if atoms are lost. If the value is *ignore*, LAMMPS

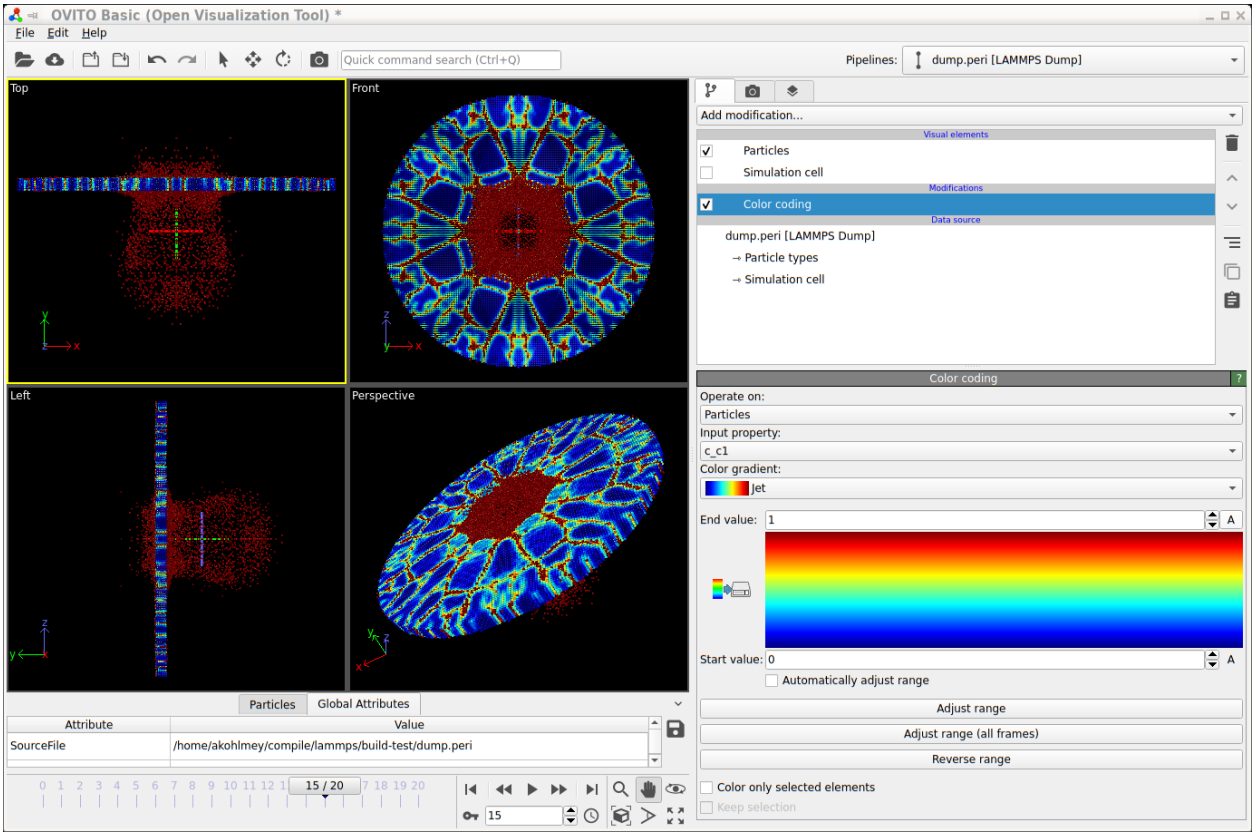


Fig. 3: Screenshot of visualizing a trajectory with Ovito

does not check for lost atoms. If the value is *error* or *warn*, LAMMPS checks and either issues an error or warning. The code will exit with an error and continue with a warning. This can be a useful debugging option. The default behavior of LAMMPS is to exit with an error if a particle is lost.

The peridynamic module within LAMMPS does not check for lost atoms. If a particle with unbroken bonds is lost, those bonds are marked as broken by the remaining particles.

Defining the peridynamic horizon δ

In the *pair_coeff* command, the user must specify the horizon δ. This argument determines which particles are bonded when the simulation is initialized. It is recommended that δ be set to a small fraction of a lattice constant larger than desired.

For example, if the lattice constant is 0.0005 and you wish to set the horizon to three times the lattice constant, then set δ to be 0.0015001, a value slightly larger than three times the lattice constant. This guarantees that particles three lattice constants away from each other are still bonded. If δ is set to 0.0015, for example, floating point error may result in some pairs of particles three lattice constants apart not being bonded.

Breaking bonds too early

For technical reasons, the bonds in the simulation are not created until the end of the first timestep of the simulation. Therefore, one should not attempt to break bonds until at least the second step of the simulation.

Bugs

The user is cautioned that this code is a beta release. If you are confident that you have found a bug in the peridynamic module, please report it in a *GitHub Issue <https://github.com/lammps/lammps/issues>* or send an email to the LAMMPS developers. First, check the New features and bug fixes section of the LAMMPS website site to see if the bug has already been reported or fixed. If not, the most useful thing you can do for us is to isolate the problem. Run it on the smallest number of atoms and fewest number of processors and with the simplest input script that reproduces the bug. In your message, describe the problem and any ideas you have as to what is causing it or where in the code the problem might be. We'll request your input script and data files if necessary.

Modifying and Extending the Peridynamic Module

To add new features or peridynamic potentials to the peridynamic module, the user is referred to the *Modifying & extending LAMMPS* section. To develop a new bond-based material, start with the *peri/pmb* pair style as a template. To develop a new state-based material, start with the *peri/lps* pair style as a template.

A Numerical Example

To introduce the peridynamic implementation within LAMMPS, we replicate a numerical experiment taken from section 6 of *(Silling 2005)*.

Problem Description and Setup

We consider the impact of a rigid sphere on a homogeneous disk of brittle material. The sphere has diameter 0.01 m and velocity 100 m/s directed normal to the surface of the target. The target material has density ρ = 2200 kg/m:math:^*3*. A PMB material model is used with K = 14.9 GPa and critical bond stretch parameters given by s_{00} = 0.0005 and α = 0.25. A three-dimensional simple cubic lattice is constructed with lattice constant 0.0005 m and horizon 0.0015 m. (The horizon is three times the lattice constant.) The target is a cylinder of diameter 0.074 m and thickness 0.0025 m, and the associated lattice contains 103,110 particles. Each particle i has volume fraction $V_i = 1.25 \times 10^{-10}\text{m}^3$.

The spring constant in the PMB material model is (see *(6)*)

$$c = \frac{18k}{\pi\delta^4} = \frac{18(14.9 \times 10^9)}{\pi(1.5 \times 10^{-3})^4} \approx 1.6863 \times 10^{22}.$$

The CFL analysis from *(Silling2005)* shows that a timestep of 1.0×10^{-7} is safe.

We observe here that in IEEE double-precision floating point arithmetic when computing the bond stretch $s(t, \eta, \xi)$ at each iteration where $\|\eta + \xi\|$ is computed during the iteration and $\|\xi\|$ was computed and stored for the initial lattice, it may be that $fl(s) = \varepsilon$ with $|\varepsilon| \leq \varepsilon_{machine}$ for an unstretched bond. Taking $\varepsilon = 2.220446049250313 \times 10^{-16}$, we see that the value $csV_i \approx 4.68 \times 10^{-4}$, computed when determining f, is perhaps larger than we would like, especially when the true force should be zero. One simple way to avoid this issue is to insert the following instructions in Algorithm *Algorithm 5* after instruction 21 (and similarly for Algorithm *Algorithm 2*):

if $|dr| < \varepsilon_{machine}$ **then**
    $dr = 0$
end if

Qualitatively, this says that displacements from equilibrium on the order of 10^{-16}m are taken to be exactly zero, a seemingly reasonable assumption.

The Projectile

The projectile used in the following experiments is not the one used in *(Silling 2005)*. The projectile used here exerts a force

$$F(r) = -k_s(r - R)^2$$

on each atom where k_s is a specified force constant, r is the distance from the atom to the center of the indenter, and R is the radius of the projectile. The force is repulsive and $F(r) = 0$ for $r > R$. For our problem, the projectile radius $R = 0.05$ m, and we have chosen $k_s = 1.0 \times 10^{17}$ (compare with *(6)* above).

Writing the LAMMPS Input File

We discuss the example input script *listed below*. In line 2 we specify that SI units are to be used. We specify the dimension (3) and boundary conditions ("shrink-wrapped") for the computational domain in lines 3 and 4. In line 5 we specify that peridynamic particles are to be used for this simulation. In line 7, we set the "skin" distance used in building the LAMMPS neighbor list. In line 8 we set the lattice constant (in meters) and in line 10 we define the spatial region where the target will be placed. In line 12 we specify a rectangular box enclosing the target region that defines the simulation domain. Line 14 fills the target region with atoms. Lines 15 and 17 define the peridynamic material model, and lines 19 and 21 set the particle density and particle volume, respectively. The particle volume should be set to the cube of the lattice constant for a simple cubic lattice. Line 23 sets the initial velocity of all particles to zero. Line 25 instructs LAMMPS to integrate time with velocity-Verlet, and lines 27-30 create the spherical projectile, sending it with a velocity of 100 m/s towards the target. Line 32 declares a compute style for the damage (percentage of broken bonds) associated with each particle. Line 33 sets the timestep, line 34 instructs LAMMPS to provide a screen dump of thermodynamic quantities every 200 timesteps, and line 35 instructs LAMMPS to create a data file (dump.peri) with a complete snapshot of the system every 100 timesteps. This file can be used to create still images or movies. Finally, line 36 instructs LAMMPS to run for 2000 timesteps.

Note

To use the LPS model, replace line 15 with *pair_style peri/lps* and modify line 16 accordingly.

Numerical Results and Discussion

We ran the *input script from above*. Images of the disk (projectile not shown) appear in Figure below. The plot of damage on the top monolayer was created by coloring each particle according to its damage.

The symmetry in the computed solution arises because a "perfect" lattice was used, and a because a perfectly spherical projectile impacted the lattice at its geometric center. To break the symmetry in the solution, the nodes in the peridynamic body may be perturbed slightly from the lattice sites. To do this, the lattice of points can be slightly perturbed using the *displace_atoms* command.

10.5.10 Manifolds (surfaces)

Overview:

This page is not about a LAMMPS input script command, but about manifolds, which are generalized surfaces, as defined and used by the MANIFOLD package, to track particle motion on the manifolds. See the src/MANIFOLD/README file for more details about the package and its commands.

Below is a list of currently supported manifolds by the MANIFOLD package, their parameters and a short description of them. The parameters listed here are in the same order as they should be passed to the relevant fixes.

manifold	*parameters*	*equation*	*description*
cylinder	R	x^2 + y^2 - R^2 = 0	Cylinder along z-axis, axis going through (0,0,0)
cylinder_de	R l a	x^2 + y^2 - r(z)^2 = 0, r(x) = R if | z | > l, r(z) = R - a*(1 + cos(z/l))/2 otherwise	A cylinder with a dent around z = 0
dumbbell	a A B c	-(x^2 + y^2) + (a^2 - z^2/c^2) * (1 + (A*sin(B*z^2))^4) = 0	A dumbbell
ellipsoid	a b c	(x/a)^2 + (y/b)^2 + (z/c)^2 = 0	An ellipsoid
gaussian_bu	A l rc1 rc2	if(x < rc1) -z + A * exp(-x^2 / (2 l^2)); else if(x < rc2) -z + a + b*x + c*x^2 + d*x^3; else z	A Gaussian bump at x = y = 0, smoothly tapered to a flat plane z = 0.
plane	a b c x0 y0 z0	a*(x-x0) + b*(y-y0) + c*(z-z0) = 0	A plane with normal (a,b,c) going through point (x0,y0,z0)
plane_w	a w	z - a*sin(w*x) = 0	A plane with a sinusoidal modulation on z along x.
sphere	R	x^2 + y^2 + z^2 - R^2 = 0	A sphere of radius R
supersphere	R q	| x |^q + | y |^q + | z |^q - R^q = 0	A supersphere of hyperradius R
spine	a, A, B, B2, c	-(x^2 + y^2) + (a^2 - z^2/f(z)^2)*(1 + (A*sin(g(z)*z^2))^4), f(z) = c if z > 0, 1 otherwise; g(z) = B if z > 0, B2 otherwise	An approximation to a dendritic spine
spine_t	a, A, B, B2, c	-(x^2 + y^2) + (a^2 - z^2/f(z)^2)*(1 + (A*sin(g(z)*z^2))^2), f(z) = c if z > 0, 1 otherwise; g(z) = B if z > 0, B2 otherwise	Another approximation to a dendritic spine
thylakoid	wB LB lB	Various, see *(Paquay)*	A model grana thylakoid consisting of two block-like compartments connected by a bridge of width wB, length LB and taper length lB
torus	R r	(R - sqrt(x^2 + y^2))^2 + z^2 - r^2	A torus with large radius R and small radius r, centered on (0,0,0)

10.5.11 Reproducing hydrodynamics and elastic objects (RHEO)

The RHEO package is a hybrid implementation of smoothed particle hydrodynamics (SPH) for fluid flow, which can couple to the *BPM package* to model solid elements. RHEO combines these methods to enable mesh-free modeling of multi-phase material systems. Its SPH solver supports many advanced options including reproducing kernels, particle shifting, free surface identification, and solid surface reconstruction. To model fluid-solid systems, the status of particles can dynamically change between a fluid and solid state, e.g. during melting/solidification, which determines how they interact and their physical behavior. The package is designed with modularity in mind, so one can easily turn various features on/off, adjust physical details of the system, or develop new capabilities. For instance, the numerics associated with calculating gradients, reproducing kernels, etc. are separated into distinct classes to simplify the development of new integration schemes which can call these calculations. Additional numerical details can be found in *(Palermo)* and *(Clemmer)*. Example movies illustrating some of these capabilities are found at https://www.lammps.org/movies.html#rheopackage.

Note, if you simply want to run a traditional SPH simulation, the *SPH package* package is likely better suited for your application. It has fewer advanced features and therefore benefits from improved performance. The *MACHDYN* package for solids may also be relevant for fluid-solid problems.

At the core of the package is *fix rheo* which integrates particle trajectories and controls many optional features (e.g. the use of reproducing kernels). In conjunction to fix rheo, one must specify an instance of *fix rheo/pressure* and *fix rheo/viscosity* to define a pressure equation of state and viscosity model, respectively. Optionally, one can model a heat equation with *fix rheo/thermal*, which also allows the user to specify equations for a particle's thermal conductivity, specific heat, latent heat, and melting temperature. The ordering of these fixes in an an input script matters. Fix rheo must be defined prior to all other RHEO fixes.

Typically, RHEO requires atom style rheo. In addition to typical atom properties like positions and forces, particles store a local density, viscosity, pressure, and status. If thermal evolution is modeled, one must use atom style rheo/thermal which also includes a local energy, temperature, and conductivity. Note that the temperature is always derived from the energy. This implies the *temperature* attribute of *the set command* does not affect particles. Instead, one should use the *sph/e* attribute.

The status variable uses bit-masking to track various properties of a particle such as its current state of matter (fluid or solid) and its location relative to a surface. Some of these properties (and others) can be accessed using *compute rheo/property/atom*. The *status* attribute in *the set command* only allows control over the first bit which sets the state of matter, 0 is fluid and 1 is solid.

Fluid interactions, including pressure forces, viscous forces, and heat exchange, are calculated using *pair rheo*. Unlike typical pair styles, pair rheo ignores the *special bond* settings. Instead, it determines whether to calculate forces based on the status of particles: e.g., hydrodynamic forces are only calculated if a fluid particle is involved.

To model elastic objects, there are currently two mechanisms in RHEO, one designed for bulk solid bodies and the other for thin shells. Both mechanisms rely on introducing bonded forces between particles and therefore require a hybrid of atom style bond and rheo (or rheo/thermal).

To create an elastic solid body, one has to (a) change the status of constituent particles to solid (e.g. with the *set* command), (b) create bpm bonds between the particles (see the *bpm howto* page for more details), and (c) use *pair rheo/solid* to apply repulsive contact forces between distinct solid bodies. Akin to pair rheo, pair rheo/solid considers a particle's fluid/solid phase to determine whether to apply forces. However, unlike pair rheo, pair rheo/solid does obey special bond settings such that contact forces do not have to be calculated between two bonded solid particles in the same elastic body.

In systems with thermal evolution, fix rheo/thermal can optionally set a melting/solidification temperature allowing particles to dynamically swap their state between fluid and solid when the temperature exceeds or drops below the critical temperature, respectively. Using the *react* option, one can specify a maximum bond length and a bond type. Then, when solidifying, particles search their local neighbors and automatically create bonds with any neighboring

solid particles in range. For BPM bond styles, bonds then use the immediate position of the two particles to calculate a reference state. When melting, particles delete any bonds of the specified type when reverting to a fluid state. Special bonds are updated as bonds are created/broken.

The other option for elastic objects is an elastic shell that is nominally much thinner than a particle diameter, e.g. a oxide skin which gradually forms over time on the surface of a fluid. Currently, this is implemented using *fix rheo/oxidation* and bond style *rheo/shell*. Essentially, fix rheo/oxidation creates candidate bonds of a specified type between surface fluid particles within a specified distance. a newly created rheo/shell bond will then start a timer. While the timer is counting down, the bond will delete itself if particles move too far apart or move away from the surface. However, if the timer reaches a user-defined threshold, then the bond will activate and apply additional forces to the fluid particles. Bond style rheo/shell then operates very similarly to a BPM bond style, storing a reference length and breaking if stretched too far. Unlike the above method, this option does not remove the underlying fluid interactions (although particle shifting is turned off) and does not modify special bond settings of particles.

While these two options are not expected to be appropriate for every system, either framework can be modified to create more suitable models (e.g. by changing the criteria for creating/deleting a bond or altering force calculations).

10.5.12 Magnetic spins

The magnetic spin simulations are enabled by the SPIN package, whose implementation is detailed in *Tranchida*.

The model represents the simulation of atomic magnetic spins coupled to lattice vibrations. The dynamics of those magnetic spins can be used to simulate a broad range a phenomena related to magneto-elasticity, or or to study the influence of defects on the magnetic properties of materials.

The magnetic spins are interacting with each others and with the lattice via pair interactions. Typically, the magnetic exchange interaction can be defined using the *pair/spin/exchange* command. This exchange applies a magnetic torque to a given spin, considering the orientation of its neighboring spins and their relative distances. It also applies a force on the atoms as a function of the spin orientations and their associated inter-atomic distances.

The command *fix precession/spin* allows to apply a constant magnetic torque on all the spins in the system. This torque can be an external magnetic field (Zeeman interaction), and an uniaxial or cubic magnetic anisotropy.

A Langevin thermostat can be applied to those magnetic spins using *fix langevin/spin*. Typically, this thermostat can be coupled to another Langevin thermostat applied to the atoms using *fix langevin* in order to simulate thermostatted spin-lattice systems.

The magnetic damping can also be applied using *fix langevin/spin*. It allows to either dissipate the thermal energy of the Langevin thermostat, or to perform a relaxation of the magnetic configuration toward an equilibrium state.

The command *fix setforce/spin* allows to set the components of the magnetic precession vectors (while erasing and replacing the previously computed magnetic precession vectors on the atom). This command can be used to freeze the magnetic moment of certain atoms in the simulation by zeroing their precession vector.

The command *fix nve/spin* can be used to perform a symplectic integration of the combined dynamics of spins and atomic motions.

The minimization style *min/spin* can be applied to the spins to perform a minimization of the spin configuration.

All the computed magnetic properties can be output by two main commands. The first one is *compute spin*, that enables to evaluate magnetic averaged quantities, such as the total magnetization of the system along x, y, or z, the spin temperature, or the magnetic energy. The second command is *compute property/atom*. It enables to output all the per atom magnetic quantities. Typically, the orientation of a given magnetic spin, or the magnetic force acting on this spin.

(Tranchida) Tranchida, Plimpton, Thibaudeau and Thompson, Journal of Computational Physics, 372, 406-425, (2018).

10.5.13 Adaptive-precision interatomic potentials (APIP)

The *PKG-APIP* enables use of adaptive-precision potentials as described in *(Immel)*. In the context of this package, precision refers to the accuracy of an interatomic potential.

Modern machine-learning (ML) potentials translate the accuracy of DFT simulations into MD simulations, i.e., ML potentials are more accurate compared to traditional empirical potentials. However, this accuracy comes at a cost: there is a considerable performance gap between the evaluation of classical and ML potentials, e.g., the force calculation of a classical EAM potential is 100-1000 times faster compared to the ML-based ACE method. The evaluation time difference results in a conflict between large time and length scales on the one hand and accuracy on the other. This conflict is resolved by an APIP model for simulations, in which the highest precision is required only locally but not globally.

An APIP model uses a precise but expensive ML potential only for a subset of atoms, while a fast potential is used for the remaining atoms. Whether the precise or the fast potential is used is determined by a continuous switching parameter λ_i that can be defined for each atom i. The switching parameter can be adjusted dynamically during a simulation or kept constant as explained below.

The potential energy E_i of an atom i described by an adaptive-precision interatomic potential is given by *(Immel)*

$$E_i = \lambda_i E_i^{(\text{fast})} + (1 - \lambda_i) E_i^{(\text{precise})},$$

whereas $E_i^{(\text{fast})}$ is the potential energy of atom i according to a fast interatomic potential, $E_i^{(\text{precise})}$ is the potential energy according to a precise interatomic potential and $\lambda_i \in [0, 1]$ is the switching parameter that decides how the potential energies are weighted.

Adaptive-precision saves computation time when the computation of the precise potential is not required for many atoms, i.e., when $\lambda_i = 1$ applies for many atoms.

The currently implemented potentials are:

Fast potential	Precise potential
ACE	*ACE*
EAM	

In theory, any short-range potential can be used for an adaptive-precision interatomic potential. How to implement a new (fast or precise) adaptive-precision potential is explained in *here*.

The switching parameter λ_i that combines the two potentials can be dynamically calculated during a simulation. Alternatively, one can set a constant switching parameter before the start of a simulation. To run a simulation with an adaptive-precision potential, one needs the following components:

dynamic switching parameter

1. *atom_style apip* so that the switching parameter λ_i can be stored.
2. A fast potential: *eam/apip* or *pace/fast/apip*.
3. A precise potential: *pace/precise/apip*.
4. *pair_style lambda/input/apip* to calculate λ_i^{input}, from which λ_i is calculated.
5. *fix lambda/apip* to calculate the switching parameter λ_i.

6. *pair_style lambda/zone/apip* to calculate the spatial transition zone of the switching parameter.
7. *pair_style hybrid/overlay* to combine the previously mentioned pair_styles.
8. *fix lambda_thermostat/apip* to conserve the energy when switching parameters change.
9. *fix atom_weight/apip* to approximate the load caused by every atom, as the computations of the pair_styles are only required for a subset of atoms.
10. *fix balance* to perform dynamic load balancing with the calculated load.

constant switching parameter

1. *atom_style apip* so that the switching parameter λ_i can be stored.
2. A fast potential: *eam/apip* or *pace/fast/apip*.
3. A precise potential: *pace/precise/apip*.
4. *set* command to set the switching parameter λ_i.
5. *pair_style hybrid/overlay* to combine the previously mentioned pair_styles.
6. *fix atom_weight/apip* to approximate the load caused by every atom, as the computations of the pair_styles are only required for a subset of atoms.
7. *fix balance* to perform dynamic load balancing with the calculated load.

Example

Note

How to select the values of the parameters of an adaptive-precision interatomic potential is discussed in detail in *(Immel)*.

dynamic switching parameter

Lines like these would appear in the input script:

```
atom_style apip
comm_style tiled

pair_style hybrid/overlay eam/fs/apip pace/precise/apip lambda/input/csp/apip fcc cutoff 5.0␣
↪lambda/zone/apip 12.0
pair_coeff * * eam/fs/apip Cu.eam.fs Cu
pair_coeff * * pace/precise/apip Cu.yace Cu
pair_coeff * * lambda/input/csp/apip
pair_coeff * * lambda/zone/apip

fix 2 all lambda/apip 2.5 3.0 time_averaged_zone 4.0 12.0 110 110 min_delta_lambda 0.01
fix 3 all lambda_thermostat/apip N_rescaling 200
fix 4 all atom_weight/apip 100 eam ace lambda/input lambda/zone all

variable myweight atom f_4

fix 5 all balance 100 1.1 rcb weight var myweight
```

First, the *atom_style apip* and the communication style are set.

Note

Note, that *comm_style tiled* is required for the style *rcb* of *fix balance*, but not for APIP. However, the

constant switching parameter

Lines like these would appear in the input script:

```
atom_style apip
comm_style tiled

pair_style hybrid/overlay eam/fs/apip pace/precise/apip
pair_coeff * * eam/fs/apip Cu.eam.fs Cu
pair_coeff * * pace/precise/apip Cu.yace Cu

# calculate lambda somehow
variable lambda atom ...
set group all apip/lambda v_lambda

fix 4 all atom_weight/apip 100 eam ace lambda/input lambda/zone all

variable myweight atom f_4

fix 5 all balance 100 1.1 rcb weight var myweight
```

First, the *atom_style apip* and the communication style are set.

Note

Note, that *comm_style tiled* is required for the style *rcb* of *fix balance*, but not for APIP. However, the flexibility offered by the balancing style *rcb*, compared to the balancing style *shift*, is advantageous for APIP.

An adaptive-precision EAM-ACE potential is defined via *pair_style hybrid/overlay*. The switching parameter λ_i of the adaptive-precision EAM-ACE potential is set via the *set command*. The parameter is not updated during the simulation. Therefore, the potential is conservative. The fixes ensure that the weight for the load balancing is calculated and the load-balancing itself is done.

Implementing new APIP pair styles

One can introduce adaptive-precision to an existing pair style by modifying the original pair style. One should calculate the force $F_i = -\nabla_i \sum_j E_j^{\text{original}}$ for a fast potential or $F_i = -(1-\nabla_i) \sum_j E_j^{\text{original}}$ for a precise potential from the original potential energy E_j^{original} to see where the switching parameter λ_i needs to be introduced in the force calculation. The switching parameter λ_i is known for all atoms i in force calculation routine. One needs to introduce an abortion criterion based on λ_i to ensure that all not required calculations are skipped and compute time can be saved. Furthermore, one needs to provide the number of calculations and measure the computation time. Communication within the force calculation needs to be prevented to allow effective load-balancing. With communication, the load balancer cannot balance few calculations of the precise potential on one processor with many computations of the fast potential on another processor.

All changes in the pair_style pace/apip compared to the pair_style pace are annotated and commented. Thus, the pair_style pace/apip can serve as an example for the implementation of new adaptive-precision potentials.

10.6 Tutorials howto

10.6.1 Using CMake with LAMMPS

The support for building LAMMPS with CMake is a recent addition to LAMMPS thanks to the efforts of Christoph Junghans (LANL) and Richard Berger (LANL). One of the key strengths of CMake is that it is not tied to a specific platform or build system. Instead it generates the files necessary to build and develop for different build systems and on different platforms. Note, that this applies to the build system itself not the LAMMPS code. In other words, without additional porting effort, it is not possible - for example - to compile LAMMPS with Visual C++ on Windows. The build system output can also include support files necessary to program LAMMPS as a project in integrated development environments (IDE) like Eclipse, Visual Studio, QtCreator, Xcode, CodeBlocks, Kate and others.

A second important feature of CMake is that it can detect and validate available libraries, optimal settings, available support tools and so on, so that by default LAMMPS will take advantage of available tools without requiring to provide the details about how to enable/integrate them.

The downside of this approach is, that there is some complexity associated with running CMake itself and how to customize the building of LAMMPS. This tutorial will show how to manage this through some selected examples. Please see the chapter about *building LAMMPS* for descriptions of specific flags and options for LAMMPS in general and for specific packages.

Changed in version 10Sep2025.

CMake can be used through either the command-line interface (CLI) program `cmake` (or `cmake3`), a text mode interactive user interface (TUI) program `ccmake` (or `ccmake3`), or a graphical user interface (GUI) program `cmake-gui`. All of them are portable software available on all supported platforms and can be used interchangeably. Since LAMMPS version 10Sep2025, the minimum required CMake version is 3.20.

All details about features and settings for CMake are in the CMake online documentation. We focus below on the most important aspects with respect to compiling LAMMPS.

Prerequisites

This tutorial assumes that you are operating in a command-line environment using a shell like Bash or Zsh.

- Linux: any Terminal window will work or text console
- macOS: launch the Terminal application
- Windows 10 or 11: install and run the *Windows Subsystem for Linux*
- other Unix-like operating systems like FreeBSD

> **Note**
>
> It is also possible to use CMake on Windows 10 or 11 through either the Microsoft Visual Studio IDE with the bundled CMake or from the Windows command prompt using a separately installed CMake package, both using the native Microsoft Visual C++ compilers and (optionally) the Microsoft MPI SDK. This tutorial, however, only covers unix-like command-line interfaces.

We also assume that you have downloaded and unpacked a recent LAMMPS source code package or used Git to create a clone of the LAMMPS sources on your compilation machine.

You should change into the top level directory of the LAMMPS source tree all paths mentioned in the tutorial are relative to that. Immediately after downloading it should look like this:

```
$ ls
bench  doc      lib      potentials  README  tools
cmake  examples  LICENSE  python     src
```

Build versus source directory

When using CMake the build procedure is separated into multiple distinct phases:

1. **Configuration:** detect or define which features and settings should be enable and used and how LAMMPS should be compiled
2. **Compilation:** generate and compile all necessary source files and build libraries and executables.
3. **Installation:** copy selected files from the compilation into your file system, so they can be used without having to keep the source and build tree around.

The configuration and compilation of LAMMPS has to happen in a dedicated *build directory* which must be different from the source directory. Also the source directory (src) must remain pristine, so it is not allowed to "install" packages using the traditional make process and after an compilation attempt all created source files must be removed. This can be achieved with make no-all purge.

You can pick **any** folder outside the source tree. We recommend to create a folder build in the top-level directory, or multiple folders in case you want to have separate builds of LAMMPS with different options (build-parallel, build-serial) or with different compilers (build-gnu, build-clang, build-intel) and so on. All the auxiliary files created by one build process (executable, object files, log files, etc) are stored in this directory or subdirectories within it that CMake creates.

Running CMake

CLI version

In the (empty) build directory, we now run the command cmake ../cmake, which will start the configuration phase and you will see the progress of the configuration printed to the screen followed by a summary of the enabled features, options and compiler settings. A typical summary screen will look like this:

```
$ cmake ../cmake/
-- The CXX compiler identification is GNU 8.2.0
-- Check for working CXX compiler: /opt/tools/gcc-8.2.0/bin/c++
-- Check for working CXX compiler: /opt/tools/gcc-8.2.0/bin/c++ - works

```

The cmake command has one mandatory argument, and that is a folder with either the file CMakeLists.txt or CMakeCache.txt. The CMakeCache.txt file is created during the CMake configuration run and contains all active settings, thus after a first run of CMake all future runs in the build folder can use the folder . and CMake will know where to find the CMake scripts and reload the settings from the previous step. This means, that one can modify an existing configuration by re-running CMake, but only needs to provide flags indicating the desired change, everything else will be retained. One can also mix compilation and configuration, i.e. start with a minimal configuration and then, if needed, enable additional features and recompile.

The steps above **will NOT compile the code**. The compilation can be started in a portable fashion with cmake --build ., or you use the selected built tool, e.g. make.

TUI version

For the text mode UI CMake program the basic principle is the same. You start the command ccmake ../cmake in the build folder.

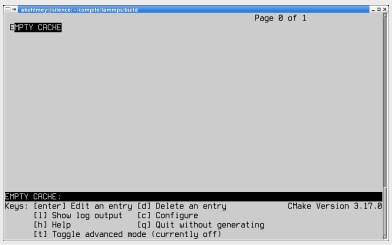

Fig. 5: Initial ccmake screen

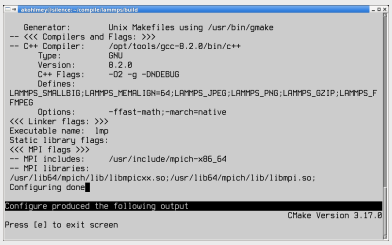

Fig. 6: Configure output of ccmake

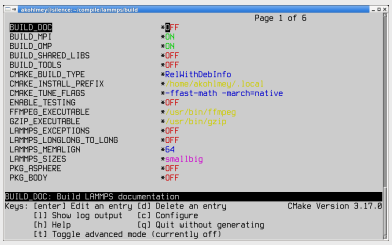

Fig. 7: Options screen of ccmake

This will show you the initial screen (left image) with the empty configuration cache. Now you type the 'c' key to run the configuration step. That will do a first configuration run and show the summary (center image). You exit the summary screen with 'e' and see now the main screen with detected options and settings. You can now make changes by moving and down with the arrow keys of the keyboard and modify entries. For on/off settings, the enter key will toggle the state. For others, hitting enter will allow you to modify the value and you commit the change by hitting the enter key again or cancel using the escape key. All "new" settings will be marked with a star '*' and for as long as one setting is marked like this, you have to re-run the configuration by hitting the 'c' key again, sometimes multiple times unless the TUI shows the word "generate" next to the letter 'g' and by hitting the 'g' key the build files will be written to the folder and the TUI exits. You can quit without generating build files by hitting 'q'.

GUI version

For the graphical CMake program the steps are similar to the TUI version. You can type the command cmake-gui ../cmake in the build folder. In this case the path to the CMake script folder is not required, it can also be entered from the GUI.

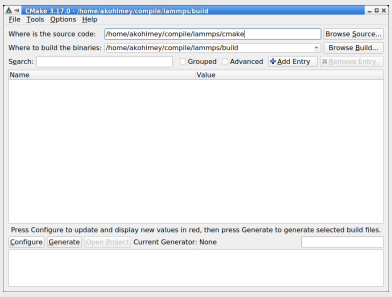

Fig. 8: Initial cmake-gui screen

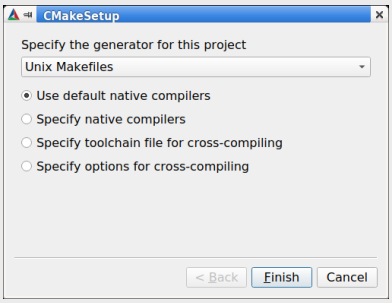

Fig. 9: Generator selection in cmake-gui

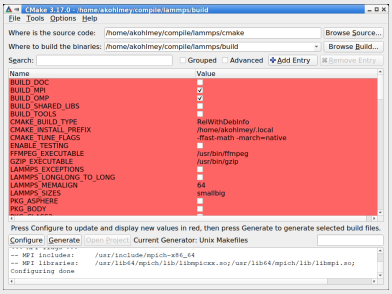

Fig. 10: Options screen of cmake-gui

Again, you start with an empty configuration cache (left image) and need to start the configuration step. For the very first configuration in a folder, you will have a pop-up dialog (center image) asking to select the desired build tool and some configuration settings (stick with the default) and then you get the option screen with all new settings highlighted in red. You can modify them (or not) and click on the "configure" button again until satisfied and click on the "generate" button to write out the build files. You can exit the GUI from the "File" menu or hit "ctrl-q".

Setting options

Options that enable, disable or modify settings are modified by setting the value of CMake variables. This is done on the command-line with the *-D* flag in the format -D VARIABLE=value, e.g. -D CMAKE_BUILD_TYPE=Release or -D BUILD_MPI=on. There is one quirk: when used before the CMake directory, there may be a space between the *-D* flag and the variable, after it must not be. Such CMake variables can have boolean values (on/off, yes/no, or 1/0 are all valid) or are strings representing a choice, or a path, or are free format. If the string would contain whitespace, it must be put in quotes, for example -D CMAKE_CXX_FLAGS="-O3 -Wall -ftree-vectorize -ffast-math".

CMake variables fall into two categories: 1) common CMake variables that are used by default for any CMake configuration setup and 2) project specific variables, i.e. settings that are specific for LAMMPS. Also CMake variables can be flagged as *advanced*, which means they are not shown in the text mode or graphical CMake program in the overview of all settings by default, but only when explicitly requested (by hitting the 't' key or clicking on the 'Advanced' check-box).

Some common CMake variables

Variable	Description
CMAKE_INSTALL_PREFIX	root directory of install location for make install (default: $HOME/.local)
LAMMPS_INSTALL_RPATH	set or remove runtime path setting from binaries for make install (default: off)
CMAKE_BUILD_TYPE	controls compilation options: one of RelWithDebInfo (default), Release, Debug, MinSizeRel
BUILD_SHARED_LIBS	if set to on build the LAMMPS library as shared library (default: off)
CMAKE_MAKE_PROGRAM	name/path of the compilation command (default depends on *-G* option, usually make)
CMAKE_VERBOSE_MAKE	if set to on echo commands while executing during build (default: off)
CMAKE_C_COMPILER	C compiler to be used for compilation (default: system specific, gcc on Linux)
CMAKE_CXX_COMPILER	C++ compiler to be used for compilation (default: system specific, g++ on Linux)
CMAKE_Fortran_COMPILER	Fortran compiler to be used for compilation (default: system specific, gfortran on Linux)
CXX_COMPILER_LAUNCH	tool to launch the C++ compiler, e.g. ccache or distcc for faster compilation (default: empty)

Some common LAMMPS specific variables

Variable	Description
BUILD_MPI	build LAMMPS with MPI support (default: on if a working MPI available, else off)
BUILD_OMP	build LAMMPS with OpenMP support (default: on if compiler supports OpenMP fully, else off)
BUILD_TOOLS	compile some additional executables from the tools folder (default: off)
BUILD_DOC	include building the HTML format documentation for packaging/installing (default: off)
LAMMPS_MACH	when set to name the LAMMPS executable and library will be called lmp_name and liblammps_name.a
FFT	select which FFT library to use: FFTW3, MKL, KISS (default, unless FFTW3 is found)
FFT_KOKKOS	select which FFT library to use in Kokkos-enabled styles: FFTW3, MKL, HIPFFT, CUFFT, MKL_GPU, KISS (default)
FFT_SINGLE	select whether to use single precision FFTs (default: off)
WITH_JPEG	whether to support JPEG format in *dump image* (default: on if found)
WITH_PNG	whether to support PNG format in *dump image* (default: on if found)
WITH_GZIP	whether to support reading and writing compressed files (default: on if found)
WITH_FFMPEG	whether to support generating movies with *dump movie* (default: on if found)

Enabling or disabling LAMMPS packages

The LAMMPS software is organized into a common core that is always included and a large number of *add-on packages* that have to be enabled to be included into a LAMMPS executable. Packages are enabled through setting variables of the kind PKG_<NAME> to on and disabled by setting them to off (or using yes, no, 1, 0 correspondingly). <NAME> has to be replaced by the name of the package, e.g. MOLECULE or EXTRA-PAIR.

Using presets

Since LAMMPS has a lot of optional features and packages, specifying them all on the command-line can be tedious. Or when selecting a different compiler toolchain, multiple options have to be changed consistently and that is rather error prone. Or when enabling certain packages, they require consistent settings to be operated in a particular mode. For this purpose, we are providing a selection of "preset files" for CMake in the folder cmake/presets. They represent a way to pre-load or override the CMake configuration cache by setting or changing CMake variables. Preset files are loaded using the *-C* command-line flag. You can combine loading multiple preset files or change some variables later with additional *-D* flags. A few examples:

```
cmake -C ../cmake/presets/basic.cmake -D PKG_MISC=on ../cmake
cmake -C ../cmake/presets/clang.cmake -C ../cmake/presets/most.cmake ../cmake
cmake -C ../cmake/presets/basic.cmake -D BUILD_MPI=off ../cmake
```

The first command will install the packages KSPACE, MANYBODY, MOLECULE, RIGID and MISC; the first four from the preset file and the fifth from the explicit variable definition. The second command will first switch the compiler toolchain to use the Clang compilers and install a large number of packages that are not depending on any special external libraries or tools and are not very unusual. The third command will enable the first four packages like above and then enforce compiling LAMMPS as a serial program (using the MPI STUBS library).

It is also possible to do this incrementally.

```
cmake -C ../cmake/presets/basic.cmake ../cmake
cmake -D PKG_MISC=on .
```

will achieve the same final configuration as in the first example above. In this scenario it is particularly convenient to do the second configuration step using either the text mode or graphical user interface (ccmake or cmake-gui).

Note

Using a preset to select a compiler package (clang.cmake, gcc.cmake, intel.cmake, oneapi.cmake, or pgi.cmake) are an exception to the mechanism of updating the configuration incrementally, as they will trigger a reset of cached internal CMake settings and thus reset settings to their default values.

Compilation and build targets

The actual compilation will be started by running the selected build command (on Linux this is by default make, see below how to select alternatives). You can also use the portable command cmake --build . which will adapt to whatever the selected build command is. This is particularly convenient, if you have set a custom build command via the CMAKE_MAKE_PROGRAM variable.

When calling the build program, you can also select which "target" is to be build through appending the --target flag and the name of the target to the build command. When using make as build tool, you can just append the target name to the command. Example: cmake --build . --target all or make all. The following abstract targets are available:

Target	Description
all	build “everything” (default)
lammps	build the LAMMPS library and executable
doc	build the HTML documentation (if configured)
install	install all target files into folders in CMAKE_INSTALL_PREFIX
test	run some tests (if configured with -D ENABLE_TESTING=on)
clean	remove all generated files

Choosing generators

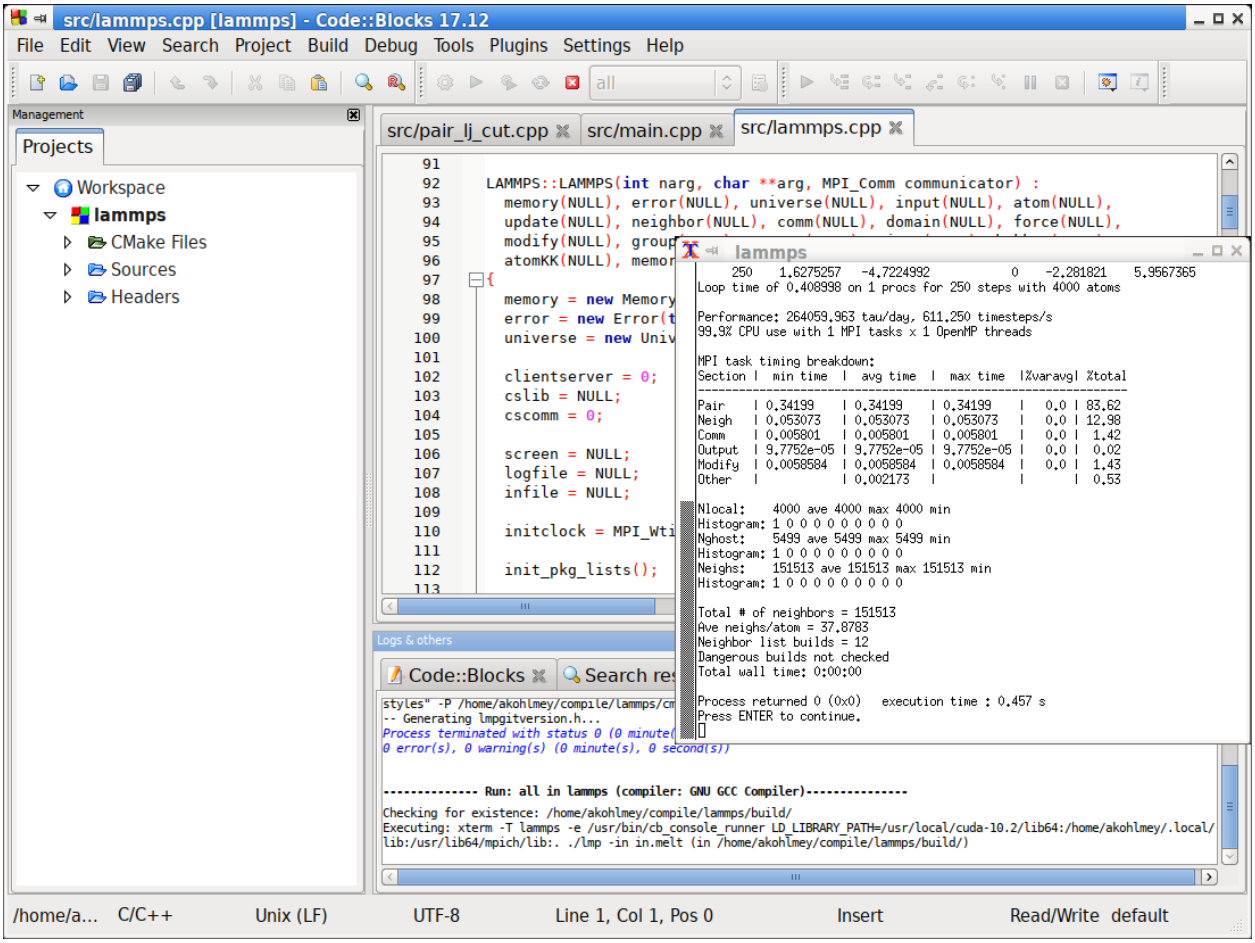
While CMake usually defaults to creating makefiles to compile software with the make program, it supports multiple alternate build tools (e.g. ninja-build which tends to be faster and more efficient in parallelizing builds than make) and can generate project files for integrated development environments (IDEs) like VisualStudio, Eclipse or CodeBlocks. This is specific to how the local CMake version was configured and compiled. The list of available options can be seen at the end of the output of cmake --help. Example on Fedora 31 this is:

```
Generators

The following generators are available on this platform (* marks default):
* Unix Makefiles               = Generates standard UNIX makefiles.
  Green Hills MULTI            = Generates Green Hills MULTI files
                                 (experimental, work-in-progress).
  Ninja                        = Generates build.ninja files.
  Ninja Multi-Config           = Generates build-<Config>.ninja files.
  Watcom WMake                 = Generates Watcom WMake makefiles.
  CodeBlocks - Ninja           = Generates CodeBlocks project files.
  CodeBlocks - Unix Makefiles  = Generates CodeBlocks project files.
  CodeLite - Ninja             = Generates CodeLite project files.
  CodeLite - Unix Makefiles    = Generates CodeLite project files.
  Sublime Text 2 - Ninja       = Generates Sublime Text 2 project files.
  Sublime Text 2 - Unix Makefiles
                               = Generates Sublime Text 2 project files.
  Kate - Ninja                 = Generates Kate project files.
  Kate - Unix Makefiles        = Generates Kate project files.
  Eclipse CDT4 - Ninja         = Generates Eclipse CDT 4.0 project files.
  Eclipse CDT4 - Unix Makefiles= Generates Eclipse CDT 4.0 project files.
```

Below is a screenshot of using the CodeBlocks IDE with the ninja build tool after running CMake as follows:

```
cmake -G 'CodeBlocks - Ninja' ../cmake/presets/most.cmake ../cmake/
```



10.6.2 LAMMPS GitHub tutorial

written by Stefan Paquay

This document describes the process of how to use GitHub to integrate changes or additions you have made to LAMMPS into the official LAMMPS distribution. It uses the process of updating this very tutorial as an example to describe the individual steps and options. You need to be familiar with git and you may want to have a look at the git book to familiarize yourself with some of the more advanced git features used below.

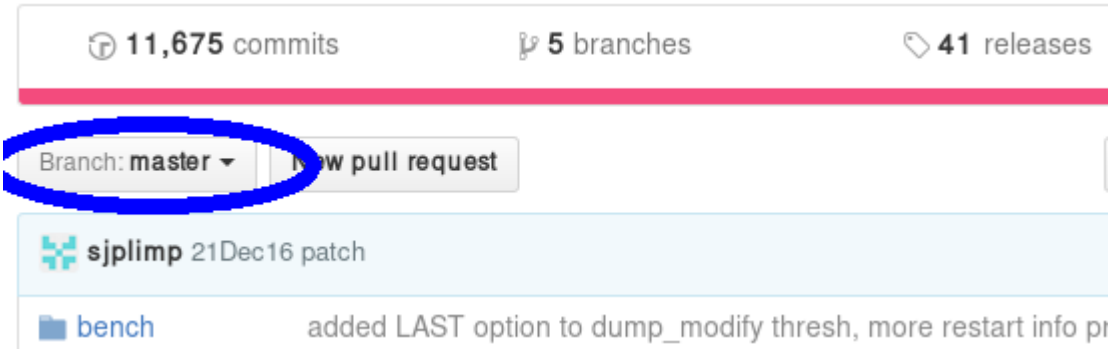
As of fall 2016, submitting contributions to LAMMPS via pull requests on GitHub is the preferred option for integrating contributed features or improvements to LAMMPS, as it significantly reduces the amount of work required by the LAMMPS developers. Consequently, creating a pull request will increase your chances to have your contribution included and will reduce the time until the integration is complete. For more information on the requirements to have your code included into LAMMPS please see *this page*.

Making an account

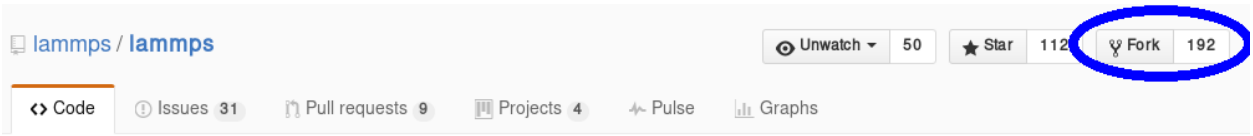
First of all, you need a GitHub account. This is fairly simple, just go to GitHub and create an account by clicking the "Sign up for GitHub" button. Once your account is created, you can sign in by clicking the button in the top left and filling in your username or e-mail address and password.

Forking the repository

To get changes into LAMMPS, you need to first fork the *lammps/lammps* repository on GitHub. At the time of writing, *develop* is the preferred target branch. Thus go to LAMMPS on GitHub and make sure branch is set to "develop", as shown in the figure below.



If it is not, use the button to change it to *develop*. Once it is, use the fork button to create a fork.



This will create a fork (which is essentially a copy, but uses less resources) of the LAMMPS repository under your own GitHub account. You can make changes in this fork and later file *pull requests* to allow the upstream repository to merge changes from your own fork into the one we just forked from (or others that were forked from the same repository). At the same time, you can set things up, so you can include changes from upstream into your repository and thus keep it in sync with the ongoing LAMMPS development.

Adding changes to your own fork

Additions to the upstream version of LAMMPS are handled using *feature branches*. For every new feature, a so-called feature branch is created, which contains only those modification relevant to one specific feature. For example, adding a single fix would consist of creating a branch with only the fix header and source file and nothing else. It is explained in more detail here: feature branch workflow.

Feature branches

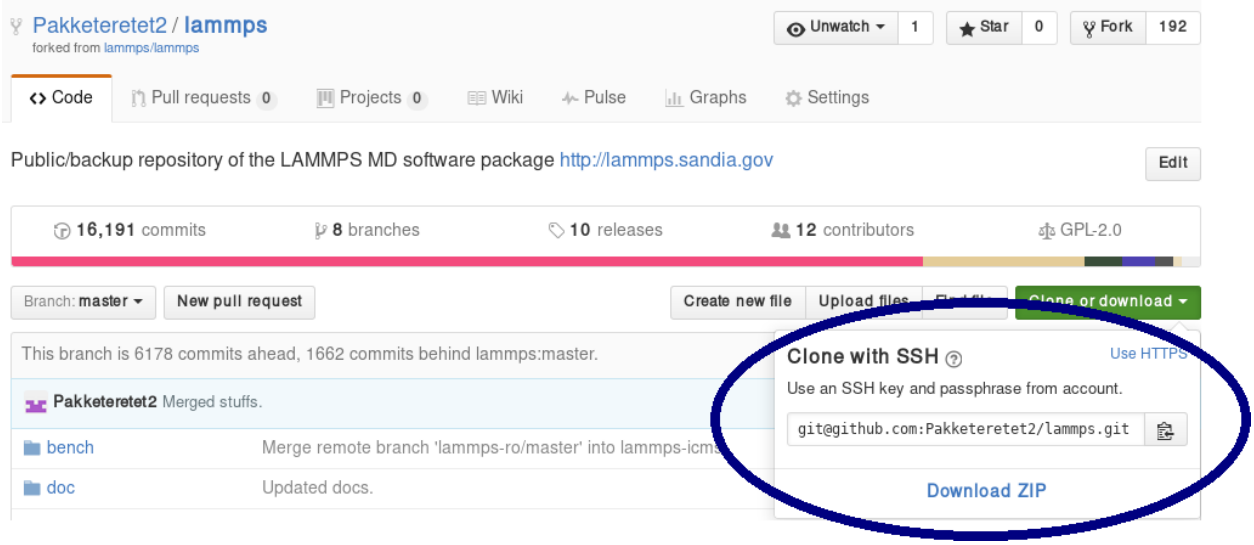
First of all, create a clone of your version on GitHub on your local machine via HTTPS:

```
git clone https://github.com/<your user name>/lammps.git <some name>
```

or, if you have set up your GitHub account for using SSH keys, via SSH:

```
git clone git@github.com:<your user name>/lammps.git
```

You can find the proper URL by clicking the "Clone or download"-button:



The above command copies ("clones") the git repository to your local machine to a directory with the name you chose. If none is given, it will default to "lammps". Typical names are "mylammps" or something similar.

You can use this local clone to make changes and test them without interfering with the repository on GitHub.

To pull changes from upstream into this copy, you can go to the directory and use git pull:

```
cd mylammps
git checkout develop
git pull https://github.com/lammps/lammps develop
```

You can also add this URL as a remote:

```
git remote add upstream https://www.github.com/lammps/lammps
```

From then on you can update your upstream branches with:

```
git fetch upstream
```

and then refer to the upstream repository branches with *upstream/develop* or *upstream/release* and so on.

At this point, you typically make a feature branch from the updated branch for the feature you want to work on. This tutorial contains the workflow that updated this tutorial, and hence we will call the branch "github-tutorial-update":

```
git fetch upstream
git checkout -b github-tutorial-update upstream/develop
```

Now that we have changed branches, we can make our changes to our local repository. Just remember that if you want to start working on another, unrelated feature, you should switch branches!

Note

Committing changes to the *develop*, *release*, or *stable* branches is strongly discouraged. While it may be convenient initially, it will create more work in the long run. Various texts and tutorials on using git effectively discuss the motivation for using feature branches instead.

After changes are made

After everything is done, add the files to the branch and commit them:

```
git add doc/src/Howto_github.txt
git add doc/src/JPG/tutorial*.png
```

Warning

Do not use *git commit -a* (or *git add -A*). The -a flag (or -A flag) will automatically include **all** modified **and** new files and that is rarely the behavior you want. It can easily lead to accidentally adding unrelated and unwanted changes into the repository. Instead it is preferable to explicitly use *git add*, *git rm*, *git mv* for adding, removing, renaming individual files, respectively, and then *git commit* to finalize the commit. Carefully check all pending changes with *git status* before committing them. If you find doing this on the command-line too tedious, consider using a GUI, for example the one included in git distributions written in Tk, i.e. use *git gui* (on some Linux distributions it may be required to install an additional package to use it).

After adding all files, the change set can be committed with some useful message that explains the change.

```
git commit -m 'Finally updated the GitHub tutorial'
```

After the commit, the changes can be pushed to the same branch on GitHub:

```
git push
```

Git will ask you for your user name and password on GitHub if you have not configured anything. If your local branch is not present on GitHub yet, it will ask you to add it by running

```
git push --set-upstream origin github-tutorial-update
```

If you correctly type your user name and password, the feature branch should be added to your fork on GitHub.

If you want to make really sure you push to the right repository (which is good practice), you can provide it explicitly:

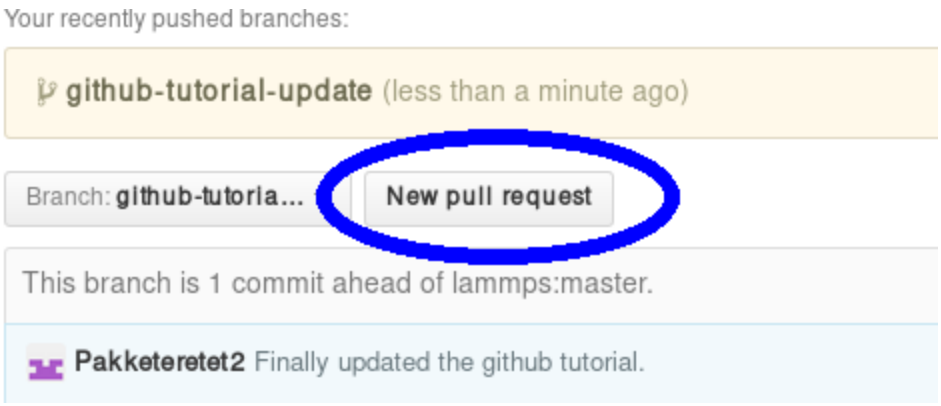
```
git push origin
```

or using an explicit URL:

```
git push git@github.com:Pakketeretet2/lammps.git
```

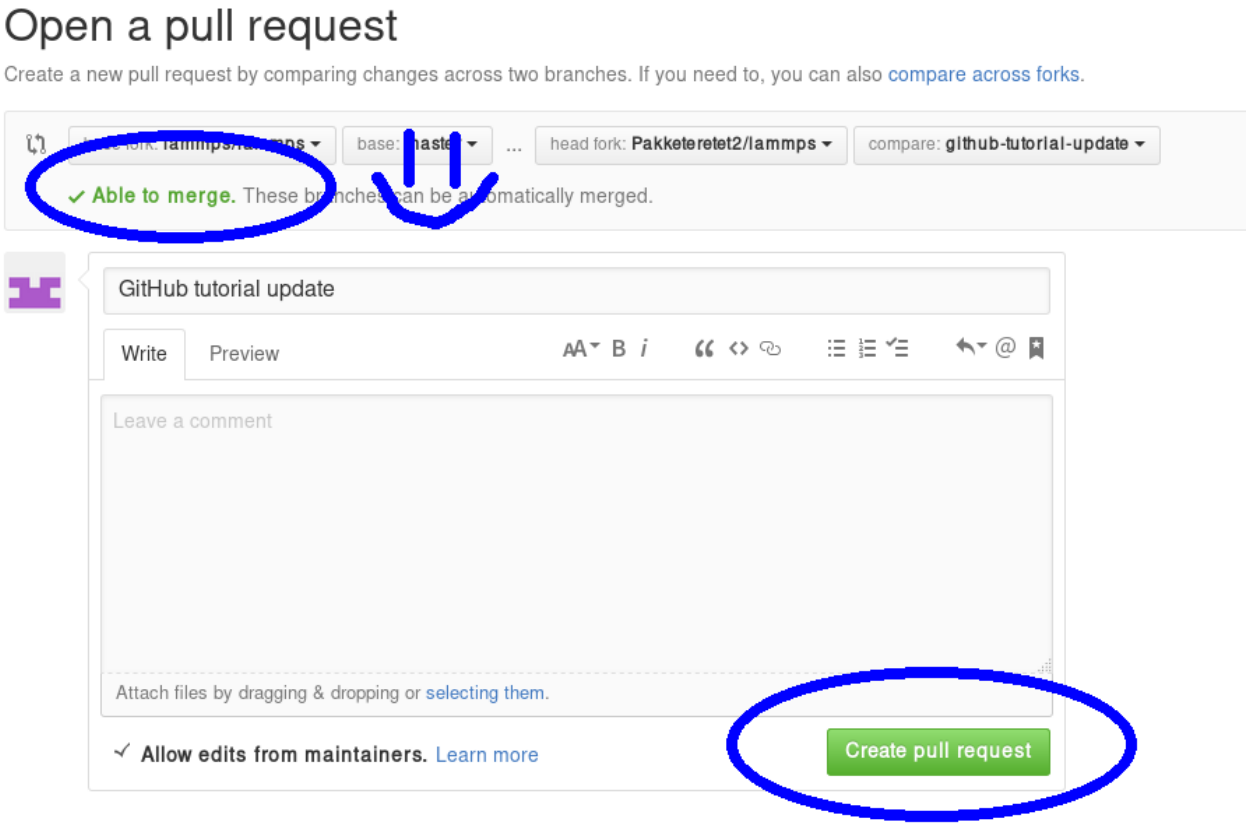
Filing a pull request

Up to this point in the tutorial, all changes were to *your* clones of LAMMPS. Eventually, however, you want this feature to be included into the official LAMMPS version. To do this, you will want to file a pull request by clicking on the "New pull request" button:



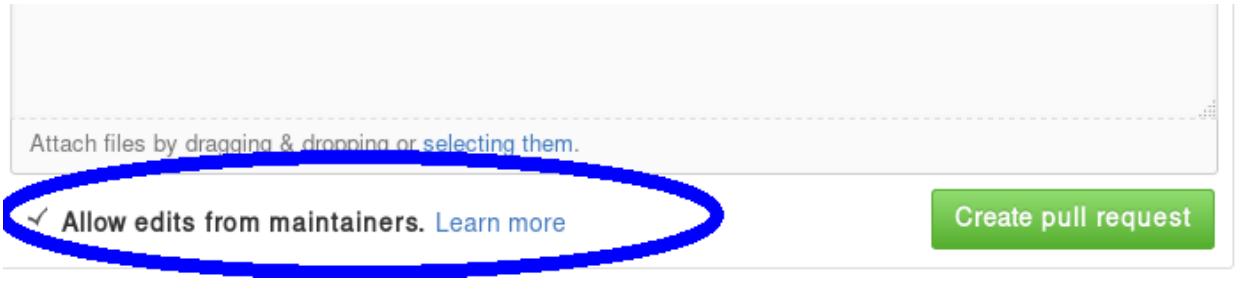
Make sure that the current branch is set to the correct one, which, in this case, is "github-tutorial-update". If done correctly, the only changes you will see are those that were made on this branch.

This will open up a new window that lists changes made to the repository. If you are just adding new files, there is not much to do, but I suppose merge conflicts are to be resolved here if there are changes in existing files. If all changes can automatically be merged, green text at the top will say so and you can click the "Create pull request" button, see image.



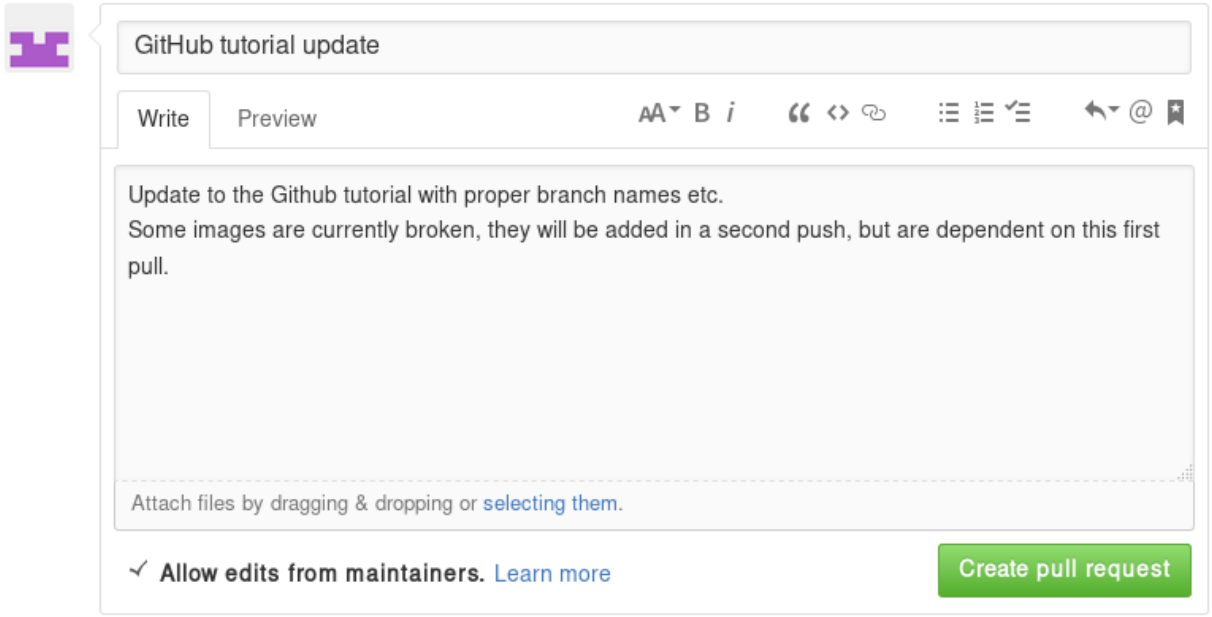
Before creating the pull request, make sure the short title is accurate and add a comment with details about your pull request. Here you write what your modifications do and why they should be incorporated upstream.

Note the checkbox that says "Allow edits from maintainers". This is checked by default checkbox (although in my version of Firefox, only the checkmark is visible):



If it is checked, maintainers can immediately add their own edits to the pull request. This helps the inclusion of your branch significantly, as simple/trivial changes can be added directly to your pull request branch by the LAMMPS maintainers. The alternative would be that they make changes on their own version of the branch and file a reverse pull request to you. Just leave this box checked unless you have a very good reason not to.

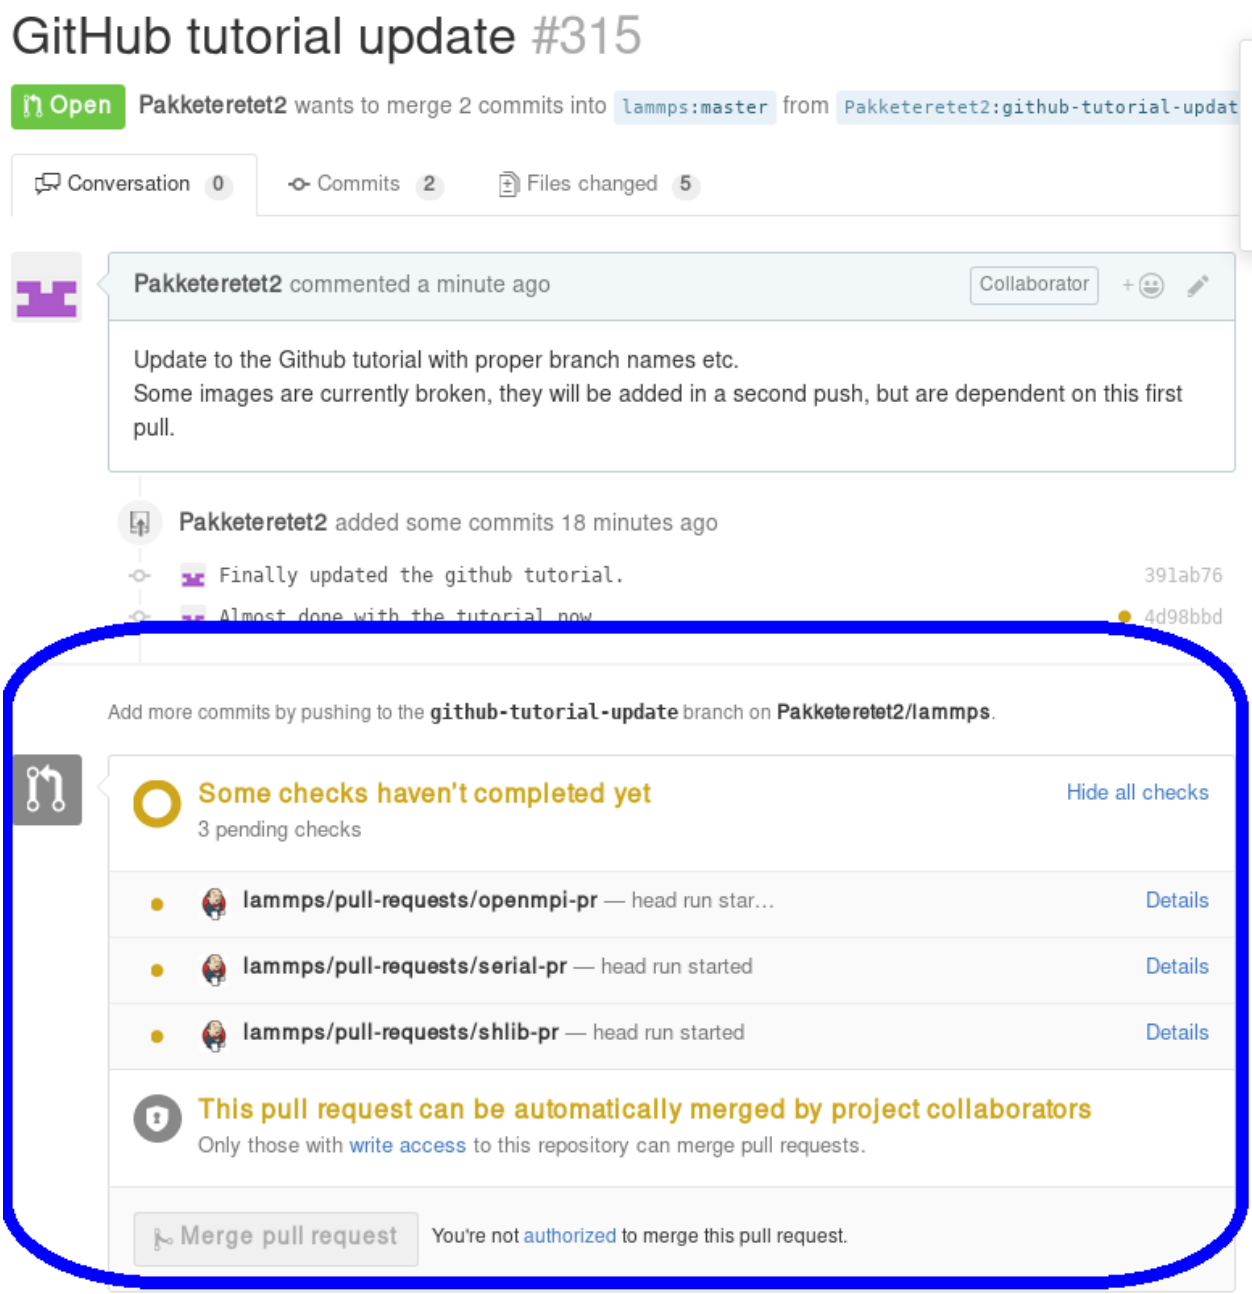
Now just write some nice comments and click on "Create pull request".



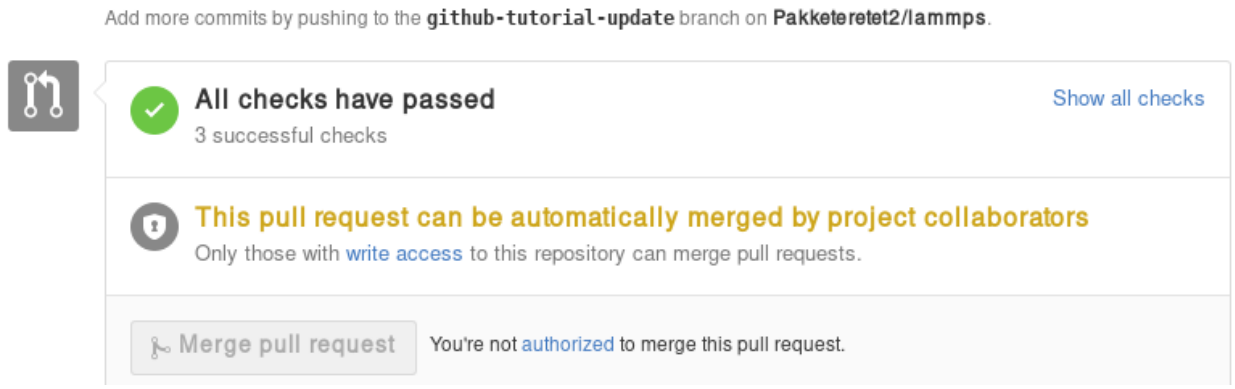
After filing a pull request

> **Note**
>
> When you submit a pull request (or ask for a pull request) for the first time, you will receive an invitation to become a LAMMPS project collaborator. Please accept this invite as being a collaborator will simplify certain administrative tasks and will probably speed up the merging of your feature, too.

You will notice that after filing the pull request, some checks are performed automatically:



If all is fine, you will see this:

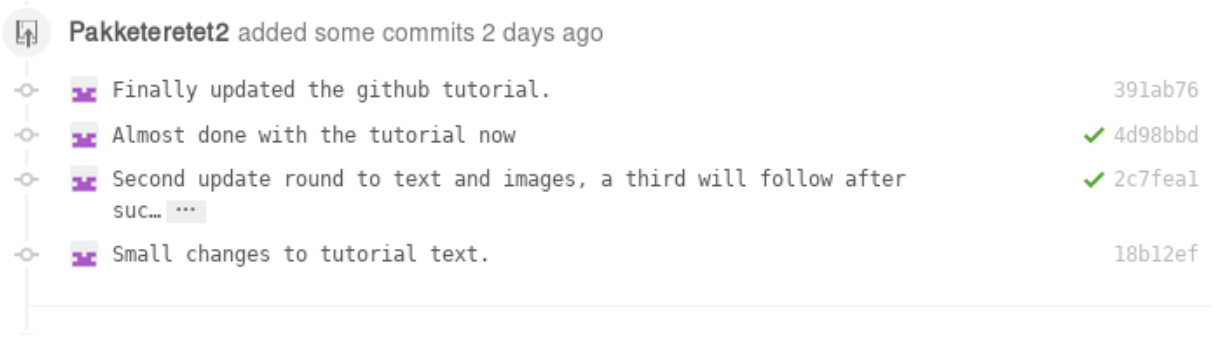


If any of the checks are failing, your pull request will not be processed, as your changes may break compilation for certain configurations or may not merge cleanly. It is your responsibility to remove the reason(s) for the failed test(s). If you need help with this, please contact the LAMMPS developers by adding a comment explaining your problems with resolving the failed tests.

A few further interesting things (can) happen to pull requests before they are included.

Additional changes

First of all, any additional changes you push into your branch in your repository will automatically become part of the pull request:



This means you can add changes that should be part of the feature after filing the pull request, which is useful in case you have forgotten them, or if a developer has requested that something needs to be changed before the feature can be accepted into the official LAMMPS version. After each push, the automated checks are run again.

Labels

LAMMPS developers may add labels to your pull request to assign it to categories (mostly for bookkeeping purposes), but a few of them are important: *needs_work*, *work_in_progress*, *run_tests*, *test_for_regression*, and *ready_for_merge*. The first two indicate, that your pull request is not considered to be complete. With "needs_work" the burden is on exclusively on you; while "work_in_progress" can also mean, that a LAMMPS developer may want to add changes. Please watch the comments to the pull requests. The two "test" labels are used to trigger extended tests before the code is merged. This is sometimes done by LAMMPS developers, if they suspect that there may be some subtle side effects from your changes. It is not done by default, because those tests are very time-consuming. The *ready_for_merge* label is usually attached when the LAMMPS developer assigned to the pull request considers this request complete and to trigger a final full test evaluation.

Reviews

As of Fall 2021, a pull request needs to pass all automatic tests and at least 1 approving review from a LAMMPS developer with write access to the repository before it is eligible for merging. In case your changes touch code that certain developers are associated with, they are auto-requested by the GitHub software. Those associations are set in the file .github/CODEOWNERS Thus if you want to be automatically notified to review when anybody changes files or

packages, that **you** have contributed to LAMMPS, you can add suitable patterns to that file, or a LAMMPS developer may add you.

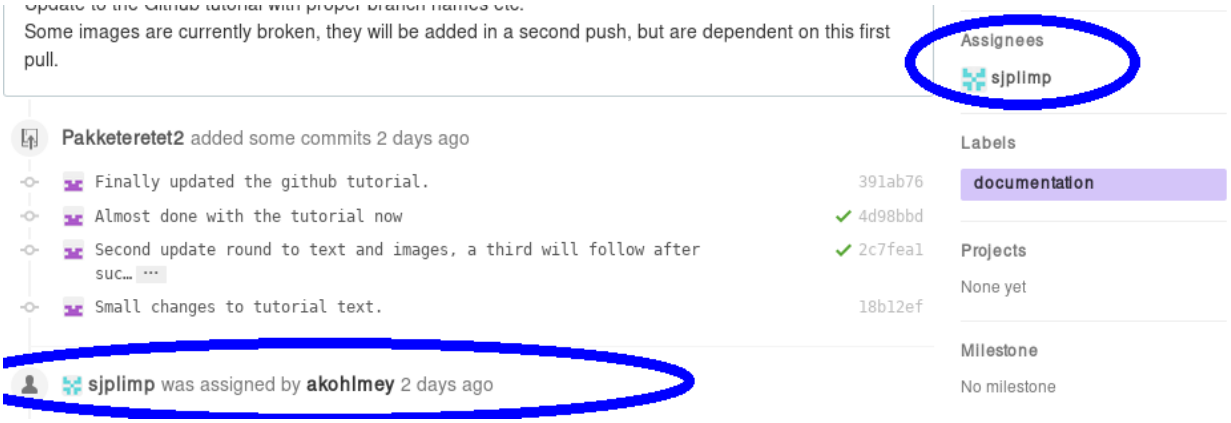
Otherwise, you can also manually request reviews from specific developers, or LAMMPS developers - in their assessment of your pull request - may determine who else should be reviewing your contribution and add that person. Through reviews, LAMMPS developers also may request specific changes from you. If those are not addressed, your pull requests cannot be merged.

Assignees

There is an assignee property for pull requests. If the request has not been reviewed by any developer yet, it is not assigned to anyone. After revision, a developer can choose to assign it to either a) you, b) a LAMMPS developer (including him/herself) or c) Axel Kohlmeyer (akohlmey).

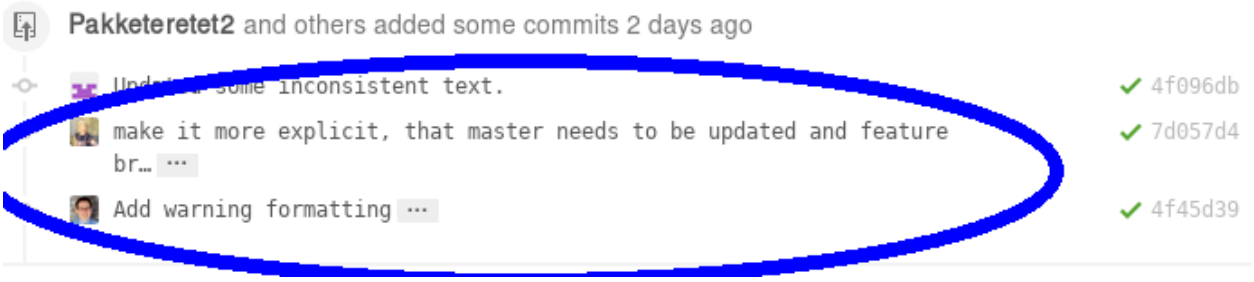
- Case a) happens if changes are required on your part
- Case b) means that at the moment, it is being tested and reviewed by a LAMMPS developer with the expectation that some changes would be required. After the review, the developer can choose to implement changes directly or suggest them to you.
- Case c) means that the pull request has been assigned to the developer overseeing the merging of pull requests into the *develop* branch.

In this case, Axel assigned the tutorial to Steve:



Edits from LAMMPS maintainers

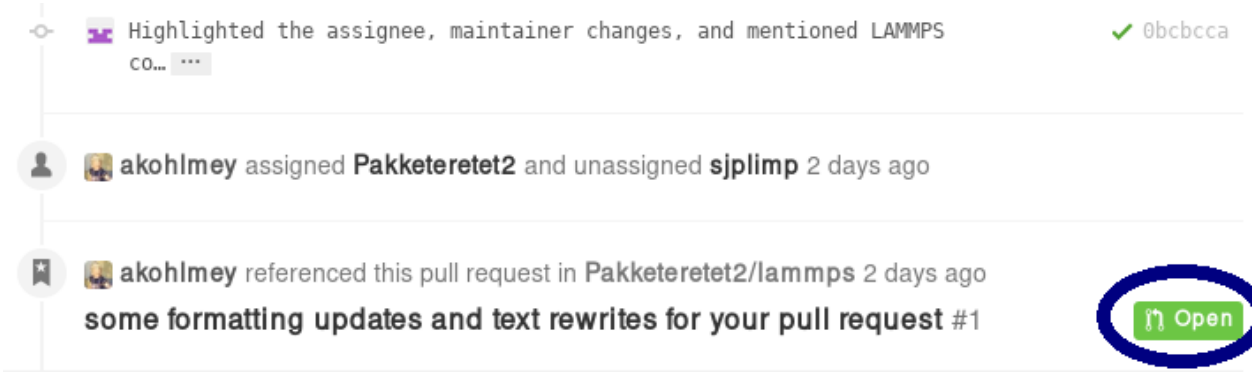
If you allowed edits from maintainers (the default), any LAMMPS maintainer can add changes to your pull request. In this case, both Axel and Richard made changes to the tutorial:



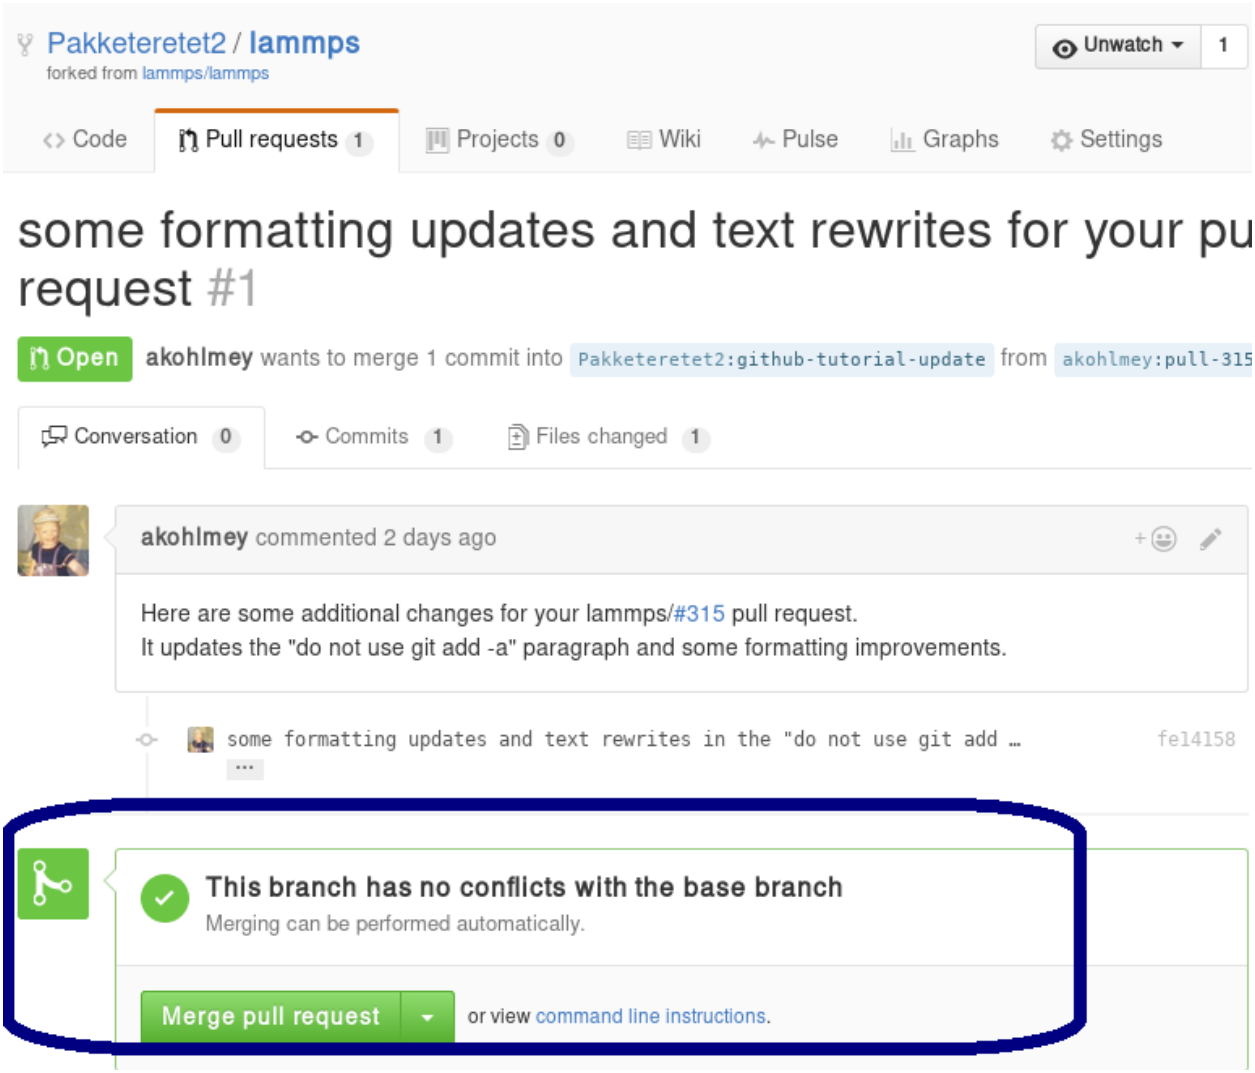
Reverse pull requests

Sometimes, however, you might not feel comfortable having other people push changes into your own branch, or maybe the maintainers are not sure their idea was the right one. In such a case, they can make changes, reassign you as the assignee, and file a "reverse pull request", i.e. file a pull request in **your** forked GitHub repository to include changes in the branch, that you have submitted as a pull request yourself. In that case, you can choose to merge their changes

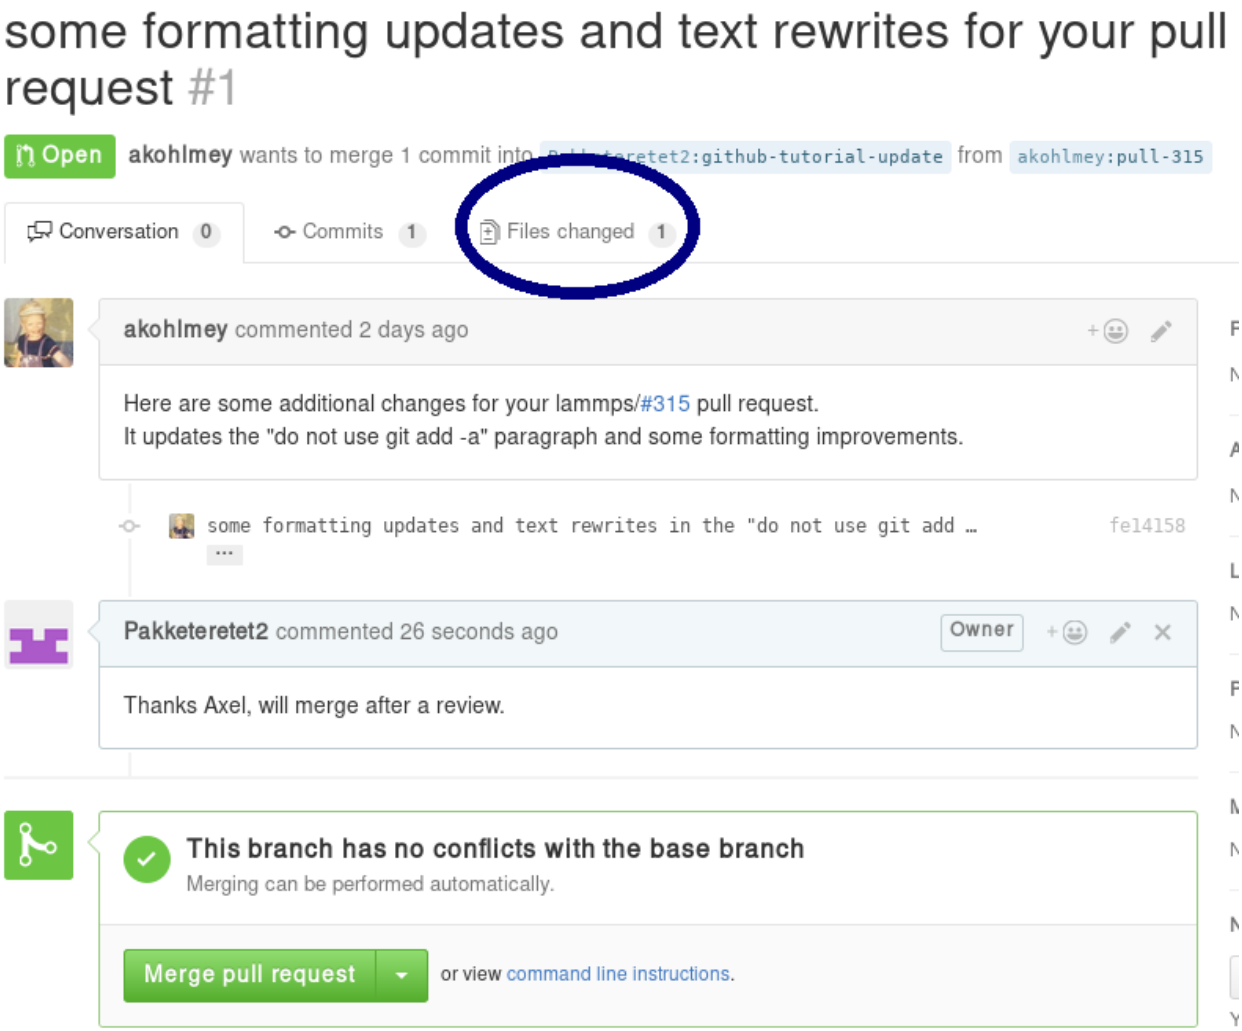
back into your branch, possibly make additional changes or corrections and proceed from there. It looks something like this:



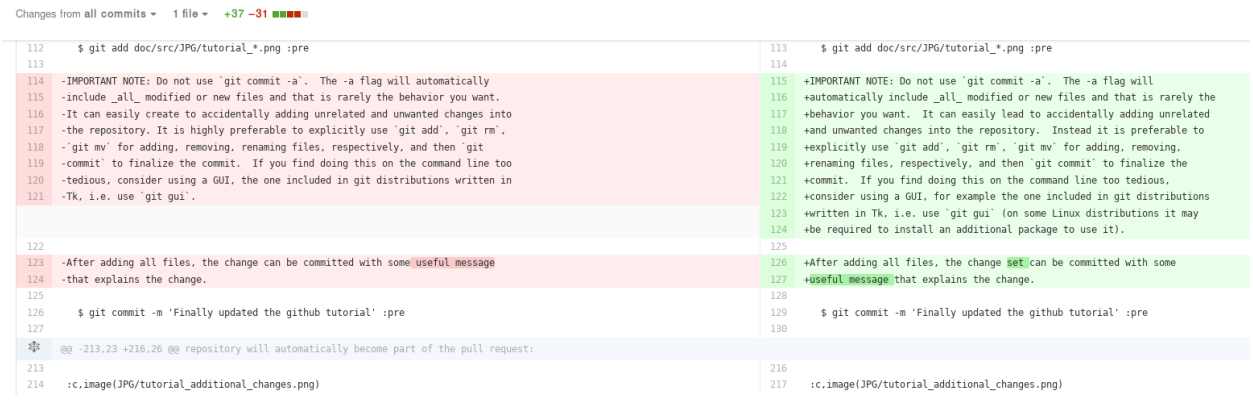
For some reason, the highlighted button did not work in my case, but I can go to my own repository and merge the pull request from there:



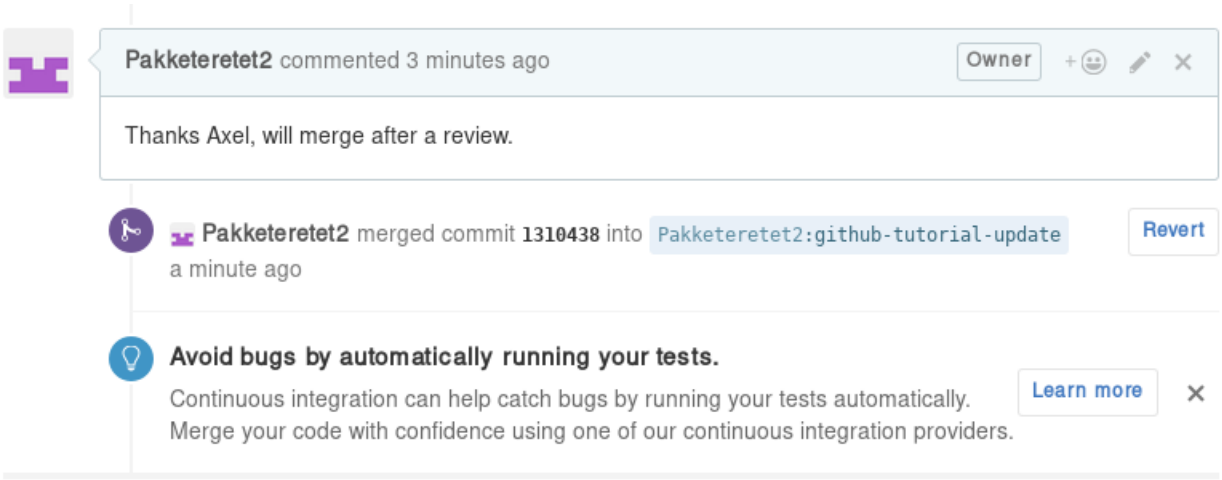
Be sure to check the changes to see if you agree with them by clicking on the tab button:



In this case, most of it is changes in the markup and a short rewrite of Axel's explanation of the "git gui" and "git add" commands.



Because the changes are OK with us, we are going to merge by clicking on "Merge pull request". After a merge it looks like this:



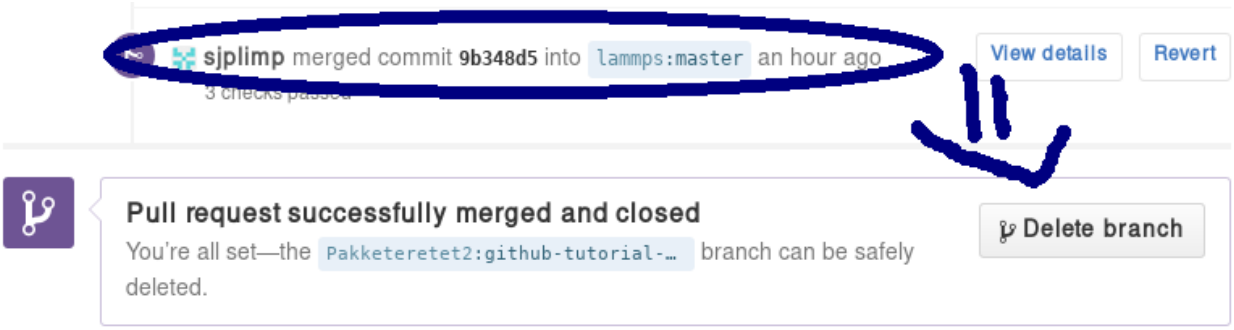
Now, since in the meantime our local text for the tutorial also changed, we need to pull Axel's change back into our branch, and merge them:

```
git add Howto_github.txt
git add JPG/tutorial_reverse_pull_request*.png
git commit -m "Updated text and images on reverse pull requests"
git pull
```

In this case, the merge was painless because git could auto-merge:

```
[ stefan@phys8250 src ] % git pull
Auto-merging doc/src/tutorial_github.txt
Waiting for Emacs...
Merge made by the 'recursive' strategy.
 doc/src/tutorial_github.txt | 68 ++++++
```

When everything is fine, the feature branch is merged into the *develop* branch:



Now one question remains: What to do with the feature branch that got merged into upstream?

It is in principle safe to delete them from your own fork. This helps keep it a bit more tidy. Note that you first have to switch to another branch!

```
git checkout develop
git pull https://github.com/lammps/lammps develop
git branch -d github-tutorial-update
```

If you do not pull first, it is not really a problem but git will warn you at the next statement that you are deleting a local branch that was not yet fully merged into HEAD. This is because git does not yet know your branch just got merged into LAMMPS upstream. If you first delete and then pull, everything should still be fine. You can display all branches that are fully merged by:

Finally, if you delete the branch locally, you might want to push this to your remote(s) as well:

```
git push origin :github-tutorial-update
```

Recent changes in the workflow

Some recent changes to the workflow are not captured in this tutorial. For example, in addition to the *develop* branch, to which all new features should be submitted, there is also a *release*, a *stable*, and a *maintenance* branch; the *release* branch is updated from the *develop* branch as part of a "feature release", and *stable* (together with *release*) are updated from *develop* when a "stable release" is made. In between stable releases, selected bug fixes and infrastructure updates are back-ported from the *develop* branch to the *maintenance* branch and occasionally merged to *stable* as an update release.

Furthermore, the naming of the release tags now follow the pattern "patch_<Day><Month><Year>" to simplify comparisons between releases. For stable releases additional "stable_<Day><Month><Year>" tags are applied and update releases are tagged with "stable_<Day><Month><Year>_update<Number>", Finally, all releases and submissions are subject to automatic testing and code checks to make sure they compile with a variety of compilers and popular operating systems. Some unit and regression testing is applied as well.

A detailed discussion of the LAMMPS developer GitHub workflow can be found in the file doc/github-development-workflow.md

10.6.3 Using LAMMPS-GUI

Changed in version 10Sep2025.

This page used to contain the documentation for LAMMPS-GUI. LAMMPS-GUI, however, is no longer bundled with LAMMPS and its documentation has moved to https://lammps-gui.lammps.org/

10.6.4 Moltemplate Tutorial

In this tutorial, we are going to use the tool *Moltemplate* from https://moltemplate.org/ to set up a classical molecular dynamic simulation using the *OPLS-AA force field*. The first task is to describe an organic compound and create a complete input deck for LAMMPS. The second task is to use moltemplate to build a polymer. The third task is to map the OPLS-AA force field to a molecular sample created with an external tool, e.g. PACKMOL, and exported as a PDB file. The files used in this tutorial can be found in the tools/moltemplate/tutorial-files folder of the LAMMPS source code distribution.

Many more examples can be found here: https://moltemplate.org/examples.html

Simulating an organic solvent

This example aims to create a cubic box of the organic solvent formamide.

The first step is to create a molecular topology in the LAMMPS-template (LT) file format representing a single molecule, which will be stored in a Moltemplate object called _FAM inherits OPLSAA {}. This command states that the object _FAM is based on an existing object called OPLSAA, which contains OPLS-AA parameters, atom type definitions, partial charges, masses and bond-angle rules for many organic and biological compounds. The atomic structure is the starting point to populate the command write('Data Atoms') {}, which will write the Atoms section in the LAMMPS data file. The OPLS-AA force field uses the atom_style full, therefore, this column format is used: # atomID molID atomType charge coordX coordY coordZ. The atomIDs are replaced with Moltemplate $-type variables, which are then substituted with unique numerical IDs. The same logic is applied to the molID, except that the same variable is used for the whole molecule. The atom types are assigned using @-type variables. The assignment of atom types (e.g. @atom:177, @atom:178) is done using the OPLS-AA atom types defined in the "In Charges" section of the file oplsaa2024.lt, looking for a reasonable match with the description of the atom. The resulting file (formamide.lt) follows:

```
import /usr/local/moltemplate/moltemplate/force_fields/oplsaa2024.lt  # defines OPLSAA

_FAM inherits OPLSAA {
```

(continues on next page)

(continued from previous page)

```
  # atomID    molID  atomType  charge  coordX  coordY  coordZ
  write('Data Atoms') {
    $atom:C00  $mol  @atom:235  0.00    0.100   0.490   0.0
    $atom:O01  $mol  @atom:236  0.00    1.091  -0.250   0.0
    $atom:N02  $mol  @atom:237  0.00   -1.121  -0.181   0.0
    $atom:H03  $mol  @atom:240  0.00   -2.013   0.272   0.0
    $atom:H04  $mol  @atom:240  0.00   -1.056  -1.190   0.0
    $atom:H05  $mol  @atom:279  0.00    0.144   1.570   0.0
  }

  # A list of the bonds in the molecule:
  # BondID   AtomID1   AtomID2
  write('Data Bond List') {
    $bond:C1 $atom:C00 $atom:O01
    $bond:C2 $atom:C00 $atom:H05
    $bond:C3 $atom:C00 $atom:N02
    $bond:C4 $atom:N02 $atom:H03
    $bond:C5 $atom:N02 $atom:H04
  }
}
```

You don't have to specify the charge in this example because the OPLSAA force-field assigns charge according to the atom type. (This is not true when using other force fields.) A "Data Bond List" section is needed as the atom type will determine the bond type. The other bonded interactions (e.g. angles, dihedrals, and impropers) will be automatically generated by Moltemplate.

If the simulation is not charge-neutral, or Moltemplate complains that you have missing bond, angle, or dihedral types, this probably means that at least one of your atom types is incorrect (or that perhaps there is no suitable atom type currently defined in the oplsaa2024.lt file).

The second step is to create a master file with instructions to build a starting structure and the LAMMPS commands to run an NPT simulation. The master file (solv_01.lt) follows:

```
import formamide.lt  # Defines "_FAM" and OPLSAA

# Distribute the molecules on a 5x5x5 cubic grid with spacing 4.6
solv = new _FAM [5].move( 4.6, 0, 0)
                [5].move( 0, 4.6, 0)
                [5].move( 0, 0, 4.6)
solv[*][*][*].move(-11.5, -11.5, -11.5)

# Set the simulation box.
write_once("Data Boundary") {
 -11.5 11.5 xlo xhi
 -11.5 11.5 ylo yhi
 -11.5 11.5 zlo zhi
}

# Note: The lines below in the "In Run" section are often omitted.

write_once("In Run"){
 # Create an input deck for LAMMPS.
```

(continues on next page)

(continued from previous page)

```
# Run an NPT simulation.
# Input variables.
variable run    string solv_01   # output name
variable ts     equal  1         # timestep
variable temp   equal  300       # equilibrium temperature
variable p      equal  1.        # equilibrium pressure
variable d      equal  1000      # output frequency
variable equi   equal  5000      # Equilibration steps
variable prod   equal  30000     # Production steps

# Derived variables.
variable tcouple equal \$\{ts\}*100
variable pcouple equal \$\{ts\}*1000

# Output.
thermo          \$d
thermo_style custom step etotal evdwl ecoul elong ebond eangle &
edihed eimp ke pe temp press vol density cpu
thermo_modify flush yes

# Trajectory.
dump TRJ all dcd \$d \$\{run\}.dcd
dump_modify TRJ unwrap yes

# Thermalisation and relaxation, NPT ensemble.
timestep        \$\{ts\}
fix             NPT all npt temp \$\{temp\} \$\{temp\} \$\{tcouple\} iso \$p \$p \$\{pcouple\}
velocity all create \$\{temp\} 858096 dist gaussian
# Short runs to update the PPPM settings as the box shinks.
run     \$\{equi\} post no
run     \$\{equi\} post no
run     \$\{equi\} post no
run     \$\{equi\}
# From now on, the density shouldn't change too much.
run     \$\{prod\}
unfix NPT
}
```

The first two commands insert the content of files oplsaa2024.lt and formamide.lt into the master file. At this point, we can use the command solv = new _FAM [N] to create N copies of a molecule of type _FAM. In this case, we create an array of 5*5*5 molecules on a cubic grid using the coordinate transformation command .move(4.6, 0, 0). See the Moltemplate documentation to learn more about the syntax. As the sample was created from scratch, we also specify the simulation box size in the "Data Boundary" section.

The LAMMPS setting for the force field are specified in the file oplsaa2024.lt and are written automatically in the input deck. We also specify the boundary conditions and a set of variables in the "In Init" section.

The remaining commands to run an NPT simulation are written in the "In Run" section. Note that in this script, LAMMPS variables are protected with the escape character \ to distinguish them from Moltemplate variables, e.g. \$\{run\} is a LAMMPS variable that is written in the input deck as ${run}.

(Note: Moltemplate can be slow to run, so you need to change you run settings frequently, I recommended moving those commands (from "In Run") out of your .lt files and into a separate file. Moltemplate creates a file named run.in.EXAMPLE for this purpose. You can put your run settings and fixes that file and then invoke LAMMPS using

mpirun -np 4 lmp -in run.in.EXAMPLE instead.)

Compile the master file with:

```
moltemplate.sh solv_01.lt
cleanup_moltemplate.sh   # <-- optional: see below
```

(Note: The optional "cleanup_moltemplate.sh" command deletes unused atom types, which sometimes makes LAMMPS run faster. But it does not work with many-body pair styles or dreiding-style h-bonds. Fortunately most force fields, including OPLSAA, don't use those features.)

Then execute the simulation with the following:

```
mpirun -np 4 lmp -in solv_01.in -l solv_01.log
```

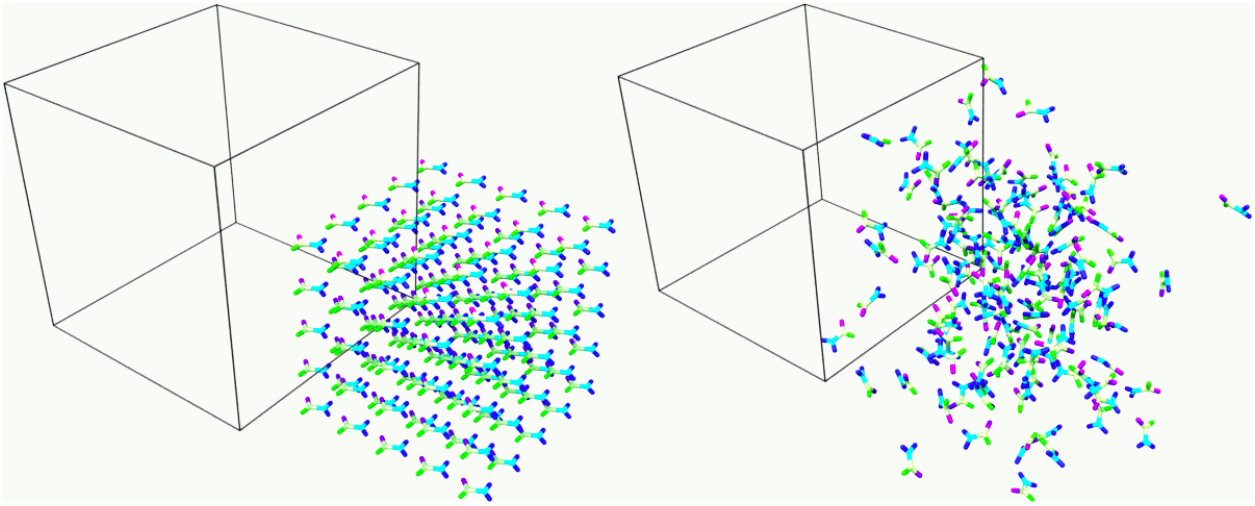


Fig. 11: Snapshot of the sample at the beginning and end of the simulation. Rendered with Ovito.

Building a simple polymer

Moltemplate is particularly useful for building polymers (and other molecules with sub-units). As an simple example, consider butane:

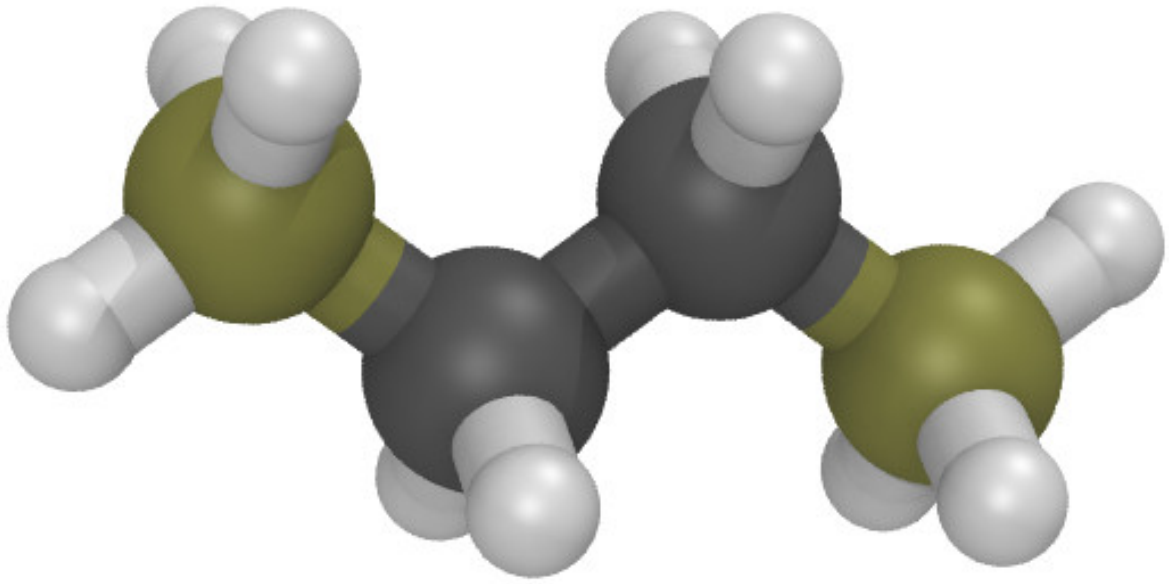
The butane.lt file below defines Butane as a polymer containing 4 monomers (of type CH3, CH2, CH2, CH3).

```
import /usr/local/moltemplate/moltemplate/force_fields/oplsaa2024.lt  # defines OPLSAA

CH3 inherits OPLSAA {

  # atomID    molID   atomType  charge   coordX   coordY    coordZ
  write("Data Atoms") {
    $atom:c  $mol:... @atom:54   0.0   0.000000  0.4431163  0.000000
    $atom:h1 $mol:... @atom:60   0.0   0.000000  1.0741603  0.892431
    $atom:h2 $mol:... @atom:60   0.0   0.000000  1.0741603 -0.892431
    $atom:h3 $mol:... @atom:60   0.0  -0.892431 -0.1879277  0.000000
  }
  # (Using "$mol:..." indicates this object ("CH3") is part of a larger
  #  molecule. Moltemplate will share the molecule-ID with that molecule.)
```

(continues on next page)



(continued from previous page)

```
  # A list of the bonds within the "CH3" molecular sub-unit:
  # BondID   AtomID1   AtomID2
  write('Data Bond List') {
    $bond:ch1 $atom:c $atom:h1
    $bond:ch2 $atom:c $atom:h2
    $bond:ch3 $atom:c $atom:h3
  }
}

CH2 inherits OPLSAA {

  # atomID    molID   atomType  charge   coordX   coordY    coordZ
  write("Data Atoms") {
    $atom:c  $mol:... @atom:57   0.0   0.000000  0.4431163  0.000000
    $atom:h1 $mol:... @atom:60   0.0   0.000000  1.0741603  0.892431
    $atom:h2 $mol:... @atom:60   0.0   0.000000  1.0741603 -0.892431
  }

  # A list of the bonds within the "CH2" molecular sub-unit:
  # BondID   AtomID1   AtomID2
  write('Data Bond List') {
    $bond:ch1 $atom:c $atom:h1
    $bond:ch2 $atom:c $atom:h2
  }
}

Butane inherits OPLSAA {

  create_var {$mol}  # optional:force all monomers to share the same molecule-ID
```

(continues on next page)

(continued from previous page)

```
  # - Create 4 monomers
  # - Move them along the X axis using ".move()",
  # - Rotate them 180 degrees with respect to the previous monomer
  monomer1 = new CH3
  monomer2 = new CH2.rot(180,1,0,0).move(1.2533223,0,0)
  monomer3 = new CH2.move(2.5066446,0,0)
  monomer4 = new CH3.rot(180,0,0,1).move(3.7599669,0,0)

  # A list of the bonds connecting different monomers together:
  write('Data Bond List') {
    $bond:b1  $atom:monomer1/c $atom:monomer2/c
    $bond:b2  $atom:monomer2/c $atom:monomer3/c
    $bond:b3  $atom:monomer3/c $atom:monomer4/c
  }
}
```

Again, you don't have to specify the charge in this example because OPLSAA assigns charges according to the atom type.

This Butane object is a molecule which can be used anywhere other molecules can be used. (You can arrange Butane molecules on a lattice, as we did previously. You can also modify individual butane molecules by adding or deleting atoms or bonds. You can add bonds between specific butane molecules or use Butane as a sub-unit to define even larger molecules. See the moltemplate manual for details.)

How to build a complex polymer

A similar procedure can be used to create more complicated polymers, such as the NIPAM polymer example shown below. For details, see:

https://github.com/jewettaij/moltemplate/tree/master/examples/all_atom/force_field_OPLSAA/NIPAM_polymer+water+ions

Mapping an existing structure

Another helpful way to use Moltemplate is mapping an existing molecular sample to a force field. This is useful when a complex sample is assembled from different simulations or created with specialized software (e.g. PACKMOL). (Note: The previous link shows how to build this entire system from scratch using only moltemplate. However here we will assume instead that we obtained a PDB file for this system using PACKMOL.)

As in the previous examples, all molecular species in the sample are defined using single-molecule Moltemplate objects. For this example, we use a short polymer in a box containing water molecules and ions in the PDB file model.pdb.

It is essential to understand that the order of atoms in the PDB file and in the Moltemplate master script must match, as we are using the coordinates from the PDB file in the order they appear. The order of atoms and molecules in the PDB file provided is as follows:

- 500 water molecules, with atoms ordered in this sequence:

```
ATOM      1  O   MOL D   1      5.901   7.384   1.103  0.00  0.00      DUM
ATOM      2  H   MOL D   1      6.047   8.238   0.581  0.00  0.00      DUM
ATOM      3  H   MOL D   1      6.188   7.533   2.057  0.00  0.00      DUM
```

- 1 polymer molecule.
- 1 Ca^{2+} ion.

- 2 Cl^- ions.

In the master LT file, this sequence of molecules is matched with the following commands:

```
# Create the sample.
wat=new SPC[500]
pol=new PolyNIPAM[1]
cat=new Ca[1]
ani=new Cl[2]
```

Note that the first command would create 500 water molecules in the same position in space, and the other commands will use the coordinates specified in the corresponding molecular topology block. However, the coordinates will be overwritten by rendering an external atomic structure file. Note that if the same molecule species are scattered in the input structure, it is recommended to reorder and group together for molecule types to facilitate the creation of the input sample.

The molecular topology for the polymer is created as in the previous example, with the atom types assigned as in the following schema:

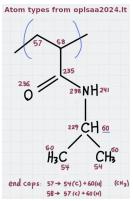


Fig. 12: Atom types assigned to the polymer's repeating unit.

The molecular topology of the water and ions is stated directly into the master file for the sake of space, but they could also be written in a separate file(s) and imported before the sample is created.

The resulting master LT file defining short annealing at a fixed volume (NVT) follows:

```
# Use the OPLS-AA force field for all species.
import /usr/local/moltemplate/moltemplate/force_fields/oplsaa2024.lt
import PolyNIPAM.lt

# Define the SPC water and ions as in the OPLS-AA
Ca inherits OPLSAA {
  write("Data Atoms"){
    $atom:a1  $mol:. @atom:412 0.0  0.00000 0.00000 0.000000
  }
}
Cl inherits OPLSAA {
  write("Data Atoms"){
    $atom:a1  $mol:. @atom:401 0.0  0.00000 0.00000 0.000000
  }
}
SPC inherits OPLSAA {
  write("Data Atoms"){

  # Minimise the input structure, just in case.
  minimize        .01 .001 1000 100000
  write_data \$\{run\}.min

  # Set the constrains.
  group watergroup type @atom:9991 @atom:9990
  fix 0 watergroup shake 0.0001 10 0 b @bond:spcO_spcH a @angle:spcH_spcO_spcH

  # Short annealing.
  timestep        \$\{ts\}
```

(continues on next page)

(continued from previous page)

```
  fix       1 all nvt temp \${temp\} \${temp\} \$(100*dt)
  velocity    all create \${temp\} 315443
  run           \${equi\}
  unfix 1
}
```

In this example, the water model is SPC and it is defined in the oplsaa2024.lt file with atom types @atom:9991 and @atom:9990. For water we also use the group and fix shake commands with Moltemplate @-type variables, to ensure consistency with the numerical values assigned during compilation. To identify the bond and angle types, look for the extended @atom IDs, which in this case are:

```
replace{ @atom:9991 @atom:9991_bspcO_aspcO_dspcO_ispcO }
replace{ @atom:9990 @atom:9990_bspcH_aspcH_dspcH_ispcH }
```

From which we can identify the following "Data Bonds By Type": @bond:spcO_spcH @atom:*_bspcO*_a*_d*_i* @atom:*_bspcH*_a*_d*_i* and "Data Angles By Type": @angle:spcH_spcO_spcH @atom:*_b*_aspcH*_d*_i* @atom:*_b*_aspcO*_d*_i* @atom:*_b*_aspcH*_d*_i*

Compile the master file with:

```
moltemplate.sh -pdb model.pdb sample01.lt
cleanup_moltemplate.sh
```

And execute the simulation with the following:

```
mpirun -np 4 lmp -in sample01.in -l sample01.log
```

Overview

The lammps Python module is a wrapper class for the LAMMPS *C language library interface API* which is written using Python ctypes. The design choice of this wrapper class is to follow the C language API closely with only small changes related to Python specific requirements and to better accommodate object oriented programming.

In addition to this flat ctypes interface, the lammps wrapper class exposes a discoverable API that doesn't require as much knowledge of the underlying C language library interface or LAMMPS C++ code implementation.

Finally, the API exposes some additional features for IPython integration into Jupyter notebooks, e.g. for embedded visualization output from *dump style image*.

Quick Start

System-wide or User Installation

Step 1: Building LAMMPS as a shared library

To use LAMMPS inside of Python it has to be compiled as shared library. This library is then loaded by the Python interface. In this example we enable the *MOLECULE package* and compile LAMMPS with *PNG, JPEG and FFMPEG output support* enabled.

CMake build

```
mkdir $LAMMPS_DIR/build-shared
cd  $LAMMPS_DIR/build-shared

# MPI, PNG, Jpeg, FFMPEG are auto-detected
cmake ../cmake -DPKG_MOLECULE=yes -DPKG_PYTHON=on -DBUILD_SHARED_
↪LIBS=yes
make
```

Traditional make

```
cd $LAMMPS_DIR/src

# add LAMMPS packages if necessary
make yes-MOLECULE
make yes-PYTHON

# compile shared library using Makefile
make mpi mode=shlib LMP_INC="-DLAMMPS_PNG -DLAMMPS_JPEG -
→DLAMMPS_FFMPEG" JPG_LIB="-lpng -ljpeg"
```

Step 2: Installing the LAMMPS Python module

Next install the LAMMPS Python module into your current Python installation with:

```
make install-python
```

This will create a so-called "wheel" and then install the LAMMPS Python module from that "wheel" into either into a system folder (provided the command is executed with root privileges) or into your personal Python module folder.

Note

Recompiling the shared library requires re-installing the Python package.

Handling an "externally-managed-environment" Error

Some Python installations made through Linux distributions (e.g. Ubuntu 24.04LTS or later) will prevent installing the LAMMPS Python module into a system folder or a corresponding folder of the individual user as attempted by `make install-python` with an error stating that an *externally managed* python installation must be only managed by the same package package management tool. This is an optional setting, so not all Linux distributions follow it currently (Spring 2025). The reasoning and explanations for this error can be found in the Python Packaging User Guide

These guidelines suggest to create a virtual environment and install the LAMMPS Python module there (see below). This is generally a good idea and the LAMMPS developers recommend this, too. If, however, you want to proceed and install the LAMMPS Python module regardless, you can install the "wheel" file (see above) manually with the `pip` command by adding the `--break-system-packages` flag.

Installation inside of a virtual environment

You can use virtual environments to create a custom Python environment specifically tuned for your workflow.

Benefits of using a virtualenv

- isolation of your system Python installation from your development installation
- installation can happen in your user directory without root access (useful for HPC clusters)
- installing packages through pip allows you to get newer versions of packages than e.g., through apt-get or yum package managers (and without root access)
- you can even install specific old versions of a package if necessary

Prerequisite (e.g. on Ubuntu)

```
apt-get install python-venv
```

Creating a virtualenv with lammps installed

```
# create virtual envrionment named 'testing'
python3 -m venv $HOME/python/testing

# activate 'testing' environment
source $HOME/python/testing/bin/activate
```

Now configure and compile the LAMMPS shared library as outlined above. When using CMake and the shared library has already been build, you need to re-run CMake to update the location of the python executable to the location in the virtual environment with:

```
cmake . -DPython_EXECUTABLE=$(which python)

# install LAMMPS package in virtualenv
(testing) make install-python

# install other useful packages
(testing) pip install matplotlib jupyter mpi4py pandas

...

# return to original shell
(testing) deactivate
```

Creating a new lammps instance

To create a lammps object you need to first import the class from the lammps module. By using the default constructor, a new lammps instance is created.

```
from lammps import lammps
L = lammps()
```

See the *LAMMPS Python documentation* for how to customize the instance creation with optional arguments.

Commands

Sending a LAMMPS command with the library interface is done using the command method of the lammps object.

For instance, let's take the following LAMMPS command:

```
region box block 0 10 0 5 -0.5 0.5
```

This command can be executed with the following Python code if L is a lammps instance:

```
L.command("region box block 0 10 0 5 -0.5 0.5")
```

For convenience, the lammps class also provides a command wrapper cmd that turns any LAMMPS command into a regular function call:

```
L.cmd.region("box block", 0, 10, 0, 5, -0.5, 0.5)
```

Note that each parameter is set as Python number literal. With the wrapper each command takes an arbitrary parameter list and transparently merges it to a single command string, separating individual parameters by white-space.

The benefit of this approach is avoiding redundant command calls and easier parameterization. With the command function each call needs to be assembled manually using formatted strings.

```
L.command(f"region box block {xlo} {xhi} {ylo} {yhi} {zlo} {zhi}")
```

The wrapper accepts parameters directly and will convert them automatically to a final command string.

```
L.cmd.region("box block", xlo, xhi, ylo, yhi, zlo, zhi)
```

Note

When running in IPython you can use Tab-completion after L.cmd. to see all available LAMMPS commands.

Accessing atom data

All per-atom properties that are part of the *atom style* in the current simulation can be accessed using the extract_atoms() method. This can be retrieved as ctypes objects or as NumPy arrays through the lammps.numpy module. Those represent the *local* atoms of the individual sub-domain for the current MPI process and may contain information for the local ghost atoms or not depending on the property. Both can be accessed as lists, but for the ctypes list object the size is not known and hast to be retrieved first to avoid out-of-bounds accesses.

```
nlocal = L.extract_setting("nlocal")
nall = L.extract_setting("nall")
print("Number of local atoms ", nlocal, "  Number of local and ghost atoms ", nall);

# access via ctypes directly
atom_id = L.extract_atom("id")
print("Atom IDs", atom_id[0:nlocal])

# access through numpy wrapper
atom_type = L.numpy.extract_atom("type")
print("Atom types", atom_type)

x = L.numpy.extract_atom("x")
v = L.numpy.extract_atom("v")
print("positions array shape", x.shape)
print("velocity array shape", v.shape)
# turn on communicating velocities to ghost atoms
L.cmd.comm_modify("vel", "yes")
v = L.numpy.extract_atom('v')
print("velocity array shape", v.shape)
```

Some properties can also be set from Python since internally the data of the C++ code is accessed directly:

```
# set position in 2D simulation
x[0] = (1.0, 0.0)

# set position in 3D simulation
x[0] = (1.0, 0.0, 1.)
```

Retrieving the values of thermodynamic data and variables

To access thermodynamic data from the last completed timestep, you can use the get_thermo() method, and to extract the value of (compatible) variables, you can use the extract_variable() method.

```
result = L.get_thermo("ke") # kinetic energy
result = L.get_thermo("pe") # potential energy

result = L.extract_variable("t") / 2.0
```

Error handling

We are using C++ exceptions in LAMMPS for errors and the C language library interface captures and records them. This allows checking whether errors have happened in Python during a call into LAMMPS and then re-throw the error as a Python exception. This way you can handle LAMMPS errors in the conventional way through the Python exception handling mechanism.

Warning

Capturing a LAMMPS exception in Python can still mean that the current LAMMPS process is in an illegal state and must be terminated. It is advised to save your data and terminate the Python instance as quickly as possible.

Using LAMMPS in IPython notebooks and Jupyter

If the LAMMPS Python package is installed for the same Python interpreter as IPython, you can use LAMMPS directly inside of an IPython notebook inside of Jupyter. Jupyter is a powerful integrated development environment (IDE) for many dynamic languages like Python, Julia and others, which operates inside of any web browser. Besides auto-completion and syntax highlighting it allows you to create formatted documents using Markup, mathematical formulas, graphics and animations intermixed with executable Python code. It is a great format for tutorials and showcasing your latest research.

To launch an instance of Jupyter simply run the following command inside your Python environment (this assumes you followed the Quick Start instructions):

```
jupyter notebook
```

Interactive Python Examples

Examples of IPython notebooks can be found in the python/examples/ipython subdirectory. To open these notebooks launch jupyter notebook inside this directory and navigate to one of them. If you compiled and installed a LAMMPS shared library with PNG, JPEG and FFMPEG support you should be able to rerun all of these notebooks.

Validating a dihedral potential

This example showcases how an IPython Notebook can be used to compare a simple LAMMPS simulation of a harmonic dihedral potential to its analytical solution. Four atoms are placed in the simulation and the dihedral potential is applied on them using a datafile. Then one of the atoms is rotated along the central axis by setting its position from Python, which changes the dihedral angle.

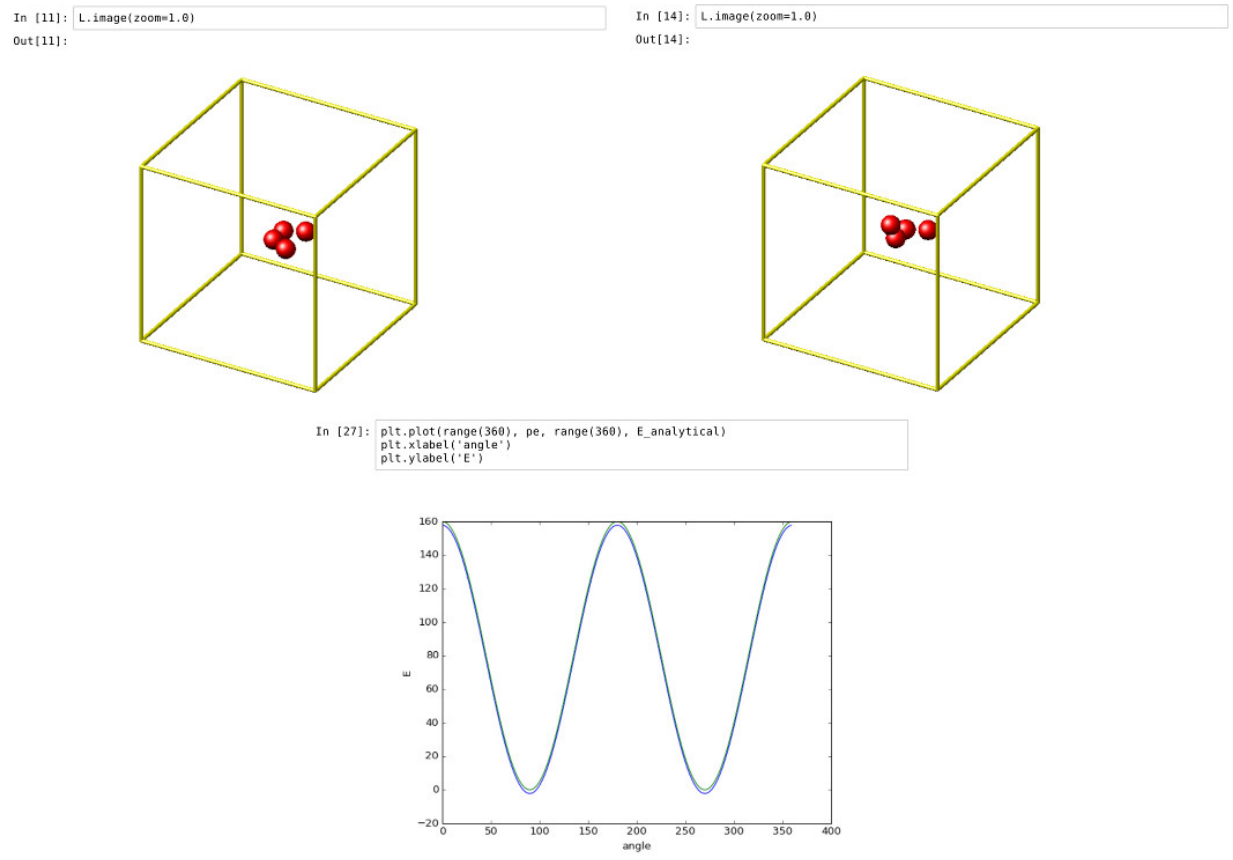
```
phi = [d \* math.pi / 180 for d in range(360)]

pos = [(1.0, math.cos(p), math.sin(p)) for p in phi]

x = L.numpy.extract_atom("x")

pe = []
for p in pos:
    x[3] = p
    L.cmd.run(0, "post", "no")
    pe.append(L.get_thermo("pe"))
```

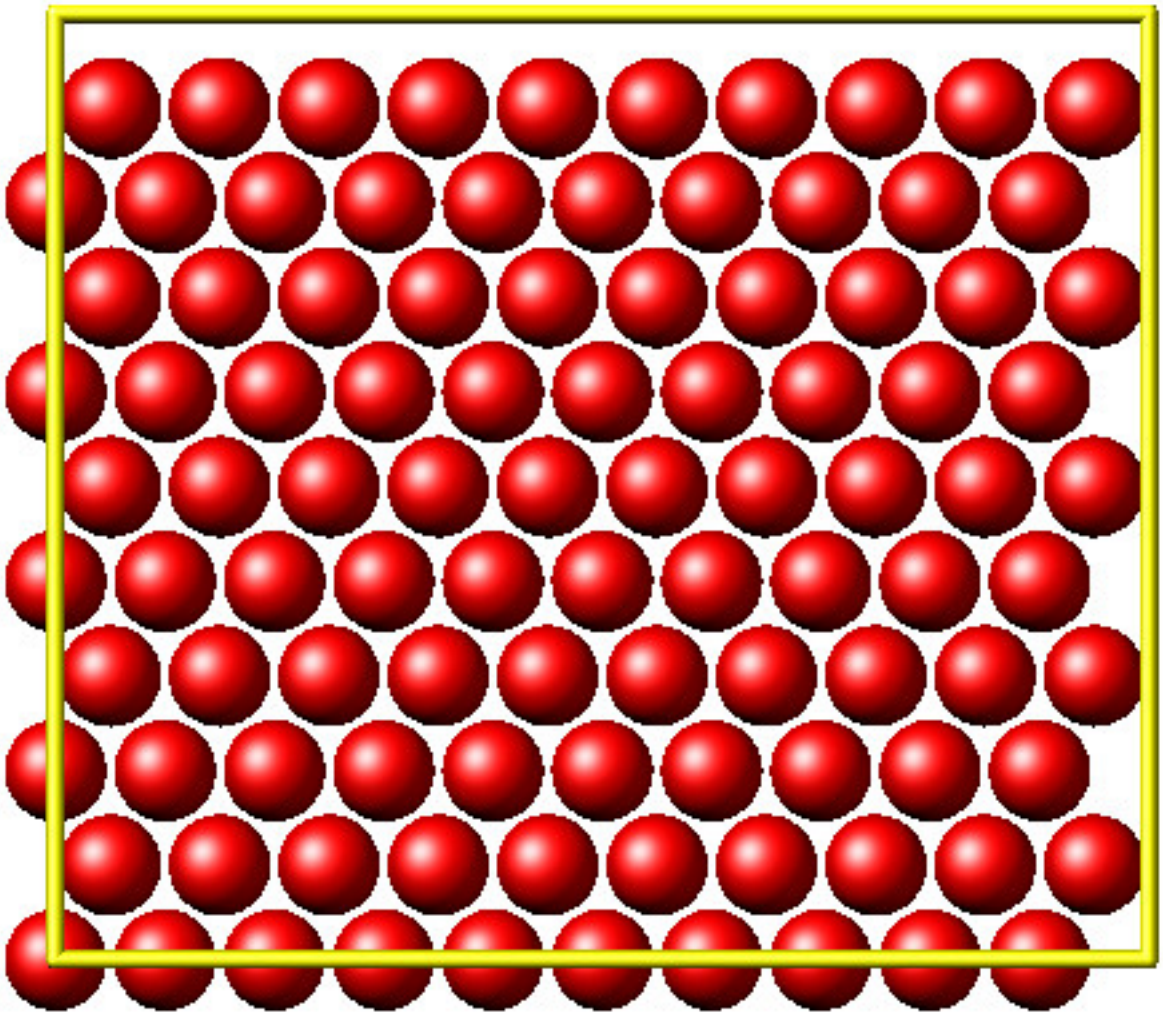
By evaluating the potential energy for each position we can verify that trajectory with the analytical formula. To compare both solutions, we plot both trajectories over each other using matplotlib, which embeds the generated plot inside the IPython notebook.



Running a Monte Carlo relaxation

This second example shows how to use the *lammps* Python interface to create a 2D Monte Carlo Relaxation simulation, computing and plotting energy terms and even embedding video output.

Initially, a 2D system is created in a state with minimal energy.



It is then disordered by moving each atom by a random delta.

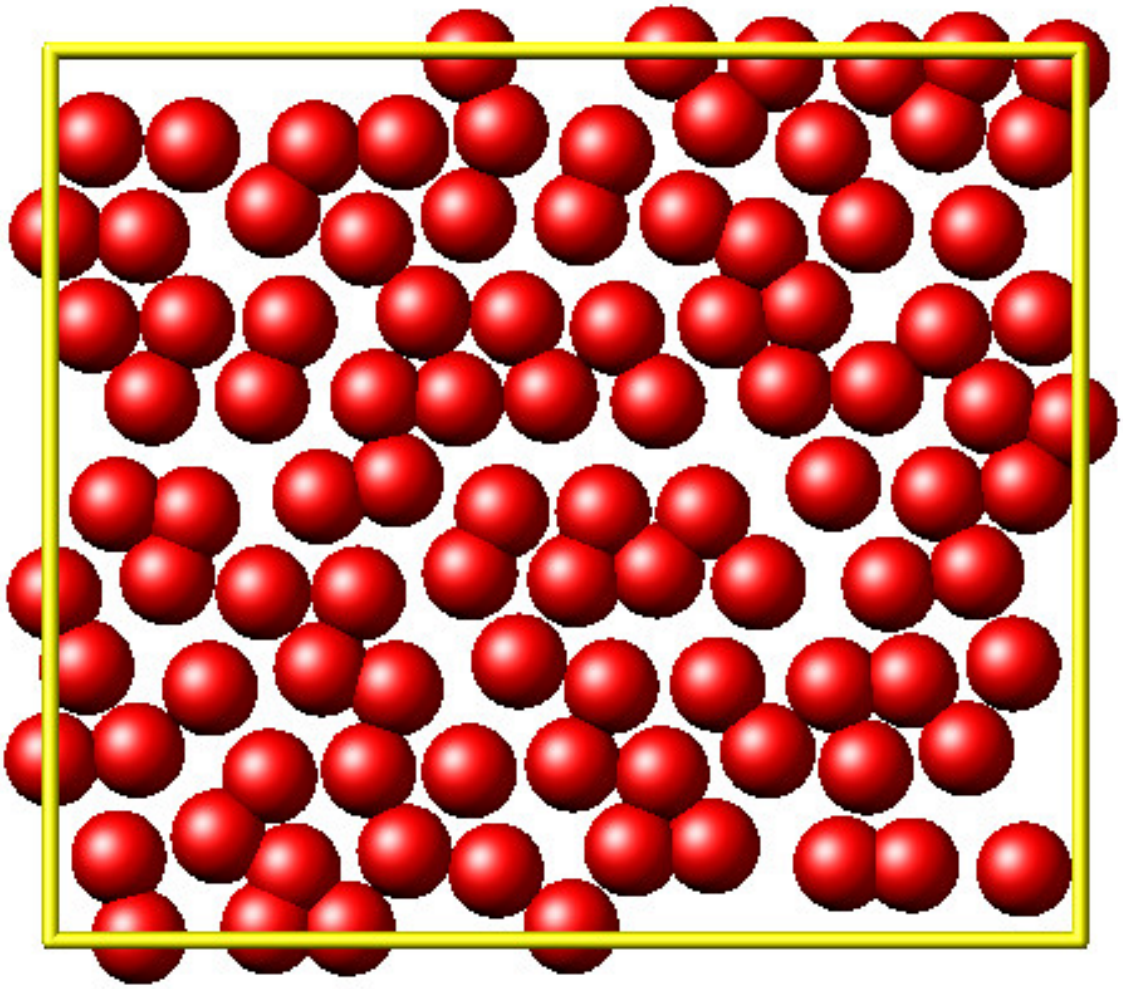
```
random.seed(27848)
deltaperturb = 0.2
x = L.numpy.extract_atom("x")
natoms = x.shape[0]

for i in range(natoms):
    dx = deltaperturb \* random.uniform(-1, 1)
    dy = deltaperturb \* random.uniform(-1, 1)
    x[i][0] += dx
    x[i][1] += dy
```

(continues on next page)

(continued from previous page)

```
L.cmd.run(0, "post", "no")
```



Finally, the Monte Carlo algorithm is implemented in Python. It continuously moves random atoms by a random delta and only accepts certain moves.

```
estart = L.get_thermo("pe")
elast = estart

naccept = 0
energies = [estart]

niterations = 3000
deltamove = 0.1
kT = 0.05

for i in range(niterations):
```

(continues on next page)

(continued from previous page)

```
x = L.numpy.extract_atom("x")
natoms = x.shape[0]
iatom = random.randrange(0, natoms)
current_atom = x[iatom]

x0 = current_atom[0]
y0 = current_atom[1]

dx = deltamove \* random.uniform(-1, 1)
dy = deltamove \* random.uniform(-1, 1)

current_atom[0] = x0 + dx
current_atom[1] = y0 + dy

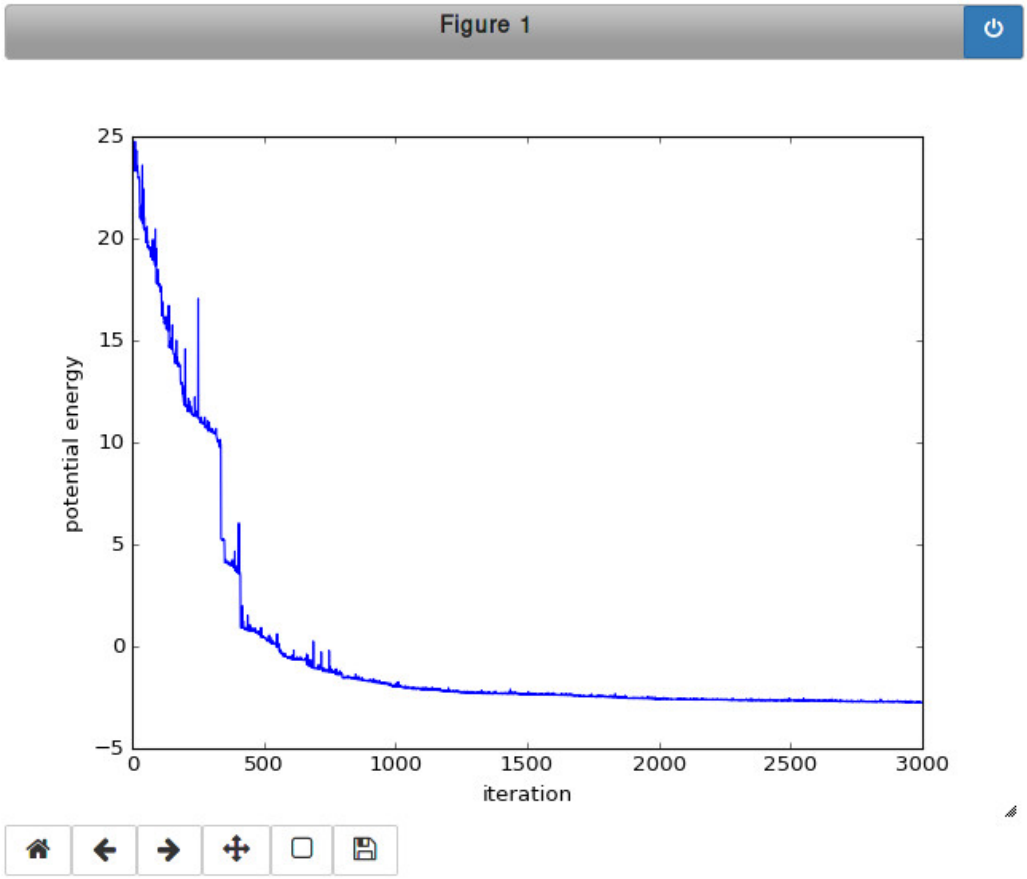
L.cmd.run(1, "pre no post no")

e = L.get_thermo("pe")
energies.append(e)

if e <= elast:
    naccept += 1
    elast = e
elif random.random() <= math.exp(natoms\*(elast-e)/kT):
    naccept += 1
    elast = e
else:
    current_atom[0] = x0
    current_atom[1] = y0
```

The energies of each iteration are collected in a Python list and finally plotted using matplotlib.

```
In [20]: plt.xlabel('iteration')
         plt.ylabel('potential energy')
         plt.plot(energies)
```



```
Out[20]: [<matplotlib.lines.Line2D at 0x7f26a40123c8>]
```

The IPython notebook also shows how to use dump commands and embed video files inside of the IPython notebook.

10.6.6 Using LAMMPS on Windows 10 with WSL

written by Richard Berger

It's always been tricky for us to have LAMMPS users and developers work on Windows. We primarily develop LAMMPS to run on Linux clusters. To teach LAMMPS in workshop settings, we had to redirect Windows users to Linux Virtual Machines such as VirtualBox or Unix-like compilation with Cygwin.

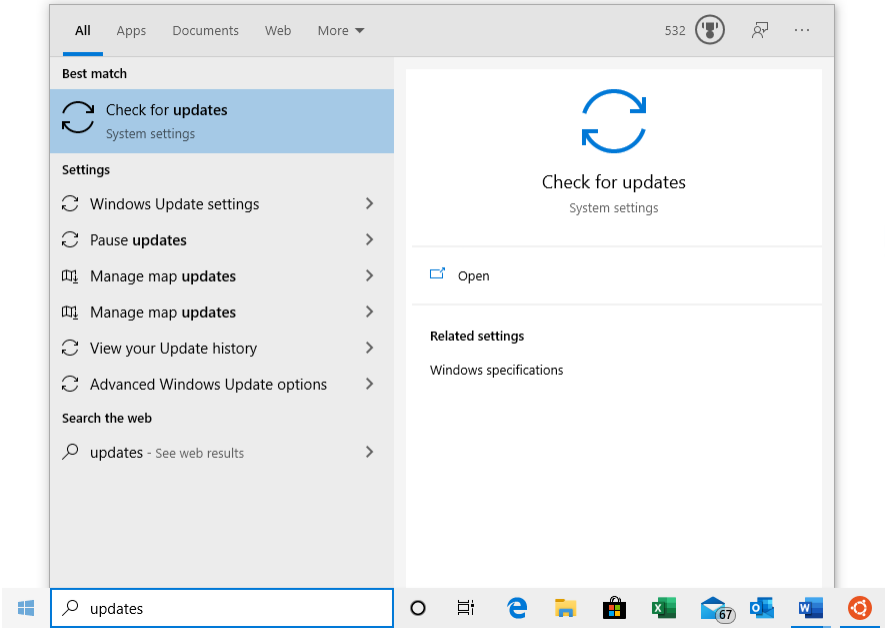
With the latest updates in Windows 10 (Version 2004, Build 19041 or higher), Microsoft has added a new way to work on Linux-based code. The Windows Subsystem for Linux (WSL). With WSL Version 2, you now get a Linux Virtual Machine that transparently integrates into Windows. All you need is to ensure you have the latest Windows updates installed and enable this new feature. Linux VMs are then easily installed using the Microsoft Store.

In this tutorial, I'll show you how to set up and compile LAMMPS for both serial and MPI usage in WSL2.

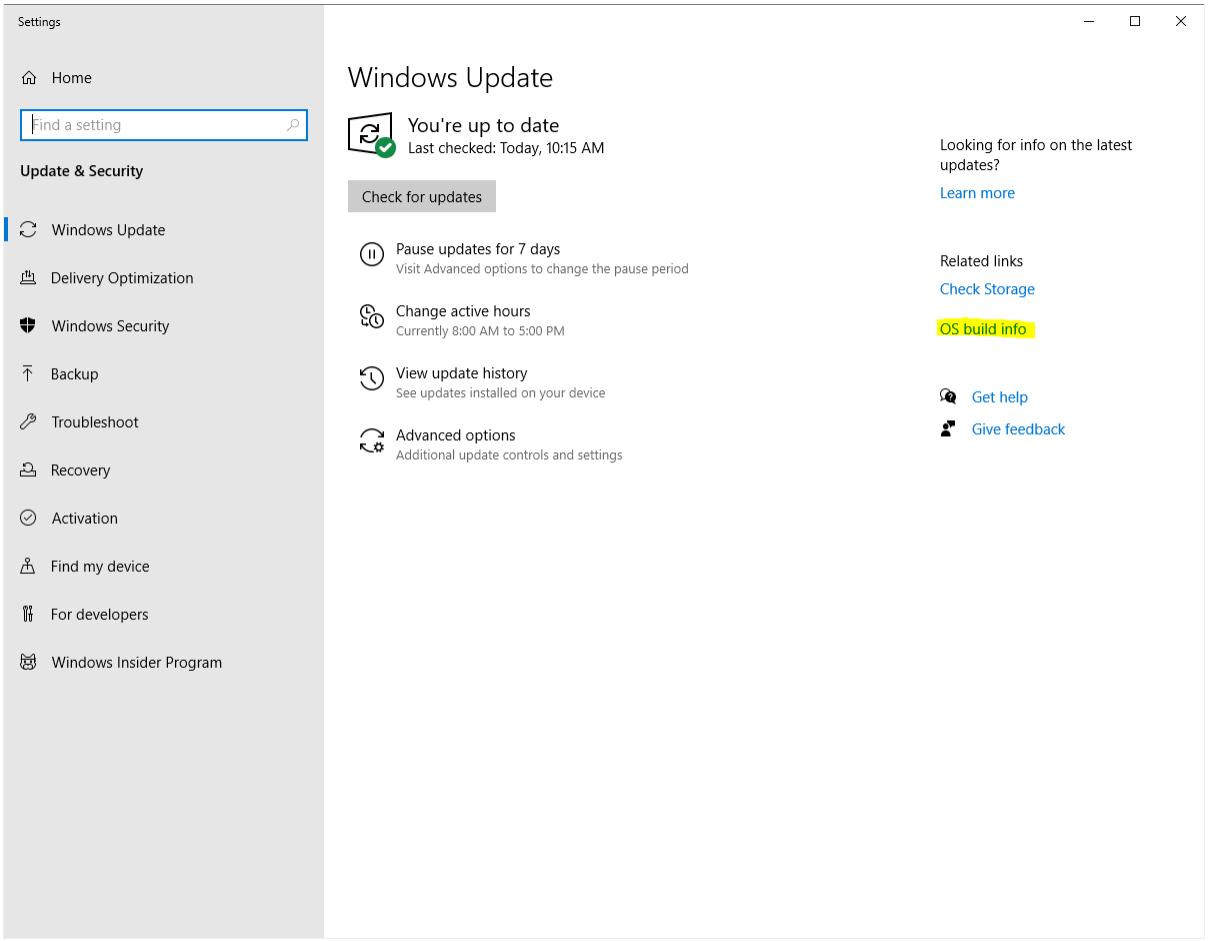
Installation

Upgrade to the latest Windows 10

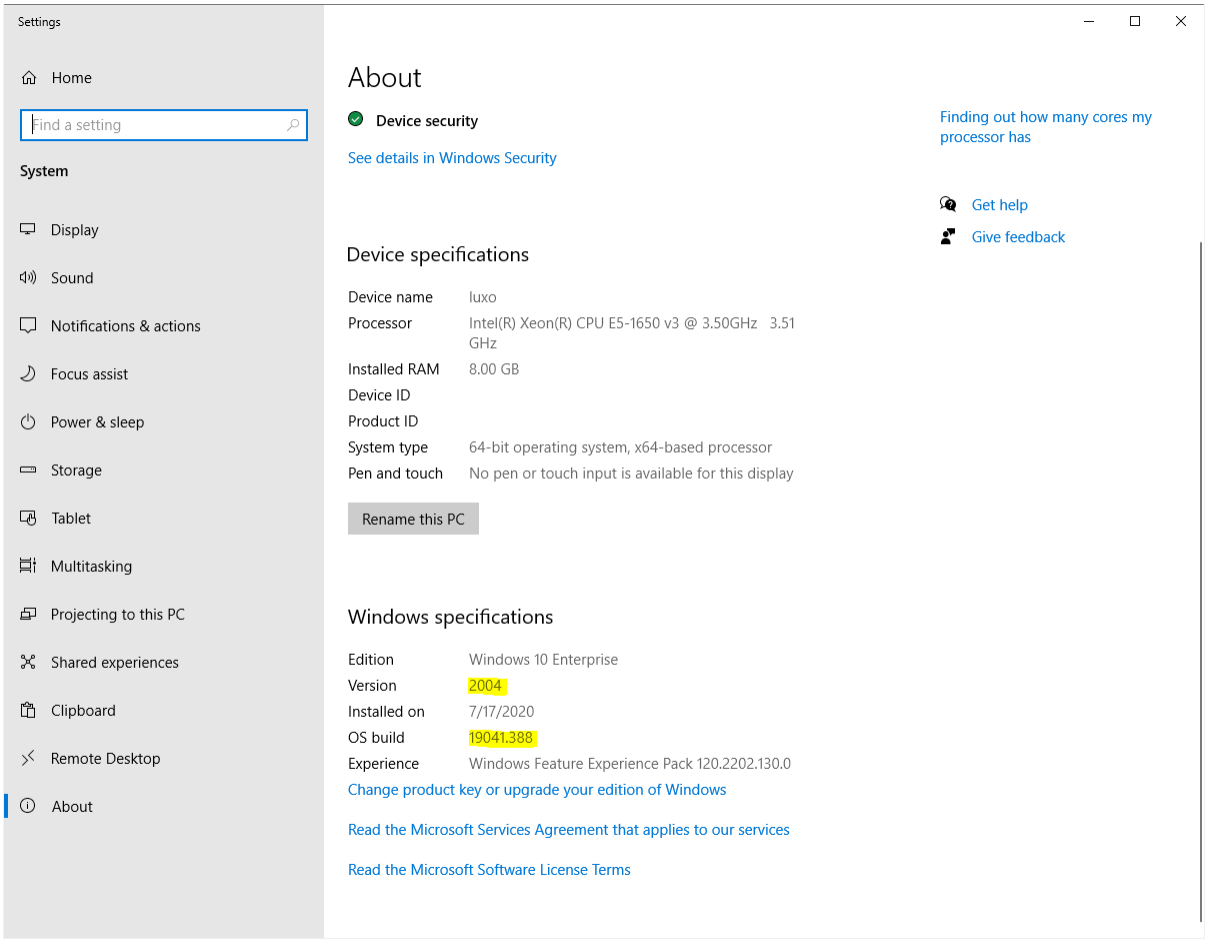
Type “Updates” in Windows Start and select “Check for Updates”.



Install all pending updates and reboot your system as many times as necessary. Continue until your Windows installation is updated.

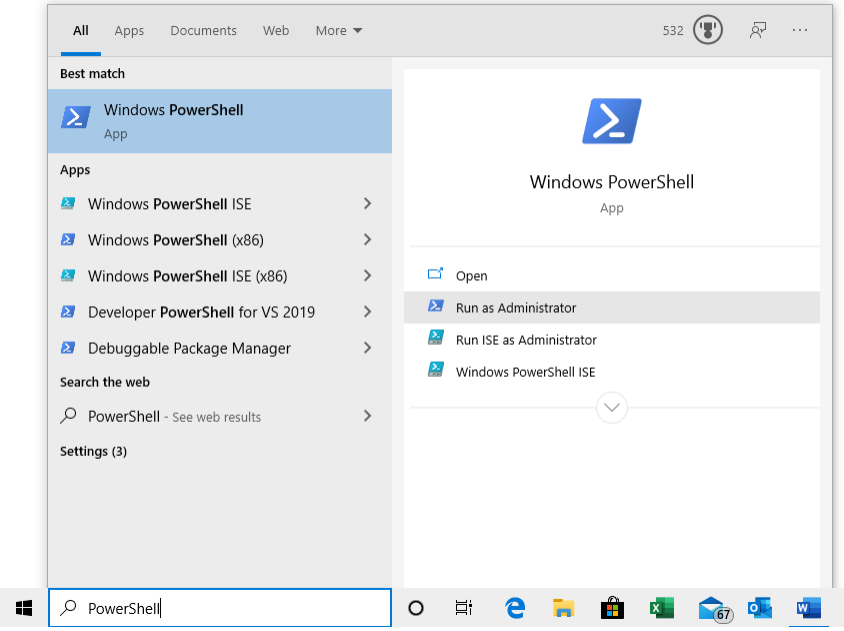


Verify your system has at least **version 2004 and build 19041 or later**. You can find this information by clicking on "OS build info".



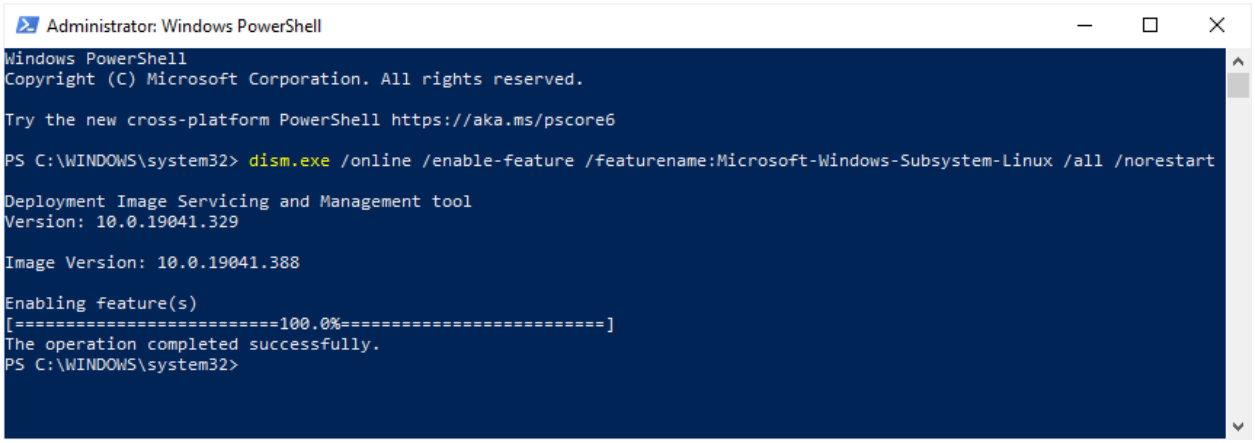
Enable WSL

Next, we must install two additional Windows features to enable WSL support. Open a PowerShell window as an administrator. Type "PowerShell" in Windows Start and select "Run as Administrator".



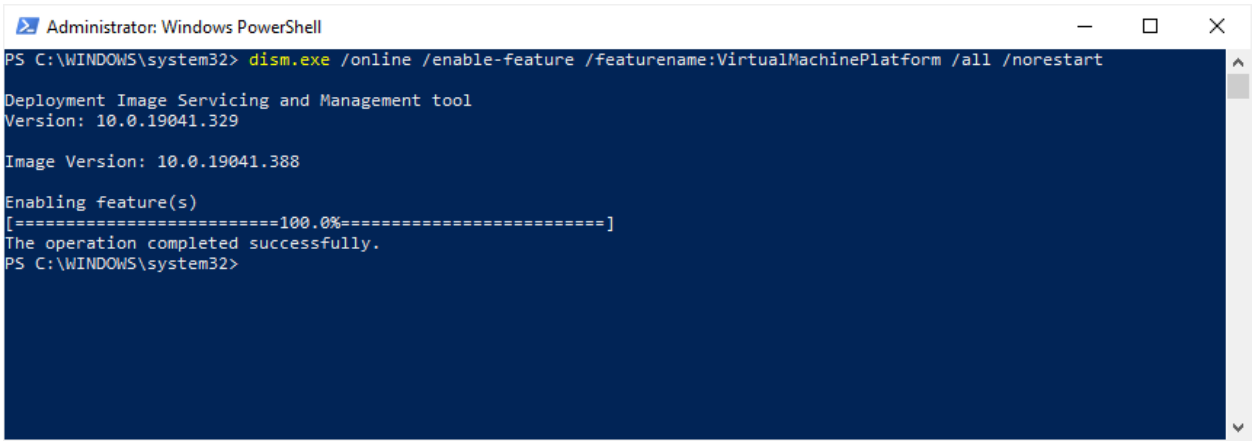
Windows will ask you for administrator access. After you accept a new command line window will appear. Type in the following command to install WSL:

```
dism.exe /online /enable-feature /featurename:Microsoft-Windows-Subsystem-Linux /all /norestart
```



Next, enable the VirtualMachinePlatform feature using the following command:

```
dism.exe /online /enable-feature /featurename:VirtualMachinePlatform /all /norestart
```



Finally, reboot your system.

Update WSL kernel component

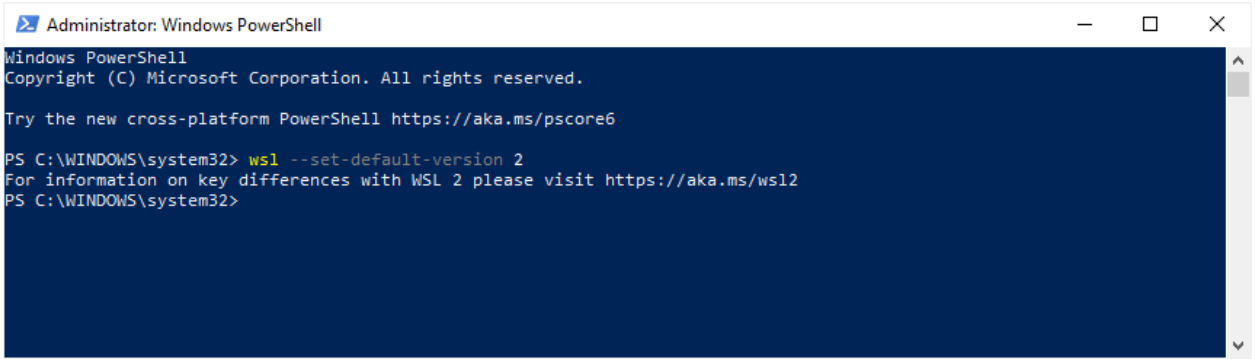
Download and install the WSL Kernel Component Update. Afterwards, reboot your system.

Set WSL2 as default

Again, open PowerShell as administrator and run the following command:

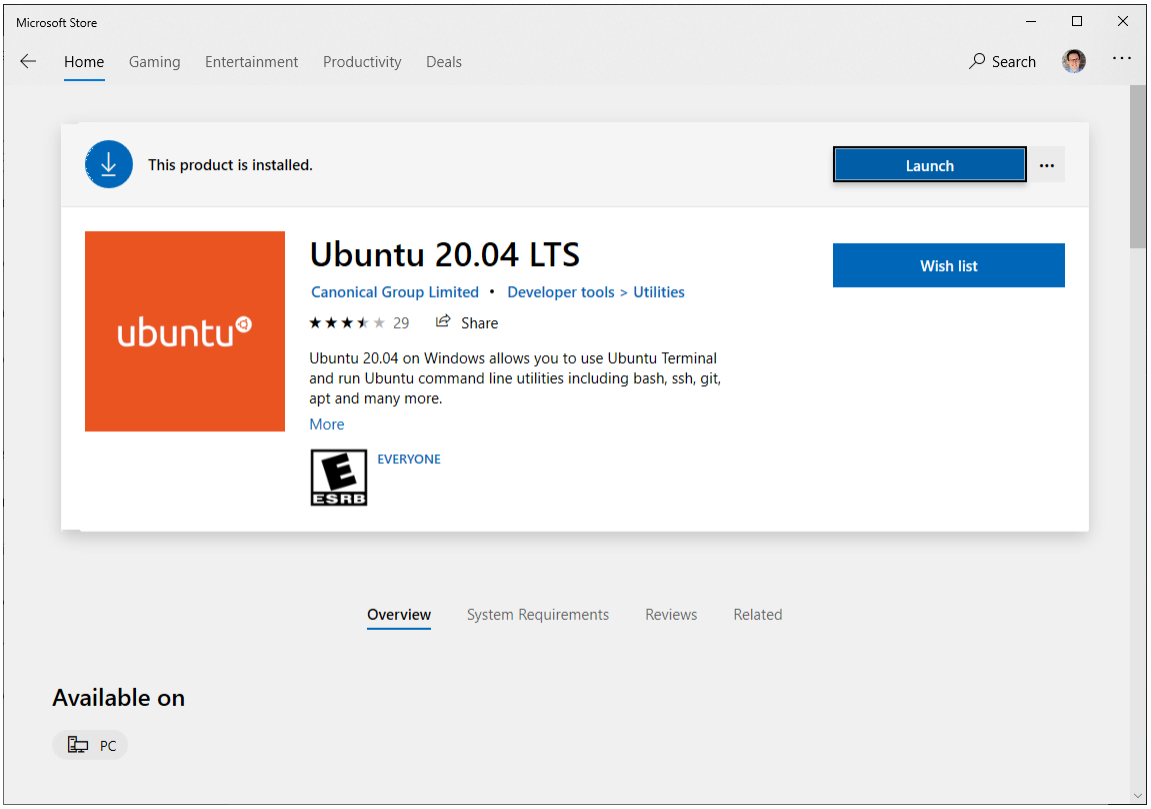
```
wsl --set-default-version 2
```

This command ensures that all future Linux installations will use WSL version 2.



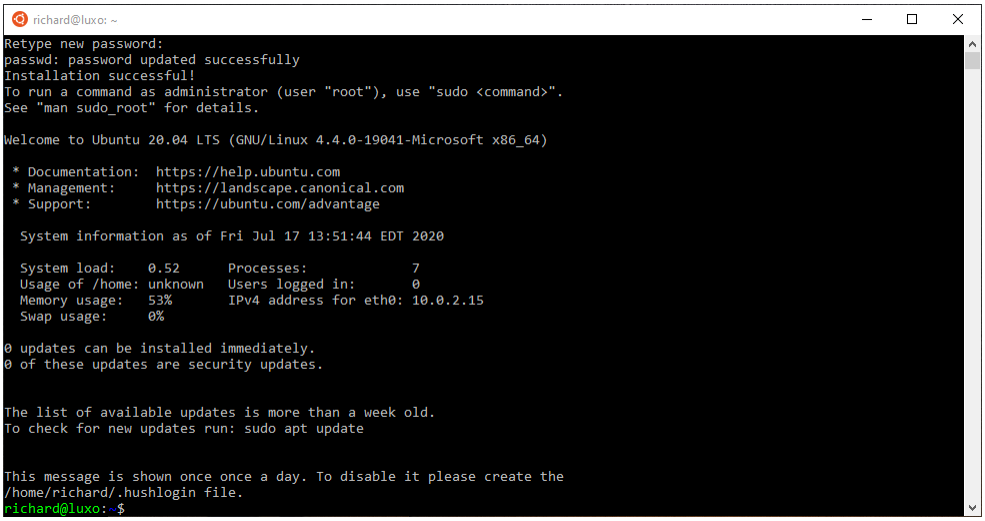
Install a Linux Distribution

Next, we need to install a Linux distribution via the Microsoft Store. Install Ubuntu 20.04 LTS. Once installed, you can launch it like any other application from the Start Menu.



Initial Setup

The first time you launch the Ubuntu Linux console, it will prompt you for a UNIX username and password. You will need this password to perform sudo commands later. Once completed, your Linux shell is ready for use. All your actions and commands will run as the Linux user you specified.

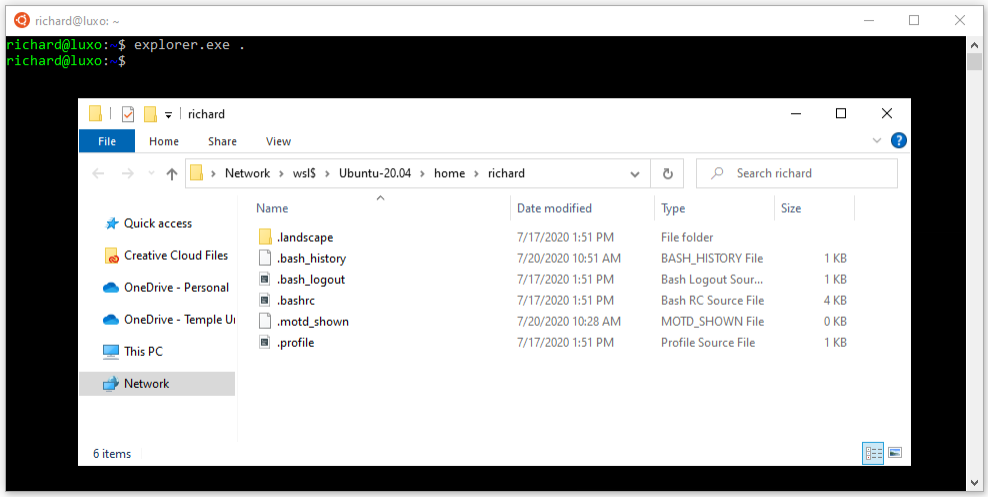


Windows Explorer / WSL integration

Your Linux installation will have its own Linux filesystem, which contains the Ubuntu files. Your Linux user will have a regular Linux home directory in /home/<USERNAME>. This directory is different from your Windows User directory. Windows and Linux filesystems are connected through WSL.

All hard drives in Windows are accessible in the /mnt directory in Linux. E.g., WSL maps the C hard drive to the /mnt/c directory. That means you can access your Windows User directory in /mnt/c/Users/<WINDOWS_USERNAME>.

The Windows Explorer can also access the Linux filesystem. To illustrate this integration, open an Ubuntu console and navigate to a directory of your choice. To view this location in Windows Explorer, use the explorer.exe . command (do not forget the final dot!).



Compiling LAMMPS

You now have a fully functioning Ubuntu installation and can follow most guides to install LAMMPS on a Linux system. Here are some of the essential steps to follow:

Install prerequisite packages

Before we can begin, we need to download the necessary compiler toolchain and libraries to compile LAMMPS. In our Ubuntu-based Linux installation, we will use the apt package manager to install additional packages.

First, upgrade all existing packages using apt update and apt upgrade.

```
sudo apt update
sudo apt upgrade -y
```

Next, install the following packages with apt install:

```
sudo apt install -y cmake build-essential ccache gfortran openmpi-bin libopenmpi-dev \
                    libfftw3-dev libjpeg-dev libpng-dev python3-dev python3-pip \
                    python3-virtualenv libblas-dev liblapack-dev libhdf5-serial-dev \
                    hdf5-tools
```

Download LAMMPS

Obtain a copy of the LAMMPS source code and go into it using the cd command.

Option 1: Download a LAMMPS tarball using wget

```
wget https://github.com/lammps/lammps/archive/stable_3Mar2020.tar.gz
tar xvzf stable_3Mar2020.tar.gz
cd lammps
```

Option 2: Download a LAMMPS development version from GitHub

```
git clone --depth=1 https://github.com/lammps/lammps.git
cd lammps
```

Configure and Compile LAMMPS with CMake

A beginner-friendly way to compile LAMMPS is to use CMake. Create a build directory to compile LAMMPS and move into it. This directory will store the build configuration and any binaries generated during compilation.

```
mkdir build
cd build
```

There are countless ways to compile LAMMPS. It is beyond the scope of this tutorial. If you want to find out more about what can be enabled, please consult the extensive documentation.

To compile a minimal version of LAMMPS, we're going to use a preset. Presets are a way to specify a collection of CMake options using a file.

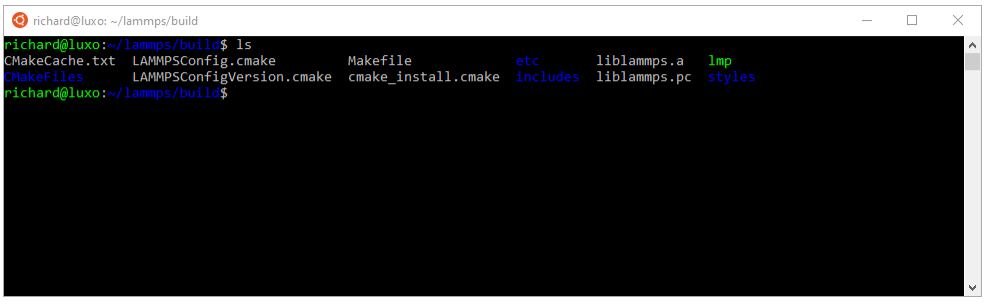
```
cmake ../cmake/presets/basic.cmake ../cmake
```

This command configures the build and generates the necessary Makefiles. To compile the binary, run the make command.

```
make -j 4
```

The -j option specifies how many parallel processes will perform the compilation. This option can significantly speed up compilation times. Use a number that corresponds to the number of processors in your system.

After the compilation completes successfully, you will have an executable called lmp in the build directory.



Please take note of the absolute path of your build directory. You will need to know the location to execute the LAMMPS binary later.

One way of getting the absolute path of the current directory is through the $PWD variable:

```
# prints out the current value of the PWD variable
echo $PWD
```

Let us save this value in a temporary variable LAMMPS_BUILD_DIR for future use:

```
LAMMPS_BUILD_DIR=$PWD
```

The full path of the LAMMPS binary then is $LAMMPS_BUILD_DIR/lmp.

Running an example script

Now that we have a LAMMPS binary, we will run a script from the examples folder.

Switch into the examples/melt folder:

```
cd ../examples/melt
```

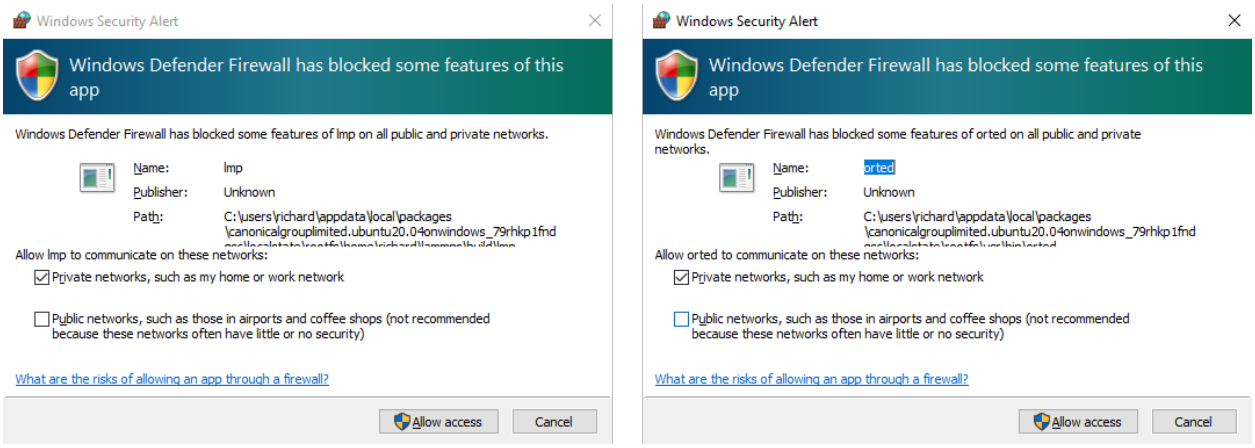
To run this example in serial, use the following command:

```
$LAMMPS_BUILD_DIR/lmp -in in.melt
```

To run the same script in parallel using MPI with 4 processes, do the following:

```
mpirun -np 4 $LAMMPS_BUILD_DIR/lmp -in in.melt
```

If you run LAMMPS for the first time, the Windows Firewall might prompt you to confirm access. LAMMPS is accessing the network stack to enable parallel computation. Allow the access.



In either serial or MPI case, LAMMPS executes and will output something similar to this:

```
LAMMPS (30 Jun 2020)
...
...
...
Total # of neighbors = 151513
Ave neighs/atom = 37.878250
Neighbor list builds = 12
Dangerous builds not checked
Total wall time: 0:00:00
```

Congratulations! You've successfully compiled and executed LAMMPS on WSL!

Final steps

It is cumbersome to always specify the path of your LAMMPS binary. You can avoid this by adding the absolute path of your build directory to your PATH environment variable.

```
export PATH=$LAMMPS_BUILD_DIR:$PATH
```

You can then run LAMMPS input scripts like this:

```
lmp -in in.melt
```

or

```
mpirun -np 4 lmp -in in.melt
```

Note

The value of this PATH variable will disappear once you close your console window. To persist this setting edit the $HOME/.bashrc file using your favorite text editor and add this line:

```
export PATH=/full/path/to/your/lammps/build:$PATH
```

Example: If the LAMMPS executable *lmp* has the following absolute path:

```
/home/<USERNAME>/lammps/build/lmp
```

the PATH variable should be:

```
export PATH=/home/<USERNAME>/lammps/build:$PATH
```

Once set up, all your Ubuntu consoles will always have access to your lmp binary without having to specify its location.

Conclusion

I hope this gives you good overview on how to start compiling and running LAMMPS on Windows. WSL makes preparing and running scripts on Windows a much better experience.

If you are completely new to Linux, I highly recommend investing some time in studying Linux online tutorials. E.g., tutorials about Bash Shell and Basic Unix commands (e.g., Linux Journey). Acquiring these skills will make you much more productive in this environment.

CHAPTER

ELEVEN

EXAMPLE SCRIPTS

The LAMMPS distribution includes an examples subdirectory with many sample problems. Many are 2d models that run quickly and are straightforward to visualize, requiring at most a couple of minutes to run on a desktop machine. Each problem has an input script (in.*) and produces a log file (log.*) when it runs. Some use a data file (data.*) of initial coordinates as additional input. A few sample log file run on different machines and different numbers of processors are included in the directories to compare your answers to. E.g. a log file like log.date.crack.foo.P means the "crack" example was run on P processors of machine "foo" on that date (i.e. with that version of LAMMPS).

Many of the input files have commented-out lines for creating dump files and image files.

If you uncomment the *dump* command in the input script, a text dump file will be produced, which can be animated by various visualization programs.

If you uncomment the *dump image* command in the input script, and assuming you have built LAMMPS with a JPG library, JPG snapshot images will be produced when the simulation runs. They can be quickly post-processed into a movie using commands described on the *dump image* doc page.

Animations of many of the examples can be viewed on the Movies section of the LAMMPS website.

There are two kinds of subdirectories in the examples folder. Lower case named directories contain one or a few simple, quick-to-run problems. Upper case named directories contain up to several complex scripts that illustrate a particular kind of simulation method or model. Some of these run for longer times, e.g. to measure a particular quantity.

Lists of both kinds of directories are given below.

11.1 Lowercase directories

airebo	polyethylene with AIREBO potential
amoeba	small water and bio models with AMOEBA and HIPPO potentials
atm	Axilrod-Teller-Muto potential example
balance	dynamic load balancing, 2d system
body	body particles, 2d system
bpm	simulations of solid elastic/plastic deformation and fracture
cmap	CMAP 5-body contributions to CHARMM force field
colloid	big colloid particles in a small particle solvent, 2d system
comb	models using the COMB potential
controller	use of fix controller as a thermostat
coreshell	core/shell model using CORESHELL package
crack	crack propagation in a 2d solid
deposit	deposit atoms and molecules on a surface
dipole	point dipolar particles, 2d system

continues on next page

Table 1 – continued from previous page

dreiding	methanol via Dreiding FF
eim	NaCl using the EIM potential
ellipse	ellipsoidal particles in spherical solvent, 2d system
fire	examples for using minimization styles fire and quickmin
flow	Couette and Poiseuille flow in a 2d channel
friction	frictional contact of spherical asperities between 2d surfaces
gjf	examples for Gronbech-Jensen thermostats with large time step
granregion	use of fix wall/region/gran as boundary on granular particles
grid	use of commands which overlay grids on the simulation domain
hugoniostat	Hugoniostat shock dynamics
hyper	global and local hyperdynamics of diffusion on Pt surface
indent	spherical indenter into a 2d solid
kim	use of potentials from the OpenKIM Repository
mc	Monte Carlo features via fix gcmc, widom and other commands
mdi	use of the MDI package and MolSSI MDI code coupling library
meam	MEAM test for SiC and shear (same as shear examples)
melt	rapid melt of 3d LJ system
mesh	create_atoms mesh command examples
micelle	self-assembly of small lipid-like molecules into 2d bilayers
min	energy minimization of 2d LJ melt
mliap	examples for using several bundled ML-IAP potentials
msst	MSST shock dynamics
multi	multi neighboring for systems with large interaction disparities
nb3b	use of non-bonded 3-body harmonic pair style
neb	nudged elastic band (NEB) calculation for barrier finding
nemd	non-equilibrium MD of 2d sheared system
numdiff	get forces, virial, and Born matrix from numerical differences
obstacle	flow around two voids in a 2d channel
peptide	dynamics of a small solvated peptide chain (5-mer)
peri	Peridynamic model of cylinder impacted by indenter
pour	pouring of granular particles into a 3d box, then chute flow
prd	parallel replica dynamics of vacancy diffusion in bulk Si
python	using embedded Python in a LAMMPS input script
qeq	use of the QEQ package for charge equilibration
rdf-adf	computing radial and angle distribution functions for water
reaxff	RDX and TATB models and more using ReaxFF
replicate	use of replicate command
rerun	use of rerun and read_dump commands
rheo	RHEO simulations of fluid flows and phase transitions
rigid	rigid bodies modeled as independent or coupled
shear	sideways shear applied to 2d solid, with and without a void
snap	NVE dynamics for BCC tantalum crystal using SNAP potential
srd	stochastic rotation dynamics (SRD) particles as solvent
steinhardt	Steinhardt-Nelson Q_l and W_l parameters using orientorder/atom
streitz	use of Streitz/Mintmire potential with charge equilibration
stress_vcm	removing binned rigid body motion from binned stress profile
tad	temperature-accelerated dynamics of vacancy diffusion in bulk Si
tersoff	regression test input for Tersoff potential variants
threebody	regression test input for a variety of manybody potentials
tracker	track interactions in LJ melt
triclinic	general triclinic simulation boxes versus orthogonal boxes
ttm	two-temperature model examples

continues on next page

Table 1 – continued from previous page

vashishta	use of the Vashishta potential
voronoi	Voronoi tesselation via compute voronoi/atom command
wall	use of reflective walls with different stochastic models
yaml	demonstrates use of yaml thermo and dump styles

Here is how you can run and visualize one of the sample problems:

```
cd indent
cp ../../src/lmp_linux .          # copy LAMMPS executable to this dir
lmp_linux -in in.indent           # run the problem
```

Running the simulation produces the files *dump.indent* and *log.lammps*. You can visualize the dump file of snapshots with a variety of third-party tools highlighted on the Visualization page of the LAMMPS website.

If you uncomment the *dump image* line(s) in the input script a series of JPG images will be produced by the run (assuming you built LAMMPS with JPG support; see the *Build_settings* page for details). These can be viewed individually or turned into a movie or animated by tools like ImageMagick or QuickTime or various Windows-based tools. See the *dump image* page for more details. E.g. this Imagemagick command would create a GIF file suitable for viewing in a browser.

```
% convert -loop 1 *.jpg foo.gif
```

11.2 Uppercase directories

ASPHERE	various aspherical particle models, using ellipsoids, rigid bodies, line/triangle particles, etc
COUPLE	examples of how to use LAMMPS as a library
DIFFUSE	compute diffusion coefficients via several methods
ELASTIC	compute elastic constants at zero temperature
ELASTIC_T	compute elastic constants at finite temperature
HEAT	compute thermal conductivity for LJ and water via fix ehex
KAPPA	compute thermal conductivity via several methods
LEPTON	use of fix efield/lepton
MC-LOOP	using LAMMPS in a Monte Carlo mode to relax the energy of a system in a input script loop
PACKAGES	examples for specific packages and contributed commands
QUANTUM	how to use LAMMPS in tandem with several quantum codes via the MDI code coupling library
SPIN	examples for features of the SPIN package
UNITS	examples that run the same simulation in lj, real, metal units
VISCOSITY	compute viscosity via several methods

Nearly all of these directories have README files which give more details on how to understand and use their contents.

The PACKAGES directory has a large number of subdirectories which correspond by name to specific packages. They contain scripts that illustrate how to use the command(s) provided in those packages. Many of the subdirectories have their own README files which give further instructions. See the *Packages_details* doc page for more info on specific packages.

Part II

Programmer Guide

CHAPTER

ONE

LAMMPS LIBRARY INTERFACES

As described on the *library interface to LAMMPS* page, LAMMPS can be built as a library (static or shared), so that it can be called by another code, used in a *coupled manner* with other codes, or driven through a *Python script*. The LAMMPS standalone executable itself is essentially a thin wrapper on top of the LAMMPS library, which creates a LAMMPS instance, passes the input for processing to that instance, and then exits.

Most of the APIs described below are based on C language wrapper functions in the files src/library.h and src/library.cpp, but it is also possible to use C++ directly. The basic procedure is always the same: you create one or more instances of LAMMPS, pass commands as strings or from files to that LAMMPS instance to execute calculations, and/or call functions that read, manipulate, and update data from the active class instances inside LAMMPS to do analysis or perform operations that are not possible with existing input script commands.

Thread-safety

LAMMPS was initially not conceived as a thread-safe program, but over the years changes have been applied to replace operations that collide with creating multiple LAMMPS instances from multiple-threads of the same process with thread-safe alternatives. This primarily applies to the core LAMMPS code and less so on add-on packages, especially when those packages require additional code in the *lib* folder, interface LAMMPS to Fortran libraries, or the code uses static variables (like the COLVARS package).

Another major issue to deal with is to correctly handle MPI. Creating a LAMMPS instance requires passing an MPI communicator, or it assumes the MPI_COMM_WORLD communicator, which spans all MPI processor ranks. When creating multiple LAMMPS object instances from different threads, this communicator has to be different for each thread or else collisions can happen. Or it has to be guaranteed, that only one thread at a time is active. MPI communicators, however, are not a problem, if LAMMPS is compiled with the MPI STUBS library, which implies that there is no MPI communication and only 1 MPI rank.

1.1 LAMMPS C Library API

The C library interface is the most commonly used path to manage LAMMPS instances from a compiled code and it is the basis for the *Python* and *Fortran* modules. Almost all functions of the C language API require an argument containing a "handle" in the form of a void * type variable, which points to the location of a LAMMPS class instance.

The library.h header file by default does not include the mpi.h header file and thus hides the lammps_open() function which requires the declaration of the MPI_comm data type. This is only a problem when the communicator that would be passed is different from MPI_COMM_WORLD. Otherwise calling lammps_open_no_mpi() will work just as well. To make lammps_open() available, you need to compile the code with -DLAMMPS_LIB_MPI or add the line #define LAMMPS_LIB_MPI before #include "library.h".

Please note the mpi.h file must usually be the same (and thus the MPI library in use) for the LAMMPS code and library and the calling code. The exception is when LAMMPS was compiled in serial mode using the STUBS MPI library.

In that case the calling code may be compiled with a different MPI library so long as lammps_open_no_mpi() is called to create a LAMMPS instance. In that case each MPI rank will run LAMMPS in serial mode.

Errors versus exceptions

If the LAMMPS executable encounters an error condition, it will abort after printing an error message. It does so by catching the exceptions that LAMMPS could throw. For a C library interface this is usually not desirable since the calling code might lack the ability to catch such exceptions. Thus, the library functions will catch those exceptions and return from the affected functions. The error status can be queried and an error message retrieved. This is, for example used by the *LAMMPS python module* and then a suitable Python exception is thrown.

Using the C library interface as a plugin

Rather than including the C library interface directly including the library.h header file and linking to the LAMMPS (static or shared) library at compile time, you can dynamically load LAMMPS at runtime, provided you compiled LAMMPS using a shared library or DLL. The liblammpsplugin.h header file and the liblammpsplugin.c C code in the examples/COUPLE/plugin folder for an interface to LAMMPS that is largely identical to the regular library interface, only that it will load a LAMMPS shared library file at runtime. This can be useful for applications where the interface to LAMMPS would be an optional feature or where you would like to load different versions of the LAMMPS library (e.g. an updated one) without replacing the executable. The *LAMMPS-GUI* is an example for such an application. It has a wrapper class that supports both modes and which is used can be changed at compile time.

Warning

No checks are made on the arguments of the function calls of the C library interface. *All* function arguments must be non-NULL unless *explicitly* allowed, and must point to consistent and valid data. Buffers for storing returned data must be allocated to a suitable size. Passing invalid or unsuitable information will likely cause crashes or corrupt data.

1.1.1 Creating or deleting a LAMMPS object

This section documents the following functions:

- lammps_open()
- lammps_open_no_mpi()
- lammps_open_fortran()
- lammps_close()
- lammps_mpi_init()
- lammps_mpi_finalize()
- lammps_kokkos_finalize()
- lammps_python_finalize()
- lammps_plugin_finalize()
- lammps_error()

The lammps_open() and lammps_open_no_mpi() functions are used to create and initialize a LAMMPS() instance. They return a reference to this instance as a void * pointer to be used as the "handle" argument in subsequent function calls until that instance is destroyed by calling lammps_close(). Here is a simple example demonstrating its use:

```
#include "library.h"
#include <stdio.h>

int main(int argc, char **argv)
{
  void *handle;
  int version;
  const char *lmpargv[] = { "liblammps", "-log", "none"};
  int lmpargc = sizeof(lmpargv)/sizeof(const char *);

  /* create LAMMPS instance */
  handle = lammps_open_no_mpi(lmpargc, (char **)lmpargv, NULL);
  if (handle == NULL) {
    printf("LAMMPS initialization failed");
    lammps_mpi_finalize();
    return 1;
  }

  /* get and print numerical version code */
  version = lammps_version(handle);
  printf("LAMMPS Version: %d\n",version);

  /* delete LAMMPS instance and shut down MPI */
  lammps_close(handle);
  lammps_mpi_finalize();
  return 0;
}
```

The LAMMPS library uses the MPI library it was compiled with and will either run on all processors in the MPI_COMM_WORLD communicator or on the set of processors in the communicator passed as the comm argument of lammps_open(). This means the calling code can run LAMMPS on all or a subset of processors. For example, a wrapper code might decide to alternate between LAMMPS and another code, allowing them both to run on all the processors. Or it might allocate part of the processors to LAMMPS and the rest to the other code by creating a custom communicator with MPI_Comm_split() and running both codes concurrently before syncing them up periodically. Or it might instantiate multiple instances of LAMMPS to perform different calculations and either alternate between them, run them concurrently on split communicators, or run them one after the other. The lammps_open() function may be called multiple times for this latter purpose.

The lammps_close() function is used to shut down the LAMMPS class pointed to by the handle passed as an argument and free all its memory. This has to be called for every instance created with one of the lammps_open() functions. It will, however, **not** call MPI_Finalize(), since that may only be called once. See lammps_mpi_finalize() for an alternative to invoking MPI_Finalize() explicitly from the calling program.

---

void *lammps_open(int argc, char **argv, MPI_Comm comm, void **ptr)

Create instance of the LAMMPS class and return pointer to it.

The lammps_open() function creates a new LAMMPS class instance while passing in a list of strings as if they were *command-line arguments* for the LAMMPS executable, and an MPI communicator for LAMMPS to run under. Since the list of arguments is **exactly** as when called from the command-line, the first argument would be the name of the executable and thus is otherwise ignored. However argc may be set to 0 and then argv may be NULL. If MPI is not yet initialized, MPI_Init() will be called during creation of the LAMMPS class instance.

If for some reason the creation or initialization of the LAMMPS instance fails a null pointer is returned.

Changed in version 18Sep2020: This function now has the pointer to the created LAMMPS class instance as return value. For backward compatibility it is still possible to provide the address of a pointer variable as final argument *ptr*.

Deprecated since version 18Sep2020: The *ptr* argument will be removed in a future release of LAMMPS. It should be set to NULL instead.

See also

lammps_open_no_mpi(), lammps_open_fortran()

Note

This function is **only** declared when the code using the LAMMPS library.h include file is compiled with -DLAMMPS_LIB_MPI, or contains a #define LAMMPS_LIB_MPI 1 statement before #include "library.h". Otherwise you can only use the lammps_open_no_mpi() or lammps_open_fortran() functions.

Parameters

- argc – number of command-line arguments
- argv – list of command-line argument strings
- comm – MPI communicator for this LAMMPS instance
- ptr – pointer to a void pointer variable which serves as a handle; may be NULL

Returns

pointer to new LAMMPS instance cast to void *

---

void *lammps_open_no_mpi(int argc, char **argv, void **ptr)

Variant of lammps_open() that implicitly uses MPI_COMM_WORLD.

This function is a version of lammps_open(), that is missing the MPI communicator argument. It will use MPI_COMM_WORLD instead. The type and purpose of arguments and return value are otherwise the same.

Outside of the convenience, this function is useful, when the LAMMPS library was compiled in serial mode, but the calling code runs in parallel and the MPI_Comm data type of the STUBS library would not be compatible with that of the calling code.

If for some reason the creation or initialization of the LAMMPS instance fails a null pointer is returned.

Changed in version 18Sep2020: This function now has the pointer to the created LAMMPS class instance as return value. For backward compatibility it is still possible to provide the address of a pointer variable as final argument *ptr*.

Deprecated since version 18Sep2020: The *ptr* argument will be removed in a future release of LAMMPS. It should be set to NULL instead.

See also

lammps_open(), lammps_open_fortran()

Parameters

- argc – number of command-line arguments
- argv – list of command-line argument strings
- ptr – pointer to a void pointer variable which serves as a handle; may be NULL

Returns

pointer to new LAMMPS instance cast to void *

---

void *lammps_open_fortran(int argc, char **argv, int f_comm)

Variant of lammps_open() using a Fortran MPI communicator.

Added in version 18Sep2020.

This function is a version of lammps_open(), that uses an integer for the MPI communicator as the MPI Fortran interface does. It is used in the lammps() constructor of the LAMMPS Fortran module. Internally it converts the *f_comm* argument into a C-style MPI communicator with MPI_Comm_f2c() and then calls lammps_open().

If for some reason the creation or initialization of the LAMMPS instance fails a null pointer is returned.

See also

lammps_open_fortran(), lammps_open_no_mpi()

Parameters

- argc – number of command-line arguments
- argv – list of command-line argument strings
- f_comm – Fortran style MPI communicator for this LAMMPS instance

Returns

pointer to new LAMMPS instance cast to void *

---

void lammps_close(void *handle)

Delete a LAMMPS instance created by lammps_open() or its variants.

This function deletes the LAMMPS class instance pointed to by handle that was created by one of the lammps_open() variants. It does **not** call MPI_Finalize() to allow creating and deleting multiple LAMMPS instances concurrently or sequentially. See lammps_mpi_finalize() for a function performing this operation.

Parameters

handle – pointer to a previously created LAMMPS instance

---

void lammps_mpi_init()

Ensure the MPI environment is initialized.

Added in version 18Sep2020.

The MPI standard requires that any MPI application must call MPI_Init() exactly once before performing any other MPI function calls. This function checks, whether MPI is already initialized and calls MPI_Init() in case it is not.

---

void lammps_mpi_finalize()

Shut down the MPI infrastructure.

Added in version 18Sep2020.

The MPI standard requires that any MPI application calls MPI_Finalize() before exiting. Even if a calling program does not do any MPI calls, MPI is still initialized internally to avoid errors accessing any MPI functions. This function should then be called right before exiting the program to wait until all (parallel) tasks are completed and then MPI is cleanly shut down. After calling this function no more MPI calls may be made.

See also

lammps_kokkos_finalize(), lammps_python_finalize(), lammps_plugin_finalize()

---

void lammps_kokkos_finalize()

Shut down the Kokkos library environment.

Added in version 2Jul2021.

The Kokkos library may only be initialized once during the execution of a process. This is done automatically the first time Kokkos functionality is used. This requires that the Kokkos environment must be explicitly shut down after any LAMMPS instance using it is closed (to release associated resources). After calling this function no Kokkos functionality may be used.

See also

lammps_mpi_finalize(), lammps_python_finalize(), lammps_plugin_finalize()

---

void lammps_python_finalize()

Clear the embedded Python environment

Added in version 20Sep2021.

This function resets and clears an embedded Python environment by calling the Py_Finalize() function of the embedded Python library, if enabled. This call would free up all allocated resources and release loaded shared objects.

However, this is **not** done when a LAMMPS instance is deleted because a) LAMMPS may have been used through the Python module and thus the Python interpreter is external and not embedded into LAMMPS and therefore may not be reset by LAMMPS b) some Python modules and extensions, most notably NumPy, are not compatible with being initialized multiple times, which would happen if additional LAMMPS instances using Python would be created *after* after calling Py_Finalize().

This function can be called to explicitly clear the Python environment in case it is safe to do so.

See also

lammps_mpi_finalize(), lammps_kokkos_finalize(), lammps_plugin_finalize()

---

void lammps_plugin_finalize()

Unload all plugins and release the corresponding DSO handles

Added in version 12Jun2025.

This function clears the list of all loaded plugins and closes the corresponding DSO handles and releases the imported executable code.

However, this is **not** done when a LAMMPS instance is deleted because plugins and their shared objects are global properties.

This function can be called to explicitly clear out all loaded plugins in case it is safe to do so.

See also

lammps_mpi_finalize(), lammps_kokkos_finalize(), lammps_python_finalize()

---

void lammps_error(void *handle, int error_type, const char *error_text)

Call a LAMMPS Error class function

Added in version 3Nov2022.

This function is a wrapper around functions in the Error to print an error message and then stop LAMMPS.

The *error_type* parameter selects which function to call. It is a sum of constants from _LMP_ERROR_CONST. If the value does not match any valid combination of constants a warning is printed and the function returns.

Parameters

- handle – pointer to a previously created LAMMPS instance
- error_type – parameter to select function in the Error class
- error_text – error message

1.1.2 Executing commands

This section documents the following functions:

- lammps_file()
- lammps_command()
- lammps_commands_list()
- lammps_commands_string()
- lammps_expand()

Once a LAMMPS instance is created, there are multiple ways to "drive" a simulation. In most cases it is easiest to process single or multiple LAMMPS commands like in an input file. This can be done through reading a file or passing single commands or lists of commands or blocks of commands with the following functions.

Via these functions, the calling code can have LAMMPS act on a series of *input file commands* that are either read from a file or passed as strings. For example, this allows setup of a problem from an input script, and then running it in stages while performing other operations in between or concurrently. The caller can interleave the LAMMPS function calls with operations it performs, such as calls to extract information from or set information within LAMMPS, or calls to another code's library.

Just as with *input script parsing* comments can be included in the file or strings, and expansion of variables with ${name} or $(expression) syntax is performed. Below is a short example using some of these functions.

```
/* define to make the otherwise hidden prototype for "lammps_open()" visible */
#define LAMMPS_LIB_MPI
#include "library.h"

#include <mpi.h>
#include <stdio.h>

int main(int argc, char **argv)
{
  void *handle;
  int i;

  MPI_Init(&argc, &argv);
  handle = lammps_open(0, NULL, MPI_COMM_WORLD, NULL);
  lammps_file(handle,"in.sysinit");
  lammps_command(handle,"run 1000 post no");

  for (i=0; i < 100; ++i) {
    lammps_commands_string(handle,"run 100 pre no post no\n"
                           "print 'PE = $(pe)'\n"
                           "print 'KE = $(ke)'\n");
  }
  lammps_close(handle);
  MPI_Finalize();
  return 0;
}
```

---

void lammps_file(void *handle, const char *file)

Process LAMMPS input from a file.

This function processes commands in the file pointed to by *filename* line by line and thus functions very similar to the *include* command. The function returns when the end of the file is reached and the commands have completed.

The actual work is done by the functions Input::file(const char *) and Input::file().

Parameters

- handle – pointer to a previously created LAMMPS instance
- filename – name of a file with LAMMPS input

---

char *lammps_command(void *handle, const char *cmd)

Process a single LAMMPS input command from a string.

This function tells LAMMPS to execute the single command in the string *cmd*. The entire string is considered as command and need not have a (final) newline character. Newline characters in the body of the string, however, will be treated as part of the command and will **not** start a second command. The function lammps_commands_string() processes a string with multiple command-lines.

The function returns the name of the command on success or NULL when passing a string without a command.

Parameters

- handle – pointer to a previously created LAMMPS instance
- cmd – string with a single LAMMPS command

Returns

string with parsed command name or NULL

---

void lammps_commands_list(void *handle, int ncmd, const char **cmds)

Process multiple LAMMPS input commands from list of strings.

This function processes multiple commands from a list of strings by first concatenating the individual strings in *cmds* into a single string, inserting newline characters as needed. The combined string is passed to lammps_commands_string() for processing.

Parameters

- handle – pointer to a previously created LAMMPS instance
- ncmd – number of lines in *cmds*
- cmds – list of strings with LAMMPS commands

---

void lammps_commands_string(void *handle, const char *str)

Process a block of LAMMPS input commands from a single string.

This function processes a multi-line string similar to a block of commands from a file. The string may have multiple lines (separated by newline characters) and also single commands may be distributed over multiple lines with continuation characters ('&'). Those lines are combined by removing the '&' and the following newline character. After this processing the string is handed to LAMMPS for parsing and executing.

Added in version 21Nov2023: The command is now able to process long strings with triple quotes and loops using *jump SELF <label>*.

Parameters

- handle – pointer to a previously created LAMMPS instance
- str – string with block of LAMMPS input commands

---

char *lammps_expand(void *handle, const char *line)

expand a single LAMMPS input line from a string.

This function tells LAMMPS to expand the string in *cmd* like it would process an input line fed to lammps_command() **without** executing it. The *entire* string is considered as input and need not have a (final) newline character. Newline characters in the body of the string, however, will be treated as part of the command and will **not** start a second command.

The function returns the expanded string in a new string buffer that must be freed with lammps_free() after use to avoid a memory leak.

See also

lammps_eval()

Parameters

- handle – pointer to a previously created LAMMPS instance
- line – string with a single LAMMPS input line

Returns

string with expanded line

1.1.3 System properties

This section documents the following functions:

- lammps_get_natoms()
- lammps_get_thermo()
- lammps_last_thermo()
- lammps_extract_box()
- lammps_reset_box()
- lammps_memory_usage()
- lammps_get_mpi_comm()
- lammps_extract_setting()
- lammps_extract_global_datatype()
- lammps_extract_global()
- lammps_extract_pair_dimension()
- lammps_extract_pair()
- lammps_map_atom()

The library interface allows the extraction of different kinds of information about the active simulation instance and also - in some cases - to apply modifications to it. This enables combining of a LAMMPS simulation with other processing and simulation methods computed by the calling code, or by another code that is coupled to LAMMPS via the library interface. In some cases the data returned is direct reference to the original data inside LAMMPS, cast to a void pointer. In that case the data needs to be cast to a suitable pointer for the calling program to access it, and you may need to know the correct dimensions and lengths. This also means you can directly change those value(s) from the calling program (e.g., to modify atom positions). Of course, changing values should be done with care. When accessing per-atom data,

please note that these data are the per-processor **local** data and are indexed accordingly. Per-atom data can change sizes and ordering at every neighbor list rebuild or atom sort event as atoms migrate between subdomains and processors.

```
#include "library.h"
#include <stdio.h>

int main(int argc, char **argv)
{
  void *handle;
  int i;

  handle = lammps_open_no_mpi(0, NULL, NULL);
  lammps_file(handle,"in.sysinit");
  printf("Running a simulation with %g atoms.\n",
         lammps_get_natoms(handle));

  printf(" %d local and %d ghost atoms. %d atom types\n",
         lammps_extract_setting(handle,"nlocal"),
         lammps_extract_setting(handle,"nghost"),
         lammps_extract_setting(handle,"ntypes"));

  double  *dt = (double *)lammps_extract_global(handle,"dt");
  printf("Changing timestep from %g to 0.5\n", *dt);
  *dt = 0.5;

  lammps_command(handle,"run 1000 post no");

  for (i=0; i < 10; ++i) {
    lammps_command(handle,"run 100 pre no post no");
    printf("PE = %g\nKE = %g\n",
           lammps_get_thermo(handle,"pe"),
           lammps_get_thermo(handle,"ke"));
  }
  lammps_close(handle);
  return 0;
}
```

---

double lammps_get_natoms(void *handle)

Return the total number of atoms in the system.

This number may be very large when running large simulations across multiple processes. Depending on compile time choices, LAMMPS may be using either 32-bit or a 64-bit integer to store this number. For portability this function returns thus a double precision floating point number, which can represent up to a 53-bit signed integer exactly ($\approx 10^{16}$).

As an alternative, you can use lammps_extract_global() and cast the resulting pointer to an integer pointer of the correct size and dereference it. The size of that integer (in bytes) can be queried by calling lammps_extract_setting() to return the size of a bigint integer.

Changed in version 18Sep2020: The type of the return value was changed from int to double to accommodate reporting atom counts for larger systems that would overflow a 32-bit int without having to depend on a 64-bit bit integer type definition.

Parameters
handle – pointer to a previously created LAMMPS instance

Returns
total number of atoms or 0 if value is too large

---

double lammps_get_thermo(void *handle, const char *keyword)

Evaluate a thermo keyword.

This function returns the current value of a *thermo keyword*. Unlike lammps_extract_global() it does not give access to the storage of the desired data but returns its value as a double, so it can also return information that is computed on-the-fly. Use lammps_last_thermo() to get access to the cached data from the last thermo output.

Parameters

- handle – pointer to a previously created LAMMPS instance
- keyword – string with the name of the thermo keyword

Returns
value of the requested thermo property or 0.0

---

void *lammps_last_thermo(void *handle, const char *what, int index)

Access cached data from last thermo output

Added in version 15Jun2023.

This function provides access to cached data from the last thermo output. This differs from lammps_get_thermo() in that it does **not** trigger an evaluation. Instead it provides direct access to a read-only location of the last thermo output data and the corresponding keyword strings. How to handle the return value depends on the value of the *what* argument string. When accessing the data from a concurrent thread while LAMMPS is running, the cache needs to be locked first and then unlocked after the data is obtained, so that the data is not corrupted while reading in case LAMMPS wants to update it at the same time. Outside of a run, the lock/unlock calls have no effect.

Value of *what*	Description of return value	Data type	Uses index
setup	1 if setup is not completed and thus thermo data invalid, 0 otherwise	pointer to int	no
line	line number (0-based) of current line in current file or buffer	pointer to int	no
imagename	file name of the last *dump image* file written	pointer to 0-terminated const char array	no
step	timestep when the last thermo output was generated or -1	pointer to bigint	no
num	number of fields in thermo output	pointer to int	no
keyword	column keyword for thermo output	pointer to 0-terminated const char array	yes
type	data type of thermo output column; see _LMP_DATATYPE_CONST	pointer to int	yes
data	actual field data for column	pointer to int, int64_t or double	yes
lock	acquires lock to thermo data cache	NULL pointer	no
unlock	releases lock to thermo data cache	NULL pointer	no

Note

The *type* property points to a static location that is reassigned with every call, so the returned pointer should be recast, dereferenced, and assigned immediately. Otherwise, its value may be changed with the next invocation of the function.

Parameters

- handle – pointer to a previously created LAMMPS instance
- what – string with the kind of data requested
- index – integer with index into data arrays, ignored for scalar data

Returns

pointer to location of requested data cast to void or NULL

---

void lammps_extract_box(void *handle, double *boxlo, double *boxhi, double *xy, double *yz, double *xz, int *pflags, int *boxflag)

Extract simulation box parameters.

This function (re-)initializes the simulation box and boundary information and then assign the designated data to the locations in the pointers passed as arguments. Any argument (except the first) may be a NULL pointer and then will not be assigned.

Parameters

- handle – pointer to a previously created LAMMPS instance
- boxlo – pointer to 3 doubles where the lower box boundary is stored
- boxhi – pointer to 3 doubles where the upper box boundary is stored
- xy – pointer to a double where the xy tilt factor is stored

- yz – pointer to a double where the yz tilt factor is stored
- xz – pointer to a double where the xz tilt factor is stored
- pflags – pointer to 3 ints, set to 1 for periodic boundaries and 0 for non-periodic
- boxflag – pointer to an int, which is set to 1 if the box will be changed during a simulation by a fix and 0 if not.

---

void lammps_reset_box(void *handle, double *boxlo, double *boxhi, double xy, double yz, double xz)

Reset simulation box parameters.

This function sets the simulation box dimensions (upper and lower bounds and tilt factors) from the provided data and then re-initializes the box information and all derived settings. It may only be called before atoms are created.

Parameters

- handle – pointer to a previously created LAMMPS instance
- boxlo – pointer to 3 doubles containing the lower box boundary
- boxhi – pointer to 3 doubles containing the upper box boundary
- xy – xy tilt factor
- yz – yz tilt factor
- xz – xz tilt factor

---

void lammps_memory_usage(void *handle, double *meminfo)

Get memory usage information

Added in version 18Sep2020.

This function will retrieve memory usage information for the current LAMMPS instance or process. The *meminfo* buffer will be filled with 3 different numbers (if supported by the operating system). The first is the tally (in MBytes) of all large memory allocations made by LAMMPS. This is a lower boundary of how much memory is requested and does not account for memory allocated on the stack or allocations via new. The second number is the current memory allocation of the current process as returned by a memory allocation reporting in the system library. The third number is the maximum amount of RAM (not swap) used by the process so far. If any of the two latter parameters is not supported by the operating system it will be set to zero.

Parameters

- handle – pointer to a previously created LAMMPS instance
- meminfo – buffer with space for at least 3 double to store data in.

---

int lammps_get_mpi_comm(void *handle)

Return current LAMMPS world communicator as integer

Added in version 18Sep2020.

This will take the LAMMPS "world" communicator and convert it to an integer using MPI_Comm_c2f(), so it is equivalent to the corresponding MPI communicator in Fortran. This way it can be safely passed around between different programming languages. To convert it to the C language representation use MPI_Comm_f2c().

If LAMMPS was compiled with MPI_STUBS, this function returns -1.

See also

lammps_open_fortran()

Parameters

handle – pointer to a previously created LAMMPS instance

Returns

Fortran representation of the LAMMPS world communicator

---

int lammps_extract_setting(void *handle, const char *keyword)

Query LAMMPS about global settings.

This function will retrieve or compute global properties. In contrast to lammps_get_thermo() this function returns an int. The following tables list the currently supported keyword. If a keyword is not recognized, the function returns -1. The integer sizes functions may be called without a valid LAMMPS object handle (it is ignored).

- *Integer sizes*
- *Image masks*
- *System status*
- *System sizes*
- *Neighbor list settings*
- *Atom style flags*
- *Thermo settings*

Integer sizes

Keyword	Description / Return value
bigint	size of the bigint integer type, 4 or 8 bytes. Set at *compile time*.
tagint	size of the tagint integer type, 4 or 8 bytes. Set at *compile time*.
imageint	size of the imageint integer type, 4 or 8 bytes. Set at *compile time*.

Image masks

These settings are related to how LAMMPS stores and interprets periodic images. The values are used internally by the *Fortran interface* and are not likely to be useful to users.

Keyword	Description / Return value
IMGMASK	Bit-mask used to convert image flags to a single integer
IMGMAX	Maximum allowed image number for a particular atom
IMGBITS	Bits used in image counts
IMG2BITS	Second bitmask used in image counts

System status

Keyword	Description / Return value
dimension	Number of dimensions: 2 or 3. See *dimension command*.
box_exist	1 if the simulation box is defined, 0 if not. See *create_box command*.
kokkos_active	1 if the KOKKOS package is compiled in **and** activated, 0 if not. See *KOKKOS package*.
kokkos_nthreads	Number of Kokkos threads per MPI process, 0 if Kokkos is not active. See *KOKKOS package*.
kokkos_ngpus	Number of Kokkos gpus per physical node, 0 if Kokkos is not active or no GPU support. See *KOKKOS package*.
nthreads	Number of requested OpenMP threads per MPI process for LAMMPS' execution
newton_bond	1 if Newton's 3rd law is applied to bonded interactions, 0 if not.
newton_pair	1 if Newton's 3rd law is applied to non-bonded interactions, 0 if not.
triclinic	1 if the the simulation box is triclinic, 0 if orthogonal. See *change_box command*.

Communication status

Keyword	Description / Return value
universe_rank	MPI rank on LAMMPS' universe communicator (0 <= universe_rank < universe_size)
universe_size	Number of ranks on LAMMPS' universe communicator (world_size <= universe_size)
world_rank	MPI rank on LAMMPS' world communicator (0 <= world_rank < world_size, = comm->me)
world_size	Number of ranks on LAMMPS' world communicator (aka comm->nprocs)
comm_style	communication style (0 = BRICK, 1 = TILED)
comm_layout	communication layout (0 = LAYOUT_UNIFORM, 1 = LAYOUT_NONUNIFORM, 2 = LAYOUT_TILED)
comm_mode	communication mode (0 = SINGLE, 1 = MULTI)
ghost_velocity	whether velocities are communicated for ghost atoms (0 = no, 1 = yes)

System sizes

Keyword	Description / Return value
nlocal	number of "owned" atoms of the current MPI rank.
nghost	number of "ghost" atoms of the current MPI rank.
nall	number of all "owned" and "ghost" atoms of the current MPI rank.
nmax	maximum of nlocal+nghost across all MPI ranks (for per-atom data array size).
ntypes	number of atom types
nbondtypes	number of bond types
nangletypes	number of angle types
ndihedraltypes	number of dihedral types
nimpropertypes	number of improper types
bond_per_atom	size of per-atom bond data arrays
angle_per_atom	size of per-atom angle data arrays
dihedral_per_atom	size of per-atom dihedral data arrays
improper_per_atom	size of per-atom improper data arrays
maxspecial	size of per-atom special data array
nellipsoids	number of atoms that have ellipsoid data
nlines	number of atoms that have line data (see *pair style line/lj*)
ntris	number of atoms that have triangle data (see *pair style tri/lj*)
nbodies	number of atoms that have body data (see *the Body particle HowTo*)

Neighbor list settings

neigh_every	neighbor lists are rebuild every this many steps
neigh_delay	neighbor lists are rebuild delayed this many steps
neigh_dist_check	0 if always rebuild, 1 rebuild after 1/2 skin
neigh_ago	neighbor lists were rebuilt this many steps ago
nbondlist	number of entries in bondlist (get list with *lammps_extract_global()*)
nanglelist	number of entries in anglelist (get list with *lammps_extract_global()*)
ndihedrallist	number of entries in dihedrallist (get list with *lammps_extract_global()*)
nimproperlist	number of entries in improperlist (get list with *lammps_extract_global()*)

Atom style flags

Keyword	Description / Return value
molecule_flag	1 if the atom style includes molecular topology data. See *atom_style command*.
q_flag	1 if the atom style includes point charges. See *atom_style command*.
mu_flag	1 if the atom style includes point dipoles. See *atom_style command*.
rmass_flag	1 if the atom style includes per-atom masses, 0 if there are per-type masses. See *atom_style command*.
radius_flag	1 if the atom style includes a per-atom radius. See *atom_style command*.
ellipsoid_flag	1 if the atom style describes extended particles that may be ellipsoidal. See *atom_style command*.
omega_flag	1 if the atom style can store per-atom rotational velocities. See *atom_style command*.
torque_flag	1 if the atom style can store per-atom torques. See *atom_style command*.
angmom_flag	1 if the atom style can store per-atom angular momentum. See *atom_style command*.

Thermo settings

Keyword	Description / Return value
thermo_every	The current interval of thermo output. See *thermo command*.
thermo_norm	1 if the thermo output is normalized. See *thermo_modify command*.

See also

lammps_extract_global()

Parameters

- handle – pointer to a previously created LAMMPS instance
- keyword – string with the name of the thermo keyword

Returns

value of the queried setting or -1 if unknown

---

int lammps_extract_global_datatype(void *handle, const char *name)

Get data type of internal global LAMMPS variables or arrays.

Added in version 18Sep2020.

This function returns an integer that encodes the data type of the global property with the specified name. See _LMP_DATATYPE_CONST for valid values. Callers of lammps_extract_global() can use this information to then decide how to cast the void * pointer and access the data.

Parameters

- handle – pointer to a previously created LAMMPS instance (unused)
- name – string with the name of the extracted property

Returns

integer constant encoding the data type of the property or -1 if not found.

---

void *lammps_extract_global(void *handle, const char *name)

Get pointer to internal global LAMMPS variables or arrays.

This function returns a pointer to the location of some global property stored in one of the constituent classes of a LAMMPS instance. The returned pointer is cast to void * and needs to be cast to a pointer of the type that the entity represents. The pointers returned by this function are generally persistent; therefore it is not necessary to call the function again, unless a *clear command* command is issued which wipes out and recreates the contents of the LAMMPS class.

Please also see lammps_extract_setting(), lammps_get_thermo(), and lammps_extract_box().

The following tables list the supported names, their data types, length of the data area, and a short description. The data type can also be queried through calling lammps_extract_global_datatype(). The bigint type may be defined to be either an int or an int64_t. This is set at *compile time* of the LAMMPS library and can be queried through calling lammps_extract_setting(). The function lammps_extract_global_datatype() will directly report the "native" data type. The following tables are provided:

- *Timestep settings*
- *Simulation box settings*
- *System property settings*
- *Neighbor topology data*
- *Energy and virial tally settings*
- *Git revision and version settings*
- *Unit settings*

Timestep settings

Name	Type	Length	Description
dt	double	1	length of the time step. See *timestep command*.
ntimestep	bigint	1	current time step number. See *reset_timestep command*.
atime	double	1	accumulated simulation time in time units.
atimestep	bigint	1	the number of the timestep when "atime" was last updated.
respa_levels	int	1	N_{respa} = number of r-RESPA levels. See *run_style command*.
respa_dt	double	N_{respa}	length of the time steps with r-RESPA. See *run_style command*.

Simulation box settings

Name	Type	Length	Description
boxlo	double	3	lower box boundaries in x-, y-, and z-direction; see *create_box command*.
boxhi	double	3	lower box boundaries in x-, y-, and z-direction; see *create_box command*.
boxxlo	double	1	lower box boundary in x-direction; see *create_box command*.
boxxhi	double	1	upper box boundary in x-direction; see *create_box command*.
boxylo	double	1	lower box boundary in y-direction; see *create_box command*.
boxyhi	double	1	upper box boundary in y-direction; see *create_box command*.
boxzlo	double	1	lower box boundary in z-direction; see *create_box command*.
boxzhi	double	1	upper box boundary in z-direction; see *create_box command*.
sublo	double	3	subbox lower boundaries in x-, y-, and z-direction
subhi	double	3	subbox upper boundaries in x-, y-, and z-direction
sublo_lambda	double	3	subbox lower boundaries in fractional coordinates (for triclinic cells only)
subhi_lambda	double	3	subbox upper boundaries in fractional coordinates (for triclinic cells only)
periodicity	int	3	0 if non-periodic, 1 if periodic for x, y, and z; see *boundary command*.
triclinic	int	1	1 if box is triclinic, 0 if orthogonal; see *change_box command*.
xy	double	1	triclinic tilt factor; see *Triclinic (non-orthogonal) simulation boxes*.
yz	double	1	triclinic tilt factor; see *Triclinic (non-orthogonal) simulation boxes*.
xz	double	1	triclinic tilt factor; see *Triclinic (non-orthogonal) simulation boxes*.
xlattice	double	1	lattice spacing in x-direction; see *lattice command*.
ylattice	double	1	lattice spacing in y-direction; see *lattice command*.
zlattice	double	1	lattice spacing in z-direction; see *lattice command*.
procgrid	int	3	processor count in x-, y-, and z- direction; see *processors command*.

System property settings

Name	Type	Length	Description
natoms	bigint	1	total number of atoms in the simulation.
nbonds	bigint	1	total number of bonds in the simulation.
nangles	bigint	1	total number of angles in the simulation.
ndihedrals	bigint	1	total number of dihedrals in the simulation.
nimpropers	bigint	1	total number of impropers in the simulation.
nlocal	int	1	number of "owned" atoms of the current MPI rank.
nghost	int	1	number of "ghost" atoms of the current MPI rank.
nmax	int	1	maximum of nlocal+nghost across all MPI ranks (for per-atom data array size).
ntypes	int	1	number of atom types
special_lj	double	4	special *pair weighting factors* for LJ interactions (first element is always 1.0)
special_coul	double	4	special *pair weighting factors* for Coulomb interactions (first element is always 1.0)
map_style	int	1	*atom map setting*: 0 = none, 1 = array, 2 = hash, 3 = yes
map_tag_max	int/bigint	1	largest atom ID that can be mapped to a local index (bigint with -DLAMMPS_BIGBIG)
sametag	int	variable	index of next local atom with the same ID in ascending order. -1 signals end.
sortfreq	int	1	frequency of atom sorting. 0 means sorting is off.
nextsort	bigint	1	timestep when atoms are sorted next
q_flag	int	1	**deprecated**. Use lammps_extract_setting() instead.
atom_style	char *	1	string with the current atom style.
pair_style	char *	1	string with the current pair style.
bond_style	char *	1	string with the current bond style.
angle_style	char *	1	string with the current angle style.
dihedral_style	char *	1	string with the current dihedral style.
improper_style	char *	1	string with the current improper style.
kspace_style	char *	1	string with the current KSpace style.

Neighbor topology data

Get length of lists with *lammps_extract_setting()*.

Name	Type	Length	Description
neigh_skin	double	1	neighbor list skin
neigh_cutmin	double	1	minimum neighbor cutoff across all type pairs
neigh_cutmax	double	1	maximum neighbor cutoff across all type pairs
neigh_bondlist	2d int	nbondlist	list of bonds (atom1, atom2, type)
neigh_anglelist	2d int	nanglelist	list of angles (atom1, atom2, atom3, type)
neigh_dihedrallist	2d int	ndihedrallist	list of dihedrals (atom1, atom2, atom3, atom4, type)
neigh_improperlist	2d int	nimproperlist	list of impropers (atom1, atom2, atom3, atom4, type)

Energy and virial tally settings

Name	Type	Length	Description
eflag_global	bigint	1	timestep global energy is tallied on
eflag_atom	bigint	1	timestep per-atom energy is tallied on
vflag_global	bigint	1	timestep global virial is tallied on
vflag_atom	bigint	1	timestep per-atom virial is tallied on

Git revision and version settings

Name	Type	Length	Description
git_commit	const char *	1	Git commit hash for the LAMMPS version.
git_branch	const char *	1	Git branch for the LAMMPS version.
git_descriptor	const char *	1	Combined descriptor for the git revision
lammps_version	const char *	1	LAMMPS version string.

Unit settings

Name	Type	Length	Description
units	char *	1	string with the current unit style. See *units command*.
boltz	double	1	value of the "boltz" constant. See *units command*.
hplanck	double	1	value of the "hplanck" constant. See *units command*.
mvv2e	double	1	factor to convert $\frac{1}{2}mv^2$ for a particle to the current energy unit; See *units command*.
ftm2v	double	1	(description missing) See *units command*.
mv2d	double	1	(description missing) See *units command*.
nktv2p	double	1	(description missing) See *units command*.
qqr2e	double	1	factor to convert $\frac{q_i q_j}{r}$ to energy units; See *units command*.
qe2f	double	1	(description missing) See *units command*.
vxmu2f	double	1	(description missing) See *units command*.
xxt2kmu	double	1	(description missing) See *units command*.
dielectric	double	1	value of the dielectric constant. See *dielectric command*.
qqrd2e	double	1	(description missing) See *units command*.
e_mass	double	1	(description missing) See *units command*.
hhmrr2e	double	1	(description missing) See *units command*.
mvh2r	double	1	(description missing) See *units command*.
angstrom	double	1	constant to convert current length unit to angstroms; 1.0 for reduced (aka "lj") units. See *units command*.
femtosecond	double	1	constant to convert current time unit to femtoseconds; 1.0 for reduced (aka "lj") units
qelectron	double	1	(description missing) See *units command*.

Warning

Modifying the data in the location pointed to by the returned pointer may lead to inconsistent internal data and thus may cause failures or crashes or bogus simulations. In general it is thus usually better to use a LAMMPS input command that sets or changes these parameters. Those will take care of all side effects and necessary updates of settings derived from such settings. Where possible, a reference to such a command or a relevant section of the manual is given below.

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – string with the name of the extracted property

Returns

pointer (cast to void *) to the location of the requested property. NULL if name is not known.

---

int lammps_extract_pair_dimension(void *handle, const char *name)

Get data dimension of pair style data accessible via Pair::extract().

Added in version 29Aug2024.

This function returns an integer that specified the dimensionality of the data that can be extracted from the current pair style with Pair::extract(). Callers of lammps_extract_pair() can use this information to then decide how to cast the void * pointer and access the data.

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – string with the name of the extracted property

Returns

integer constant encoding the dimensionality of the extractable pair style property or -1 if not found.

---

void *lammps_extract_pair(void *handle, const char *name)

Get extract pair style data accessible via Pair::extract().

Added in version 29Aug2024.

This function returns a pointer to data available from the current pair style with Pair::extract(). The dimensionality of the returned pointer can be determined with lammps_extract_pair_dimension().

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – string with the name of the extracted property

Returns

pointer (cast to void *) to the location of the requested property. NULL if name is not known.

---

int lammps_map_atom(void *handle, const void *id)

Map global atom ID to local atom index

Added in version 27June2024.

This function returns an integer that corresponds to the local atom index for an atom with the global atom ID *id*. The atom ID is passed as a void pointer so that it can use the same interface for either a 32-bit or 64-bit tagint. The size of the tagint can be determined using lammps_extract_setting().

Parameters

- handle – pointer to a previously created LAMMPS instance
- id – void pointer to the atom ID (of data type tagint, i.e. 32-bit or 64-bit integer)

Returns

local atom index or -1 if the atom is not found or no map exists

1.1.4 Per-atom properties

This section documents the following functions:

- lammps_extract_atom_datatype()
- lammps_extract_atom_size()
- lammps_extract_atom()

---

int lammps_extract_atom_datatype(void *handle, const char *name)

Get data type of a LAMMPS per-atom property

Added in version 18Sep2020.

This function returns an integer that encodes the data type of the per-atom property with the specified name. See _LMP_DATATYPE_CONST for valid values. Callers of lammps_extract_atom() can use this information to decide how to cast the void * pointer and access the data. In addition, lammps_extract_atom_size() can be used to get information about the vector or array dimensions.

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – string with the name of the extracted property

Returns

integer constant encoding the data type of the property or -1 if not found.

---

int lammps_extract_atom_size(void *handle, const char *name, int type)

Get dimension info of a LAMMPS per-atom property

Added in version 19Nov2024.

This function returns an integer with the size of the per-atom property with the specified name. This allows to accurately determine the size of the per-atom data vectors or arrays. For per-atom arrays, the *type* argument is required to return either the number of rows or the number of columns. It is ignored for per-atom vectors.

Callers of lammps_extract_atom() can use this information in combination with the result from lammps_extract_atom_datatype() to decide how to cast the void * pointer and access the data.

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – string with the name of the extracted property
- type – either LMP_SIZE_ROWS or LMP_SIZE_COLS if *name* refers to a per-atom array otherwise ignored

Returns
integer with the size of the vector or array dimension or -1

---

void *lammps_extract_atom(void *handle, const char *name)

Get pointer to a LAMMPS per-atom property.

This function returns a pointer to the location of per-atom properties (and per-atom-type properties in the case of the 'mass' keyword). Per-atom data is distributed across sub-domains and thus MPI ranks. The returned pointer is cast to void * and needs to be cast to a pointer of data type that the entity represents. You can use the functions lammps_extract_atom_datatype() and lammps_extract_atom_size() to determine data type, dimensions and sizes of the storage pointed to by the returned pointer.

A table with supported keywords is included in the documentation of the Atom::extract() function.

Warning

The pointers returned by this function are generally not persistent since per-atom data may be re-distributed, re-allocated, and re-ordered at every re-neighboring operation.

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – string with the name of the extracted property

Returns
pointer (cast to void *) to the location of the requested data or NULL if not found.

1.1.5 Computes, fixes, variables

This section documents accessing or modifying data stored by computes, fixes, or variables in LAMMPS using the following functions:

- lammps_extract_compute()
- lammps_extract_fix()
- lammps_extract_variable_datatype()
- lammps_extract_variable()
- lammps_set_variable()
- lammps_set_string_variable()
- lammps_set_internal_variable()
- lammps_variable_info()
- lammps_eval()

- lammps_clearstep_compute()
- lammps_addstep_compute_all()
- lammps_addstep_compute()

---

void *lammps_extract_compute(void *handle, const char *id, int style, int type)

Get pointer to data from a LAMMPS compute.

This function returns a pointer to the location of data provided by a *compute command* instance identified by the compute-ID. Computes may provide global, per-atom, or local data, and those may be a scalar, a vector, or an array or they may provide the information about the dimensions of the respective data. Since computes may provide multiple kinds of data, it is required to set style and type flags representing what specific data is desired. This also determines to what kind of pointer the returned pointer needs to be cast to access the data correctly. The function returns NULL if the compute ID is not found or the requested data is not available or current. The following table lists the available options.

Style (see _LMP_STYLE_CONS	Type (see _LMP_TYPE_CONS	Returned type	Returned data
LMP_STYLE_GLOBAL	LMP_TYPE_SCALAR	double *	Global scalar
LMP_STYLE_GLOBAL	LMP_TYPE_VECTOR	double *	Global vector
LMP_STYLE_GLOBAL	LMP_TYPE_ARRAY	double **	Global array
LMP_STYLE_GLOBAL	LMP_SIZE_VECTOR	int *	Length of global vector
LMP_STYLE_GLOBAL	LMP_SIZE_ROWS	int *	Rows of global array
LMP_STYLE_GLOBAL	LMP_SIZE_COLS	int *	Columns of global array
LMP_STYLE_ATOM	LMP_TYPE_VECTOR	double *	Per-atom value
LMP_STYLE_ATOM	LMP_TYPE_ARRAY	double **	Per-atom vector
LMP_STYLE_ATOM	LMP_SIZE_COLS	int *	Columns in per-atom array, 0 if vector
LMP_STYLE_LOCAL	LMP_TYPE_VECTOR	double *	Local data vector
LMP_STYLE_LOCAL	LMP_TYPE_ARRAY	double **	Local data array
LMP_STYLE_LOCAL	LMP_SIZE_VECTOR	int *	Alias for LMP_SIZE_ROWS
LMP_STYLE_LOCAL	LMP_SIZE_ROWS	int *	Number of local array rows or length of vector
LMP_STYLE_LOCAL	LMP_SIZE_COLS	int *	Number of local array columns, 0 if vector

Note

If the compute's data is not computed for the current step, the compute will be invoked. LAMMPS cannot easily check at that time, if it is valid to invoke a compute, so it may fail with an error. The caller has to check to avoid such an error.

Warning

The pointers returned by this function are generally not persistent since the computed data may be re-distributed, re-allocated, and re-ordered at every invocation. It is advisable to re-invoke this function before the data is accessed, or make a copy if the data shall be used after other LAMMPS commands have been issued.

Parameters

- handle – pointer to a previously created LAMMPS instance
- id – string with ID of the compute
- style – constant indicating the style of data requested (global, per-atom, or local)
- type – constant indicating type of data (scalar, vector, or array) or size of rows or columns

Returns

pointer (cast to void *) to the location of the requested data or NULL if not found.

---

void *lammps_extract_fix(void *handle, const char *id, int style, int type, int nrow, int ncol)

Get pointer to data from a LAMMPS fix.

This function returns a pointer to data provided by a *fix command* instance identified by its fix-ID. Fixes may provide global, per-atom, or local data, and those may be a scalar, a vector, or an array, or they may provide the information about the dimensions of the respective data. Since individual fixes may provide multiple kinds of data, it is required to set style and type flags representing what specific data is desired. This also determines to what kind of pointer the returned pointer needs to be cast to access the data correctly. The function set the error status and returns NULL if the fix ID is not found or the requested data is not available.

Accessing global data

When requesting **global** data, the fix data can internally only be accessed one item at a time without access to the underlying pointer itself (it may also be computed on-the-fly). Thus this function allocates temporary storage for the requested data, copy the the data to it, and return a pointer to the location of the copy. Therefore the allocated storage needs to be freed with lammps_free() after its use to avoid a memory leak. Example:

```
double *dptr = (double *) lammps_extract_fix(handle, name, LMP_STYLE_GLOBAL, LMP_
↪TYPE_VECTOR, 0, 0);
double value = *dptr;
lammps_free((void *)dptr);
```

Requesting rows, columns, or the entire global array

In order to avoid the inefficient allocation and deallocation of temporary storage for single values, this functions accepts special values of -1 for the nrow and ncol arguments. For the negative values, the entire row, or column, or full array is copied to a (flat) block of storage and its pointer returned. This still is a copy and needs to be deallocated with lammps_free() as indicated in the note above. In case of requesting the whole array, the data is returned column by column, i.e. as d(c_0,r_0), d(c_0,r_1), … d(c_0, c_nrow-1), d(c_1,r_0), d(c_1,r_1), … d(c_ncol-1, r_nrow-1) for a total of nrow * ncol elements. Example use:

```
int nrows = *(int *) lammps_extract_fix(handle, name, LMP_STYLE_GLOBAL, LMP_
↪SIZE_ROWS, 0,0);
int ncols = *(int *) lammps_extract_fix(handle, name, LMP_STYLE_GLOBAL, LMP_SIZE_
↪COLS, 0,0);
double *dptr = (double *) lammps_extract_fix(handle, name, LMP_STYLE_GLOBAL, LMP_
↪TYPE_ARRAY, -1, -1);
printf("values[%d][%d] = {\n", ncols, nrows);
for (int j = 0; j < ncols; ++j) {
```

```
  printf(" { ");
  for (int i = 0; i < nrows; ++i) printf("%g, ", dvalue[j * nrows + i]);
  printf("},\n");
}
printf("};\n");
lammps_free((void *)dptr);
```

The following table lists the available options.

Style (see _LMP_STYLE_CONS	Type (see _LMP_TYPE_CONS	Returned type	Returned data
LMP_STYLE_GLOBAL	LMP_TYPE_SCALAR	double *	Copy of global scalar
LMP_STYLE_GLOBAL	LMP_TYPE_VECTOR	double *	Copy of global vector element at index nrow
LMP_STYLE_GLOBAL	LMP_TYPE_ARRAY	double *	Copy of global array element at nrow, ncol
LMP_STYLE_GLOBAL	LMP_SIZE_VECTOR	int *	Length of global vector
LMP_STYLE_GLOBAL	LMP_SIZE_ROWS	int *	Rows in global array
LMP_STYLE_GLOBAL	LMP_SIZE_COLS	int *	Columns in global array
LMP_STYLE_ATOM	LMP_TYPE_VECTOR	double *	Per-atom value
LMP_STYLE_ATOM	LMP_TYPE_ARRAY	double **	Per-atom vector
LMP_STYLE_ATOM	LMP_SIZE_COLS	int *	Columns of per-atom array, 0 if vector
LMP_STYLE_LOCAL	LMP_TYPE_VECTOR	double *	Local data vector
LMP_STYLE_LOCAL	LMP_TYPE_ARRAY	double **	Local data array
LMP_STYLE_LOCAL	LMP_SIZE_ROWS	int *	Number of local data rows
LMP_STYLE_LOCAL	LMP_SIZE_COLS	int *	Number of local data columns

Note

LAMMPS cannot easily check if it is valid to access the data, so it may fail with an error and return a NULL pointer. The caller has to avoid such an error.

Warning

The pointers returned by this function for per-atom or local data are generally not persistent, since the computed data may be re-distributed, re-allocated, and re-ordered at every invocation of the fix. It is thus advisable to re-invoke this function before the data is accessed, or make a copy, if the data shall be used after other LAMMPS commands have been issued.

Parameters

- handle – pointer to a previously created LAMMPS instance
- id – string with ID of the fix
- style – constant indicating the style of data requested (global, per-atom, or local)
- type – constant indicating type of data (scalar, vector, or array) or size of rows or columns
- nrow – row index (only used for global vectors and arrays), zero-based

- ncol – column index (only used for global arrays), zero-based

Returns

pointer (cast to void *) to the location of the requested data or NULL if not found.

---

int lammps_extract_variable_datatype(void *handle, const char *name)

Get data type of a LAMMPS variable.

Added in version 3Nov2022.

This function returns an integer that encodes the data type of the variable with the specified name. See _LMP_VAR_CONST for valid values. Callers of lammps_extract_variable() can use this information to decide how to cast the void * pointer and access the data.

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – string with the name of the extracted variable

Returns

integer constant encoding the data type of the property or -1 if not found.

---

void *lammps_extract_variable(void *handle, const char *name, const char *group)

Get pointer to data from a LAMMPS variable.

This function returns a pointer to data from a LAMMPS *variable command* identified by its name. When the variable is either an *equal*-style compatible variable, a *vector*-style variable, or an *atom*-style variable, the variable is evaluated and the corresponding value(s) returned. Variables of style *internal* are compatible with *equal*-style variables and so are *python*-style variables, if they return a numeric value. For other variable styles, their string value is returned. The function returns NULL when a variable of the provided *name* is not found or of an incompatible style. The *group* argument is only used for *atom*-style variables and ignored otherwise, with one exception: for style *vector*, if *group* is "GET_VECTOR_SIZE", the returned pointer will yield the length of the vector to be returned when dereferenced. This pointer must be deallocated after the value is read to avoid a memory leak. If *group* is set to NULL when extracting data from an *atom*-style variable, the group is assumed to be "all".

When requesting data from an *equal*-style or compatible variable this function allocates storage for a single double value, copies the returned value to it, and returns a pointer to the location of the copy. Therefore the allocated storage needs to be freed after its use to avoid a memory leak. Example:

```
double *dptr = (double *) lammps_extract_variable(handle, name, NULL);
double value = *dptr;
lammps_free((void *)dptr);
```

For *atom*-style variables, the return value is a pointer to an allocated block of storage of double of the length atom->nlocal. Since the data returned are a copy, the location will persist, but its content will not be updated in case the variable is re-evaluated. To avoid a memory leak, this pointer needs to be freed after use in the calling program.

For *vector*-style variables, the returned pointer points to actual LAMMPS data and thus it should **not** be deallocated. Its length depends on the variable, compute, or fix data used to construct the *vector*-style variable. This

length can be fetched by calling this function with *group* set to a non-NULL pointer (NULL returns the vector). In that case it will return the vector length as an allocated int pointer cast to a void * pointer. That pointer can be recast and dereferenced to an integer yielding the length of the vector. This pointer must be deallocated when finished with it to avoid memory leaks. Example:

```
double *vectvals = (double *) lammps_extract_variable(handle, name, NULL);
int *intptr = (int *) lammps_extract_variable(handle, name, 1);
int vectlen = *intptr;
lammps_free((void *)intptr);
```

For other variable styles the returned pointer needs to be cast to a char pointer and it should **not** be deallocated. Example:

```
const char *cptr = (const char *) lammps_extract_variable(handle,name,NULL);
printf("The value of variable %s is %s\n", name, cptr);
```

Note

LAMMPS cannot easily check if it is valid to access the data referenced by the variables (e.g., computes, fixes, or thermodynamic info), so it may fail with an error. The caller has to make certain that the data is extracted only when it safe to evaluate the variable and thus an error or crash are avoided.

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – name of the variable
- group – group-ID for atom style variable or NULL or non-NULL to get vector length

Returns

pointer (cast to void *) to the location of the requested data or NULL if not found.

---

int lammps_set_variable(void *handle, const char *name, const char *str)

Set the value of a string-style variable.

Deprecated since version 7Feb2024.

This function assigns a new value from the string str to the string-style variable *name*. This is a way to directly change the string value of a LAMMPS variable that was previous defined with a *variable name string* command without using any LAMMPS commands to delete and redefine the variable.

Returns -1 if a variable of that name does not exist or if it is not a string-style variable, otherwise 0.

Warning

This function is deprecated and lammps_set_string_variable() should be used instead.

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – name of the variable
- str – new value of the variable

Returns
0 on success or -1 on failure

---

int lammps_set_string_variable(void *handle, const char *name, const char *str)

Set the value of a string-style variable.

Added in version 7Feb2024.

This function assigns a new value from the string str to the string-style variable *name*. This is a way to directly change the string value of a LAMMPS variable that was previous defined with a *variable name string* command without using any LAMMPS commands to delete and redefine the variable.

Returns -1 if a variable of that name does not exist or if it is not a string-style variable, otherwise 0.

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – name of the variable
- str – new value of the variable

Returns
0 on success or -1 on failure

---

int lammps_set_internal_variable(void *handle, const char *name, double value)

Set the value of an internal-style variable.

Added in version 7Feb2024.

This function assigns a new value from the floating point number *value* to the internal-style variable *name*. This is a way to directly change the numerical value of such a LAMMPS variable that was previous defined with a *variable name internal* command without using any LAMMPS commands to delete and redefine the variable.

Returns -1 if a variable of that name does not exist or is not an internal-style variable, otherwise 0.

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – name of the variable
- value – new value of the variable

Returns
0 on success or -1 on failure

---

int lammps_variable_info(void *handle, int idx, char *buf, int bufsize)

Retrieve informational string for a variable.

Added in version 21Nov2023.

This function copies a string with human readable information about a defined variable: name, style, current value(s) into the provided C-style string buffer. That is the same info as produced by the *info variables* command.

The length of the buffer must be provided as *buf_size* argument. If the info exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and *buffer* is set to an empty string, otherwise 1.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- idx – index of the variable (0 <= idx < nvar)
- buffer – string buffer to copy the info to
- buf_size – size of the provided string buffer

Returns

1 if successful, otherwise 0

---

double lammps_eval(void *handle, const char *expr)

Evaluate an immediate variable expression

Added in version 4Feb2025.

This function takes a string with an expression that can be used for *equal style variables*, evaluates it and returns the resulting (scalar) value as a floating point number.

See also

lammps_expand()

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- expr – string with expression

Returns

result from expression

---

void lammps_clearstep_compute(void *handle)

Clear whether a compute has been invoked.

Added in version 4Feb2025: This function clears the invoked flag of all computes. Called everywhere that computes are used, before computes are invoked. The invoked flag is used to avoid re-invoking same compute multiple times and to flag computes that store invocation times as having been invoked

See also

lammps_addstep_compute_all() lammps_addstep_compute()

Parameters

handle – pointer to a previously created LAMMPS instance cast to void *.

---

void lammps_addstep_compute_all(void *handle, void *nextstep)

Add next timestep to all computes

Added in version 4Feb2025: loop over all computes schedule next invocation for those that store invocation times called when not sure what computes will be needed on newstep do not loop only over n_timeflag, since may not be set yet

See also

lammps_clearstep_compute() lammps_addstep_compute()

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- newstep – pointer to bigint of next timestep the compute will be invoked

---

void lammps_addstep_compute(void *handle, void *nextstep)

Add next timestep to compute if it has been invoked in the current timestep

Added in version 4Feb2025: loop over computes that store invocation times if its invoked flag set on this timestep, schedule next invocation called everywhere that computes are used, after computes are invoked

See also

lammps_addstep_compute_all() lammps_clearstep_compute()

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- newstep – next timestep the compute will be invoked

---

enum LAMMPS_NS::multitype::_LMP_DATATYPE_CONST

Data type constants for extracting data from atoms, computes and fixes

This enum must be kept in sync with the corresponding enum or constants in python/lammps/constants.py, fortran/lammps.f90, tools/swig/lammps.i, src/library.h, and examples/COUPLE/plugin/liblammpsplugin.h

Values:

enumerator LAMMPS_NONE

no data type assigned (yet)

enumerator LAMMPS_INT

32-bit integer (array)

enumerator LAMMPS_INT_2D

two-dimensional 32-bit integer array

enumerator LAMMPS_DOUBLE

64-bit double (array)

enumerator LAMMPS_DOUBLE_2D

two-dimensional 64-bit double array

enumerator LAMMPS_INT64

64-bit integer (array)

enumerator LAMMPS_INT64_2D

two-dimensional 64-bit integer array

enumerator LAMMPS_STRING

C-String

enum _LMP_STYLE_CONST

Style constants for extracting data from computes and fixes.

Must be kept in sync with the equivalent constants in python/lammps/constants.py, fortran/lammps.f90, tools/swig/lammps.i, and examples/COUPLE/plugin/liblammpsplugin.h

Values:

enumerator LMP_STYLE_GLOBAL

return global data

enumerator LMP_STYLE_ATOM

return per-atom data

enumerator LMP_STYLE_LOCAL

return local data

enum _LMP_TYPE_CONST

Type and size constants for extracting data from computes and fixes.

Must be kept in sync with the equivalent constants in python/lammps/constants.py, fortran/lammps.f90, tools/swig/lammps.i, and examples/COUPLE/plugin/liblammpsplugin.h

Values:

enumerator LMP_TYPE_SCALAR

return scalar

enumerator LMP_TYPE_VECTOR

return vector

enumerator LMP_TYPE_ARRAY

return array

enumerator LMP_SIZE_VECTOR
return length of vector

enumerator LMP_SIZE_ROWS
return number of rows

enumerator LMP_SIZE_COLS
return number of columns

enum _LMP_VAR_CONST
Variable style constants for extracting data from variables.

Must be kept in sync with the equivalent constants in python/lammps/constants.py, fortran/lammps.f90, tools/swig/lammps.i, and examples/COUPLE/plugin/liblammpsplugin.h

Values:

enumerator LMP_VAR_EQUAL
compatible with equal-style variables

enumerator LMP_VAR_ATOM
compatible with atom-style variables

enumerator LMP_VAR_VECTOR
compatible with vector-style variables

enumerator LMP_VAR_STRING
return value will be a string (catch-all)

1.1.6 Scatter/gather operations

This section has functions which gather per-atom data from one or more processors into a contiguous global list ordered by atom ID. The same list is returned to all calling processors. It also contains functions which scatter per-atom data from a contiguous global list across the processors that own those atom IDs. It also has a create_atoms() function which can create new atoms by scattering them appropriately to owning processors in the LAMMPS spatial decomposition.

It documents the following functions:

- lammps_gather_atoms()
- lammps_gather_atoms_concat()
- lammps_gather_atoms_subset()
- lammps_scatter_atoms()
- lammps_scatter_atoms_subset()
- lammps_gather_bonds()
- lammps_gather_angles()
- lammps_gather_dihedrals()
- lammps_gather_impropers()

- lammps_gather()
- lammps_gather_concat()
- lammps_gather_subset()
- lammps_scatter()
- lammps_scatter_subset()
- lammps_create_atoms()
- lammps_create_molecule()

---

void lammps_gather_atoms(void *handle, const char *name, int type, int count, void *data)

Gather the named atom-based entity for all atoms across all processes, in order.

This subroutine gathers data for all atoms and stores them in a one-dimensional array allocated by the user. The data will be ordered by atom ID, which requires consecutive atom IDs (1 to *natoms*). If you need a similar array but have non-consecutive atom IDs, see lammps_gather_atoms_concat(); for a similar array but for a subset of atoms, see lammps_gather_atoms_subset().

The *data* array will be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = x[0][0], x[0][1], x[0][2], x[1][0], x[1][1], x[1][2], x[2][0], ...); *data* must be pre-allocated by the caller to length (*count* × *natoms*), as queried by lammps_get_natoms(), lammps_extract_global(), or lammps_extract_setting().

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined and consecutive.

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – desired quantity (e.g., *x* or *q*)
- dtype – 0 for int values, 1 for double values
- count – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with *image* if you want a single image flag unpacked into (*x*,*y*,*z*) components.
- data – per-atom values packed in a 1-dimensional array of length *natoms* * *count*.

---

void lammps_gather_atoms_concat(void *handle, const char *name, int type, int count, void *data)

Gather the named atom-based entity for all atoms across all processes, unordered.

This subroutine gathers data for all atoms and stores them in a one-dimensional array allocated by the user. The data will be a concatenation of chunks from each processor's owned atoms, in whatever order the atoms are in on each processor. This process has no requirement that the atom IDs be consecutive. If you need the ID of each

atom, you can do another lammps_gather_atoms_concat() call with *name* set to id. If you have consecutive IDs and want the data to be in order, use lammps_gather_atoms(); for a similar array but for a subset of atoms, use lammps_gather_atoms_subset().

The *data* array will be in groups of *count* values, with *natoms* groups total, but not in order by atom ID (e.g., if *name* is *x* and *count* is 3, then *data* might be something like x[10][0], x[10][1], x[10][2], x[2][0], x[2][1], x[2][2], x[4][0], ...); *data* must be pre-allocated by the caller to length (*count* × *natoms*), as queried by lammps_get_natoms(), lammps_extract_global(), or lammps_extract_setting().

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined.

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – desired quantity (e.g., *x* or *q*\ )
- dtype – 0 for int values, 1 for double values
- count – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with "image" if you want single image flags unpacked into (*x*,*y*,*z*)
- data – per-atom values packed in a 1-dimensional array of length *natoms* * *count*.

---

void lammps_gather_atoms_subset(void *handle, const char *name, int type, int count, int ndata, int *ids, void *data)

Gather the named atom-based entity for a subset of atoms.

This subroutine gathers data for the requested atom IDs and stores them in a one-dimensional array allocated by the user. The data will be ordered by atom ID, but there is no requirement that the IDs be consecutive. If you wish to return a similar array for *all* the atoms, use lammps_gather_atoms() or lammps_gather_atoms_concat().

The *data* array will be in groups of *count* values, sorted by atom ID in the same order as the array *ids* (e.g., if *name* is *x*, *count* = 3, and *ids* is {100, 57, 210}, then *data* might look like {x[100][0], x[100][1], x[100][2], x[57][0], x[57][1], x[57][2], x[210][0], ...); *ids* must be provided by the user with length *ndata*, and *data* must be pre-allocated by the caller to length (*count* × *ndata*).

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- handle – pointer to a previously created LAMMPS instance

- name – desired quantity (e.g., *x* or *q*)
- dtype – 0 for int values, 1 for double values
- count – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with "image" if you want single image flags unpacked into (*x*,*y*,*z*)
- ndata – number of atoms for which to return data (can be all of them)
- ids – list of *ndata* atom IDs for which to return data
- data – per-atom values packed in a 1-dimensional array of length *ndata* * *count*.

---

void lammps_scatter_atoms(void *handle, const char *name, int type, int count, void *data)

Scatter the named atom-based entities in *data* to all processes.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to all atoms on all processes. The data must be ordered by atom ID, with the requirement that the IDs be consecutive. Use lammps_scatter_atoms_subset() to scatter data for some (or all) atoms, unordered.

The *data* array needs to be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = {x[0][0], x[0][1], x[0][2], x[1][0], x[1][1], x[1][2], x[2][0], ...}); *data* must be of length (*count* × *natoms*).

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined, must be consecutive, and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – desired quantity (e.g., *x* or *q*)
- dtype – 0 for int values, 1 for double values
- count – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with *image* if you have a single image flag packed into (*x*,*y*,*z*) components.
- data – per-atom values packed in a one-dimensional array of length *natoms* * *count*.

---

void lammps_scatter_atoms_subset(void *handle, const char *name, int type, int count, int ndata, int *ids, void *data)

Scatter the named atom-based entities in *data* from a subset of atoms to all processes.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to a subset of atoms on all processes. The array *data* contains data associated with atom IDs, but there is no requirement that the IDs be consecutive, as they are provided in a separate array. Use lammps_scatter_atoms() to scatter data for all atoms, in order.

The *data* array needs to be organized in groups of *count* values, with the groups in the same order as the array *ids*. For example, if you want *data* to be the array {x[1][0], x[1][1], x[1][2], x[100][0], x[100][1], x[100][2], x[57][0], x[57][1], x[57][2]}, then *count* = 3, *ndata* = 3, and *ids* would be {1, 100, 57}.

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – desired quantity (e.g., *x* or *q*)
- dtype – 0 for int values, 1 for double values
- count – number of per-atom values (e.g., 1 for *dtype* or *q*, 3 for *x* or *f*); use *count* = 3 with "image" if you have all the image flags packed into (*xyz*)
- ndata – number of atoms listed in *ids* and *data* arrays
- ids – list of *ndata* atom IDs to scatter data to
- data – per-atom values packed in a 1-dimensional array of length *ndata* * *count*.

---

void lammps_gather_bonds(void *handle, void *data)

Gather type and constituent atom info for all bonds

Added in version 28Jul2021.

This function copies the list of all bonds into a buffer provided by the calling code. The buffer will be filled with bond type, bond atom 1, bond atom 2 for each bond. Thus the buffer has to be allocated to the dimension of 3 times the **total** number of bonds times the size of the LAMMPS "tagint" type, which is either 4 or 8 bytes depending on whether they are stored in 32-bit or 64-bit integers, respectively. This size depends on the compile time settings used when compiling the LAMMPS library and can be queried by calling lammps_extract_setting() with the keyword "tagint".

When running in parallel, the data buffer must be allocated on **all** MPI ranks and will be filled with the information for **all** bonds in the system.

Below is a brief C code demonstrating accessing this collected bond information.

```
#include "library.h"

#include <stdint.h>
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char **argv)
{
    int tagintsize;
```

(continues on next page)

(continued from previous page)

```
    int64_t i, nbonds;
    void *handle, *bonds;

    handle = lammps_open_no_mpi(0, NULL, NULL);
    lammps_file(handle, "in.some_input");

    tagintsize = lammps_extract_setting(handle, "tagint");
    if (tagintsize == 4)
        nbonds = *(int32_t *)lammps_extract_global(handle, "nbonds");
     else
        nbonds = *(int64_t *)lammps_extract_global(handle, "nbonds");
    bonds = malloc(nbonds * 3 * tagintsize);

    lammps_gather_bonds(handle, bonds);

    if (lammps_extract_setting(handle, "world_rank") == 0) {
        if (tagintsize == 4) {
            int32_t *bonds_real = (int32_t *)bonds;
            for (i = 0; i < nbonds; ++i) {
                printf("bond % 4ld: type = %d, atoms: % 4d  % 4d\n",i,
                       bonds_real[3*i], bonds_real[3*i+1], bonds_real[3*i+2]);
            }
        } else {
            int64_t *bonds_real = (int64_t *)bonds;
            for (i = 0; i < nbonds; ++i) {
                printf("bond % 4ld: type = %ld, atoms: % 4ld  % 4ld\n",i,
                       bonds_real[3*i], bonds_real[3*i+1], bonds_real[3*i+2]);
            }
        }
    }

    lammps_close(handle);
    lammps_mpi_finalize();
    free(bonds);
    return 0;
}
```

Parameters

- handle – pointer to a previously created LAMMPS instance
- data – pointer to data to copy the result to

---

void lammps_gather_angles(void *handle, void *data)

Gather type and constituent atom info for all angles

Added in version 8Feb2023.

This function copies the list of all angles into a buffer provided by the calling code. The buffer will be filled with angle type, angle atom 1, angle atom 2, angle atom 3 for each angle. Thus the buffer has to be allocated to the dimension of 4 times the **total** number of angles times the size of the LAMMPS "tagint" type, which

is either 4 or 8 bytes depending on whether they are stored in 32-bit or 64-bit integers, respectively. This size depends on the compile time settings used when compiling the LAMMPS library and can be queried by calling lammps_extract_setting() with the keyword "tagint".

When running in parallel, the data buffer must be allocated on **all** MPI ranks and will be filled with the information for **all** angles in the system.

Below is a brief C code demonstrating accessing this collected angle information.

```
#include "library.h"

#include <stdint.h>
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char **argv)
{
    int tagintsize;
    int64_t i, nangles;
    void *handle, *angles;

    handle = lammps_open_no_mpi(0, NULL, NULL);
    lammps_file(handle, "in.some_input");

    tagintsize = lammps_extract_setting(handle, "tagint");
    if (tagintsize == 4)
        nangles = *(int32_t *)lammps_extract_global(handle, "nangles");
     else
        nangles = *(int64_t *)lammps_extract_global(handle, "nangles");
    angles = malloc(nangles * 4 * tagintsize);

    lammps_gather_angles(handle, angles);

    if (lammps_extract_setting(handle, "world_rank") == 0) {
        if (tagintsize == 4) {
            int32_t *angles_real = (int32_t *)angles;
            for (i = 0; i < nangles; ++i) {
                printf("angle % 4ld: type = %d, atoms: % 4d  % 4d  % 4d\n",i,
                       angles_real[4*i], angles_real[4*i+1], angles_real[4*i+2], angles_real[4*i+3]);
            }
        } else {
            int64_t *angles_real = (int64_t *)angles;
            for (i = 0; i < nangles; ++i) {
                printf("angle % 4ld: type = %ld, atoms: % 4ld  % 4ld  % 4ld\n",i,
                       angles_real[4*i], angles_real[4*i+1], angles_real[4*i+2], angles_real[4*i+3]);
            }
        }
    }

    lammps_close(handle);
    lammps_mpi_finalize();
    free(angles);
    return 0;
}
```

Parameters

- handle – pointer to a previously created LAMMPS instance
- data – pointer to data to copy the result to

---

void lammps_gather_dihedrals(void *handle, void *data)

Gather type and constituent atom info for all dihedrals

Added in version 8Feb2023.

This function copies the list of all dihedrals into a buffer provided by the calling code. The buffer will be filled with dihedral type, dihedral atom 1, dihedral atom 2, dihedral atom 3, dihedral atom 4 for each dihedral. Thus the buffer has to be allocated to the dimension of 5 times the **total** number of dihedrals times the size of the LAMMPS "tagint" type, which is either 4 or 8 bytes depending on whether they are stored in 32-bit or 64-bit integers, respectively. This size depends on the compile time settings used when compiling the LAMMPS library and can be queried by calling lammps_extract_setting() with the keyword "tagint".

When running in parallel, the data buffer must be allocated on **all** MPI ranks and will be filled with the information for **all** dihedrals in the system.

Below is a brief C code demonstrating accessing this collected dihedral information.

```
#include "library.h"

#include <stdint.h>
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char **argv)
{
    int tagintsize;
    int64_t i, ndihedrals;
    void *handle, *dihedrals;

    handle = lammps_open_no_mpi(0, NULL, NULL);
    lammps_file(handle, "in.some_input");

    tagintsize = lammps_extract_setting(handle, "tagint");
    if (tagintsize == 4)
        ndihedrals = *(int32_t *)lammps_extract_global(handle, "ndihedrals");
     else
        ndihedrals = *(int64_t *)lammps_extract_global(handle, "ndihedrals");
    dihedrals = malloc(ndihedrals * 5 * tagintsize);

    lammps_gather_dihedrals(handle, dihedrals);

    if (lammps_extract_setting(handle, "world_rank") == 0) {
        if (tagintsize == 4) {
            int32_t *dihedrals_real = (int32_t *)dihedrals;
            for (i = 0; i < ndihedrals; ++i) {
                printf("dihedral % 4ld: type = %d, atoms: % 4d  % 4d  % 4d  % 4d\n",i,
                       dihedrals_real[5*i], dihedrals_real[5*i+1], dihedrals_real[5*i+2], dihedrals_
```

(continues on next page)

(continued from previous page)

```
↪real[5*i+3], dihedrals_real[5*i+4]);
        }
    } else {
        int64_t *dihedrals_real = (int64_t *)dihedrals;
        for (i = 0; i < ndihedrals; ++i) {
            printf("dihedral % 4ld: type = %ld, atoms: % 4ld  % 4ld  % 4ld  % 4ld\n",i,
                dihedrals_real[5*i], dihedrals_real[5*i+1], dihedrals_real[5*i+2], dihedrals_
↪real[5*i+3], dihedrals_real[5*i+4]);
        }
    }
}

lammps_close(handle);
lammps_mpi_finalize();
free(dihedrals);
return 0;
}
```

Parameters

- handle – pointer to a previously created LAMMPS instance
- data – pointer to data to copy the result to

---

void lammps_gather_impropers(void *handle, void *data)

Gather type and constituent atom info for all impropers

Added in version 8Feb2023.

This function copies the list of all impropers into a buffer provided by the calling code. The buffer will be filled with improper type, improper atom 1, improper atom 2, improper atom 3, improper atom 4 for each improper. Thus the buffer has to be allocated to the dimension of 5 times the **total** number of impropers times the size of the LAMMPS "tagint" type, which is either 4 or 8 bytes depending on whether they are stored in 32-bit or 64-bit integers, respectively. This size depends on the compile time settings used when compiling the LAMMPS library and can be queried by calling lammps_extract_setting() with the keyword "tagint".

When running in parallel, the data buffer must be allocated on **all** MPI ranks and will be filled with the information for **all** impropers in the system.

Below is a brief C code demonstrating accessing this collected improper information.

```
#include "library.h"

#include <stdint.h>
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char **argv)
{
    int tagintsize;
    int64_t i, nimpropers;
```

(continues on next page)

(continued from previous page)

```
  void *handle, *impropers;

  handle = lammps_open_no_mpi(0, NULL, NULL);
  lammps_file(handle, "in.some_input");

  tagintsize = lammps_extract_setting(handle, "tagint");
  if (tagintsize == 4)
    nimpropers = *(int32_t *)lammps_extract_global(handle, "nimpropers");
   else
    nimpropers = *(int64_t *)lammps_extract_global(handle, "nimpropers");
  impropers = malloc(nimpropers * 5 * tagintsize);

  lammps_gather_impropers(handle, impropers);

  if (lammps_extract_setting(handle, "world_rank") == 0) {
    if (tagintsize == 4) {
      int32_t *impropers_real = (int32_t *)impropers;
      for (i = 0; i < nimpropers; ++i) {
        printf("improper % 4ld: type = %d, atoms: % 4d  % 4d  % 4d  % 4d\n",i,
               impropers_real[5*i], impropers_real[5*i+1], impropers_real[5*i+2], impropers_
↪real[5*i+3], impropers_real[5*i+4]);
      }
    } else {
      int64_t *impropers_real = (int64_t *)impropers;
      for (i = 0; i < nimpropers; ++i) {
        printf("improper % 4ld: type = %ld, atoms: % 4ld  % 4ld  % 4ld  % 4ld\n",i,
               impropers_real[5*i], impropers_real[5*i+1], impropers_real[5*i+2], impropers_
↪real[5*i+3], impropers_real[5*i+4]);
      }
    }
  }

  lammps_close(handle);
  lammps_mpi_finalize();
  free(impropers);
  return 0;
}
```

Parameters

- handle – pointer to a previously created LAMMPS instance
- data – pointer to data to copy the result to

---

void lammps_gather(void *handle, const char *name, int type, int count, void *data)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes, in order by atom ID.

This subroutine gathers data from all processes and stores them in a one-dimensional array allocated by the user. The array *data* will be ordered by atom ID, which requires consecutive IDs (1 to *natoms*). If you need a similar

array but for non-consecutive atom IDs, see lammps_gather_concat(); for a similar array but for a subset of atoms, see lammps_gather_subset().

The *data* array will be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x*, then *data* is {x[0][0], x[0][1], x[0][2], x[1][0], x[1][1], x[1][2], x[2][0], ...}); *data* must be pre-allocated by the caller to the correct length (*count* × *natoms*), as queried by lammps_get_natoms(), lammps_extract_global(), or lammps_extract_setting().

This function will return an error if fix or compute data are requested and the fix or compute ID given does not have per-atom data.

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined and must be consecutive.

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – desired quantity (e.g., "x" or "f" for atom properties, "f_id" for per-atom fix data, "c_id" for per-atom compute data, "d_name" or "i_name" for fix property/atom vectors with *count* = 1, "d2_name" or "i2_name" for fix property/atom vectors with *count* > 1)
- dtype – 0 for int values, 1 for double values
- count – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with *image* if you want the image flags unpacked into (*x*,*y*,*z*) components.
- data – per-atom values packed into a one-dimensional array of length *natoms* * *count*.

---

void lammps_gather_concat(void *handle, const char *name, int type, int count, void *data)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes, unordered.

This subroutine gathers data for all atoms and stores them in a one-dimensional array allocated by the user. The data will be a concatenation of chunks from each processor's owned atoms, in whatever order the atoms are in on each processor. This process has no requirement that the atom IDs be consecutive. If you need the ID of each atom, you can do another call to either lammps_gather_atoms_concat() or lammps_gather_concat() with *name* set to id. If you have consecutive IDs and want the data to be in order, use lammps_gather(); for a similar array but for a subset of atoms, use lammps_gather_subset().

The *data* array will be in groups of *count* values, with *natoms* groups total, but not in order by atom ID (e.g., if *name* is *x* and *count* is 3, then *data* might be something like {x[10][0], x[10][1], x[10][2], x[2][0], x[2][1], x[2][2], x[4][0], ...}); *data* must be pre-allocated by the caller to length (*count* × *natoms*), as queried by lammps_get_natoms(), lammps_extract_global(), or lammps_extract_setting().

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined.

The total number of atoms must be less than 2147483647 (max 32-bit signed int).

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – desired quantity (e.g., "x" or "f" for atom properties, "f_id" for per-atom fix data, "c_id" for per-atom compute data, "d_name" or "i_name" for fix property/atom vectors with count = 1, "d2_name" or "i2_name" for fix property/atom vectors with count > 1)
- dtype – 0 for int values, 1 for double values
- count – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with *image* if you want the image flags unpacked into (*x*,*y*,*z*) components.
- data – per-atom values packed into a one-dimensional array of length *natoms* * *count*.

---

void lammps_gather_subset(void *handle, const char *name, int type, int count, int ndata, int *ids, void *data)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes for a subset of atoms.

This subroutine gathers data for the requested atom IDs and stores them in a one-dimensional array allocated by the user. The data will be ordered by atom ID, but there is no requirement that the IDs be consecutive. If you wish to return a similar array for *all* the atoms, use lammps_gather() or lammps_gather_concat().

The *data* array will be in groups of *count* values, sorted by atom ID in the same order as the array *ids* (e.g., if *name* is *x*, *count* = 3, and *ids* is {100, 57, 210}, then *data* might look like {x[100][0], x[100][1], x[100][2], x[57][0], x[57][1], x[57][2], x[210][0], . . .}); *ids* must be provided by the user with length *ndata*, and *data* must be pre-allocated by the caller to length (*count* × *ndata*).

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – desired quantity (e.g., "x" or "f" for atom properties, "f_id" for per-atom fix data, "c_id" for per-atom compute data, "d_name" or "i_name" for fix property/atom vectors with *count* = 1, "d2_name" or "i2_name" for fix property/atom vectors with *count* > 1)
- dtype – 0 for int values, 1 for double values
- count – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with *image* if you want the image flags unpacked into (*x*,*y*,*z*) components.
- ndata – number of atoms for which to return data (can be all of them)
- ids – list of *ndata* atom IDs for which to return data

- data – per-atom values packed into a one-dimensional array of length *ndata* * *count*.

---

void lammps_scatter(void *handle, const char *name, int type, int count, void *data)

Scatter the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entity in *data* to all processes.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to all atoms on all processes. The data must be ordered by atom ID, with the requirement that the IDs be consecutive. Use lammps_scatter_subset() to scatter data for some (or all) atoms, unordered.

The *data* array needs to be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = {x[0][0], x[0][1], x[0][2], x[1][0], x[1][1], x[1][2], x[2][0], ...}); *data* must be of length (*count* $\times$ *natoms*).

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined, must be consecutive, and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – desired quantity (e.g., "x" or "f" for atom properties, "f_id" for per-atom fix data, "c_id" for per-atom compute data, "d_name" or "i_name" for fix property/atom vectors with *count* = 1, "d2_name" or "i2_name" for fix property/atom vectors with *count* > 1)
- dtype – 0 for int values, 1 for double values
- count – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with *image* if you have a single image flag packed into (*x*,*y*,*z*) components.
- data – per-atom values packed in a one-dimensional array of length *natoms* * *count*.

---

void lammps_scatter_subset(void *handle, const char *name, int type, int count, int ndata, int *ids, void *data)

Scatter the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities in *data* from a subset of atoms to all processes.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to a subset of atoms on all processes. The array *data* contains data associated with atom IDs, but there is no requirement that the IDs be consecutive, as they are provided in a separate array. Use lammps_scatter() to scatter data for all atoms, in order.

The *data* array needs to be organized in groups of *count* values, with the groups in the same order as the array *ids*. For example, if you want *data* to be the array {x[1][0], x[1][1], x[1][2], x[100][0], x[100][1], x[100][2], x[57][0], x[57][1], x[57][2]}, then *count* = 3, *ndata* = 3, and *ids* would be {1, 100, 57}.

Restrictions

This function is not compatible with -DLAMMPS_BIGBIG.

Atom IDs must be defined and an *atom map must be enabled*

The total number of atoms must not be more than 2147483647 (max 32-bit signed int).

Parameters

- handle – pointer to a previously created LAMMPS instance
- name – desired quantity (e.g., "x" or "f" for atom properties, "f_id" for per-atom fix data, "c_id" for per-atom compute data, "d_name" or "i_name" for fix property/atom vectors with *count* = 1, "d2_name" or "i2_name" for fix property/atom vectors with *count* > 1)
- dtype – 0 for int values, 1 for double values
- count – number of per-atom values (e.g., 1 for *type* or *q*, 3 for *x* or *f*); use *count* = 3 with "image" if you want single image flags unpacked into (*x*,*y*,*z*)
- ndata – number of atoms listed in *ids* and *data* arrays
- ids – list of *ndata* atom IDs to scatter data to
- data – per-atom values packed in a 1-dimensional array of length *ndata* * *count*.

---

int lammps_create_atoms(void *handle, int n, const int *id, const int *type, const double *x, const double *v, const int *image, int bexpand)

Create N atoms from list of coordinates

The prototype for this function when compiling with -DLAMMPS_BIGBIG is:

```
int lammps_create_atoms(void *handle, int n, int64_t *id, int *type, double *x, double *v, int64_
↪t *image, int bexpand);
```

This function creates additional atoms from a given list of coordinates and a list of atom types. Additionally the atom-IDs, velocities, and image flags may be provided. If atom-IDs are not provided, they will be automatically created as a sequence following the largest existing atom-ID.

This function is useful to add atoms to a simulation or - in tandem with lammps_reset_box() - to restore a previously extracted and saved state of a simulation. Additional properties for the new atoms can then be assigned via the lammps_scatter_atoms() lammps_extract_atom() functions.

For non-periodic boundaries, atoms will **not** be created that have coordinates outside the box unless it is a shrink-wrap boundary and the shrinkexceed flag has been set to a non-zero value. For periodic boundaries atoms will be wrapped back into the simulation cell and its image flags adjusted accordingly, unless explicit image flags are provided.

The function returns the number of atoms created or -1 on failure (e.g., when called before as box has been created).

Coordinates and velocities have to be given in a 1d-array in the order X(1), Y(1), Z(1), X(2), Y(2), Z(2), ..., X(N), Y(N), Z(N).

Parameters

- handle – pointer to a previously created LAMMPS instance
- n – number of atoms, N, to be added to the system
- id – pointer to N atom IDs; NULL will generate IDs
- type – pointer to N atom types (required)
- x – pointer to 3N doubles with x-,y-,z- positions of the new atoms (required)
- v – pointer to 3N doubles with x-,y-,z- velocities of the new atoms (set to 0.0 if NULL)
- image – pointer to N imageint sets of image flags, or NULL
- bexpand – if 1, atoms outside of shrink-wrap boundaries will still be created and not dropped and the box extended

Returns

number of atoms created on success; -1 on failure (no box, no atom IDs, etc.)

---

void lammps_create_molecule(void *handle, const char *id, const char *json)

Create new molecule template from JSON data provided as C-style string

Added in version 22Jul2025.

This function creates a new molecule template similar to the *molecule command*, but uses JSON data passed as a C-style string instead of reading it from a file.

Parameters

- handle – pointer to a previously created LAMMPS instance
- id – molecule-ID
- jsonstr – molecule data in JSON format as C-style string

1.1.7 Neighbor list access

The following functions enable access to neighbor lists generated by LAMMPS or querying of their properties:

- lammps_find_compute_neighlist()
- lammps_find_fix_neighlist()
- lammps_find_pair_neighlist()
- lammps_neighlist_num_elements()
- lammps_neighlist_element_neighbors()

---

int lammps_find_compute_neighlist(void *handle, const char *id, int request)

Find index of a neighbor list requested by a compute

The neighbor list request from a compute is identified by the compute ID and the request ID. The request ID is typically 0, but will be

0 in case a compute has multiple neighbor list requests.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- id – Identifier of compute instance
- reqid – request id to identify neighbor list in case there are multiple requests from the same compute

Returns
return neighbor list index if found, otherwise -1

---

int lammps_find_fix_neighlist(void *handle, const char *id, int request)

Find index of a neighbor list requested by a fix

The neighbor list request from a fix is identified by the fix ID and the request ID. The request ID is typically 0, but will be > 0 in case a fix has multiple neighbor list requests.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- id – Identifier of fix instance
- reqid – request id to identify neighbor list in case there are multiple requests from the same fix

Returns
return neighbor list index if found, otherwise -1

---

int lammps_find_pair_neighlist(void *handle, const char *style, int exact, int nsub, int request)

Find index of a neighbor list requested by a pair style

This function determines which of the available neighbor lists for pair styles matches the given conditions. It first matches the style name. If exact is 1 the name must match exactly, if exact is 0, a regular expression or sub-string match is done. If the pair style is hybrid or hybrid/overlay the style is matched against the sub styles instead. If a the same pair style is used multiple times as a sub-style, the nsub argument must be > 0 and represents the nth instance of the sub-style (same as for the pair_coeff command, for example). In that case nsub=0 will not produce a match and this function will return -1.

The final condition to be checked is the request ID (reqid). This will normally be 0, but some pair styles request multiple neighbor lists and set the request ID to a value > 0.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- style – String used to search for pair style instance
- exact – Flag to control whether style should match exactly or only a regular expression / sub-string match is applied.
- nsub – match nsub-th hybrid sub-style instance of the same style
- reqid – request id to identify neighbor list in case there are multiple requests from the same pair style instance

Returns
return neighbor list index if found, otherwise -1

---

int lammps_neighlist_num_elements(void *handle, int idx)

Return the number of entries in the neighbor list with given index

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- idx – neighbor list index

Returns

return number of entries in neighbor list, -1 if idx is not a valid index

---

void lammps_neighlist_element_neighbors(void *handle, int idx, int element, int *iatom, int *numneigh, int **neighbors)

Return atom local index, number of neighbors, and array of neighbor local atom indices of neighbor list entry

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- idx – index of this neighbor list in the list of all neighbor lists
- element – index of this neighbor list entry
- iatom – **[out]** local atom index (i.e. in the range [0, nlocal + nghost), -1 if invalid idx or element value
- numneigh – **[out]** number of neighbors of atom iatom or 0
- neighbors – **[out]** pointer to array of neighbor atom local indices or NULL

1.1.8 Configuration information

This section documents the following functions:

- lammps_version()
- lammps_get_os_info()
- lammps_config_has_mpi_support()
- lammps_config_has_omp_support()
- lammps_config_has_gzip_support()
- lammps_config_has_png_support()
- lammps_config_has_jpeg_support()
- lammps_config_has_ffmpeg_support()
- lammps_config_has_exceptions()
- lammps_config_has_package()
- lammps_config_package_count()
- lammps_config_package_name()
- lammps_config_accelerator()
- lammps_has_gpu_device()
- lammps_gpu_device_info()
- lammps_has_style()

- lammps_style_count()
- lammps_style_name()
- lammps_has_id()
- lammps_id_count()
- lammps_id_name()

These library functions can be used to query the LAMMPS library for compile time settings and included packages and styles. This enables programs that use the library interface to determine whether the linked LAMMPS library is compatible with the requirements of the application without crashing during the LAMMPS functions (e.g. due to missing pair styles from packages) or to choose between different options (e.g. whether to use lj/cut, lj/cut/opt, lj/cut/omp or lj/cut/intel). Most of the functions can be called directly without first creating a LAMMPS instance. While crashes within LAMMPS may be recovered from by enabling *exceptions*, avoiding them proactively is a safer approach.

Listing 1: Example for using configuration settings functions

```
#include "library.h"
#include <stdio.h>

int main(int argc, char **argv)
{
  void *handle;

  handle = lammps_open_no_mpi(0, NULL, NULL);
  lammps_file(handle, "in.missing");
  if (lammps_has_error(handle)) {
    char errmsg[256];
    int errtype;
    errtype = lammps_get_last_error_message(handle, errmsg, 256);
    fprintf(stderr, "LAMMPS failed with error: %s\n", errmsg);
    return 1;
  }
  /* write compressed dump file depending on available of options */
  if (lammps_has_style(handle, "dump", "atom/zstd")) {
    lammps_command(handle, "dump d1 all atom/zstd 100 dump.zst");
  } else if (lammps_has_style(handle, "dump", "atom/gz")) {
    lammps_command(handle, "dump d1 all atom/gz 100 dump.gz");
  } else if (lammps_config_has_gzip_support()) {
    lammps_command(handle, "dump d1 all atom 100 dump.gz");
  } else {
    lammps_command(handle, "dump d1 all atom 100 dump");
  }
  lammps_close(handle);
  return 0;
}
```

---

int lammps_version(void *handle)

Get numerical representation of the LAMMPS version date.

The lammps_version() function returns an integer representing the version of the LAMMPS code in the format YYYYMMDD. This can be used to implement backward compatibility in software using the LAMMPS library interface. The specific format guarantees, that this version number is growing with every new LAMMPS release.

Parameters
handle – pointer to a previously created LAMMPS instance

Returns
an integer representing the version data in the format YYYYMMDD

---

void lammps_get_os_info(char *buffer, int buf_size)

Get operating system and architecture information

Added in version 9Oct2020.

The lammps_get_os_info() function can be used to retrieve detailed information about the hosting operating system and compiler/runtime.

A suitable buffer for a C-style string has to be provided and its length. The assembled text will be truncated to not overflow this buffer. The string is typically a few hundred bytes long.

Parameters

- buffer – string buffer to copy the information to
- buf_size – size of the provided string buffer

---

int lammps_config_has_mpi_support()

This function is used to query whether LAMMPS was compiled with a real MPI library or in serial. For the real MPI library it reports the size of the MPI communicator in bytes (4 or 8), which allows to check for compatibility with a hosting code.

Returns
0 when compiled with MPI STUBS, otherwise the MPI_Comm size in bytes

---

int lammps_config_has_omp_support()

This function is used to query whether LAMMPS was compiled with OpenMP enabled.

Added in version 10Sep2025.

See also
lammps_config_has_mpi_support()

Returns
1 when compiled with OpenMP enabled, otherwise 0

---

int lammps_config_has_gzip_support()

Check if the LAMMPS library supports reading or writing compressed files via a pipe to gzip or similar compression programs

Several LAMMPS commands (e.g., *read_data command*, *write_data command*, *dump styles atom, custom, and xyz*) support reading and writing compressed files via creating a pipe to the gzip program. This function checks whether this feature was *enabled at compile time*. It does **not** check whether``gzip`` or any other supported compression programs themselves are installed and usable.

Returns
1 if yes, otherwise 0

---

int lammps_config_has_png_support()

Check if the LAMMPS library supports writing PNG format images

The LAMMPS *dump style image* supports writing multiple image file formats. Most of them, however, need support from an external library, and using that has to be *enabled at compile time*. This function checks whether support for the PNG image file format is available in the current LAMMPS library.

Returns
1 if yes, otherwise 0

---

int lammps_config_has_jpeg_support()

Check if the LAMMPS library supports writing JPEG format images

The LAMMPS *dump style image* supports writing multiple image file formats. Most of them, however, need support from an external library, and using that has to be *enabled at compile time*. This function checks whether support for the JPEG image file format is available in the current LAMMPS library.

Returns
1 if yes, otherwise 0

---

int lammps_config_has_ffmpeg_support()

Check if the LAMMPS library supports creating movie files via a pipe to ffmpeg

The LAMMPS *dump style movie* supports generating movies from images on-the-fly via creating a pipe to the ffmpeg program. This function checks whether this feature was *enabled at compile time*. It does **not** check whether the ffmpeg itself is installed and usable.

Returns
1 if yes, otherwise 0

---

int lammps_config_has_exceptions()

Check whether LAMMPS errors will throw C++ exceptions.

Deprecated since version 21Nov2023: LAMMPS has now exceptions always enabled, so this function will now always return 1 and can be removed from applications using the library interface.

In case of an error, LAMMPS will either abort or throw a C++ exception. The latter has to be *enabled at compile time*. This function checks if exceptions were enabled.

When using the library interface with C++ exceptions enabled, the library interface functions will "catch" them and the error status can then be checked by calling lammps_has_error() and the most recent error message can be retrieved via lammps_get_last_error_message(). This can allow to restart a calculation or delete and recreate the LAMMPS instance when C++ exceptions are enabled. One application of using exceptions this way is the *LAMMPS-GUI*. If C++ exceptions are disabled and an error happens during a call to LAMMPS, the application will terminate.

Returns
1 if yes, otherwise 0

---

int lammps_config_has_package(const char*)

Check whether a specific package has been included in LAMMPS

This function checks whether the LAMMPS library in use includes the specific *LAMMPS package* provided as argument.

Parameters
name – string with the name of the package

Returns
1 if included, 0 if not.

---

int lammps_config_package_count()

Count the number of installed packages in the LAMMPS library.

This function counts how many *LAMMPS packages* are included in the LAMMPS library in use.

Returns
number of packages included

---

int lammps_config_package_name(int, char*, int)

Get the name of a package in the list of installed packages in the LAMMPS library.

This function copies the name of the package with the index *idx* into the provided C-style string buffer. The length of the buffer must be provided as *buf_size* argument. If the name of the package exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and *buffer* is set to an empty string, otherwise 1;

Parameters

- idx – index of the package in the list of included packages (0 <= idx < package count)
- buffer – string buffer to copy the name of the package to
- buf_size – size of the provided string buffer

Returns
1 if successful, otherwise 0

---

int lammps_config_accelerator(const char*, const char*, const char*)

Check for compile time settings in accelerator packages included in LAMMPS.

This function checks availability of compile time settings of included *accelerator packages* in LAMMPS. Supported packages names are "GPU", "KOKKOS", "INTEL", and "OPENMP". Supported categories are "api" with possible settings "cuda", "hip", "phi", "pthreads", "opencl", "openmp", and "serial", and "precision" with possible settings "double", "mixed", and "single". If the combination of package, category, and setting is available, the function returns 1, otherwise 0.

Parameters

- package – string with the name of the accelerator package
- category – string with the category name of the setting
- setting – string with the name of the specific setting

Returns

1 if available, 0 if not.

---

int lammps_has_gpu_device()

Check for presence of a viable GPU package device

Added in version 14May2021.

The lammps_has_gpu_device() function checks at runtime if an accelerator device is present that can be used with the *GPU package*. If at least one suitable device is present the function will return 1, otherwise 0.

More detailed information about the available device or devices can be obtained by calling the lammps_get_gpu_device_info() function.

Returns

1 if viable device is available, 0 if not.

---

void lammps_get_gpu_device_info(char *buffer, int buf_size)

Get GPU package device information

Added in version 14May2021.

The lammps_get_gpu_device_info() function can be used to retrieve detailed information about any accelerator devices that are viable for use with the *GPU package*. It will produce a string that is equivalent to the output of the nvc_get_device or ocl_get_device or hip_get_device tools that are compiled alongside LAMMPS if the GPU package is enabled.

A suitable buffer for a C-style string has to be provided and its length. The assembled text will be truncated to not overflow this buffer. This string can be several kilobytes long, if multiple devices are present.

Parameters

- buffer – string buffer to copy the information to
- buf_size – size of the provided string buffer

---

int lammps_has_style(void*, const char*, const char*)

Check if a specific style has been included in LAMMPS

This function checks if the LAMMPS library in use includes the specific *style* of a specific *category* provided as an argument. Valid categories are: *atom*, *integrate*, *minimize*, *pair*, *bond*, *angle*, *dihedral*, *improper*, *kspace*, *compute*, *fix*, *region*, *dump*, and *command*.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- category – category of the style
- name – name of the style

Returns

1 if included, 0 if not.

---

int lammps_style_count(void*, const char*)

Count the number of styles of category in the LAMMPS library.

This function counts how many styles in the provided *category* are included in the LAMMPS library in use. Please see lammps_has_style() for a list of valid categories.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- category – category of styles

Returns

number of styles in category

---

int lammps_style_name(void*, const char*, int, char*, int)

Look up the name of a style by index in the list of style of a given category in the LAMMPS library.

This function copies the name of the *category* style with the index *idx* into the provided C-style string buffer. The length of the buffer must be provided as *buf_size* argument. If the name of the style exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and *buffer* is set to an empty string, otherwise 1.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- category – category of styles
- idx – index of the style in the list of *category* styles (0 <= idx < style count)
- buffer – string buffer to copy the name of the style to
- buf_size – size of the provided string buffer

Returns

1 if successful, otherwise 0

---

int lammps_has_id(void*, const char*, const char*)

Check if a specific ID exists in the current LAMMPS instance

Added in version 9Oct2020.

This function checks if the current LAMMPS instance a *category* ID of the given *name* exists. Valid categories are: *compute*, *dump*, *fix*, *group*, *molecule*, *region*, and *variable*.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- category – category of the id
- name – name of the id

Returns

1 if included, 0 if not.

---

int lammps_id_count(void*, const char*)

Count the number of IDs of a category.

Added in version 9Oct2020.

This function counts how many IDs in the provided *category* are defined in the current LAMMPS instance. Please see lammps_has_id() for a list of valid categories.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- category – category of IDs

Returns

number of IDs in category

---

int lammps_id_name(void*, const char*, int, char*, int)

Look up the name of an ID by index in the list of IDs of a given category.

Added in version 9Oct2020.

This function copies the name of the *category* ID with the index *idx* into the provided C-style string buffer. The length of the buffer must be provided as *buf_size* argument. If the name of the style exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, the function returns 0 and *buffer* is set to an empty string, otherwise 1.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- category – category of IDs
- idx – index of the ID in the list of *category* styles (0 <= idx < count)

- buffer – string buffer to copy the name of the style to
- buf_size – size of the provided string buffer

Returns
1 if successful, otherwise 0

1.1.9 Utility functions

To simplify some tasks, the library interface contains these utility functions. They do not directly call the LAMMPS library.

- lammps_encode_image_flags()
- lammps_decode_image_flags()
- lammps_set_fix_external_callback()
- lammps_fix_external_get_force()
- lammps_fix_external_set_energy_global()
- lammps_fix_external_set_energy_peratom()
- lammps_fix_external_set_virial_global()
- lammps_fix_external_set_virial_peratom()
- lammps_fix_external_set_vector_length()
- lammps_fix_external_set_vector()
- lammps_flush_buffers()
- lammps_free()
- lammps_is_running()
- lammps_force_timeout()
- lammps_has_error()
- lammps_get_last_error_message()
- lammps_set_show_error()
- lammps_python_api_version()

The lammps_free() function is a clean-up function to free memory that the library had allocated previously via other function calls. Look for notes in the descriptions of the individual commands where such memory buffers were allocated that require the use of lammps_free().

---

int lammps_encode_image_flags(int ix, int iy, int iz)

Encode three integer image flags into a single imageint.

The prototype for this function when compiling with -DLAMMPS_BIGBIG is:

```
int64_t lammps_encode_image_flags(int ix, int iy, int iz);
```

This function performs the bit-shift, addition, and bit-wise OR operations necessary to combine the values of three integers representing the image flags in x-, y-, and z-direction. Unless LAMMPS is compiled with -DLAMMPS_BIGBIG, those integers are limited 10-bit signed integers [-512, 511]. Otherwise the return type changes from int to int64_t and the valid range for the individual image flags becomes [-1048576,1048575], i.e. that of a 21-bit signed integer. There is no check on whether the arguments conform to these requirements.

Parameters

- ix – image flag value in x
- iy – image flag value in y
- iz – image flag value in z

Returns

encoded image flag integer

---

void lammps_decode_image_flags(int image, int *flags)

Decode a single image flag integer into three regular integers

The prototype for this function when compiling with -DLAMMPS_BIGBIG is:

```
void lammps_decode_image_flags(int64_t image, int *flags);
```

This function does the reverse operation of lammps_encode_image_flags() and takes an image flag integer does the bit-shift and bit-masking operations to decode it and stores the resulting three regular integers into the buffer pointed to by *flags*.

Parameters

- image – encoded image flag integer
- flags – pointer to storage where the decoded image flags are stored.

---

void lammps_set_fix_external_callback(void *handle, const char *id, FixExternalFnPtr funcptr, void *ptr)

Set up the callback function for a fix external instance with the given ID.

Fix *external* allows programs that are running LAMMPS through its library interface to modify certain LAMMPS properties on specific timesteps, similar to the way other fixes do.

This function sets the callback function for use with the "pf/callback" mode. The function has to have C language bindings with the prototype:

```
void func(void *ptr, bigint timestep, int nlocal, tagint *ids, double **x, double **fexternal);
```

The argument *ptr* to this function will be stored in fix external and the passed as the first argument calling the callback function *func()*. This would usually be a pointer to the active LAMMPS instance, i.e. the same pointer as the *handle* argument. This would be needed to call functions that set the global or per-atom energy or virial contributions from within the callback function.

The callback mechanism is one of the two modes of how forces and can be applied to a simulation with the help of fix external. The alternative is the array mode where you call lammps_fix_external_get_force().

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Changed in version 28Jul2021.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- id – fix ID of fix external instance
- funcptr – pointer to callback function
- ptr – pointer to object in calling code, passed to callback function as first argument

---

double **lammps_fix_external_get_force(void *handle, const char *id)

Get pointer to the force array storage in a fix external instance with the given ID.

Added in version 28Jul2021.

Fix *external* allows programs that are running LAMMPS through its library interface to add or modify certain LAMMPS properties on specific timesteps, similar to the way other fixes do.

This function provides access to the per-atom force storage in a fix external instance with the given fix-ID to be added to the individual atoms when using the "pf/array" mode. The *fexternal* array can be accessed like other "native" per-atom arrays accessible via the lammps_extract_atom() function. Please note that the array stores holds the forces for *local* atoms for each MPI ranks, in the order determined by the neighbor list build. Because the underlying data structures can change as well as the order of atom as they migrate between MPI processes because of the domain decomposition parallelization, this function should be always called immediately before the forces are going to be set to get an up-to-date pointer. You can use, for example, lammps_extract_setting() to obtain the number of local atoms *nlocal* and then assume the dimensions of the returned force array as double force[nlocal][3].

This is an alternative to the callback mechanism in fix external set up by lammps_set_fix_external_callback(). The main difference is that this mechanism can be used when forces are be pre-computed and the control alternates between LAMMPS and the external code, while the callback mechanism can call the external code to compute the force when the fix is triggered and needs them.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- id – fix ID of fix external instance

Returns

a pointer to the per-atom force array allocated by the fix

---

void lammps_fix_external_set_energy_global(void *handle, const char *id, double eng)

Set the global energy contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a companion function to lammps_set_fix_external_callback() and lammps_fix_external_get_force() to also set the contribution to the global energy from the external code. The value of the *eng* argument will be stored in the fix and applied on the current and all following timesteps until changed by another call to this function. The energy is in energy units as determined by the current *units* settings and is the **total** energy of the contribution. Thus when running in parallel all MPI processes have to call this function with the **same** value and this will be returned as scalar property of the fix external instance when accessed in LAMMPS input commands or from variables.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- id – fix ID of fix external instance
- eng – total energy to be added to the global energy

---

void lammps_fix_external_set_energy_peratom(void *handle, const char *id, double *eng)

Set the per-atom energy contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a companion function to lammps_set_fix_external_callback() to set the per-atom energy contribution due to the fix from the external code as part of the callback function. For this to work, the handle to the LAMMPS object must be passed as the *ptr* argument when registering the callback function.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Note

This function is fully independent from lammps_fix_external_set_energy_global() and will **NOT** add any contributions to the global energy tally and **NOT** check whether the sum of the contributions added here are consistent with the global added energy.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- id – fix ID of fix external instance
- eng – pointer to array of length nlocal with the energy to be added to the per-atom energy

---

void lammps_fix_external_set_virial_global(void *handle, const char *id, double *virial)

Set the global virial contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a companion function to lammps_set_fix_external_callback() and lammps_fix_external_get_force() to set the contribution to the global virial from the external code.

The 6 values of the *virial* array will be stored in the fix and applied on the current and all following timesteps until changed by another call to this function. The components of the virial need to be stored in the order: *xx*, *yy*, *zz*, *xy*, *xz*, *yz*. In LAMMPS the virial is stored internally as *stress*volume* in units of *pressure*volume* as determined by the current *units* settings and is the **total** contribution. Thus when running in parallel all MPI processes have to call this function with the **same** value and this will then be added by fix external.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- id – fix ID of fix external instance
- virial – the 6 global stress tensor components to be added to the global virial

---

void lammps_fix_external_set_virial_peratom(void *handle, const char *id, double **virial)

Set the per-atom virial contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a companion function to lammps_set_fix_external_callback() to set the per-atom virial contribution due to the fix from the external code as part of the callback function. For this to work, the handle to the LAMMPS object must be passed as the *ptr* argument when registering the callback function.

The order and units of the per-atom stress tensor elements are the same as for the global virial. The code in fix external assumes the dimensions of the per-atom virial array is double virial[nlocal][6].

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Note

This function is fully independent from lammps_fix_external_set_virial_global() and will **NOT** add any contributions to the global virial tally and **NOT** check whether the sum of the contributions added here are consistent with the global added virial.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- id – fix ID of fix external instance
- virial – a list of nlocal entries with the 6 per-atom stress tensor components to be added to the per-atom virial

---

void lammps_fix_external_set_vector_length(void *handle, const char *id, int len)

Set the vector length for a global vector stored with fix external for analysis

Added in version 28Jul2021.

This is a companion function to lammps_set_fix_external_callback() and lammps_fix_external_get_force() to set the length of a global vector of properties that will be stored with the fix via lammps_fix_external_set_vector().

This function needs to be called **before** a call to lammps_fix_external_set_vector() and **before** a run or minimize command. When running in parallel it must be called from **all** MPI processes and with the same length parameter.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- id – fix ID of fix external instance
- len – length of the global vector to be stored with the fix

---

void lammps_fix_external_set_vector(void *handle, const char *id, int idx, double val)

Store a global vector value for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a companion function to lammps_set_fix_external_callback() and lammps_fix_external_get_force() to set the values of a global vector of properties that will be stored with the fix. And can be accessed from within LAMMPS input commands (e.g., fix ave/time or variables) when used in a vector context.

This function needs to be called **after** a call to lammps_fix_external_set_vector_length() and the and **before** a run or minimize command. When running in parallel it must be called from **all** MPI processes and with the **same** index and value parameters. The value is assumed to be extensive.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Note

The index in the *idx* parameter is 1-based, i.e. the first element is set with idx = 1 and the last element of the vector with idx = N, where N is the value of the *len* parameter of the call to lammps_fix_external_set_vector_length().

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void *.
- id – fix ID of fix external instance

- idx – 1-based index of in global vector
- val – value to be stored in global vector

---

void lammps_flush_buffers(void *ptr)

Flush output buffers

This function can be used to flush buffered output to be written to screen and logfile pointers to simplify capturing output from LAMMPS library calls.

Parameters
handle – pointer to a previously created LAMMPS instance cast to void *.

---

void lammps_free(void *ptr)

Free memory buffer allocated by LAMMPS.

Some of the LAMMPS C library interface functions return data as pointer to a buffer that has been allocated by LAMMPS or the library interface. This function can be used to delete those in order to avoid memory leaks.

Parameters
ptr – pointer to data allocated by LAMMPS

---

int lammps_is_running(void *handle)

Check if LAMMPS is currently inside a run or minimization

This function can be used from signal handlers or multi-threaded applications to determine if the LAMMPS instance is currently active.

Parameters
handle – pointer to a previously created LAMMPS instance cast to void *.

Returns
0 if idle or >0 if active

---

void lammps_force_timeout(void *handle)

Force a timeout to stop an ongoing run cleanly.

This function can be used from signal handlers or multi-threaded applications to cleanly terminate an ongoing run.

Parameters
handle – pointer to a previously created LAMMPS instance cast to void *

---

int lammps_has_error(void *handle)

Check if there is a (new) error message available

This function can be used to query if an error inside of LAMMPS has thrown a *C++ exception*.

Note

Changed in version 2Aug2023.

The *handle* pointer may be NULL for this function, as would be the case when a call to create a LAMMPS instance has failed. Then this function will not check the error status inside the LAMMPS instance, but instead would check the global error buffer of the library interface.

Parameters

handle – pointer to a previously created LAMMPS instance cast to void * or NULL

Returns

0 on no error, 1 on error.

---

int lammps_get_last_error_message(void *handle, char *buffer, int buf_size)

Copy the last error message into the provided buffer

This function can be used to retrieve the error message that was set in the event of an error inside of LAMMPS which resulted in a *C++ exception*. A suitable buffer for a C-style string has to be provided and its length. If the internally stored error message is longer, it will be truncated accordingly. If the buffer is a NULL pointer, then nothing will be copied. The return value of the function corresponds to the kind of error: a "1" indicates an error that occurred on all MPI ranks and is often recoverable, while a "2" indicates an abort that would happen only in a single MPI rank and thus may not be recoverable, as other MPI ranks may be waiting on the failing MPI ranks to send messages.

Note

Changed in version 2Aug2023.

The *handle* pointer may be NULL for this function, as would be the case when a call to create a LAMMPS instance has failed. Then this function will not check the error buffer inside the LAMMPS instance, but instead would check the global error buffer of the library interface.

Changed in version 21Nov2023.

The *buffer* pointer may be NULL. This will clear any error status without copying the error message.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void * or NULL.
- buffer – string buffer to copy the error message to, may be NULL
- buf_size – size of the provided string buffer

Returns

1 when all ranks had the error, 2 on a single rank error.

---

int lammps_set_show_error(void *handle, const int flag)

Enable or disable direct printing of error messages

Added in version 2Apr2025.

This function can be used to stop LAMMPS from printing error messages *before* LAMMPS throws a *C++ exception*. This is so it may be left to the code calling the library interface whether to check for them, and retrieve and print error messages using the library interface functions lammps_has_error() and lammps_get_last_error_message(). The function returns the previous setting so that one can easily override the setting temporarily and restore it afterwards.

Parameters

- handle – pointer to a previously created LAMMPS instance cast to void * or NULL
- flag – enable (not 0) or disable (0) printing error messages before throwing exception

Returns
previous setting of the flag

---

int lammps_python_api_version()
Return API version of embedded Python interpreter

Added in version 3Nov2022.

This function is used by the ML-IAP python code (mliappy) to verify the API version of the embedded python interpreter of the PYTHON package. It returns -1 if the PYTHON package is not enabled.

Returns
PYTHON_API_VERSION constant of the python interpreter or -1

1.1.10 Extending the C API

The functionality of the LAMMPS library interface has historically been motivated by the needs of its users. Functions have been added or expanded as they were needed and used. Contributions to the interface are always welcome. However with a refactoring of the library interface and its documentation that started in Spring 2020, there are now a few requirements for including new changes or extensions.

- New functions should be orthogonal to existing ones and not implement functionality that can already be achieved with the existing APIs.
- All changes and additions should be documented with Doxygen style comments and references to those functions added to the corresponding files in the doc/src folder.
- If possible, new unit tests to test those new features should be added.
- New features should also be implemented and documented not just for the C interface, but also the Python and Fortran interfaces.
- All additions should work and be compatible with -DLAMMPS_BIGBIG, -DLAMMPS_SMALLBIG as well as when compiling with and without MPI support.
- The library.h file should be kept compatible to C code at a level similar to C89. Its interfaces may not reference any custom data types (e.g. bigint, tagint, and so on) that are only known inside of LAMMPS; instead int and int64_t should be used.
- only use C style comments, not C++ style

Please note that these are not **strict** requirements, but the LAMMPS developers very much appreciate, if they are followed and can assist with implementing what is missing. It helps maintaining the code base and keeping it consistent.

1.2 LAMMPS Python API

The LAMMPS Python module enables calling the LAMMPS C library API from Python by dynamically loading functions in the LAMMPS shared library through the Python ctypes module. Because of the dynamic loading, it is **required** that LAMMPS is compiled in *"shared" mode*. The Python interface is object-oriented, but otherwise tries to be very similar to the C library API. More information on this is in the *Use Python with LAMMPS* section of the manual. Use of the LAMMPS Python module is described in *The lammps Python module*.

1.3 LAMMPS Fortran API

The LAMMPS Fortran module is a wrapper around calling functions from the LAMMPS C library API. This is done using the ISO_C_BINDING feature in Fortran 2003. The interface is object-oriented but otherwise tries to be very similar to the C library API and the basic Python module.

1.3.1 The LIBLAMMPS Fortran Module

The LIBLAMMPS module provides an interface to call LAMMPS from Fortran. It is based on the LAMMPS C library interface and requires a fully Fortran 2003-compatible compiler to be compiled. It is designed to be self-contained and not require any support functions written in C, C++, or Fortran other than those in the C library interface and the LAMMPS Fortran module itself.

While C libraries have a defined binary interface (ABI) and can thus be used from multiple compiler versions from different vendors as long as they are compatible with the hosting operating system, the same is not true for Fortran programs. Thus, the LAMMPS Fortran module needs to be compiled alongside the code using it from the source code in fortran/lammps.f90 *and* with the same compiler used to build the rest of the Fortran code that interfaces to LAMMPS. When linking, you also need to *link to the LAMMPS library*. A typical command for a simple program using the Fortran interface would be:

```
mpifort -o testlib.x lammps.f90 testlib.f90 -L. -llammps
```

Please note that the MPI compiler wrapper is only required when the calling the library *from* an MPI-parallelized program. Otherwise, using the plain Fortran compiler (gfortran, ifort, flang, etc.) will suffice, since there are no direct references to MPI library features, definitions and subroutine calls; MPI communicators are referred to by their integer index representation as required by the Fortran MPI interface. It may be necessary to link to additional libraries, depending on how LAMMPS was configured and whether the LAMMPS library *was compiled as a static or dynamic library*.

If the LAMMPS library itself has been compiled with MPI support, the resulting executable will be able to run LAMMPS in parallel with mpirun, mpiexec, or equivalent. This may be either on the "world" communicator or a sub-communicator created by the calling Fortran code. If, on the other hand, the LAMMPS library has been compiled **without** MPI support, each LAMMPS instance will run independently using just one processor.

Please also note that the order of the source files matters: the lammps.f90 file needs to be compiled first, since it provides the LIBLAMMPS module that would need to be imported by the calling Fortran code in order to uses the Fortran interface. A working example can be found together with equivalent examples in C and C++ in the examples/COUPLE/simple folder of the LAMMPS distribution.

Fortran compiler compatibility

A fully Fortran 2003 compatible Fortran compiler is required. This means that currently only GNU Fortran 9 and later are compatible and thus the default compilers of Red Hat or CentOS 7 and Ubuntu 18.04 LTS and not compatible. Either newer compilers need to be installed or the Linux updated.

1.3.2 Creating or deleting a LAMMPS object

With the Fortran interface, the creation of a LAMMPS instance is included in the constructor for creating the lammps() derived type. To import the definition of that type and its type-bound procedures, you need to add a USE LIBLAMMPS statement. Internally, it will call either lammps_open_fortran() or lammps_open_no_mpi() from the C library API to create the class instance. All arguments are optional and lammps_mpi_init() will be called automatically if it is needed. Similarly, optional calls to lammps_mpi_finalize(), lammps_kokkos_finalize(), lammps_python_finalize(), and lammps_plugin_finalize() are integrated into the close() function and triggered with the optional logical argument set to .TRUE.. Here is a simple example:

```
PROGRAM testlib
  USE LIBLAMMPS                ! include the LAMMPS library interface
  IMPLICIT NONE
  TYPE(lammps) :: lmp          ! derived type to hold LAMMPS instance
  CHARACTER(LEN=12), PARAMETER :: args(3) = &
     [ CHARACTER(LEN=12) :: 'liblammps', '-log', 'none' ]

  ! create a LAMMPS instance (and initialize MPI)
  lmp = lammps(args)
  ! get and print numerical version code
  PRINT*, 'LAMMPS Version: ', lmp%version()
  ! delete LAMMPS instance (and shutdown MPI)
  CALL lmp%close(.TRUE.)
END PROGRAM testlib
```

It is also possible to pass command-line flags from Fortran to C/C++ and thus make the resulting executable behave similarly to the standalone executable (it will ignore the *-in/-i* flag, though). This allows using the command-line to configure accelerator and suffix settings, configure screen and logfile output, or to set index style variables from the command-line and more. Here is a correspondingly adapted version of the previous example:

```
PROGRAM testlib2
  USE LIBLAMMPS                ! include the LAMMPS library interface
  IMPLICIT NONE
  TYPE(lammps) :: lmp          ! derived type to hold LAMMPS instance
  CHARACTER(LEN=128), ALLOCATABLE :: command_args(:)
  INTEGER :: i, argc

  ! copy command-line flags to `command_args()`
  argc = COMMAND_ARGUMENT_COUNT()
  ALLOCATE(command_args(0:argc))
  DO i=0, argc
    CALL GET_COMMAND_ARGUMENT(i, command_args(i))
  END DO

  ! create a LAMMPS instance (and initialize MPI)
  lmp = lammps(command_args)
  ! get and print numerical version code
  PRINT*, 'Program name:   ', command_args(0)
  PRINT*, 'LAMMPS Version: ', lmp%version()
  ! delete LAMMPS instance (and shuts down MPI)
  CALL lmp%close(.TRUE.)
```

(continues on next page)

(continued from previous page)

```
  DEALLOCATE(command_args)
END PROGRAM testlib2
```

1.3.3 Executing LAMMPS commands

Once a LAMMPS instance is created, it is possible to "drive" the LAMMPS simulation by telling LAMMPS to read commands from a file or to pass individual or multiple commands from strings or lists of strings. This is done similarly to how it is implemented in the *C library interface*. Before handing off the calls to the C library interface, the corresponding Fortran versions of the calls (file(), command(), commands_list(), and commands_string()) have to make copies of the strings passed as arguments so that they can be modified to be compatible with the requirements of strings in C without affecting the original strings. Those copies are automatically deleted after the functions return. Below is a small demonstration of the uses of the different functions.

```
PROGRAM testcmd
  USE LIBLAMMPS
  TYPE(lammps) :: lmp
  CHARACTER(LEN=512) :: cmds
  CHARACTER(LEN=40), ALLOCATABLE :: cmdlist(:)
  CHARACTER(LEN=10) :: trimmed
  INTEGER :: i

  lmp = lammps()
  CALL lmp%file('in.melt')
  CALL lmp%command('variable zpos index 1.0')
  ! define 10 groups of 10 atoms each
  ALLOCATE(cmdlist(10))
  DO i=1, 10
    WRITE(trimmed,'(I10)') 10*i
    WRITE(cmdlist(i),'(A,I1,A,I10,A,A)')       &
        'group g', i-1, ' id ', 10*(i-1)+1, ':', ADJUSTL(trimmed)
  END DO
  CALL lmp%commands_list(cmdlist)
  ! run multiple commands from multi-line string
  cmds = 'clear' // NEW_LINE('A') //                    &
      'region  box block 0 2 0 2 0 2' // NEW_LINE('A') //  &
      'create_box 1 box' // NEW_LINE('A') //              &
      'create_atoms 1 single 1.0 1.0 ${zpos}'
  CALL lmp%commands_string(cmds)
  CALL lmp%close(.TRUE.)
END PROGRAM testcmd
```

1.3.4 Accessing system properties

The C library interface allows the *extraction of different kinds of information* about the active simulation instance and also—in some cases—to apply modifications to it, and the Fortran interface provides access to the same data using Fortran-style, C-interoperable data types. In some cases, the Fortran library interface makes pointers to internal LAMMPS data structures accessible; when accessing them through the library interfaces, special care is needed to avoid data corruption and crashes. Please see the documentation of the individual type-bound procedures for details.

Below is an example demonstrating some of the possible uses.

```
PROGRAM testprop
  USE LIBLAMMPS
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_double, c_int64_t, c_int
  USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : OUTPUT_UNIT
  TYPE(lammps) :: lmp
  INTEGER(KIND=c_int64_t), POINTER :: natoms, ntimestep, bval
  REAL(KIND=c_double), POINTER :: dt, dval
  INTEGER(KIND=c_int), POINTER :: nfield, typ, ival
  INTEGER(KIND=c_int) :: i
  CHARACTER(LEN=11) :: key
  REAL(KIND=c_double) :: pe, ke

  lmp = lammps()
  CALL lmp%file('in.sysinit')
  natoms = lmp%extract_global('natoms')
  WRITE(OUTPUT_UNIT,'(A,I0,A)') 'Running a simulation with ', natoms, ' atoms'
  WRITE(OUTPUT_UNIT,'(I0,A,I0,A,I0,A)') lmp%extract_setting('nlocal'), &
      ' local and ', lmp%extract_setting('nghost'), ' ghost atoms. ', &
      lmp%extract_setting('ntypes'), ' atom types'

  CALL lmp%command('run 2 post no')

  ntimestep = lmp%last_thermo('step', 0)
  nfield = lmp%last_thermo('num', 0)
  WRITE(OUTPUT_UNIT,'(A,I0,A,I0)') 'Last thermo output on step: ', ntimestep, &
      ',  number of fields: ', nfield
  DO i=1, nfield
      key = lmp%last_thermo('keyword',i)
      typ = lmp%last_thermo('type',i)
      IF (typ == lmp%dtype%i32) THEN
          ival = lmp%last_thermo('data',i)
          WRITE(OUTPUT_UNIT,*) key, ':', ival
      ELSE IF (typ == lmp%dtype%i64) THEN
          bval = lmp%last_thermo('data',i)
          WRITE(OUTPUT_UNIT,*) key, ':', bval
      ELSE IF (typ == lmp%dtype%r64) THEN
          dval = lmp%last_thermo('data',i)
          WRITE(OUTPUT_UNIT,*) key, ':', dval
      END IF
  END DO

  dt = lmp%extract_global('dt')
  ntimestep = lmp%extract_global('ntimestep')
  WRITE(OUTPUT_UNIT,'(A,I0,A,F4.1,A)') 'At step: ', ntimestep, &
      '  Changing timestep from', dt, ' to 0.5'
  dt = 0.5_c_double
  CALL lmp%command('run 2 post no')

  WRITE(OUTPUT_UNIT,'(A,I0)') 'At step: ', ntimestep
  pe = lmp%get_thermo('pe')
  ke = lmp%get_thermo('ke')
  WRITE(OUTPUT_UNIT,*) 'PE = ', pe
  WRITE(OUTPUT_UNIT,*) 'KE = ', ke
```

(continues on next page)

(continued from previous page)

```
  CALL lmp%close(.TRUE.)
END PROGRAM testprop
```

1.3.5 The LIBLAMMPS module API

Below are the detailed descriptions of definitions and interfaces of the contents of the LIBLAMMPS Fortran interface to LAMMPS.

type lammps

Derived type that is the general class of the Fortran interface. It holds a reference to the LAMMPS class instance to which any of the included calls are forwarded.

Type fields

- % handle *[c_ptr]* :: reference to the LAMMPS class
- % style *[type(lammps_style)]* :: derived type to access lammps style constants
- % type *[type(lammps_type)]* :: derived type to access lammps type constants
- % dtype *[type(lammps_dtype)]* :: derived type to access lammps data type constants
- % close *[subroutine]* :: close()
- % error *[subroutine]* :: error()
- % file *[subroutine]* :: file()
- % command *[subroutine]* :: command()
- % commands_list *[subroutine]* :: commands_list()
- % commands_string *[subroutine]* :: commands_string()
- % get_natoms *[function]* :: get_natoms()
- % get_thermo *[function]* :: get_thermo()
- % last_thermo *[function]* :: last_thermo()
- % extract_box *[subroutine]* :: extract_box()
- % reset_box *[subroutine]* :: reset_box()
- % memory_usage *[subroutine]* :: memory_usage()
- % get_mpi_comm *[function]* :: get_mpi_comm()
- % extract_setting *[function]* :: extract_setting()
- % extract_global *[function]* :: extract_global()
- % map_atom *[function]* :: map_atom()
- % extract_atom *[function]* :: extract_atom()
- % extract_compute *[function]* :: extract_compute()
- % extract_fix *[function]* :: extract_fix()
- % extract_variable *[function]* :: extract_variable()
- % set_variable *[subroutine]* :: set_variable()

- % set_string_variable *[subroutine]* :: set_set_string_variable()
- % set_internal_variable *[subroutine]* :: set_internal_variable()
- % eval *[function]* :: eval()
- % clearstep_compute *[subroutine]* :: clearstep_compute()
- % addstep_compute *[subroutine]* :: addstep_compute()
- % addstep_compute_all *[subroutine]* :: addstep_compute_all()
- % gather_atoms *[subroutine]* :: gather_atoms()
- % gather_atoms_concat *[subroutine]* :: gather_atoms_concat()
- % gather_atoms_subset *[subroutine]* :: gather_atoms_subset()
- % scatter_atoms *[subroutine]* :: scatter_atoms()
- % scatter_atoms_subset *[subroutine]* :: scatter_atoms_subset()
- % gather_bonds *[subroutine]* :: gather_bonds()
- % gather_angles *[subroutine]* :: gather_angles()
- % gather_dihedrals *[subroutine]* :: gather_dihedrals()
- % gather_impropers *[subroutine]* :: gather_impropers()
- % gather *[subroutine]* :: gather()
- % gather_concat *[subroutine]* :: gather_concat()
- % gather_subset *[subroutine]* :: gather_subset()
- % scatter *[subroutine]* :: scatter()
- % scatter_subset *[subroutine]* :: scatter_subset()
- % create_atoms *[subroutine]* :: create_atoms()
- % find_pair_neighlist *[function]* :: find_pair_neighlist()
- % find_fix_neighlist *[function]* :: find_fix_neighlist()
- % find_compute_neighlist *[function]* :: find_compute_neighlist()
- % neighlist_num_elements *[function]* :: neighlist_num_elements()
- % neighlist_element_neighbors *[subroutine]* :: neighlist_element_neighbors()
- % version *[function]* :: version()
- % get_os_info *[subroutine]* :: get_os_info()
- % config_has_mpi_support *[function]* :: config_has_mpi_support()
- % config_has_omp_support *[function]* :: config_has_omp_support()
- % config_has_gzip_support *[function]* :: config_has_gzip_support()
- % config_has_png_support *[function]* :: config_has_png_support()
- % config_has_jpeg_support *[function]* :: config_has_jpeg_support()
- % config_has_ffmpeg_support *[function]* :: config_has_ffmpeg_support()
- % config_has_exceptions *[function]* :: config_has_exceptions()
- % config_has_package *[function]* :: config_has_package()

- % config_package_count *[function]* :: config_package_count()
- % config_package_name *[function]* :: config_package_name()
- % installed_packages *[subroutine]* :: installed_packages()
- % config_accelerator *[function]* :: config_accelerator()
- % has_gpu_device *[function]* :: has_gpu_device()
- % get_gpu_device_info *[subroutine]* :: get_gpu_device_info()
- % has_style *[function]* :: has_style()
- % style_count *[function]* :: style_count()
- % style_name *[function]* :: style_name()
- % has_id *[function]* :: has_id()
- % id_count *[function]* :: id_count()
- % id_name *[subroutine]* :: id_name()
- % plugin_count *[subroutine]* :: plugin_count()
- % plugin_name :: plugin_name()
- % encode_image_flags *[function]* :: encode_image_flags()
- % decode_image_flags *[subroutine]* :: decode_image_flags()
- % set_fix_external_callback *[subroutine]* :: set_fix_external_callback()
- % fix_external_get_force *[function]* :: fix_external_get_force()
- % fix_external_set_energy_global *[subroutine]* :: fix_external_set_energy_global()
- % fix_external_set_virial_global *[subroutine]* :: fix_external_set_virial_global()
- % fix_external_set_energy_peratom *[subroutine]* :: fix_external_set_energy_peratom()
- % fix_external_set_virial_peratom *[subroutine]* :: fix_external_set_virial_peratom()
- % fix_external_set_vector_length *[subroutine]* :: fix_external_set_vector_length()
- % fix_external_set_vector *[subroutine]* :: fix_external_set_vector()
- % flush_buffers *[subroutine]* :: flush_buffers()
- % is_running *[function]* :: is_running()
- % force_timeout *[subroutine]* :: force_timeout()
- % has_error *[function]* :: has_error()
- % get_last_error_message *[subroutine]* :: get_last_error_message()

---

function lammps(*[args][,comm]*)

This is the constructor for the Fortran class and will forward the arguments to a call to either lammps_open_fortran() or lammps_open_no_mpi(). If the LAMMPS library has been compiled with MPI support, it will also initialize MPI, if it has not already been initialized before.

The *args* argument with the list of command-line parameters is optional and so it the *comm* argument with the MPI communicator. If *comm* is not provided, MPI_COMM_WORLD is assumed. For more details please see the documentation of lammps_open().

Options

- **args** *[character(len=*),dimension(:),optional]* :: arguments as list of strings
- **comm** *[integer,optional]* :: MPI communicator

Call to

lammps_open_fortran() lammps_open_no_mpi()

Return

lammps :: an instance of the lammps derived type

Note

The MPI_F08 module, which defines Fortran 2008 bindings for MPI, is not directly supported by this interface due to the complexities of supporting both the MPI_F08 and MPI modules at the same time. However, you should be able to use the MPI_VAL member of the MPI_comm derived type to access the integer value of the communicator, such as in

```
PROGRAM testmpi
  USE LIBLAMMPS
  USE MPI_F08
  TYPE(lammps) :: lmp
  lmp = lammps(comm=MPI_COMM_SELF%MPI_VAL)
END PROGRAM testmpi
```

type lammps_style

This derived type is there to provide a convenient interface for the style constants used with extract_compute(), extract_fix(), and extract_variable(). Assuming your LAMMPS instance is called lmp, these constants will be lmp%style%global, lmp%style%atom, and lmp%style%local. These values are identical to the values described in _LMP_STYLE_CONST for the C library interface.

Type fields

- % global *[integer(c_int)]* :: used to request global data
- % atom *[integer(c_int)]* :: used to request per-atom data
- % local *[integer(c_int)]* :: used to request local data

type lammps_type

This derived type is there to provide a convenient interface for the type constants used with extract_compute(), extract_fix(), and extract_variable(). Assuming your LAMMPS instance is called lmp, these constants will be lmp%type%scalar, lmp%type%vector, and lmp%type%array. These values are identical to the values described in _LMP_TYPE_CONST for the C library interface.

Type fields

- % scalar *[integer(c_int)]* :: used to request scalars
- % vector *[integer(c_int)]* :: used to request vectors
- % array *[integer(c_int)]* :: used to request arrays (matrices)

Procedures Bound to the lammps Derived Type

subroutine close([*finalize*])

This method will close down the LAMMPS instance through calling lammps_close(). If the *finalize* argument is present and has a value of .TRUE., then this subroutine also calls lammps_kokkos_finalize(), lammps_mpi_finalize(), lammps_python_finalize(), and lammps_plugin_finalize().

Options

finalize *[logical,optional]* :: shut down the MPI environment of the LAMMPS library if .TRUE.
.

Call to

lammps_close() lammps_mpi_finalize() lammps_kokkos_finalize() lammps_python_finalize() lammps_plugin_finalize()

---

subroutine error(*error_type*, *error_text*)

This method is a wrapper around the lammps_error() function and will dispatch an error through the LAMMPS Error class.

Added in version 3Nov2022.

Parameters

- **error_type** *[integer(c_int)]* :: constant to select which Error class function to call
- **error_text** *[character(len=*)]* :: error message

Call to

lammps_error()

---

subroutine file(*filename*)

This method will call lammps_file() to have LAMMPS read and process commands from a file.

Parameters

filename *[character(len=*)]* :: name of file with LAMMPS commands

Call to

lammps_file()

---

subroutine command(*cmd*)

This method will call lammps_command() to have LAMMPS execute a single command.

Parameters

cmd *[character(len=*)]* :: single LAMMPS command

Call to

lammps_command()

---

subroutine commands_list(*cmds*)

This method will call lammps_commands_list() to have LAMMPS execute a list of input lines.

Parameters

cmd *[character(len=*),dimension(:)]* :: list of LAMMPS input lines

Call to
lammps_commands_list()

---

subroutine commands_string(*str*)

This method will call lammps_commands_string() to have LAMMPS execute a block of commands from a string.

Parameters
str *[character(len=*)]* :: LAMMPS input in string

Call to
lammps_commands_string()

---

function get_natoms()

This function will call lammps_get_natoms() and return the number of atoms in the system.

Call to
lammps_get_natoms()

Return
natoms *[real(c_double)]* :: number of atoms

> **Note**
>
> If you would prefer to get the number of atoms in its native format (i.e., as a 32- or 64-bit integer, depending on how LAMMPS was compiled), this can be extracted with extract_global().

---

function get_thermo(*name*)

This function will call lammps_get_thermo() and return the value of the corresponding thermodynamic keyword.

Added in version 3Nov2022.

Parameters
name *[character(len=*)]* :: string with the name of the thermo keyword

Call to
lammps_get_thermo()

Return
value *[real(c_double)]* :: value of the requested thermo property or *0.0_c_double*

---

function last_thermo(*what*, *index*)

This function will call lammps_last_thermo() and returns either a string or a pointer to a cached copy of LAMMPS last thermodynamic output, depending on the data requested through *what*. Note that *index* uses 1-based indexing to access thermo output columns.

Added in version 15Jun2023.

Note that this function actually does not return a value, but rather associates the pointer on the left side of the assignment to point to internal LAMMPS data (with the exception of string data, which are copied and returned

as ordinary Fortran strings). Pointers must be of the correct data type to point to said data (typically INTEGER(c_int), INTEGER(c_int64_t), or REAL(c_double)). The pointer being associated with LAMMPS data is type-checked at run-time via an overloaded assignment operator. The pointers returned by this function point to temporary, read-only data that may be overwritten at any time, so their target values need to be copied to local storage if they are supposed to persist.

For example,

```
PROGRAM thermo
  USE LIBLAMMPS
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_double, c_int64_t, c_int
  TYPE(lammps) :: lmp
  INTEGER(KIND=c_int64_t), POINTER :: ntimestep, bval
  REAL(KIND=c_double), POINTER :: dval
  INTEGER(KIND=c_int), POINTER :: nfield, typ, ival
  INTEGER(KIND=c_int) :: i
  CHARACTER(LEN=11) :: key

  lmp = lammps()
  CALL lmp%file('in.sysinit')

  ntimestep = lmp%last_thermo('step', 0)
  nfield = lmp%last_thermo('num', 0)
  PRINT*, 'Last thermo output on step: ', ntimestep, '  Number of fields: ', nfield
  DO i=1, nfield
     key = lmp%last_thermo('keyword',i)
     typ = lmp%last_thermo('type',i)
     IF (typ == lmp%dtype%i32) THEN
        ival = lmp%last_thermo('data',i)
        PRINT*, key, ':', ival
     ELSE IF (typ == lmp%dtype%i64) THEN
        bval = lmp%last_thermo('data',i)
        PRINT*, key, ':', bval
     ELSE IF (typ == lmp%dtype%r64) THEN
        dval = lmp%last_thermo('data',i)
        PRINT*, key, ':', dval
     END IF
  END DO
  CALL lmp%close(.TRUE.)
END PROGRAM thermo
```

would extract the last timestep where thermo output was done and the number of columns it printed. Then it loops over the columns to print out column header keywords and the corresponding data.

Note

If last_thermo() returns a string, the string must have a length greater than or equal to the length of the string (not including the terminal NULL character) that LAMMPS returns. If the variable's length is too short, the string will be truncated. As usual in Fortran, strings are padded with spaces at the end. If you use an allocatable string, the string **must be allocated** prior to calling this function.

Parameters

- **what** *[character(len=*)]* :: string with the name of the thermo keyword

- **index** *[integer(c_int)]* :: 1-based column index

Call to

lammps_last_thermo()

Return

pointer *[polymorphic]* :: pointer to LAMMPS data. The left-hand side of the assignment should be either a string (if expecting string data) or a C-compatible pointer (e.g., INTEGER(c_int), POINTER :: nlocal) to the extracted property.

Warning

Modifying the data in the location pointed to by the returned pointer may lead to inconsistent internal data and thus may cause failures, crashes, or bogus simulations. In general, it is much better to use a LAMMPS input command that sets or changes these parameters. Using an input command will take care of all side effects and necessary updates of settings derived from such settings.

---

subroutine extract_box(*[boxlo][, boxhi][, xy][, yz][, xz][, pflags][, boxflag]*)

This subroutine will call lammps_extract_box(). All parameters are optional, though obviously at least one should be present. The parameters *pflags* and *boxflag* are stored in LAMMPS as integers, but should be declared as LOGICAL variables when calling from Fortran.

Added in version 3Nov2022.

Options

- **boxlo** *[real(c_double),dimension(3),optional]* :: vector in which to store lower-bounds of simulation box
- **boxhi** *[real(c_double),dimension(3),optional]* :: vector in which to store upper-bounds of simulation box
- **xy** *[real(c_double),optional]* :: variable in which to store *xy* tilt factor
- **yz** *[real(c_double),optional]* :: variable in which to store *yz* tilt factor
- **xz** *[real(c_double),optional]* :: variable in which to store *xz* tilt factor
- **pflags** *[logical,dimension(3),optional]* :: vector in which to store periodicity flags (.TRUE. means periodic in that dimension)
- **boxflag** *[logical,optional]* :: variable in which to store boolean denoting whether the box will change during a simulation (.TRUE. means box will change)

Call to

lammps_extract_box()

Note

Note that a frequent use case of this function is to extract only one or more of the options rather than all seven. For example, assuming "lmp" represents a properly-initialized LAMMPS instance, the following code will extract the periodic box settings into the variable "periodic":

```
! code to start up
LOGICAL :: periodic(3)
! code to initialize LAMMPS / run things / etc.
CALL lmp%extract_box(pflags = periodic)
```

---

subroutine reset_box(*boxlo*, *boxhi*, *xy*, *yz*, *xz*)

This subroutine will call lammps_reset_box(). All parameters are required.

Added in version 3Nov2022.

Parameters

- **boxlo** *[real(c_double),dimension(3)]* :: vector of three doubles containing the lower box boundary
- **boxhi** *[real(c_double),dimension(3)]* :: vector of three doubles containing the upper box boundary
- **xy** *[real(c_double)]* :: *x*–*y* tilt factor
- **yz** *[real(c_double)]* :: *y*–*z* tilt factor
- **xz** *[real(c_double)]* :: *x*–*z* tilt factor

Call to

lammps_reset_box()

---

subroutine memory_usage(*meminfo*)

This subroutine will call lammps_memory_usage() and store the result in the three-element array *meminfo*.

Added in version 3Nov2022.

Parameters

meminfo *[real(c_double),dimension(3)]* :: vector of three doubles in which to store memory usage data

Call to

lammps_memory_usage()

---

function get_mpi_comm()

This function returns a Fortran representation of the LAMMPS "world" communicator.

Added in version 3Nov2022.

Call to

lammps_get_mpi_comm()

Return

comm *[integer]* :: Fortran integer equivalent to the MPI communicator LAMMPS is using

Note

The C library interface currently returns type int instead of type MPI_Fint, which is the C type corresponding to Fortran INTEGER types of the default kind. On most compilers, these are the same anyway, but this interface exchanges values this way to avoid warning messages.

Note

The MPI_F08 module, which defines Fortran 2008 bindings for MPI, is not directly supported by this function. However, you should be able to convert between the two using the *MPI_VAL* member of the communicator. For example,

```
USE MPI_F08
USE LIBLAMMPS
TYPE(lammps) :: lmp
TYPE(MPI_Comm) :: comm
! ... [commands to set up LAMMPS/etc.]
comm%MPI_VAL = lmp%get_mpi_comm()
```

should assign an MPI_F08 communicator properly.

---

function extract_setting(*keyword*)

Query LAMMPS about global settings. See the documentation for the lammps_extract_setting() function from the C library.

Added in version 3Nov2022.

Parameters

keyword *[character(len=*)]* :: string containing the name of the thermo keyword

Call to

lammps_extract_setting()

Return

setting *[integer(c_int)]* :: value of the queried setting or −1 if unknown

---

function extract_global(*name*)

This function calls lammps_extract_global() and returns either a string or a pointer to internal global LAMMPS data, depending on the data requested through *name*.

Added in version 3Nov2022.

Note that this function actually does not return a value, but rather associates the pointer on the left side of the assignment to point to internal LAMMPS data (with the exception of string data, which are copied and returned as ordinary Fortran strings). Pointers must be of the correct data type to point to said data (typically INTEGER(c_int), INTEGER(c_int64_t), or REAL(c_double)) and have compatible kind and rank. The pointer being associated with LAMMPS data is type-, kind-, and rank-checked at run-time via an overloaded assignment operator. The pointers returned by this function are generally persistent; therefore it is not necessary to call the function again unless a *clear command* command has been issued, which wipes out and recreates the contents of the LAMMPS class.

For example,

```
PROGRAM demo
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int64_t, c_int, c_double
  USE LIBLAMMPS
  TYPE(lammps) :: lmp
  INTEGER(c_int), POINTER :: nlocal => NULL()
  INTEGER(c_int64_t), POINTER :: ntimestep => NULL()
  REAL(c_double), POINTER :: dt => NULL()
```

(continues on next page)

(continued from previous page)

```
  CHARACTER(LEN=10) :: units
  lmp = lammps()
  ! other commands
  nlocal = lmp%extract_global('nlocal')
  ntimestep = lmp%extract_global('ntimestep')
  dt = lmp%extract_global('dt')
  units = lmp%extract_global('units')
  ! more commands
  lmp.close(.TRUE.)
END PROGRAM demo
```

would extract the number of atoms on this processor, the current time step, the size of the current time step, and the units being used into the variables *nlocal*, *ntimestep*, *dt*, and *units*, respectively.

Note

If extract_global() returns a string, the string must have a length greater than or equal to the length of the string (not including the terminal NULL character) that LAMMPS returns. If the variable's length is too short, the string will be truncated. As usual in Fortran, strings are padded with spaces at the end. If you use an allocatable string, the string **must be allocated** prior to calling this function, but you can automatically reallocate it to the correct length after the function returns, viz.,

```
PROGRAM test
  USE LIBLAMMPS
  TYPE(lammps) :: lmp
  CHARACTER(LEN=:), ALLOCATABLE :: str
  lmp = lammps()
  CALL lmp%command('units metal')
  ALLOCATE(CHARACTER(LEN=80) :: str)
  str = lmp%extract_global('units')
  str = TRIM(str) ! re-allocates to length len_trim(str) here
  PRINT*, LEN(str), LEN_TRIM(str)
END PROGRAM test
```

will print the number 5 (the length of the word "metal") twice.

Parameters

name *[character(len=*)]* :: string with the name of the property to extract

Call to

lammps_extract_global()

Return

pointer *[polymorphic]* :: pointer to LAMMPS data. The left-hand side of the assignment should be either a string (if expecting string data) or a C-compatible pointer (e.g., INTEGER(c_int), POINTER :: nlocal) to the extracted property. If expecting vector data, the pointer should have dimension ":".

Warning

Modifying the data in the location pointed to by the returned pointer may lead to inconsistent internal data and thus may cause failures, crashes, or bogus simulations. In general, it is much better to use a LAMMPS

input command that sets or changes these parameters. Using an input command will take care of all side effects and necessary updates of settings derived from such settings.

---

function extract_atom(*name*)

This function calls lammps_extract_atom() and returns a pointer to LAMMPS data tied to the Atom class, depending on the data requested through *name*.

Added in version 3Nov2022.

Note that this function actually does not return a pointer, but rather associates the pointer on the left side of the assignment to point to internal LAMMPS data. Pointers must be of the correct type, kind, and rank (e.g., INTEGER(c_int), DIMENSION(:) for "type", "mask", or "id"; INTEGER(c_int64_t), DIMENSION(:) for "id" if LAMMPS was compiled with the -DLAMMPS_BIGBIG flag; REAL(c_double), DIMENSION(:,:) for "x", "v", or "f"; and so forth). The pointer being associated with LAMMPS data is type-, kind-, and rank-checked at run-time.

Parameters

name *[character(len=*)]* :: string with the name of the property to extract

Call to

lammps_extract_atom()

Return

pointer *[polymorphic]* :: pointer to LAMMPS data. The left-hand side of the assignment should be a C-interoperable pointer of appropriate kind and rank (e.g., INTEGER(c_int), POINTER :: mask(:)) to the extracted property. If expecting vector data, the pointer should have dimension ":"; if expecting matrix data, the pointer should have dimension ":,:".

Warning

Pointers returned by this function are generally not persistent, as per-atom data may be redistributed, reallocated, and reordered at every re-neighboring operation. It is advisable to re-bind pointers using extract_atom() between runs.

Array index order

Two-dimensional arrays returned from extract_atom() will be **transposed** from equivalent arrays in C, and they will be indexed from 1 instead of 0. For example, in C,

```
void *lmp;
double **x;
/* more code to setup, etc. */
x = lammps_extract_atom(lmp, "x");
printf("%f\n", x[5][1]);
```

will print the *y*-coordinate of the sixth atom on this processor. Conversely,

```
TYPE(lammps) :: lmp
REAL(c_double), DIMENSION(:,:), POINTER :: x => NULL()
! more code to setup, etc.
x = lmp%extract_atom("x")
PRINT '(f0.6)', x(2,6)
```

will print the *y*-coordinate of the sixth atom on this processor (note the transposition of the two indices). This is not a choice, but rather a consequence of the different conventions adopted by the Fortran and C standards decades ago: in C, the block of data

```
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16
```

interpreted as a 4×4 matrix would be

$$\begin{bmatrix} 1 & 2 & 3 & 4 \\ 5 & 6 & 7 & 8 \\ 9 & 10 & 11 & 12 \\ 13 & 14 & 15 & 16 \end{bmatrix},$$

that is, in row-major order. In Fortran, the same block of data is interpreted in column-major order, namely,

$$\begin{bmatrix} 1 & 5 & 9 & 13 \\ 2 & 6 & 10 & 14 \\ 3 & 7 & 11 & 15 \\ 4 & 8 & 12 & 16 \end{bmatrix}.$$

This difference in interpretation of the same block of data by the two languages means, in effect, that matrices from C or C++ will be transposed when interpreted in Fortran.

Note

If you would like the indices to start at 0 instead of 1 (which follows typical notation in C and C++, but not Fortran), you can create another pointer and associate it thus:

```
REAL(c_double), DIMENSION(:,:), POINTER :: x, x0
x = lmp%extract_atom("x")
x0(0:,0:) => x
```

The above would cause the dimensions of *x* to be (1:3, 1:nmax) and those of *x0* to be (0:2, 0:nmax−1).

---

function extract_compute(*id*, *style*, *type*)

This function calls lammps_extract_compute() and returns a pointer to LAMMPS data tied to the Compute class, specifically data provided by the compute identified by *id*. Computes may provide global, per-atom, or local data, and those data may be a scalar, a vector, or an array. Since computes may provide multiple kinds of data, the user is required to specify which set of data is to be returned through the *style* and *type* variables.

Added in version 3Nov2022.

Note that this function actually does not return a value, but rather associates the pointer on the left side of the assignment to point to internal LAMMPS data. Pointers must be of the correct data type to point to said data (i.e., REAL(c_double)) and have compatible rank. The pointer being associated with LAMMPS data is type-, kind-, and rank-checked at run-time via an overloaded assignment operator.

For example,

```
TYPE(lammps) :: lmp
REAL(c_double), DIMENSION(:), POINTER :: COM
! code to setup, create atoms, etc.
```

(continues on next page)

(continued from previous page)

```
CALL lmp%command('compute COM all com')
COM = lmp%extract_compute('COM', lmp%style%global, lmp%style%type)
```

will bind the variable *COM* to the center of mass of the atoms created in your simulation. The vector in this case has length 3; the length (or, in the case of array data, the number of rows and columns) is determined for you based on data from the Compute class.

Array index order

Two-dimensional arrays returned from extract_compute() will be **transposed** from equivalent arrays in C, and they will be indexed from 1 instead of 0. See the note at extract_atom() for further details.

The following combinations are possible (assuming lmp is the name of your LAMMPS instance):

Style	Type	Type to assign to	Returned data
lmp%style%global	lmp%type%scalar	REAL(c_double), POINTER	Global scalar
lmp%style%global	lmp%type%vector	REAL(c_double), DIMENSION(:), POINTER	Global vector
lmp%style%global	lmp%type%array	REAL(c_double), DIMENSION(:,:), POINTER	Global array
lmp%style%atom	lmp%type%vector	REAL(c_double), DIMENSION(:), POINTER	Per-atom vector
lmp%style%atom	lmp%type%array	REAL(c_double), DIMENSION(:,:), POINTER	Per-atom array
lmp%style%local	lmp%type%vector	REAL(c_double), DIMENSION(:), POINTER	Local vector
lmp%style%local	lmp%type%array	REAL(c_double), DIMENSION(:,:), POINTER	Local array

Parameters

- **id** *[character(len=*)]* :: compute ID from which to extract data
- **style** *[integer(c_int)]* :: value indicating the style of data to extract (global, per-atom, or local)
- **type** *[integer(c_int)]* :: value indicating the type of data to extract (scalar, vector, or array)

Call to

lammps_extract_compute()

Return

pointer *[polymorphic]* :: pointer to LAMMPS data. The left-hand side of the assignment should be a C-compatible pointer (e.g., REAL(c_double), POINTER :: x) to the extracted property. If expecting vector data, the pointer should have dimension ":"; if expecting array (matrix) data, the pointer should have dimension ":,:".

Note

If the compute's data are not already computed for the current step, the compute will be invoked. LAMMPS cannot easily check at that time if it is valid to invoke a compute, so it may fail with an error. The caller has

to check to avoid such an error.

Warning

The pointers returned by this function are generally not persistent, since the computed data may be re-distributed, re-allocated, and re-ordered at every invocation. It is advisable to re-invoke this function before the data are accessed or make a copy if the data are to be used after other LAMMPS commands have been issued. Do **not** modify the data returned by this function.

---

function extract_fix(*id, style, type[, nrow][, ncol]*)

This function calls lammps_extract_fix() and returns a pointer to LAMMPS data tied to the Fix class, specifically data provided by the fix identified by *id*. Fixes may provide global, per-atom, or local data, and those data may be a scalar, a vector, or an array. Since many fixes provide multiple kinds of data, the user is required to specify which set of data is to be returned through the *style* and *type* variables.

Added in version 3Nov2022.

Global data are calculated at the time they are requested and are only available element-by-element. As such, the user is expected to provide the *nrow* variable to specify which element of a global vector or the *nrow* and *ncol* variables to specify which element of a global array the user wishes LAMMPS to return. The *ncol* variable is optional for global scalar or vector data, and both *nrow* and *ncol* are optional when a global scalar is requested, as well as when per-atom or local data are requested. The following combinations are possible (assuming lmp is the name of your LAMMPS instance):

Style	Type	nrow	ncol	Type to assign to	Returned data
lmp%style%global	lmp%type%scalar	Ignored	Ignored	REAL(c_double)	Global scalar
lmp%style%global	lmp%type%vector	Required	Ignored	REAL(c_double)	Element of global vector
lmp%style%global	lmp%type%array	Required	Required	REAL(c_double)	Element of global array
lmp%style%atom	lmp%type%scalar				(not allowed)
lmp%style%atom	lmp%type%vector	Ignored	Ignored	REAL(c_double), DIMENSION(:), POINTER	Per-atom vector
lmp%style%atom	lmp%type%array	Ignored	Ignored	REAL(c_double), DIMENSION(:,:), POINTER	Per-atom array
lmp%style%local	lmp%type%scalar				(not allowed)
lmp%style%local	lmp%type%vector	Ignored	Ignored	REAL(c_double), DIMENSION(:), POINTER	Per-atom vector
lmp%style%local	lmp%type%array	Ignored	Ignored	REAL(c_double), DIMENSION(:,:), POINTER	Per-atom array

In the case of global data, this function returns a value of type REAL(c_double). For per-atom or local data, this function does not return a value but instead associates the pointer on the left side of the assignment to point to internal LAMMPS data. Pointers must be of the correct type and kind to point to said data (i.e., REAL(c_double)) and have compatible rank. The pointer being associated with LAMMPS data is type-, kind-, and rank-checked at run-time via an overloaded assignment operator.

For example,

```
TYPE(lammps) :: lmp
REAL(c_double) :: dr, dx, dy, dz
! more code to set up, etc.
lmp%command('fix george all recenter 2 2 2')
! more code
dr = lmp%extract_fix("george", lmp%style%global, lmp%style%scalar)
dx = lmp%extract_fix("george", lmp%style%global, lmp%style%vector, 1)
dy = lmp%extract_fix("george", lmp%style%global, lmp%style%vector, 2)
dz = lmp%extract_fix("george", lmp%style%global, lmp%style%vector, 3)
```

will extract the global scalar calculated by *fix recenter* into the variable *dr* and the three elements of the global vector calculated by fix recenter into the variables *dx*, *dy*, and *dz*, respectively.

If asked for per-atom or local data, extract_fix() returns a pointer to actual LAMMPS data. The pointer returned will have the appropriate size to match the internal data, and will be type/kind/rank-checked at the time of the assignment. For example,

```
TYPE(lammps) :: lmp
REAL(c_double), DIMENSION(:), POINTER :: r
! more code to set up, etc.
lmp%command('fix state all store/state 0 x y z')
! more code
r = lmp%extract_fix('state', lmp%style%atom, lmp%type%array)
```

will bind the pointer *r* to internal LAMMPS data representing the per-atom array computed by *fix store/state* when three inputs are specified. Similarly,

```
TYPE(lammps) :: lmp
REAL(c_double), DIMENSION(:), POINTER :: x
! more code to set up, etc.
lmp%command('fix state all store/state 0 x')
! more code
x = lmp%extract_fix('state', lmp%style%atom, lmp%type%vector)
```

will associate the pointer *x* with internal LAMMPS data corresponding to the per-atom vector computed by *fix store/state* when only one input is specified. Similar examples with lmp%style%atom replaced by lmp%style%local will extract local data from fixes that define local vectors and/or arrays.

Warning

The pointers returned by this function for per-atom or local data are generally not persistent, since the computed data may be redistributed, reallocated, and reordered at every invocation of the fix. It is thus advisable to re-invoke this function before the data are accessed or to make a copy if the data are to be used after other LAMMPS commands have been issued.

Note

LAMMPS cannot easily check if it is valid to access the data, so it may fail with an error. The caller has to avoid such an error.

Parameters

- **id** *[character(len=*)]* :: string with the name of the fix from which to extract data
- **style** *[integer(c_int)]* :: value indicating the style of data to extract (global, per-atom, or local)
- **type** *[integer(c_int)]* :: value indicating the type of data to extract (scalar, vector, or array)
- **nrow** *[integer(c_int)]* :: row index (used only for global vectors and arrays)
- **ncol** *[integer(c_int)]* :: column index (only used for global arrays)

Call to

lammps_extract_fix()

Return

data *[polymorphic]* :: LAMMPS data (for global data) or a pointer to LAMMPS data (for per-atom or local data). The left-hand side of the assignment should be of type REAL(c_double) and have appropriate rank (i.e., DIMENSION(:) if expecting per-atom or local vector data and DIMENSION(:,:) if expecting per-atom or local array data). If expecting local or per-atom data, it should have the POINTER attribute, but if expecting global data, it should be an ordinary (non-POINTER) variable.

Array index order

Two-dimensional global, per-atom, or local array data from extract_fix() will be **transposed** from equivalent arrays in C (or in the ordinary LAMMPS interface accessed through thermodynamic output), and they will be indexed from 1, not 0. This is true even for global data, which are returned as scalars—this is done primarily so the interface is consistent, as there is no choice but to transpose the indices for per-atom or local array data. See the similar note under extract_atom() for further details.

---

function extract_variable(*name*[, *group*])

This function calls lammps_extract_variable() and returns a scalar, vector, or string containing the value of the variable identified by *name*. When the variable is an *equal*-style variable (or one compatible with that style such as *internal*), the variable is evaluated and the corresponding value returned. When the variable is an *atom*-style variable, the variable is evaluated and a vector of values is returned. With all other variables, a string is returned. The *group* argument is only used for *atom* style variables and is ignored otherwise. If *group* is absent for *atom*-style variables, the group is assumed to be "all".

Added in version 3Nov2022.

This function returns the values of the variables, not pointers to them. Vectors pointing to *atom*-style variables should be of type REAL(c_double), be of rank 1 (i.e., DIMENSION(:)), and have the ALLOCATABLE attribute.

Note

Unlike the C library interface, the Fortran interface does not require you to deallocate memory when you are through; this is done for you, behind the scenes.

For example,

```
TYPE(lammps) :: lmp
REAL(c_double) :: area
! more code to set up, etc.
lmp%command('variable A equal lx*ly')
! more code
area = lmp%extract_variable("A")
```

will extract the *x*–*y* cross-sectional area of the simulation into the variable *area*.

Parameters

name *[character(len=*)]* :: variable name to evaluate

Options

group *[character(len=*),optional]* :: group for which to extract per-atom data (if absent, use "all")

Call to

lammps_extract_variable()

Return

data *[polymorphic]* :: scalar of type REAL(c_double) (for *equal*-style variables and others that are *equal*-compatible), vector of type REAL(c_double), DIMENSION(:), ALLOCATABLE for *atom*- or *vector*-style variables, or CHARACTER(LEN=*) for *string*-style and compatible variables. Strings whose length is too short to hold the result will be truncated. Allocatable strings must be allocated before this function is called; see note at extract_global() regarding allocatable strings. Allocatable arrays (for *atom*- and *vector*-style data) will be reallocated on assignment.

Note

LAMMPS cannot easily check if it is valid to access the data referenced by the variables (e.g., computes, fixes, or thermodynamic info), so it may fail with an error. The caller has to make certain that the data are extracted only when it is safe to evaluate the variable and thus an error and crash are avoided.

---

subroutine set_variable(*name*, *str*)

Set the value of a string-style variable.

Deprecated since version 7Feb2024.

This function assigns a new value from the string *str* to the string-style variable *name*. If *name* does not exist or is not a string-style variable, an error is generated.

Warning

This subroutine is deprecated and set_string_variable() should be used instead.

Parameters

- **name** *[character(len=*)]* :: name of the variable
- **str** *[character(len=*)]* :: new value to assign to the variable

Call to

lammps_set_variable()

---

subroutine set_string_variable(*name*, *str*)

Set the value of a string-style variable.

Added in version 7Feb2024.

This function assigns a new value from the string *str* to the string-style variable *name*. If *name* does not exist or is not a string-style variable, an error is generated.

Parameters

- **name** *[character(len=*)]* :: name of the variable
- **str** *[character(len=*)]* :: new value to assign to the variable

Call to

lammps_set_string_variable()

---

subroutine set_internal_variable(*name*, *val*)

Set the value of a internal-style variable.

Added in version 7Feb2024.

This function assigns a new value from the floating-point number *val* to the internal-style variable *name*. If *name* does not exist or is not an internal-style variable, an error is generated.

Parameters

- **name** *[character(len=*)]* :: name of the variable
- **val** *[real(c_double)]* :: new value to assign to the variable

Call to

lammps_set_internal_variable()

---

function eval(*expr*)

This function is a wrapper around lammps_eval() that takes a LAMMPS equal style variable string, evaluates it and returns the resulting scalar value as a floating-point number.

Added in version 4Feb2025.

Parameters

expr *[character(len=*)]* :: string to be evaluated

Call to

lammps_eval()

Return

value *[real(c_double)]* :: result of the evaluated string

---

subroutine clearstep_compute()

Clear whether a compute has been invoked

Added in version 4Feb2025.

Call to

lammps_clearstep_compute()

---

subroutine addstep_compute(*nextstep*)

Add timestep to list of future compute invocations if the compute has been invoked on the current timestep

Added in version 4Feb2025.

overloaded for 32-bit and 64-bit integer arguments

Parameters
nextstep *[integer(kind=8 or kind=4)]* :: next timestep

Call to
lammps_addstep_compute()

---

subroutine addstep_compute_all(*nextstep*)

Add timestep to list of future compute invocations

Added in version 4Feb2025.

overloaded for 32-bit and 64-bit integer arguments

Parameters
nextstep *[integer(kind=8 or kind=4)]* :: next timestep

Call to
lammps_addstep_compute_all()

---

subroutine gather_atoms(*name*, *count*, *data*)

This function calls lammps_gather_atoms() to gather the named atom-based entity for all atoms on all processors and return it in the vector *data*. The vector *data* will be ordered by atom ID, which requires consecutive atom IDs (1 to *natoms*).

Added in version 3Nov2022.

If you need a similar array but have non-consecutive atom IDs, see gather_atoms_concat(); for a similar array but for a subset of atoms, see gather_atoms_subset().

The *data* array will be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = [*x*(1,1), *x*(2,1), *x*(3,1), *x*(1,2), *x*(2,2), *x*(3,2), *x*(1,3), . . .]); *data* must be ALLOCATABLE and will be allocated to length (*count* × *natoms*), as queried by get_natoms().

This function is not compatible with -DLAMMPS_BIGBIG.

Parameters

- **name** *[character(len=*)]* :: desired quantity (e.g., *x* or *mask*)
- **count** *[integer(c_int)]* :: number of per-atom values you expect per atom (e.g., 1 for *type*, *mask*, or *charge*; 3 for *x*, *v*, or *f*). Use *count* = 3 with *image* if you want a single image flag unpacked into *x*/*y*/*z* components.
- **data** *[polymorphic,dimension(:),allocatable]* :: array into which to store the data. Array *must* have the ALLOCATABLE attribute and be of rank 1 (i.e., DIMENSION(:)). If this array is already allocated, it will be reallocated to fit the length of the incoming data. It should have type INTEGER(c_int) if expecting integer data and REAL(c_double) if expecting floating-point data.

Call to

lammps_gather_atoms()

Note

If you want data from this function to be accessible as a two-dimensional array, you can declare a rank-2 pointer and reassign it, like so:

```
USE, INTRINSIC :: ISO_C_BINDING
USE LIBLAMMPS
TYPE(lammps) :: lmp
REAL(c_double), DIMENSION(:), ALLOCATABLE, TARGET :: xdata
REAL(c_double), DIMENSION(:,:), POINTER :: x
! other code to set up, etc.
CALL lmp%gather_atoms('x',3,xdata)
x(1:3,1:size(xdata)/3) => xdata
```

You can then access the *y*-component of atom 3 with x(2,3). See the note about array index order at extract_atom().

---

subroutine gather_atoms_concat(*name*, *count*, *data*)

This function calls lammps_gather_atoms_concat() to gather the named atom-based entity for all atoms on all processors and return it in the vector *data*.

Added in version 3Nov2022.

The vector *data* will not be ordered by atom ID, and there is no restriction on the IDs being consecutive. If you need the IDs, you can do another gather_atoms_concat() with *name* set to id.

If you need a similar array but have consecutive atom IDs, see gather_atoms(); for a similar array but for a subset of atoms, see gather_atoms_subset().

This function is not compatible with -DLAMMPS_BIGBIG.

Parameters

- **name** *[character(len=*)]* :: desired quantity (e.g., *x* or *mask*)
- **count** *[integer(c_int)]* :: number of per-atom values you expect per atom (e.g., 1 for *type*, *mask*, or *charge*; 3 for *x*, *v*, or *f*). Use *count* = 3 with *image* if you want a single image flag unpacked into *x*/*y*/*z* components.
- **data** *[polymorphic,dimension(:),allocatable]* :: array into which to store the data. Array *must* have the ALLOCATABLE attribute and be of rank 1 (i.e., DIMENSION(:)). If this array is already allocated, it will be reallocated to fit the length of the incoming data. It should have type INTEGER(c_int) if expecting integer data and REAL(c_double) if expecting floating-point data.

Call to

lammps_gather_atoms_concat()

---

subroutine gather_atoms_subset(*name*, *count*, *ids*, *data*)

This function calls lammps_gather_atoms_subset() to gather the named atom-based entity for the atoms in the array *ids* from all processors and return it in the vector *data*.

Added in version 3Nov2022.

This subroutine gathers data for the requested atom IDs and stores them in a one-dimensional allocatable array. The data will be ordered by atom ID, but there is no requirement that the IDs be consecutive. If you wish to return a similar array for *all* the atoms, use gather_atoms() or gather_atoms_concat().

The *data* array will be in groups of *count* values, sorted by atom ID in the same order as the array *ids* (e.g., if *name* is *x*, *count* = 3, and *ids* is [100, 57, 210], then *data* might look like [*x*(1,100), *x*(2,100), *x*(3,100), *x*(1,57), *x*(2,57), *x*(3,57), *x*(1,210), . . .]; *ids* must be provided by the user, and *data* must be of rank 1 (i.e., DIMENSION(:)) and have the ALLOCATABLE attribute.

This function is not compatible with -DLAMMPS_BIGBIG.

Parameters

- **name** *[character(len=*)]* :: desired quantity (e.g., *x* or *mask*)
- **count** *[integer(c_int)]* :: number of per-atom values you expect per atom (e.g., 1 for *type*, *mask*, or *charge*; 3 for *x*, *v*, or *f*). Use *count* = 3 with *image* if you want a single image flag unpacked into *x*/*y*/*z* components.
- **ids** *[integer(c_int),dimension(:)]* :: atom IDs corresponding to the atoms to be gathered
- **data** *[polymorphic,dimension(:),allocatable]* :: array into which to store the data. Array *must* have the ALLOCATABLE attribute and be of rank 1 (i.e., DIMENSION(:)). If this array is already allocated, it will be reallocated to fit the length of the incoming data. It should have type INTEGER(c_int) if expecting integer data and REAL(c_double) if expecting floating-point data.

Call to

lammps_gather_atoms_subset()

---

subroutine scatter_atoms(*name*, *data*)

This function calls lammps_scatter_atoms() to scatter the named atom-based entities in *data* to all processors.

Added in version 3Nov2022.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to all atoms on all processors. The data must be ordered by atom ID, with the requirement that the IDs be consecutive. Use scatter_atoms_subset() to scatter data for some (or all) atoms, in any order.

The *data* array needs to be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = [*x*(1,1), *x*(2,1), *x*(3,1), *x*(1,2), *x*(2,2), *x*(3,2), *x*(1,3), . . .]); *data* must be of length *natoms* or 3**natoms*.

Parameters

- **name** *[character(len=*)]* :: quantity to be scattered (e.g., *x* or *charge*)
- **data** *[polymorphic,dimension(:)]* :: per-atom values packed in a one-dimensional array containing the data to be scattered. This array must have length *natoms* (e.g., for *type* or *charge*) or length *natoms* × 3 (e.g., for *x* or *f*). The array *data* must be rank 1 (i.e., DIMENSION(:)) and be of type INTEGER(c_int) (e.g., for *mask* or *type*) or of type REAL(c_double) (e.g., for *x* or *charge* or *f*).

Call to

lammps_scatter_atoms()

---

subroutine scatter_atoms_subset(*name*, *ids*, *data*)

This function calls lammps_scatter_atoms_subset() to scatter the named atom-based entities in *data* to all processors.

Added in version 3Nov2022.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to a subset of atoms on all processors. The array *data* contains data associated with atom IDs, but there is no requirement that the IDs be consecutive, as they are provided in a separate array, *ids*. Use scatter_atoms() to scatter data for all atoms, in order.

The *data* array needs to be organized in groups of 1 or 3 values, depending on which quantity is being scattered, with the groups in the same order as the array *ids*. For example, if you want *data* to be the array [*x*(1,1), *x*(2,1), *x*(3,1), *x*(1,100), *x*(2,100), *x*(3,100), *x*(1,57), *x*(2,57), *x*(3,57)], then *ids* would be [1, 100, 57] and *name* would be *x*.

Parameters

- **name** *[character(len=*)]* :: quantity to be scattered (e.g., *x* or *charge*)
- **ids** *[integer(c_int),dimension(:)]* :: atom IDs corresponding to the atoms being scattered
- **data** *[polymorphic,dimension(:)]* :: per-atom values packed into a one-dimensional array containing the data to be scattered. This array must have either the same length as *ids* (for *mask*, *type*, etc.) or three times its length (for *x*, *f*, etc.); the array must be rank 1 and be of type INTEGER(c_int) (e.g., for *mask* or *type*) or of type REAL(c_double) (e.g., for *charge*, *x*, or *f*).

Call to

lammps_scatter_atoms_subset()

---

subroutine gather_bonds(*data*)

Gather type and constituent atom information for all bonds.

Added in version 3Nov2022.

This function copies the list of all bonds into an allocatable array. The array will be filled with (bond type, bond atom 1, bond atom 2) for each bond. The array is allocated to the right length (i.e., three times the number of bonds). The array *data* must be of the same type as the LAMMPS tagint type, which is equivalent to either INTEGER(c_int) or INTEGER(c_int64_t), depending on whether -DLAMMPS_BIGBIG was used when LAMMPS was built. If the supplied array does not match, an error will result at run-time.

An example of how to use this routine is below:

```
PROGRAM bonds
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int
  USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : OUTPUT_UNIT
  USE LIBLAMMPS
  IMPLICIT NONE
  INTEGER(c_int), DIMENSION(:), ALLOCATABLE, TARGET :: bonds
  INTEGER(c_int), DIMENSION(:,:), POINTER :: bonds_array
  TYPE(lammps) :: lmp
  INTEGER :: i
  ! other commands to initialize LAMMPS, create bonds, etc.
  CALL lmp%gather_bonds(bonds)
  bonds_array(1:3, 1:SIZE(bonds)/3) => bonds
  DO i = 1, SIZE(bonds)/3
```

(continues on next page)

(continued from previous page)

```
  WRITE(OUTPUT_UNIT,'(A,1X,I4,A,I4,1X,I4)') 'bond', bonds_array(1,i), &
    '; type = ', bonds_array(2,i), bonds_array(3,i)
 END DO
END PROGRAM bonds
```

Parameters

data *[integer(kind=*),allocatable]* :: array into which to copy the result. *The KIND parameter is either c_int or, if LAMMPS was compiled with -DLAMMPS_BIGBIG, kind c_int64_t.

Call to

lammps_gather_bonds()

---

subroutine gather_angles(*data*)

Gather type and constituent atom information for all angles.

Added in version 8Feb2023.

This function copies the list of all angles into an allocatable array. The array will be filled with (angle type, angle atom 1, angle atom 2, angle atom 3) for each angle. The array is allocated to the right length (i.e., four times the number of angles). The array *data* must be of the same type as the LAMMPS tagint type, which is equivalent to either INTEGER(c_int) or INTEGER(c_int64_t), depending on whether -DLAMMPS_BIGBIG was used when LAMMPS was built. If the supplied array does not match, an error will result at run-time.

An example of how to use this routine is below:

```
PROGRAM angles
 USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int
 USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : OUTPUT_UNIT
 USE LIBLAMMPS
 IMPLICIT NONE
 INTEGER(c_int), DIMENSION(:), ALLOCATABLE, TARGET :: angles
 INTEGER(c_int), DIMENSION(:,:), POINTER :: angles_array
 TYPE(lammps) :: lmp
 INTEGER :: i
 ! other commands to initialize LAMMPS, create angles, etc.
 CALL lmp%gather_angles(angles)
 angles_array(1:4, 1:SIZE(angles)/4) => angles
 DO i = 1, SIZE(angles)/4
   WRITE(OUTPUT_UNIT,'(A,1X,I4,A,I4,1X,I4,1X,I4)') 'angle', angles_array(1,i), &
     '; type = ', angles_array(2,i), angles_array(3,i), angles_array(4,i)
 END DO
END PROGRAM angles
```

Parameters

data *[integer(kind=*),allocatable]* :: array into which to copy the result. *The KIND parameter is either c_int or, if LAMMPS was compiled with -DLAMMPS_BIGBIG, kind c_int64_t.

Call to

lammps_gather_angles()

---

subroutine gather(*self*, *name*, *count*, *data*)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes, in order by atom ID.

Added in version 22Dec2022.

This subroutine gathers data from all processes and stores them in a one-dimensional allocatable array. The array *data* will be ordered by atom ID, which requires consecutive IDs (1 to *natoms*). If you need a similar array but for non-consecutive atom IDs, see lammps_gather_concat(); for a similar array but for a subset of atoms, see lammps_gather_subset().

The *data* array will be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x*, then *data* is [x(1,1), x(2,1), x(3,1), x(1,2), x(2,2), x(3,2), x(1,3), . . .]); *data* must be ALLOCATABLE and will be allocated to length (*count* × *natoms*), as queried by get_natoms().

This function will return an error if fix or compute data are requested and the fix or compute ID given does not have per-atom data. See the note about re-interpreting the vector as a matrix at gather_atoms().

This function is not compatible with -DLAMMPS_BIGBIG.

Parameters

- **name** *[character(len=*)]* :: desired quantity (e.g., "x" or "mask" for atom properties, "f_id" for per-atom fix data, "c_id" for per-atom compute data, "d_name" or "i_name" for fix property/atom vectors with *count* = 1, "d2_name" or "i2_name" for fix property/atom vectors with *count* > 1)
- **count** *[integer(c_int)]* :: number of per-atom values (e.g., 1 for *type* or *charge*, 3 for *x* or *f*); use *count* = 3 with *image* if you want the image flags unpacked into (*x*,*y*,*z*) components.
- **data** *[real(c_double),dimension(:),allocatable]* :: array into which to store the data. Array *must* have the ALLOCATABLE attribute and be of rank 1 (i.e., DIMENSION(:)). If this array is already allocated, it will be reallocated to fit the length of the incoming data.

Call to

lammps_gather()

---

subroutine gather_dihedrals(*data*)

Gather type and constituent atom information for all dihedrals.

Added in version 8Feb2023.

This function copies the list of all dihedrals into an allocatable array. The array will be filled with (dihedral type, dihedral atom 1, dihedral atom 2, dihedral atom 3, dihedral atom 4) for each dihedral. The array is allocated to the right length (i.e., five times the number of dihedrals). The array *data* must be of the same type as the LAMMPS tagint type, which is equivalent to either INTEGER(c_int) or INTEGER(c_int64_t), depending on whether -DLAMMPS_BIGBIG was used when LAMMPS was built. If the supplied array does not match, an error will result at run-time.

An example of how to use this routine is below:

```
PROGRAM dihedrals
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int
  USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : OUTPUT_UNIT
  USE LIBLAMMPS
  IMPLICIT NONE
  INTEGER(c_int), DIMENSION(:), ALLOCATABLE, TARGET :: dihedrals
  INTEGER(c_int), DIMENSION(:,:), POINTER :: dihedrals_array
```

(continues on next page)

(continued from previous page)

```
  TYPE(lammps) :: lmp
  INTEGER :: i
  ! other commands to initialize LAMMPS, create dihedrals, etc.
  CALL lmp%gather_dihedrals(dihedrals)
  dihedrals_array(1:5, 1:SIZE(dihedrals)/5) => dihedrals
  DO i = 1, SIZE(dihedrals)/5
    WRITE(OUTPUT_UNIT,'(A,1X,I4,A,I4,1X,I4,1X,I4,1X,I4)') 'dihedral', dihedrals_array(1,i), &
      '; type = ', dihedrals_array(2,i), dihedrals_array(3,i), dihedrals_array(4,i), dihedrals_array(5,i)
  END DO
END PROGRAM dihedrals
```

Parameters

data *[integer(kind=*),allocatable]* :: array into which to copy the result. *The KIND parameter is either c_int or, if LAMMPS was compiled with -DLAMMPS_BIGBIG, kind c_int64_t.

Call to

lammps_gather_dihedrals()

---

subroutine gather_impropers(*data*)

Gather type and constituent atom information for all impropers.

Added in version 8Feb2023.

This function copies the list of all impropers into an allocatable array. The array will be filled with (improper type, improper atom 1, improper atom 2, improper atom 3, improper atom 4) for each improper. The array is allocated to the right length (i.e., five times the number of impropers). The array *data* must be of the same type as the LAMMPS tagint type, which is equivalent to either INTEGER(c_int) or INTEGER(c_int64_t), depending on whether -DLAMMPS_BIGBIG was used when LAMMPS was built. If the supplied array does not match, an error will result at run-time.

An example of how to use this routine is below:

```
PROGRAM impropers
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int
  USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : OUTPUT_UNIT
  USE LIBLAMMPS
  IMPLICIT NONE
  INTEGER(c_int), DIMENSION(:), ALLOCATABLE, TARGET :: impropers
  INTEGER(c_int), DIMENSION(:,:), POINTER :: impropers_array
  TYPE(lammps) :: lmp
  INTEGER :: i
  ! other commands to initialize LAMMPS, create impropers, etc.
  CALL lmp%gather_impropers(impropers)
  impropers_array(1:5, 1:SIZE(impropers)/5) => impropers
  DO i = 1, SIZE(impropers)/5
    WRITE(OUTPUT_UNIT,'(A,1X,I4,A,I4,1X,I4,1X,I4,1X,I4)') 'improper', impropers_array(1,i),␣
↪&
      '; type = ', impropers_array(2,i), impropers_array(3,i), impropers_array(4,i), impropers_
↪array(5,i)
  END DO
END PROGRAM impropers
```

Parameters

data *[integer(kind=*),allocatable]* :: array into which to copy the result. *The KIND parameter is either c_int or, if LAMMPS was compiled with -DLAMMPS_BIGBIG, kind c_int64_t.

Call to

lammps_gather_impropers()

---

subroutine gather_concat(*self*, *name*, *count*, *data*)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes, unordered.

Added in version 22Dec2022.

This subroutine gathers data for all atoms and stores them in a one-dimensional allocatable array. The data will be a concatenation of chunks from each processor's owned atoms, in whatever order the atoms are in on each processor. This process has no requirement that the atom IDs be consecutive. If you need the ID of each atom, you can do another call to either gather_atoms_concat() or gather_concat() with *name* set to id. If you have consecutive IDs and want the data to be in order, use gather(); for a similar array but for a subset of atoms, use gather_subset().

The *data* array will be in groups of *count* values, with *natoms* groups total, but not in order by atom ID (e.g., if *name* is *x* and *count* is 3, then *data* might be something like [x(1,11), x(2,11), x(3,11), x(1,3), x(2,3), x(3,3), x(1,5), ...]); *data* must be ALLOCATABLE and will be allocated to length (*count* $\times$ *natoms*), as queried by get_natoms().

This function is not compatible with -DLAMMPS_BIGBIG.

Parameters

- **name** *[character(len=*)]* :: desired quantity (e.g., "x" or "mask" for atom properties, "f_id" for per-atom fix data, "c_id" for per-atom compute data, "d_name" or "i_name" for fix property/atom vectors with *count* = 1, "d2_name" or "i2_name" for fix property/atom vectors with *count* > 1)
- **count** *[integer(c_int)]* :: number of per-atom values you expect per atom (e.g., 1 for *type*, *mask*, or *charge*; 3 for *x*, *v*, or *f*). Use *count* = 3 with *image* if you want a single image flag unpacked into *x*/*y*/*z* components.
- **data** *[polymorphic,dimension(:),allocatable]* :: array into which to store the data. Array *must* have the ALLOCATABLE attribute and be of rank 1 (i.e., DIMENSION(:)). If this array is already allocated, it will be reallocated to fit the length of the incoming data. It should have type INTEGER(c_int) if expecting integer data and REAL(c_double) if expecting floating-point data.

Call to

lammps_gather_concat()

---

subroutine gather_subset(*name*, *count*, *ids*, *data*)

Gather the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities from all processes for a subset of atoms.

Added in version 22Dec2022.

This subroutine gathers data for the requested atom IDs and stores them in a one-dimensional allocatable array. The data will be ordered by atom ID, but there is no requirement that the IDs be consecutive. If you wish to return a similar array for *all* the atoms, use gather() or gather_concat().

The *data* array will be in groups of *count* values, sorted by atom ID in the same order as the array *ids* (e.g., if *name* is *x*, *count* = 3, and *ids* is [100, 57, 210], then *data* might look like [*x*(1,100), *x*(2,100), *x*(3,100), *x*(1,57), *x*(2,57), *x*(3,57), *x*(1,210), . . .]); *ids* must be provided by the user, and *data* must have the ALLOCATABLE attribute and be of rank 1 (i.e., DIMENSION(:)). If *data* is already allocated, it will be reallocated to fit the length of the incoming data.

This function is not compatible with -DLAMMPS_BIGBIG.

Parameters

- **name** *[character(len=*)]* :: quantity to be scattered
- **ids** *[integer(c_int),dimension(:)]* :: atom IDs corresponding to the atoms being scattered (e.g., "x" or "f" for atom properties, "f_id" for per-atom fix data, "c_id" for per-atom compute data, "d_name" or "i_name" for fix property/atom vectors with *count* = 1, "d2_name" or "i2_name" for fix property/atom vectors with *count* $>$ 1)
- **count** *[integer(c_int)]* :: number of per-atom values you expect per atom (e.g., 1 for *type*, *mask*, or *charge*; 3 for *x*, *v*, or *f*). Use *count* = 3 with *image* if you want a single image flag unpacked into *x*/*y*/*z* components.
- **data** *[polymorphic,dimension(:),allocatable]* :: per-atom values packed into a one-dimensional array containing the data to be scattered. This array must have the ALLOCATABLE attribute and will be allocated either to the same length as *ids* (for *mask*, *type*, etc.) or to three times its length (for *x*, *f*, etc.); the array must be rank 1 and be of type INTEGER(c_int) (e.g., for *mask* or *type*) or of type REAL(c_double) (e.g., for *charge*, *x*, or *f*).

Call to

lammps_gather_subset()

---

subroutine scatter(*name*, *data*)

This function calls lammps_scatter() to scatter the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entity in *data* to all processes.

Added in version 22Dec2022.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to all atoms on all processes. The data must be ordered by atom ID, with the requirement that the IDs be consecutive. Use scatter_subset() to scatter data for some (or all) atoms, unordered.

The *data* array needs to be ordered in groups of *count* values, sorted by atom ID (e.g., if *name* is *x* and *count* = 3, then *data* = [*x*(1,1), *x*(2,1), *x*(3,1), *x*(1,2), *x*(2,2), *x*(3,2), *x*(1,3), . . .]); *data* must be of length (*count* $\times$ *natoms*).

This function is not compatible with -DLAMMPS_BIGBIG.

Parameters

- **name** *[character(len=*)]* :: desired quantity (e.g., "x" or "f" for atom properties, "f_id" for per-atom fix data, "c_id" for per-atom compute data, "d_name" or "i_name" for fix property/atom vectors with *count* = 1, "d2_name" or "i2_name" for fix property/atom vectors with *count* $>$ 1)
- **data** *[polymorphic,dimension(:)]* :: per-atom values packed in a one-dimensional array; *data* should be of type INTEGER(c_int) or REAL(c_double), depending on the type of data being scattered, and be of rank 1 (i.e., DIMENSION(:)).

Call to

lammps_scatter()

subroutine scatter_subset(*name*, *ids*, *data*)

This function calls lammps_scatter_subset() to scatter the named per-atom, per-atom fix, per-atom compute, or fix property/atom-based entities in *data* from a subset of atoms to all processes.

Added in version 22Dec2022.

This subroutine takes data stored in a one-dimensional array supplied by the user and scatters them to a subset of atoms on all processes. The array *data* contains data associated with atom IDs, but there is no requirement that the IDs be consecutive, as they are provided in a separate array. Use scatter() to scatter data for all atoms, in order.

The *data* array needs to be organized in groups of *count* values, with the groups in the same order as the array *ids*. For example, if you want *data* to be the array [x(1,1), x(2,1), x(3,1), x(1,100), x(2,100), x(3,100), x(1,57), x(2,57), x(3,57)], then *count* = 3 and *ids* = [1, 100, 57].

This function is not compatible with -DLAMMPS_BIGBIG.

Parameters

- **name** *[character(len=*)]* :: desired quantity (e.g., "x" or "mask" for atom properties, "f_id" for per-atom fix data, "c_id" for per-atom compute data, "d_name" or "i_name" for fix property/atom vectors with *count* = 1, "d2_name" or "i2_name" for fix property/atom vectors with *count* > 1)
- **ids** *[integer(c_int)]* :: list of atom IDs to scatter data for
- **data** *[polymorphic ,dimension(:)]* :: per-atom values packed in a one-dimensional array of length *size(ids) * count*.

Call to

lammps_scatter_subset()

---

function create_atoms(*[id,] type, x, [v,] [image,] [bexpand]*)

This method calls lammps_create_atoms() to create additional atoms from a given list of coordinates and a list of atom types. Additionally, the atom IDs, velocities, and image flags may be provided.

Added in version 3Nov2022.

Parameters

- **type** *[integer(c_int),dimension(N)]* :: vector of N atom types (required/see note below)
- **x** *[real(c_double),dimension(3N)]* :: vector of $3N$ $x/y/z$ positions of the new atoms, arranged as $[x_1, y_1, z_1, x_2, y_2, \ldots]$ (required/see note below)

Options

- **id** *[integer(kind=*),dimension(N),optional]* :: vector of N atom IDs; if absent, LAMMPS will generate them for you. *The KIND parameter should be c_int unless LAMMPS was compiled with -DLAMMPS_BIGBIG, in which case it should be c_int64_t.
- **v** *[real(c_double),dimension(3N),optional]* :: vector of $3N$ x/y/z velocities of the new atoms, arranged as $[v_{1,x}, v_{1,y}, v_{1,z}, v_{2,x}, \ldots]$; if absent, they will be set to zero
- **image** *[integer(kind=*),dimension(N),optional]* :: vector of N image flags; if absent, they are set to zero. *The KIND parameter should be c_int unless LAMMPS was compiled with -DLAMMPS_BIGBIG, in which case it should be c_int64_t. See note below.

- **bexpand** *[logical,optional]* :: if .TRUE., atoms outside of shrink-wrap boundaries will be created, not dropped, and the box dimensions will be extended. Default is .FALSE.

Return
atoms *[integer(c_int)]* :: number of created atoms

Call to
lammps_create_atoms()

Note

The *type* and *x* arguments are required, but they are declared OPTIONAL in the module because making them mandatory would require *id* to be present as well. To have LAMMPS generate the ids for you, use a call something like

```
lmp%create_atoms(type=new_types, x=new_xs)
```

Note

When LAMMPS has been compiled with -DLAMMPS_BIGBIG, it is not possible to include the *image* parameter but omit the *id* parameter. Either *id* must be present, or both *id* and *image* must be absent. This is required because having all arguments be optional in both generic functions creates an ambiguous interface. This limitation does not exist if LAMMPS was not compiled with -DLAMMPS_BIGBIG.

---

subroutine create_molecule(*id*, *jsonstr*)

Add molecule template from string with JSON data

Added in version 22Jul2025.

Parameters

- **id** *[character(len=*)]* :: desired molecule-ID
- **jsonstr** *[character(len=*)]* :: string with JSON data defining the molecule template

Call to
lammps_create_molecule()

---

function find_pair_neighlist(*style[, exact][, nsub][, reqid]*)

Find index of a neighbor list requested by a pair style.

Added in version 3Nov2022.

This function determines which of the available neighbor lists for pair styles matches the given conditions. It first matches the style name. If *exact* is .TRUE., the name must match exactly; if .FALSE., a regular expression or sub-string match is done. If the pair style is *hybrid* or *hybrid/overlay*, the style is matched against the sub-styles instead. If the same pair style is used multiple times as a sub-style, the *nsub* argument must be > 0; this argument represents the *n*th instance of the sub-style (same as for the *pair_coeff* command, for example). In that case, *nsub* = 0 will not produce a match, and the function will return -1.

The final condition to be checked is the request ID (*reqid*). This will usually be zero, but some pair styles request multiple neighbor lists and set the request ID to a value greater than zero.

Parameters
style *[character(len=*)]* :: String used to search for pair style instance.

Options

- **exact** *[logical,optional]* :: Flag to control whether style should match exactly or only a regular expression/sub-string match is applied. Default: .TRUE..
- **nsub** *[integer(c_int),optional]* :: Match *nsub*th hybrid sub-style instance of the same style. Default: 0.
- **reqid** *[integer(c_int),optional]* :: Request ID to identify the neighbor list in case there are multiple requests from the same pair style instance. Default: 0.

Call to
lammps_find_pair_neighlist()

Return
index *[integer(c_int)]* :: Neighbor list index if found, otherwise −1.

---

function find_fix_neighlist(*id*[, *reqid*])

Find index of a neighbor list requested by a fix.

Added in version 3Nov2022.

The neighbor list request from a fix is identified by the fix ID and the request ID. The request ID is typically zero, but will be > 0 for fixes with multiple neighbor list requests.

Parameters
id *[character(len=*)]* :: Identifier of fix instance

Options
reqid *[integer(c_int),optional]* :: request ID to identify the neighbor list in cases in which there are multiple requests from the same fix. Default: 0.

Call to
lammps_find_fix_neighlist()

Return
index *[integer(c_int)]* :: neighbor list index if found, otherwise −1

---

function find_compute_neighlist(*id*[, *reqid*])

Find index of a neighbor list requested by a compute.

Added in version 3Nov2022.

The neighbor list request from a compute is identified by the compute ID and the request ID. The request ID is typically zero, but will be > 0 in case a compute has multiple neighbor list requests.

Parameters
id *[character(len=*)]* :: Identifier of compute instance.

Options
reqid *[integer(c_int),optional]* :: request ID to identify the neighbor list in cases in which there are multiple requests from the same compute. Default: 0.

Call to
lammps_find_compute_neighlist()

Return
index *[integer(c_int)]* :: neighbor list index if found, otherwise −1.

---

function neighlist_num_elements(*idx*)

Return the number of entries in the neighbor list with the given index.

Added in version 3Nov2022.

Parameters
idx *[integer(c_int)]* :: neighbor list index

Call to
lammps_neighlist_num_elements() lammps_neighlist_num_elements()

Return
inum *[integer(c_int)]* :: number of entries in neighbor list, or −1 if *idx* is not a valid index.

---

subroutine neighlist_element_neighbors(*idx*, *element*, *iatom*, *neighbors*)

Return atom local index, number of neighbors, and array of neighbor local atom indices of a neighbor list entry.

Added in version 3Nov2022.

Parameters

- **idx** *[integer(c_int)]* :: index of this neighbor list in the list of all neighbor lists
- **element** *[integer(c_int)]* :: index of this neighbor list entry
- **iatom** *[integer(c_int)]* :: local atom index (i.e., in the range [1,nlocal+nghost]; -1 if invalid or element value
- **neighbors** *[integer(c_int),dimension(:),pointer]* :: pointer to an array of neighboring atom local indices

Call to
lammps_neighlist_element_neighbors()

---

function version()

This method returns the numeric LAMMPS version like lammps_version() does.

Call to
lammps_version()

Return
version *[integer]* :: LAMMPS version

---

subroutine get_os_info(*buffer*)

This function can be used to retrieve detailed information about the hosting operating system and compiler/runtime environment.

Added in version 3Nov2022.

A suitable buffer has to be provided. The assembled text will be truncated so as not to overflow this buffer. The string is typically a few hundred bytes long.

Parameters
buffer *[character(len=*)]* :: string that will house the information.

Call to
lammps_get_os_info()

---

function config_has_mpi_support()

This function is used to query whether LAMMPS was compiled with a real MPI library or in serial.

Added in version 3Nov2022.

Call to
lammps_config_has_mpi_support()

Return
has_mpi *[logical]* :: .FALSE. when compiled with STUBS, .TRUE. if complied with MPI.

---

function config_has_omp_support()

This function is used to query whether LAMMPS was compiled with OpenMP enabled.

Added in version 10Sep2025.

Call to
lammps_config_has_omp_support()

Return
has_omp *[logical]* :: .TRUE. when compiled with OpenMP enabled, .FALSE. if not.

---

function config_has_gzip_support()

Check if the LAMMPS library supports reading or writing compressed files via a pipe to gzip or similar compression programs.

Added in version 3Nov2022.

Several LAMMPS commands (e.g., *read_data command*, *write_data command*, *dump styles atom, custom, and xyz*) support reading and writing compressed files via creating a pipe to the gzip program. This function checks whether this feature was *enabled at compile time*. It does **not** check whether gzip or any other supported compression programs themselves are installed and usable.

Call to
lammps_config_has_gzip_support()

Return
has_gzip *[logical]*

---

function config_has_png_support()

Check if the LAMMPS library supports writing PNG format images.

Added in version 3Nov2022.

The LAMMPS *dump style image* supports writing multiple image file formats. Most of them, however, need support from an external library, and using that has to be *enabled at compile time*. This function checks whether support for the PNG image file format is available in the current LAMMPS library.

Call to
lammps_config_has_png_support()

Return
has_png *[logical]*

---

function config_has_jpeg_support()

Check if the LAMMPS library supports writing JPEG format images.

Added in version 3Nov2022.

The LAMMPS *dump style image* supports writing multiple image file formats. Most of them, however, need support from an external library, and using that has to be *enabled at compile time*. This function checks whether support for the JPEG image file format is available in the current LAMMPS library.

Call to
lammps_config_has_jpeg_support()

Return
has_jpeg *[logical]*

---

function config_has_ffmpeg_support()

Check if the LAMMPS library supports creating movie files via a pipe to ffmpeg.

Added in version 3Nov2022.

The LAMMPS *dump style movie* supports generating movies from images on-the-fly via creating a pipe to the ffmpeg program. This function checks whether this feature was *enabled at compile time*. It does **not** check whether the ffmpeg itself is installed and usable.

Call to
lammps_config_has_ffmpeg_support()

Return
has_ffmpeg *[logical]*

---

function config_has_exceptions()

Check whether LAMMPS errors will throw C++ exceptions.

Added in version 3Nov2022.

When using the library interface, the library interface functions will "catch" exceptions, and then the error status can be checked by calling has_error(). The most recent error message can be retrieved via get_last_error_message(). This allows to restart a calculation or delete and recreate the LAMMPS instance when a C++ exception occurs. One application of using exceptions this way is LAMMPS-GUI

Call to
lammps_config_has_exceptions()

Return
has_exceptions *[logical]*

---

function config_has_package(*name*)

Check whether a specific package has been included in LAMMPS

Added in version 3Nov2022.

This function checks whether the LAMMPS library in use includes the specific *LAMMPS package* provided as argument.

Call to
lammps_config_has_package()

Return
has_package *[logical]*

---

function config_package_count()

Count the number of installed packages in the LAMMPS library.

Added in version 3Nov2022.

This function counts how many *LAMMPS packages* are included in the LAMMPS library in use. It directly calls the C library function lammps_config_package_count().

Call to
lammps_config_package_count()

Return
npackages *[integer(c_int)]* :: number of packages installed

---

subroutine config_package_name(*idx*, *buffer*)

Get the name of a package in the list of installed packages in the LAMMPS library.

Added in version 3Nov2022.

This subroutine copies the name of the package with the index *idx* into the provided string *buffer*. If the name of the package exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, *buffer* is set to an empty string.

Parameters

- **idx** *[integer(c_int)]* :: index of the package in the list of included packages ($0 \leq idx <$ package count)
- **buffer** *[character(len=*)]* :: string to hold the name of the package

Call to
lammps_config_package_name()

---

subroutine installed_packages(*package*[, *length*])

Obtain a list of the names of enabled packages in the LAMMPS shared library and store it in *package*.

Added in version 3Nov2022.

This function is analogous to the installed_packages function in the Python API. The optional argument *length* sets the length of each string in the vector *package* (default: 31).

Parameters
package *[character(len=:),dimension(:),allocatable]* :: list of packages; *must* have the ALLOCATABLE attribute and be of rank 1 (i.e., DIMENSION(:)) with allocatable length.

Options

length *[integer,optional]* :: length of each string in the list. Default: 31.

Call to

lammps_config_package_count() lammps_config_package_name()

---

function config_accelerator(*package*, *category*, *setting*)

This function calls lammps_config_accelerator() to check the availability of compile time settings of included *accelerator packages* in LAMMPS.

Added in version 3Nov2022.

Supported packages names are "GPU", "KOKKOS", "INTEL", and "OPENMP". Supported categories are "api" with possible settings "cuda", "hip", "phi", "pthreads", "opencl", "openmp", and "serial"; and "precision" with possible settings "double", "mixed", and "single".

Parameters

- **package** *[character(len=*)]* :: string with the name of the accelerator package
- **category** *[character(len=*)]* :: string with the name of the setting
- **setting** *[character(len=*)]* :: string with the name of the specific setting

Call to

lammps_config_accelerator()

Return

available *[logical]* :: .TRUE. if the combination of package, category, and setting is available, otherwise .FALSE..

---

function has_gpu_device()

Checks for the presence of a viable GPU package device.

Added in version 3Nov2022.

This function calls lammps_has_gpu_device(), which checks at runtime whether an accelerator device is present that can be used with the *GPU package*.

More detailed information about the available device or devices can be obtained by calling the get_gpu_device_info() subroutine.

Call to

lammps_has_gpu_device()

Return

available *[logical]* :: .TRUE. if a viable device is available, .FALSE. if not.

---

subroutine get_gpu_device_info(*buffer*)

Get GPU package device information.

Added in version 3Nov2022.

Calls lammps_get_gpu_device_info() to retrieve detailed information about any accelerator devices that are viable for use with the *GPU package*. It will fill *buffer* with a string that is equivalent to the output of the nvc_get_device or ocl_get_device or hip_get_device tools that are compiled alongside LAMMPS if the GPU package is enabled.

A suitable-length Fortran string has to be provided. The assembled text will be truncated so as not to overflow this buffer. This string can be several kilobytes long if multiple devices are present.

Parameters
buffer *[character(len=*)]* :: string into which to copy the information.

Call to
lammps_get_gpu_device_info()

---

function has_style(*category*, *name*)

Check whether a specific style has been included in LAMMPS.

Added in version 3Nov2022.

This function calls lammps_has_style() to check whether the LAMMPS library in use includes the specific style *name* associated with a specific *category* provided as arguments. Please see lammps_has_style() for a list of valid categories.

Parameters

- **category** *[character(len=*)]* :: category of the style
- **name** *[character(len=*)]* :: name of the style

Call to
lammps_has_style()

Return
has_style *[logical]* :: .TRUE. if included, .FALSE. if not.

---

function style_count(*category*)

Count the number of styles of *category* in the LAMMPS library.

Added in version 3Nov2022.

This function counts how many styles in the provided *category* are included in the LAMMPS library currently in use. Please see lammps_has_style() for a list of valid categories.

Parameters
category *[character(len=*)]* :: category of styles to count

Call to
lammps_style_count()

Return
count *[integer(c_int)]* :: number of styles in *category*

---

subroutine style_name(*category*, *idx*, *buffer*)

Look up the name of a style by index in the list of styles of a given category in the LAMMPS library.

Added in version 3Nov2022.

This function calls lammps_style_name() and copies the name of the *category* style with index *idx* into the provided string *buffer*. The length of *buffer* must be long enough to contain the name of the style; if it is too short, the name will be truncated accordingly. If *idx* is out of range, *buffer* will be the empty string and a warning will be issued.

Parameters

- **category** *[character(len=*)]* :: category of styles
- **idx** *[integer(c_int)]* :: index of the style in the list of *category* styles ($1 \leq idx \leq$ style count)
- **buffer** *[character(len*)]* :: string buffer to copy the name of the style into

Call to
lammps_style_name()

---

function has_id(*category*, *name*)

This function checks if the current LAMMPS instance a *category* ID of the given *name* exists. Valid categories are: *compute*, *dump*, *fix*, *group*, *molecule*, *region*, and *variable*.

Added in version 3Nov2022.

Parameters

- **category** *[character(len=*)]* :: category of the ID
- **name** *[character(len=*)]* :: name of the ID

Call to
lammps_has_id()

Return
has_id *[logical]* :: .TRUE. if *category* style *name* exists, .FALSE. if not.

---

function id_count(*category*)

This function counts how many IDs in the provided *category* are defined in the current LAMMPS instance. Please see has_id() for a list of valid categories.

Added in version 3Nov2022.

Parameters
category *[character(len=*)]* :: category of the ID

Call to
lammps_id_count()

Return
count *[integer(c_int)]* :: number of IDs in *category*

---

subroutine id_name(*category*, *idx*, *buffer*)

Look up the name of an ID by index in the list of IDs of a given category.

Added in version 3Nov2022.

This function copies the name of the *category* ID with the index *idx* into the provided string *buffer*. The length of the buffer must be long enough to hold the string; if the name of the style exceeds the length of the buffer, it will be truncated accordingly. If *buffer* is ALLOCATABLE, it must be allocated *before* the function is called. If *idx* is out of range, *buffer* is set to an empty string and a warning is issued.

Parameters

- **category** *[character(len=*)]* :: category of IDs
- **idx** *[integer(c_int)]* :: index of the ID in the list of *category* styles ($0 \leq idx <$ *count*)
- **buffer** *[character(len=*)]* :: string into which to copy the name of the style

Call to
lammps_id_name()

---

function plugin_count()

This function counts the number of loaded plugins.

Added in version 3Nov2022.

Call to
lammps_plugin_count()

Return
n *[integer(c_int)]* :: number of loaded plugins

---

subroutine plugin_name(*idx*, *stylebuf*, *namebuf*)

Look up the style and name of a plugin by its index in the list of plugins.

Added in version 3Nov2022.

This function copies the name of the *style* plugin with the index *idx* into the provided C-style string buffer. The length of the buffer must be provided as *buf_size* argument. If the name of the style exceeds the length of the buffer, it will be truncated accordingly. If the index is out of range, both strings are set to the empty string and a warning is printed.

Parameters

- **idx** *[integer(c_int)]* :: index of the plugin in the list all or *style* plugins
- **stylebuf** *[character(len=*)]* :: string into which to copy the style of the plugin
- **namebuf** *[character(len=*)]* :: string into which to copy the style of the plugin

Call to
lammps_plugin_name()

---

function encode_image_flags(*ix*, *iy*, *iz*)

Encodes three integer image flags into a single imageint.

Added in version 3Nov2022.

This function performs the bit-shift, addition, and bit-wise OR operations necessary to combine the values of three integers representing the image flags in the *x*-, *y*-, and *z*-directions. Unless LAMMPS is compiled with -DLAMMPS_BIGBIG, those integers are limited to 10-bit signed integers $[-512, 512)$. If -DLAMMPS_BIGBIG was used when compiling, then the return value is of kind c_int64_t instead of kind c_int, and the valid range for the individual image flags becomes $[-1048576, 1048575)$ (i.e., the range of a 21-bit signed integer). There is no check on whether the arguments conform to these requirements; values out of range will simply be wrapped back into the interval.

Parameters

- **ix** *[integer(c_int)]* :: image flag in *x*-direction
- **iy** *[integer(c_int)]* :: image flag in *y*-direction
- **iz** *[integer(c_int)]* :: image flag in *z*-direction

Return

imageint *[integer(kind=*)]* :: encoded image flag. *The KIND parameter is c_int unless LAMMPS was built with -DLAMMPS_BIGBIG, in which case it is c_int64_t.

Note

The fact that the programmer does not know the KIND parameter of the return value until compile time means that it is impossible to define an interface that works for both sizes of imageint. One side effect of this is that you must assign the return value of this function to a variable; it cannot be used as the argument to another function or as part of an array constructor. For example,

```
my_images = [lmp%encode_image_flags(0,0,0), lmp%encode_image_flags(1,0,0)]
```

will *not* work; instead, do something like

```
my_images(1) = lmp%encode_image_flags(0,0,0)
my_images(2) = lmp%encode_image_flags(1,0,0)
```

---

subroutine decode_image_flags(*image*, *flags*)

This function does the reverse operation of encode_image_flags(): it takes the image flag and performs the bit-shift and bit-masking operations to decode it and stores the resulting three integers into the array *flags*.

Added in version 3Nov2022.

Parameters

- **image** *[integer(kind=*)]* :: encoded image flag. *The KIND parameter is either c_int or, if LAMMPS was compiled with -DLAMMPS_BIGBIG, c_int64_t. Kind compatibility is checked at run-time.
- **flags** *[integer(c_int),dimension(3)]* :: three-element vector where the decoded image flags will be stored.

---

subroutine set_fix_external_callback(*id*, *callback*, *caller*)

Set the callback function for a *fix external* instance with the given ID.

Added in version 22Dec2022.

Fix *external* allows programs that are running LAMMPS through its library interface to modify certain LAMMPS properties on specific time steps, similar to the way other fixes do.

This subroutine sets the callback function for use with the "pf/callback" mode. The function should have Fortran language bindings with the following interface, which depends on how LAMMPS was compiled:

```
ABSTRACT INTERFACE
  SUBROUTINE external_callback(caller, timestep, ids, x, fexternal)
    USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int, c_double, c_int64_t
    CLASS(*), INTENT(INOUT) :: caller
    INTEGER(c_bigint), INTENT(IN) :: timestep
    INTEGER(c_tagint), DIMENSION(:), INTENT(IN) :: ids
    REAL(c_double), DIMENSION(:,:), INTENT(IN) :: x
    REAL(c_double), DIMENSION(:,:), INTENT(OUT) :: fexternal
  END SUBROUTINE external_callback
END INTERFACE
```

where c_bigint is c_int64_t and c_tagint is c_int64_t if -DLAMMPS_BIGBIG was used and c_int otherwise.

The argument *caller* to set_fix_external_callback() is unlimited polymorphic (i.e., it can be any Fortran object you want to pass to the calling function) and will be available as the first argument to the callback function. It can be your LAMMPS instance, which you might need if the callback function needs access to the library interface. The argument must be a scalar; to pass non-scalar data, wrap those data in a derived type and pass an instance of the derived type to *caller*.

The array *ids* is an array of length *nlocal* (as accessed from the Atom class or through extract_global()). The arrays *x* and *fexternal* are 3 × *nlocal* arrays; these are transposed from what they would look like in C (see note about array index order at extract_atom()).

The callback mechanism is one of two ways that forces can be applied to a simulation with the help of *fix external*. The alternative is *array* mode, where one calls fix_external_get_force().

Please see the documentation for *fix external* for more information about how to use the fix and couple it with external programs.

Parameters

- **id** *[character(len=*)]* :: ID of *fix external* instance
- **callback** *[external]* :: subroutine *fix external* should call
- **caller** *[class(*),optional]* :: object you wish to pass to the callback procedure (must be a scalar; see note)

Call to

lammps_set_fix_external_callback()

Note

The interface for your callback function must match types precisely with the abstract interface block given above. **The compiler probably will not be able to check this for you.** In particular, the first argument ("caller") must be of type CLASS(*) or you will probably get a segmentation fault or at least a misinterpretation of whatever is in memory there. You can resolve the object using the SELECT TYPE construct. An example callback function (assuming LAMMPS was compiled with -DLAMMPS_SMALLBIG) that applies something akin to Hooke's Law (with each atom having a different *k* value) is shown below.

```
MODULE stuff
  USE, INTRINSIC :: ISO_C_BINDING, ONLY : c_int, c_double, c_int64_t
  USE, INTRINSIC :: ISO_FORTRAN_ENV, ONLY : error_unit
  IMPLICIT NONE

  TYPE shield
    REAL(c_double), DIMENSION(:,:), ALLOCATABLE :: k
    ! assume k gets allocated to dimension(3,nlocal) at some point
    ! and assigned values
  END TYPE shield

  SUBROUTINE my_callback(caller, timestep, ids, x, fexternal)
    CLASS(*), INTENT(INOUT) :: caller
    INTEGER(c_int), INTENT(IN) :: timestep
    INTEGER(c_int64_t), INTENT(IN) :: ids
    REAL(c_double), INTENT(IN) :: x(:,:)
    REAL(c_double), INTENT(OUT) :: fexternal(:,:)
```

```
    SELECT TYPE (caller)
      TYPE IS (shield)
        fexternal = - caller%k * x
      CLASS DEFAULT
        WRITE(error_unit,*) 'UH OH...'
    END SELECT
  END SUBROUTINE my_callback
END MODULE stuff

! then, when assigning the callback function, do this:
PROGRAM example
  USE LIBLAMMPS
  USE stuff
  TYPE(lammps) :: lmp
  TYPE(shield) :: my_shield
  lmp = lammps()
  CALL lmp%command('fix ext all external pf/callback 1 1')
  CALL lmp%set_fix_external_callback('ext', my_callback, my_shield)
END PROGRAM example
```

---

function fix_external_get_force(*id*)

Get pointer to the force array storage in a fix external instance with the given ID.

Added in version 22Dec2022.

Fix *external* allows programs that are running LAMMPS through its library interfaces to add or modify certain LAMMPS properties on specific time steps, similar to the way other fixes do.

This function provides access to the per-atom force storage in a fix external instance with the given fix-ID to be added to the individual atoms when using the "pf/array" mode. The *fexternal* array can be accessed like other "native" per-atom arrays accessible via the extract_atom() function. Please note that the array stores the forces for *local* atoms for each MPI rank, in the order determined by the neighbor list build. Because the underlying data structures can change as well as the order of atom as they migrate between MPI processes because of the domain decomposition parallelization, this function should be always called immediately before the forces are going to be set to get an up-to-date pointer. You can use, for example, extract_setting() to obtain the number of local atoms *nlocal* and then assume the dimensions of the returned force array as REAL(c_double) :: force(3,nlocal).

This function is an alternative to the callback mechanism in fix external set up by set_fix_external_callback(). The main difference is that this mechanism can be used when forces are to be pre-computed and the control alternates between LAMMPS and the external driver, while the callback mechanism can call an external subroutine to compute the force when the fix is triggered and needs them.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external program.

Parameters

id *[character(len=*)]* :: ID of *fix external* instance

Call to

lammps_fix_external_get_force()

Return

fexternal *[real(c_double),dimension(3,nlocal)]* :: pointer to the per-atom force array allocated by the fix

subroutine fix_external_set_energy_global(*id*, *eng*)

Set the global energy contribution for a *fix external* instance with the given ID.

Added in version 22Dec2022.

This is a companion function to set_fix_external_callback() and fix_external_get_force() that also sets the contribution to the global energy from the external program. The value of the *eng* argument will be stored in the fix and applied on the current and all following time steps until changed by another call to this function. The energy is in energy units as determined by the current *units* settings and is the **total** energy of the contribution. Thus, when running in parallel, all MPI processes have to call this function with the **same** value, and this will be returned as a scalar property of the fix external instance when accessed in LAMMPS input commands or from variables.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external program.

Parameters

- **id** *[character(len=*)]* :: fix ID of fix external instance
- **eng** *[real(c_double)]* :: total energy to be added to the global energy

Call to

lammps_fix_external_set_energy_global()

---

subroutine fix_external_set_virial_global(*id*, *virial*)

Set the global virial contribution for a fix external instance with the given ID.

Added in version 22Dec2022.

This is a companion function to set_fix_external_callback() and fix_external_get_force() to set the contribution to the global virial from an external program.

The six values of the *virial* array will be stored in the fix and applied on the current and all following time steps until changed by another call to this function. The components of the virial need to be stored in the following order: *xx*, *yy*, *zz*, *xy*, *xz*, *yz*. In LAMMPS, the virial is stored internally as *stress*volume* in units of *pressure*volume* as determined by the current *units* settings and is the **total** contribution. Thus, when running in parallel, all MPI processes have to call this function with the **same** value, and this will then be added by fix external.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Parameters

- **id** *[character(len=*)]* :: fix ID of fix external instance
- **virial** *[real(c_double),dimension(6)]* :: the six global stress tensor components to be added to the global virial

Call to

lammps_fix_external_set_virial_global()

---

subroutine fix_external_set_energy_peratom(*id*, *eng*)

Set the per-atom energy contribution for a fix external instance with the given ID.

Added in version 22Dec2022.

This is a companion function to set_fix_external_callback() to set the per-atom energy contribution due to the fix from the external program as part of the callback function. For this to work, the LAMMPS object must be passed as part of the *caller* argument when registering the callback function, or the callback function must otherwise have access to the LAMMPS object, such as through a module-based pointer.

Note

This function is fully independent from fix_external_set_energy_global() and will **NOT** add any contributions to the global energy tally and will **NOT** check whether the sum of the contributions added here are consistent with the global added energy.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Parameters

- **id** *[character(len=*)]* :: fix ID of the fix external instance
- **eng** *[real(c_double),dimension(:)]* :: array of length *nlocal* containing the energy to add to the per-atom energy

Call to

lammps_fix_external_set_energy_peratom()

---

subroutine set_fix_external_set_virial_peratom(*id*, *virial*)

This is a companion function to set_fix_external_callback() to set the per-atom virial contribution due to the fix from the external program as part of the callback function. For this to work, the LAMMPS object must be passed as the *caller* argument when registering the callback function.

Added in version 22Dec2022.

Note

This function is fully independent from fix_external_set_virial_global() and will **NOT** add any contributions to the global virial tally and **NOT** check whether the sum of the contributions added here are consistent with the global added virial.

The order and units of the per-atom stress tensor elements are the same as for the global virial. The type and dimensions of the per-atom virial array must be REAL(c_double), DIMENSION(6,nlocal).

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external program.

Parameters

- **id** *[character(len=*)]* :: fix ID of fix external instance
- **virial** *[real(c_double),dimension(:,:)]* :: an array of 6 × *nlocal* components to be added to the per-atom virial

Call to
lammps_set_virial_peratom()

---

subroutine fix_external_set_vector_length(*id*, *length*)

Set the vector length for a global vector stored with fix external for analysis.

Added in version 22Dec2022.

This is a companion function to set_fix_external_callback() and fix_external_get_force() to set the length of a global vector of properties that will be stored with the fix via fix_external_set_vector().

This function needs to be called **before** a call to fix_external_set_vector() and **before** a run or minimize command. When running in parallel, it must be called from **all** MPI processes with the same length argument.

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external program.

Parameters

- **id** *[character(len=*)]* :: fix ID of fix external instance
- **length** *[integer(c_int)]* :: length of the global vector to be stored with the fix

Call to
lammps_fix_external_set_vector_length()

---

subroutine fix_external_set_vector(*id*, *idx*, *val*)

Store a global vector value for a fix external instance with the given ID.

Added in version 22Dec2022.

This is a companion function to set_fix_external_callback() and fix_external_get_force() to set the values of a global vector of properties that will be stored with the fix and can be accessed from within LAMMPS input commands (e.g., fix ave/time or variables) when used in a vector context.

This function needs to be called **after** a call to fix_external_set_vector_length() and **before** a run or minimize command. When running in parallel, it must be called from **all** MPI processes with the **same** *idx* and *val* parameters. The variable *val* is assumed to be extensive.

Note

The index in the *idx* parameter is 1-based (i.e., the first element is set with *idx* = 1, and the last element of the vector with *idx* = *N*, where *N* is the value of the *length* parameter of the call to fix_external_set_vector_length()).

Please see the documentation for *fix external* for more information about how to use the fix and how to couple it with an external code.

Parameters

- **id** *[character(len=*)]* :: ID of fix external instance
- **idx** *[integer(c_int)]* :: 1-based index in global vector
- **val** *[integer(c_int)]* :: value to be stored in global vector at index *idx*

Call to
lammps_fix_external_set_vector()

---

subroutine flush_buffers()

This function calls lammps_flush_buffers(), which flushes buffered output to be written to screen and logfile. This can simplify capturing output from LAMMPS library calls.

Added in version 3Nov2022.

Call to
lammps_flush_buffers()

---

function is_running()

Check if LAMMPS is currently inside a run or minimization.

Added in version 3Nov2022.

This function can be used from signal handlers or multi-threaded applications to determine if the LAMMPS instance is currently active.

Call to
lammps_is_running()

Return
is_running *[logical]* :: .FALSE. if idle or .TRUE. if active

---

subroutine force_timeout()

Force a timeout to stop an ongoing run cleanly.

Added in version 3Nov2022.

This function can be used from signal handlers or multi-threaded applications to terminate an ongoing run cleanly.

Call to
lammps_force_timeout()

---

function has_error()

Check if there is a (new) error message available.

Added in version 3Nov2022.

This function can be used to query if an error inside of LAMMPS has thrown a *C++ exception*.

Call to
lammps_has_error()

Return
has_error *[logical]* :: .TRUE. if there is an error.

---

subroutine get_last_error_message(*buffer*[, *status*])

Copy the last error message into the provided buffer.

Added in version 3Nov2022.

This function can be used to retrieve the error message that was set in the event of an error inside of LAMMPS that resulted in a *C++ exception*. A suitable buffer for a string has to be provided. If the internally-stored error message is longer than the string, it will be truncated accordingly. The optional argument *status* indicates the kind of error: a "1" indicates an error that occurred on all MPI ranks and is often recoverable, while a "2" indicates an abort that would happen only in a single MPI rank and thus may not be recoverable, as other MPI ranks may be waiting on the failing MPI rank(s) to send messages.

Parameters

buffer *[character(len=*)]* :: string buffer to copy the error message into

Options

status *[integer(c_int),optional]* :: 1 when all ranks had the error, 2 on a single-rank error.

Call to

lammps_get_last_error_message()

1.4 LAMMPS C++ API

It is also possible to invoke the LAMMPS C++ API directly in your code. It lacks some of the convenience of the C library API, but it allows more direct access to simulation data and thus more low-level manipulations. The following links provide some examples and references to the C++ API.

1.4.1 Using the C++ API directly

Using the C++ classes of the LAMMPS library is lacking some of the convenience of the C library API, but it allows a more direct access to simulation data and thus more low-level manipulations and tighter integration of LAMMPS into another code. While for the complete C library API is provided in the library.h header file, for using the C++ API it is required to include the individual header files defining the individual classes in use. Typically the name of the class and the name of the header follow some simple rule. Examples are given below.

1.4.2 Creating or deleting a LAMMPS object

When using the LAMMPS library interfaces, the core task is to create an instance of the LAMMPS_NS::LAMMPS class. In C++ this can be done directly through the new operator. All further operations are then initiated through calling member functions of some of the components of the LAMMPS class or accessing their data members. The destruction of the LAMMPS instance is correspondingly initiated by using the delete operator. Here is a simple example:

```
#include "lammps.h"

#include <mpi.h>
#include <iostream>

int main(int argc, char **argv)
{
   LAMMPS_NS::LAMMPS *lmp;
   // custom argument vector for LAMMPS library
   const char *lmpargv[] {"liblammps", "-log", "none"};
   int lmpargc = sizeof(lmpargv)/sizeof(const char *);
```

(continues on next page)

(continued from previous page)

```
    // explicitly initialize MPI
    MPI_Init(&argc, &argv);

    // create LAMMPS instance
    lmp = new LAMMPS_NS::LAMMPS(lmpargc, (char **)lmpargv, MPI_COMM_WORLD);
    // output numerical version string
    std::cout << "LAMMPS version ID: " << lmp->num_ver << std::endl;
    // delete LAMMPS instance
    delete lmp;

    // stop MPI environment
    MPI_Finalize();
    return 0;
}
```

This minimal example only requires to include the lammps.h header file since it only accesses a non-pointer member of the LAMMPS class.

1.4.3 Executing LAMMPS commands

Once a LAMMPS instance is created by your C++ code, you need to set up a simulation and that is most conveniently done by "driving" it through issuing commands like you would do when running a LAMMPS simulation from an input script. Processing of input in LAMMPS is handled by the Input class an instance of which is a member of the LAMMPS class. You have two options: reading commands from a file, or executing a single command from a string. See below for a small example:

```
#include "lammps.h"
#include "input.h"
#include <mpi.h>

using namespace LAMMPS_NS;

int main(int argc, char **argv)
{
    const char *lmpargv[] {"liblammps", "-log", "none"};
    int lmpargc = sizeof(lmpargv)/sizeof(const char *);

    MPI_Init(&argc, &argv);
    LAMMPS *lmp = new LAMMPS(lmpargc, (char **)lmpargv, MPI_COMM_WORLD);
    lmp->input->file("in.melt");
    lmp->input->one("run 100 post no");
    delete lmp;
    return 0;
}
```

CHAPTER

TWO

USE PYTHON WITH LAMMPS

These pages describe various ways that LAMMPS and Python can be used together.

2.1 Overview

The LAMMPS distribution includes a python directory with the Python code needed to run LAMMPS from Python. The python/lammps package contains *the "lammps" Python module* that wraps the LAMMPS C-library interface. This module makes it is possible to do the following either from a Python script, or interactively from a Python prompt:

- create one or more instances of LAMMPS
- invoke LAMMPS commands or read them from an input script
- run LAMMPS incrementally
- extract LAMMPS results
- and modify internal LAMMPS data structures.

From a Python script you can do this in serial or in parallel. Running Python interactively in parallel does not generally work, unless you have a version of Python that extends Python to enable multiple instances of Python to read what you type.

To do all of this, you must build LAMMPS in *"shared" mode* and make certain that your Python interpreter can find the lammps Python package and the LAMMPS shared library file.

The Python wrapper for LAMMPS uses the ctypes package in Python, which auto-generates the interface code needed between Python and a set of C-style library functions. Ctypes has been part of the standard Python distribution since version 2.5. You can check which version of Python you have by simply typing "python" at a shell prompt. Below is an example output for Python version 3.8.5.

```
$ python
Python 3.8.5 (default, Aug 12 2020, 00:00:00)
[GCC 10.2.1 20200723 (Red Hat 10.2.1-1)] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>>
```

Warning

The options described in this section of the manual for using Python with LAMMPS support only Python 3.6 or later. For use with Python 2.x you will need to use an older LAMMPS version like 29 Aug 2024 or older. If you notice Python code in the LAMMPS distribution that is not compatible with Python 3, please contact the LAMMPS developers or submit and issue on GitHub

LAMMPS can work together with Python in two ways. First, Python can wrap LAMMPS through the its *library interface*, so that a Python script can create one or more instances of LAMMPS and launch one or more simulations. In Python terms, this is referred to as "extending" Python with a LAMMPS module.

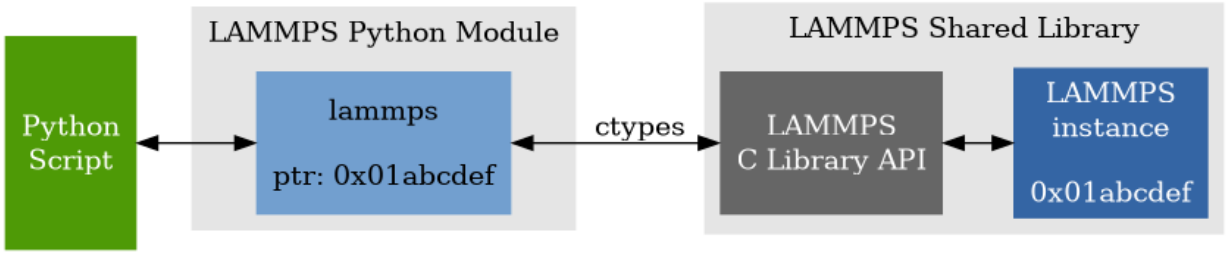

Fig. 1: Launching LAMMPS via Python

Second, LAMMPS can use the Python interpreter, so that a LAMMPS input script or styles can invoke Python code directly, and pass information back-and-forth between the input script and Python functions you write. This Python code can also call back to LAMMPS to query or change its attributes through the LAMMPS Python module mentioned above. In Python terms, this is called "embedding" Python into LAMMPS. When used in this mode, Python can perform script operations that the simple LAMMPS input script syntax can not.

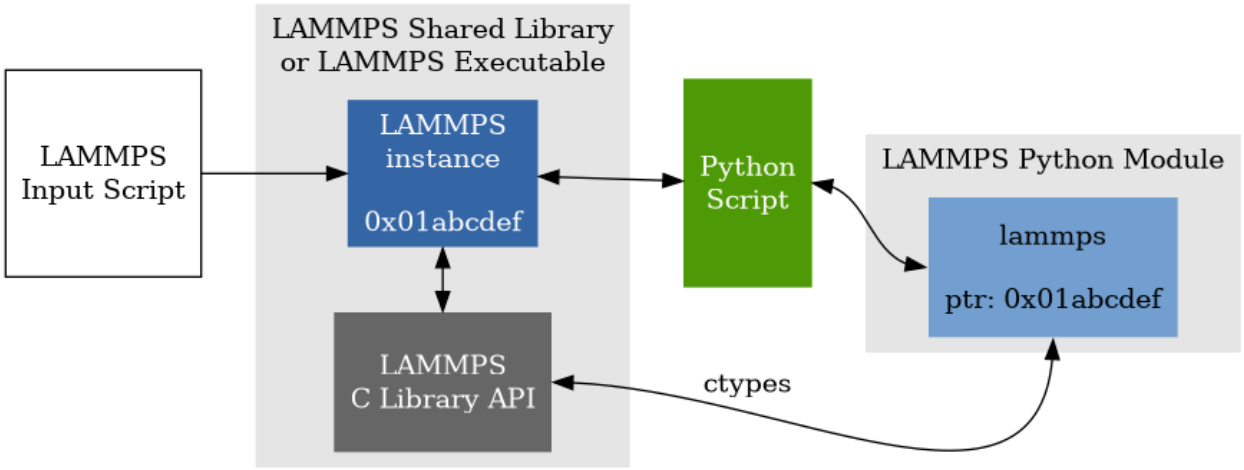

Fig. 2: Calling Python code from LAMMPS

2.2 Installation

The LAMMPS Python module enables calling the *LAMMPS C library API* from Python by dynamically loading functions in the LAMMPS shared library through the Python ctypes module. Because of the dynamic loading, it is required that LAMMPS is compiled in *"shared" mode*.

Changed in version 2Apr2025.

LAMMPS currently only supports Python version 3.6 or later.

Two components are necessary for Python to be able to invoke LAMMPS code:

- The LAMMPS Python Package (lammps) from the python folder

- The LAMMPS Shared Library (liblammps.so, liblammps.dylib or liblammps.dll) from the folder where you compiled LAMMPS.

2.2.1 Installing the LAMMPS Python Module and Shared Library

Making LAMMPS usable within Python and vice versa requires putting the LAMMPS Python package (lammps) into a location where the Python interpreter can find it and installing the LAMMPS shared library into a folder that the dynamic loader searches or inside of the installed lammps package folder. There are multiple ways to achieve this.

1. Install both components into a Python site-packages folder, either system-wide or in the corresponding user-specific folder. This way no additional environment variables need to be set, but the shared library is otherwise not accessible.
2. Do an installation into a virtual environment.
3. Leave the files where they are in the source/development tree and adjust some environment variables.

Python package

Compile LAMMPS with either *CMake* or the *traditional make* procedure in *shared mode*. After compilation has finished, type (in the compilation folder):

```
make install-python
```

This will try to build a so-called (binary) wheel file, a compressed binary python package and then install it with the python package manager 'pip'. Installation will be attempted into a system-wide site-packages folder and if that fails into the corresponding folder in the user's home directory. For a system-wide installation you usually would have to gain superuser privilege first, e.g. though sudo

File	Location	Notes
LAMMPS Python package	• $HOME/.local/lib/pythonX.Y/site-packages/lammps	X.Y depends on the installed Python version
LAMMPS shared library	• $HOME/.local/lib/pythonX.Y/site-packages/lammps	X.Y depends on the installed Python version

For a system-wide installation those folders would then become.

File	Location	Notes
LAMMPS Python package	• /usr/lib/pythonX.Y/site-packages/lammps	X.Y depends on the installed Python version
LAMMPS shared library	• /usr/lib/pythonX.Y/site-packages/lammps	X.Y depends on the installed Python version

No environment variables need to be set for those, as those folders are searched by default by Python or the LAMMPS Python package.

Changed in version 24Mar2022.

Note

If there is an existing installation of the LAMMPS python module, make install-python will try to update it. However, that will fail if the older version of the module was installed by LAMMPS versions until 17Feb2022. Those were using the distutils package, which does not create a "manifest" that allows a clean uninstall. The make install-python command will always produce a lammps-<version>-<python>-<abi>-<os>-<arch>.whl file (the 'wheel'). And this file can be later installed directly with python -m pip install <wheel file>.whl without having to type make install-python again and repeating the build step, too.

For the traditional make process you can override the python version to version x.y when calling make with PYTHON=pythonX.Y. For a CMake based compilation this choice has to be made during the CMake configuration step.

If the default settings of make install-python are not what you want, you can invoke install.py from the python directory manually as

```
python3 install.py -p <python package> -l <shared library> -v <version.h file> [-n] [-f]
```

- The -p flag argument is the full path to the python/lammps folder to be installed,
- the -l flag argument is the full path to the LAMMPS shared library file to be installed,
- the -v flag argument is the full path to the src/version.h file
- the optional -n flag instructs the script to only build a wheel file but not attempt to install it (default is to try installing),
- the optional -w flag argument is the path to a folder where to store the resulting wheel file (default is the current folder)
- and the optional -f argument instructs the script to force installation even if pip would otherwise refuse installation with an *error about externally managed environments*. The Python developers recommend to not augment a Python installation with custom packages, both at the user and the system level, and advise to use virtual environments instead. Some recent Linux distributions enforce that recommendation by default.

Example command line for building only the wheel after building LAMMPS with cmake in the folder build:

```
python3 python/install.py -n -p python/lammps -l build/liblammps.so -v src/version.h -w build
```

Virtual environment

A virtual environment is a minimal Python installation inside of a folder. It allows isolating and customizing a Python environment that is mostly independent from a user or system installation. For the core Python environment, it uses symbolic links to the system installation and thus it can be set up quickly and will not take up much disk space. This gives you the flexibility to install (newer/different) versions of Python packages that would potentially conflict with already installed system packages. It also does not requite any superuser privileges. See PEP 405: Python Virtual Environments for more information.

To create a virtual environment in the folder $HOME/myenv, use the venv module as follows.

```
# create virtual environment in folder $HOME/myenv
python3 -m venv $HOME/myenv
```

To activate the virtual environment type:

```
source $HOME/myenv/bin/activate
```

This has to be done every time you log in or open a new terminal window and after you turn off the virtual environment with the deactivate command.

When using CMake to build LAMMPS, you need to set CMAKE_INSTALL_PREFIX to the value of the $VIRTUAL_ENV environment variable during the configuration step. For the traditional make procedure, no additional steps are needed. After compiling LAMMPS you can do a "Python package only" installation with make install-python and the LAMMPS Python package and the shared library file are installed into the following locations:

File	Location	Notes
LAMMPS Python Module	• $VIRTUAL_ENV/lib/pythonX.Y/site-packages/lammps	X.Y depends on the installed Python version
LAMMPS shared library	• $VIRTUAL_ENV/lib/pythonX.Y/site-packages/lammps	X.Y depends on the installed Python version

In place usage

You can also *compile LAMMPS* as usual in *"shared" mode* leave the shared library and Python package inside the source/compilation folders. Instead of copying the files where they can be found, you need to set the environment variables PYTHONPATH (for the Python package) and LD_LIBRARY_PATH (or DYLD_LIBRARY_PATH on macOS

For Bourne shells (bash, ksh and similar) the commands are:

```
export PYTHONPATH=${PYTHONPATH}:${HOME}/lammps/python
export LD_LIBRARY_PATH=${LD_LIBRARY_PATH}:${HOME}/lammps/src
```

For the C-shells like csh or tcsh the commands are:

```
setenv PYTHONPATH ${PYTHONPATH}:${HOME}/lammps/python
setenv LD_LIBRARY_PATH ${LD_LIBRARY_PATH}:${HOME}/lammps/src
```

On macOS you may also need to set DYLD_LIBRARY_PATH accordingly. You can make those changes permanent by editing your $HOME/.bashrc or $HOME/.login files, respectively.

Note

The PYTHONPATH needs to point to the parent folder that contains the lammps package!

In case you run into an "externally-managed-environment" error when trying to install the LAMMPS Python module, please refer to *corresponding paragraph* in the Python HOWTO page to learn about options for handling this error.

To verify if LAMMPS can be successfully started from Python, start the Python interpreter, load the lammps Python module and create a LAMMPS instance. This should not generate an error message and produce output similar to the

following:

```
$ python
Python 3.8.5 (default, Sep  5 2020, 10:50:12)
[GCC 10.2.0] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>> import lammps
>>> lmp = lammps.lammps()
LAMMPS (18 Sep 2020)
using 1 OpenMP thread(s) per MPI task
>>>
```

Note

Unless you opted for "In place use", you will have to rerun the installation any time you recompile LAMMPS to ensure the latest Python package and shared library are installed and used.

Note

If you want Python to be able to load different versions of the LAMMPS shared library with different settings, you will need to manually copy the files under different names (e.g. liblammps_mpi.so or liblammps_gpu.so) into the appropriate folder as indicated above. You can then select the desired library through the *name* argument of the LAMMPS object constructor (see *Creating or deleting a LAMMPS object*).

2.2.2 Extending Python to run in parallel

If you wish to run LAMMPS in parallel from Python, you need to extend your Python with an interface to MPI. This also allows you to make MPI calls directly from Python in your script, if you desire.

We have tested this with MPI for Python (aka mpi4py) and you will find installation instruction for it below.

Installation of mpi4py (version 4.0.1 as of Feb 2025) can be done as follows:

- Via pip into a local user folder with:

```
python3 -m pip install --user mpi4py
```

- Via dnf into a system folder for RedHat/Fedora systems:

```
# for use with OpenMPI
sudo dnf install python3-mpi4py-openmpi
# for use with MPICH
sudo dnf install python3-mpi4py-mpich
```

- Via pip into a virtual environment (see above):

```
$ source $HOME/myenv/activate
(myenv)$ python -m pip install mpi4py
```

- Via pip into a system folder (not recommended):

```
sudo python3 -m pip install mpi4py
```

For more detailed installation instructions and additional options, please see the mpi4py installation page.

To use mpi4py and LAMMPS in parallel from Python, you **must** make certain that **both** are using the **same** implementation and version of MPI library. If you only have one MPI library installed on your system this is not an issue, but it can be if you have multiple MPI installations (e.g. on an HPC cluster to be selected through environment modules). Your LAMMPS build is explicit about which MPI it is using, since it is either detected during CMake configuration or in the traditional make build system you specify the details in your low-level src/MAKE/Makefile.foo file. The installation process of mpi4py uses the mpicc command to find information about the MPI it uses to build against. And it tries to load "libmpi.so" from the LD_LIBRARY_PATH. This may or may not find the MPI library that LAMMPS is using. If you have problems running both mpi4py and LAMMPS together, this is an issue you may need to address, e.g. by loading the module for different MPI installation so that mpi4py finds the right one.

If you have successfully installed mpi4py, you should be able to run Python and type

```
from mpi4py import MPI
```

without error. You should also be able to run Python in parallel on a simple test script

```
mpirun -np 4 python3 test.py
```

where test.py contains the lines

```
from mpi4py import MPI
comm = MPI.COMM_WORLD
print("Proc %d out of %d procs" % (comm.Get_rank(),comm.Get_size()))
```

and see one line of output for each processor you run on. Please note that the order of the lines is not deterministic

```
$ mpirun -np 4 python3 test.py
Proc 0 out of 4 procs
Proc 1 out of 4 procs
Proc 2 out of 4 procs
Proc 3 out of 4 procs
```

2.3 Run LAMMPS from Python

After compiling the LAMMPS shared library and making it ready to use, you can now write and run Python scripts that import the LAMMPS Python module and launch LAMMPS simulations through Python scripts. The following pages take you through the various steps necessary, what functionality is available and give some examples how to use it.

2.3.1 Running LAMMPS and Python in serial

To run a LAMMPS input in serial, type these lines into Python interactively from the bench directory:

```
from lammps import lammps
lmp = lammps()
lmp.file("in.lj")
```

Or put the same lines in the file test.py and run it as

```
python3 test.py
```

Either way, you should see the results of running the in.lj benchmark on a single processor appear on the screen, the same as if you had typed something like:

```
lmp_serial -in in.lj
```

2.3.2 Running LAMMPS and Python in parallel with MPI

To run LAMMPS in parallel, assuming you have installed the mpi4py package as discussed *Extending Python to run in parallel*, create a test.py file containing these lines:

```
from mpi4py import MPI
from lammps import lammps
lmp = lammps()
lmp.file("in.lj")
me = MPI.COMM_WORLD.Get_rank()
nprocs = MPI.COMM_WORLD.Get_size()
print("Proc %d out of %d procs has" % (me,nprocs),lmp)
MPI.Finalize()
```

You can run the script in parallel as:

```
mpirun -np 4 python3 test.py
```

and you should see the same output as if you had typed

```
mpirun -np 4 lmp_mpi -in in.lj
```

Note that without the mpi4py specific lines from test.py

```
from lammps import lammps
lmp = lammps()
lmp.file("in.lj")
```

running the script with mpirun on *P* processors would lead to *P* independent simulations to run parallel, each with a single processor. Therefore, if you use the mpi4py lines and you see multiple LAMMPS single processor outputs, mpi4py is not working correctly.

Also note that once you import the mpi4py module, mpi4py initializes MPI for you, and you can use MPI calls directly in your Python script, as described in the mpi4py documentation. The last line of your Python script should be MPI.finalize(), to ensure MPI is shut down correctly.

2.3.3 Running Python scripts

Note that any Python script (not just for LAMMPS) can be invoked in one of several ways:

```
python script.py
python -i script.py
./script.py
```

The last command requires that the first line of the script be something like this:

```
#!/usr/bin/python
```

or

```
#!/usr/bin/env python
```

where the path in the first case needs to point to where you have Python installed (the second option is workaround for when this may change), and that you have made the script file executable:

```
chmod +x script.py
```

Without the -i flag, Python will exit when the script finishes. With the -i flag, you will be left in the Python interpreter when the script finishes, so you can type subsequent commands. As mentioned above, you can only run Python interactively when running Python on a single processor, not in parallel.

2.3.4 Creating or deleting a LAMMPS object

With the Python interface the creation of a LAMMPS instance is included in the constructor for the lammps class. Internally it will call either lammps_open() or lammps_open_no_mpi() from the C library API to create the class instance.

All arguments are optional. The *name* argument allows loading a LAMMPS shared library that is named liblammps_machine.so instead of the default name of liblammps.so. In most cases the latter will be installed or used. The *ptr* argument is for use of the lammps module from inside a LAMMPS instance, e.g. with the *python* command, where a pointer to the already existing LAMMPS class instance can be passed to the Python class and used instead of creating a new instance. The *comm* argument may be used in combination with the mpi4py module to pass an MPI communicator to LAMMPS and thus it is possible to run the Python module like the library interface on a subset of the MPI ranks after splitting the communicator.

Here is a simple example using the LAMMPS Python interface:

```
from lammps import lammps

# NOTE: argv[0] is set by the lammps class constructor
args = ["-log", "none"]

# create LAMMPS instance
lmp = lammps(cmdargs=args)

# get and print numerical version code
print("LAMMPS Version: ", lmp.version())

# explicitly close and delete LAMMPS instance (optional)
lmp.close()
```

Same as with the *C library API*, this will use the MPI_COMM_WORLD communicator for the MPI library that LAMMPS was compiled with.

The lmp.close() call is optional since the LAMMPS class instance will also be deleted automatically during the lammps class destructor. Instead of lmp.close() it is also possible to call lmp.finalize(); this will destruct the LAMMPS instance, but also finalized and release the MPI and/or Kokkos environment if enabled and active.

Note that you can create multiple LAMMPS objects in your Python script, and coordinate and run multiple simulations, e.g.

```
from lammps import lammps
lmp1 = lammps()
lmp2 = lammps()
```

(continues on next page)

(continued from previous page)

```
lmp1.file("in.file1")
lmp2.file("in.file2")
```

2.3.5 Executing commands

Once an instance of the lammps class is created, there are multiple ways to "feed" it commands. In a way that is not very different from running a LAMMPS input script, except that Python has many more facilities for structured programming than the LAMMPS input script syntax. Furthermore it is possible to "compute" what the next LAMMPS command should be.

Same as in the equivalent *C library functions*, commands can be read from a file, a single string, a list of strings and a block of commands in a single multi-line string. They are processed under the same boundary conditions as the C library counterparts. The example below demonstrates the use of lammps.file(), lammps.command(), lammps.commands_list(), and lammps.commands_string():

```
from lammps import lammps
lmp = lammps()

# read commands from file 'in.melt'
lmp.file('in.melt')

# issue a single command
lmp.command('variable zpos index 1.0')

# create 10 groups with 10 atoms each
cmds = [f"group g{i} id {10*i+1}:{10*(i+1)}" for i in range(10)]
lmp.commands_list(cmds)

# run commands from a multi-line string
block = """
clear
region  box block 0 2 0 2 0 2
create_box 1 box
create_atoms 1 single 1.0 1.0 ${zpos}
"""
lmp.commands_string(block)
```

For convenience, the lammps class also provides a command wrapper cmd that turns any LAMMPS command into a regular function call.

For instance, the following LAMMPS command

```
region box block 0 10 0 5 -0.5 0.5
```

would normally be executed with the following Python code:

```
from lammps import lammps

lmp = lammps()
lmp.command("region box block 0 10 0 5 -0.5 0.5")
```

With the cmd wrapper, any LAMMPS command can be split up into arbitrary parts. These parts are then passed to a member function with the name of the *command*. For the *region* command that means the region() method can be called. The arguments of the command can be passed as one string, or individually.

```
from lammps import lammps

L = lammps()

# pass command parameters as one string
L.cmd.region("box block 0 10 0 5 -0.5 0.5")

# OR pass them individually
L.cmd.region("box block", 0, 10, 0, 5, -0.5, 0.5)
```

In the latter example, all parameters except the first are Python floating-point literals. The member function takes the entire parameter list and transparently merges it to a single command string.

The benefit of this approach is avoiding redundant command calls and easier parameterization. With *command*, *commands_list*, and *commands_string* the parameterization needed to be done manually by creating formatted command strings.

```
lmp.command("region box block %f %f %f %f %f %f" % (xlo, xhi, ylo, yhi, zlo, zhi))
```

In contrast, methods of the *cmd* wrapper accept parameters directly and will convert them automatically to a final command string.

```
L.cmd.region("box block", xlo, xhi, ylo, yhi, zlo, zhi)
```

Note

When running in IPython you can use Tab-completion after L.cmd. to see all available LAMMPS commands.

Using these facilities, the previous example shown above can be rewritten as follows:

```
from lammps import lammps
L = lammps()

# read commands from file 'in.melt'
L.file('in.melt')

# issue a single command
L.cmd.variable('zpos', 'index', 1.0)

# create 10 groups with 10 atoms each
for i in range(10):
   L.cmd.group(f"g{i}", "id", f"{10*i+1}:{10*(i+1)}")

L.cmd.clear()
L.cmd.region("box block", 0, 2, 0, 2, 0, 2)
L.cmd.create_box(1, "box")
L.cmd.create_atoms(1, "single", 1.0, 1.0, "${zpos}")
```

2.3.6 System properties

Similar to what is described in *System properties*, the instances of lammps can be used to extract different kinds of information about the active LAMMPS instance and also to modify some of it.

In some cases the data returned is a direct reference to the original data inside LAMMPS cast to ctypes pointers. Where possible, the wrappers will determine the ctypes data type and cast pointers accordingly. If numpy is installed arrays can also be extracted as numpy arrays, which will access the C arrays directly and have the correct dimensions to protect against invalid accesses.

Warning

When accessing per-atom data, please note that this data is the per-processor local data and indexed accordingly. These arrays can change sizes and order at every neighbor list rebuild and atom sort event as atoms are migrating between subdomains.

```
from lammps import lammps

lmp = lammps()
lmp.file("in.sysinit")

natoms = lmp.get_natoms()
print(f"running simulation with {natoms} atoms")

lmp.command("run 1000 post no");

for i in range(10):
  lmp.command("run 100 pre no post no")
  pe = lmp.get_thermo("pe")
  ke = lmp.get_thermo("ke")
  print(f"PE = {pe}\nKE = {ke}")

lmp.close()
```

Methods:

- version(): return the numerical version id, e.g. LAMMPS 2 Sep 2015 -> 20150902
- get_thermo(): return current value of a thermo keyword
- last_thermo(): return a dictionary of the last thermodynamic output
- get_natoms(): total # of atoms as int
- reset_box(): reset the simulation box size
- extract_setting(): return a global setting
- extract_global(): extract a global quantity
- extract_box(): extract box info
- create_atoms(): create N atoms with IDs, types, x, v, and image flags

Properties:

- last_thermo_step: the last timestep thermodynamic output was computed

2.3.7 Per-atom properties

Similar to what is described in *Per-atom properties*, the instances of lammps can be used to extract atom quantities and modify some of them.

In some cases the data returned is a direct reference to the original data inside LAMMPS cast to ctypes pointers. Where possible, the wrappers will determine the ctypes data type and cast pointers accordingly. If numpy is installed arrays can also be extracted as numpy arrays, which will access the C arrays directly and have the correct dimensions to protect against invalid accesses.

Warning

When accessing per-atom data, please note that this data is the per-processor local data and indexed accordingly. These arrays can change sizes and order at every neighbor list rebuild and atom sort event as atoms are migrating between subdomains.

```
from lammps import lammps

lmp = lammps()
lmp.file("in.sysinit")

# Read/Write access via ctypes
nlocal = lmp.extract_global("nlocal")
x = lmp.extract_atom("x")

for i in range(nlocal):
  print("(x,y,z) = (", x[i][0], x[i][1], x[i][2], ")")

# Read/Write access via NumPy arrays
atom_id = L.numpy.extract_atom("id")
atom_type = L.numpy.extract_atom("type")
x = L.numpy.extract_atom("x")
v = L.numpy.extract_atom("v")
f = L.numpy.extract_atom("f")

# set position in 2D simulation
x[0] = (1.0, 0.0)

# set position in 3D simulation
x[0] = (1.0, 0.0, 1.)

lmp.close()
```

Methods:

- extract_atom(): extract a per-atom quantity

Numpy Methods:

- numpy.extract_atom(): extract a per-atom quantity as numpy array

2.3.8 Compute, fixes, variables

This section documents accessing or modifying data from objects like computes, fixes, or variables in LAMMPS using the lammps module.

For lammps.extract_compute() and lammps.extract_fix(), the global, per-atom, or local data calculated by the compute or fix can be accessed. What is returned depends on whether the compute or fix calculates a scalar or vector or array. For a scalar, a single double value is returned. If the compute or fix calculates a vector or array, a pointer to the internal LAMMPS data is returned, which you can use via normal Python subscripting.

The one exception is that for a fix that calculates a global vector or array, a single double value from the vector or array is returned, indexed by I (vector) or I and J (array). I,J are zero-based indices. See the *Howto output* page for a discussion of global, per-atom, and local data, and of scalar, vector, and array data types. See the doc pages for individual *computes* and *fixes* for a description of what they calculate and store.

For lammps.extract_variable(), an *equal-style or atom-style variable* is evaluated and its result returned.

For equal-style variables a single c_double value is returned and the group argument is ignored. For atom-style variables, a vector of c_double is returned, one value per atom, which you can use via normal Python subscripting. The values will be zero for atoms not in the specified group.

lammps.numpy.extract_compute(), lammps.numpy.extract_fix(), and lammps.numpy.extract_variable() are equivalent NumPy implementations that return NumPy arrays instead of ctypes pointers.

The lammps.set_variable() method sets an existing string-style variable to a new string value, so that subsequent LAMMPS commands can access the variable.

Methods:

- lammps.extract_compute(): extract value(s) from a compute
- lammps.extract_fix(): extract value(s) from a fix
- lammps.extract_variable(): extract value(s) from a variable
- lammps.set_variable(): set existing named string-style variable to value

NumPy Methods:

- lammps.numpy.extract_compute(): extract value(s) from a compute, return arrays as numpy arrays
- lammps.numpy.extract_fix(): extract value(s) from a fix, return arrays as numpy arrays
- lammps.numpy.extract_variable(): extract value(s) from a variable, return arrays as numpy arrays

2.3.9 Scatter/gather operations

```
data = lmp.gather_atoms(name,dtype,count)  # return per-atom property of all atoms gathered into␣
↪data, ordered by atom ID
                                           # name = "x", "q", "type", etc
data = lmp.gather_atoms_concat(name,dtype,count)  # ditto, but concatenated atom values from each␣
↪proc (unordered)
data = lmp.gather_atoms_subset(name,dtype,count,ndata,ids)  # ditto, but for subset of Ndata atoms␣
↪with IDs

lmp.scatter_atoms(name,dtype,count,data)   # scatter per-atom property to all atoms from data,␣
↪ordered by atom ID
                                           # name = "x", "q", "type", etc
                                           # count = # of per-atom values, 1 or 3, etc
```

(continues on next page)

(continued from previous page)

```
lmp.scatter_atoms_subset(name,dtype,count,ndata,ids,data)  # ditto, but for subset of Ndata atoms␣
↪with IDs
```

The gather methods collect peratom info of the requested type (atom coords, atom types, forces, etc) from all processors, and returns the same vector of values to each calling processor. The scatter functions do the inverse. They distribute a vector of peratom values, passed by all calling processors, to individual atoms, which may be owned by different processors.

The *dtype* parameter is 0 for int values and 1 for double values. The *count* parameter is 1 for per-atom vectors like "type" or "q" and 3 for per-atom arrays like "x", "v", "f". Use *count* = 3 with name = "image" if you want the single integer storing the image flags unpacked into 3 components ("x", "y", and "z").

Note that the data returned by the gather methods, e.g. gather_atoms("x"), is different from the data structure returned by extract_atom("x") in four ways. (1) gather_atoms() returns a vector which you index as x[i]; extract_atom() returns an array which you index as x[i][j]. (2) gather_atoms() orders the atoms by atom ID while extract_atom() does not. (3) gather_atoms() returns a list of all atoms in the simulation; extract_atoms() returns just the atoms local to each processor. (4) Finally, the gather_atoms() data structure is a copy of the atom coords stored internally in LAMMPS, whereas extract_atom() returns an array that effectively points directly to the internal data. This means you can change values inside LAMMPS from Python by assigning a new values to the extract_atom() array. To do this with the gather_atoms() vector, you need to change values in the vector, then invoke the scatter_atoms("x") method.

For the scatter methods, the array of coordinates passed to must be a ctypes vector of ints or doubles, allocated and initialized something like this:

```
from ctypes import c_double
natoms = lmp.get_natoms()
n3 = 3*natoms
x = (n3*c_double)()
x[0] = x coord of atom with ID 1
x[1] = y coord of atom with ID 1
x[2] = z coord of atom with ID 1
x[3] = x coord of atom with ID 2
...
x[n3-1] = z coord of atom with ID natoms
lmp.scatter_atoms("x", 1, 3, x)
```

The coordinates can also be provided as arguments to the initializer of x:

```
from ctypes import c_double
natoms = 2
n3 = 3*natoms
# init in constructor
x = (n3*c_double)(0.0, 0.0, 0.0, 1.0, 1.0, 1.0)
lmp.scatter_atoms("x", 1, 3, x)
# or using a list
coords = [1.0, 2.0, 3.0, -3.0, -2.0, -1.0]
x = (c_double*len(coords))(*coords)
```

Alternatively, you can just change values in the vector returned by the gather methods, since they are also ctypes vectors.

2.3.10 Neighbor list access

Access to neighbor lists is handled through a couple of wrapper classes that allows one to treat it like either a python list or a NumPy array. The access procedure is similar to that of the C-library interface: use one of the "find" functions to look up the index of the neighbor list in the global table of neighbor lists and then get access to the neighbor list data. The code sample below demonstrates reading the neighbor list data using the NumPy access method.

```
from lammps import lammps
import numpy as np

lmp = lammps()
lmp.commands_string("""
region box block -2 2 -2 2 -2 2
lattice fcc 1.0
create_box 1 box
create_atoms 1 box
mass 1 1.0
pair_style lj/cut 2.5
pair_coeff 1 1 1.0 1.0
run 0 post no""")

# look up the neighbor list
nlidx = lmp.find_pair_neighlist('lj/cut')
nl = lmp.numpy.get_neighlist(nlidx)
tags = lmp.extract_atom('id')
print("half neighbor list with {} entries".format(nl.size))
# print neighbor list contents
for i in range(0,nl.size):
    idx, nlist  = nl.get(i)
    print("\natom {} with ID {} has {} neighbors:".format(idx,tags[idx],nlist.size))
    if nlist.size > 0:
        for n in np.nditer(nlist):
            print("  atom {} with ID {}".format(n,tags[n]))
```

Another example for extracting a full neighbor list without evaluating a potential is shown below.

```
from lammps import lammps
import numpy as np

lmp = lammps()
lmp.commands_string("""
newton off
region box block -2 2 -2 2 -2 2
lattice fcc 1.0
create_box 1 box
create_atoms 1 box
mass 1 1.0
pair_style zero 1.0 full
pair_coeff * *
run 0 post no""")

# look up the neighbor list
nlidx = lmp.find_pair_neighlist('zero')
nl = lmp.numpy.get_neighlist(nlidx)
```

(continues on next page)

(continued from previous page)

```
tags = lmp.extract_atom('id')
print("full neighbor list with {} entries".format(nl.size))
# print neighbor list contents
for i in range(0,nl.size):
    idx, nlist  = nl.get(i)
    print("\natom {} with ID {} has {} neighbors:".format(idx,tags[idx],nlist.size))
    if nlist.size > 0:
        for n in np.nditer(nlist):
            pass
            print("  atom {} with ID {}".format(n,tags[n]))
```

Methods:

- lammps.get_neighlist(): Get neighbor list for given index
- lammps.get_neighlist_size(): Get number of elements in neighbor list
- lammps.get_neighlist_element_neighbors(): Get element in neighbor list and its neighbors
- lammps.find_pair_neighlist(): Find neighbor list of pair style
- lammps.find_fix_neighlist(): Find neighbor list of fix style
- lammps.find_compute_neighlist(): Find neighbor list of compute style

NumPy Methods:

- lammps.numpy.get_neighlist(): Get neighbor list for given index, which uses NumPy arrays for its element neighbor arrays
- lammps.numpy.get_neighlist_element_neighbors(): Get element in neighbor list and its neighbors (as a numpy array)

2.3.11 Configuration information

The following methods can be used to query the LAMMPS library about compile time settings and included packages and styles.

Listing 1: Example for using configuration settings functions

```
from lammps import lammps

lmp = lammps()

try:
    lmp.file("in.missing")
except Exception as e:
    print("LAMMPS failed with error:", e)

# write compressed dump file depending on available of options

if lmp.has_style("dump", "atom/zstd"):
    lmp.command("dump d1 all atom/zstd 100 dump.zst")
elif lmp.has_style("dump", "atom/gz"):
    lmp.command("dump d1 all atom/gz 100 dump.gz")
elif lmp.has_gzip_support():
    lmp.command("dump d1 all atom 100 dump.gz")
```

(continues on next page)

(continued from previous page)

```
else:
    lmp.command("dump d1 all atom 100 dump")
```

Methods:

- lammps.has_mpi_support
- lammps.has_exceptions
- lammps.has_gzip_support
- lammps.has_png_support
- lammps.has_jpeg_support
- lammps.has_ffmpeg_support
- lammps.installed_packages
- lammps.get_accelerator_config
- lammps.has_style()
- lammps.available_styles()

2.4 The lammps Python module

The LAMMPS Python interface is implemented as a module called lammps which is defined in the lammps package in the python folder of the LAMMPS source code distribution. After compilation of LAMMPS, the module can be installed into a Python system folder or a user folder with make install-python. Components of the module can then loaded into a Python session with the import command.

Warning

Alternative interfaces such as PyLammps and IPyLammps classes have been deprecated and will be removed in a future version of LAMMPS.

Version check

The lammps module stores the version number of the LAMMPS version it is installed from. When initializing the lammps class, this version is checked to be the same as the result from lammps.version(), the version of the LAMMPS shared library that the module interfaces to. If the they are not the same an AttributeError exception is raised since a mismatch of versions (e.g. due to incorrect use of the LD_LIBRARY_PATH or PYTHONPATH environment variables can lead to crashes or data corruption and otherwise incorrect behavior.

LAMMPS module global members:

lammps.__version__
: Numerical representation of the LAMMPS version this module was taken from. Has the same format as the result of lammps.version().

lammps.get_version_number()
: Extract LAMMPS version string and convert to number

2.4.1 The lammps class API

The lammps class is the core of the LAMMPS Python interface. It is a wrapper around the *LAMMPS C library API* using the Python ctypes module and a shared library compiled from the LAMMPS sources code. The individual methods in this class try to closely follow the corresponding C functions. The handle argument that needs to be passed to the C functions is stored internally in the class and automatically added when calling the C library functions. Below is a detailed documentation of the API.

class lammps.lammps(*name=''*, *cmdargs=None*, *ptr=None*, *comm=None*)

Create an instance of the LAMMPS Python class.

This is a Python wrapper class that exposes the LAMMPS C-library interface to Python. It either requires that LAMMPS has been compiled as shared library which is then dynamically loaded via the ctypes Python module or that this module called from a Python function that is called from a Python interpreter embedded into a LAMMPS executable, for example through the *python invoke* command. When the class is instantiated it calls the lammps_open() function of the LAMMPS C-library interface, which in turn will create an instance of the LAMMPS C++ class. The handle to this C++ class is stored internally and automatically passed to the calls to the C library interface.

Parameters

- name (string) – "machine" name of the shared LAMMPS library ("mpi" loads liblammps_mpi.so, "" loads liblammps.so)
- cmdargs (list) – list of command line arguments to be passed to the lammps_open() function. The executable name is automatically added.
- ptr (pointer) – pointer to a LAMMPS C++ class instance when called from an embedded Python interpreter. None means load symbols from shared library.
- comm (MPI_Comm) – MPI communicator (as provided by mpi4py). None means use MPI_COMM_WORLD implicitly.

property numpy

Return object to access numpy versions of API

It provides alternative implementations of API functions that return numpy arrays instead of ctypes pointers. If numpy is not installed, accessing this property will lead to an ImportError.

Returns
instance of numpy wrapper object

Return type
numpy_wrapper

property cmd

Return object that acts as LAMMPS command wrapper

It provides alternative to lammps.command() to call LAMMPS commands as if they were regular Python functions and enables auto-complete in interactive Python sessions.

```
from lammps import lammps

# melt example
L = lammps()
L.cmd.units("lj")
L.cmd.atom_style("atomic")
L.cmd.lattice("fcc", 0.8442)
L.cmd.region("box block", 0, 10, 0, 10, 0, 10)
L.cmd.create_box(1, "box")
```

(continues on next page)

(continued from previous page)

```
L.cmd.create_atoms(1, "box")
L.cmd.mass(1, 1.0)
L.cmd.velocity("all create", 3.0, 87287, "loop geom")
L.cmd.pair_style("lj/cut", 2.5)
L.cmd.pair_coeff(1, 1, 1.0, 1.0, 2.5)
L.cmd.neighbor(0.3, "bin")
L.cmd.neigh_modify(every=20, delay=0, check=False)
L.cmd.fix(1, "all nve")
L.cmd.thermo(50)
L.cmd.run(250)
```

Returns
instance of command_wrapper object

Return type
command_wrapper

property ipython

Return object to access ipython extensions

Adds commands for visualization in IPython and Jupyter Notebooks.

Returns
instance of ipython wrapper object

Return type
ipython.wrapper

close()

Explicitly delete a LAMMPS instance through the C-library interface.

This is a wrapper around the lammps_close() function of the C-library interface.

finalize()

Shut down the MPI communication and Kokkos environment (if active) through the library interface by calling lammps_mpi_finalize(), lammps_kokkos_finalize(), lammps_python_finalize(), and lammps_plugin_finalize()

You cannot create or use any LAMMPS instances after this function is called unless LAMMPS was compiled without MPI and without Kokkos support.

error(*error_type*, *error_text*)

Forward error to the LAMMPS Error class.

Added in version 3Nov2022.

This is a wrapper around the lammps_error() function of the C-library interface.

Parameters

- error_type (int)
- error_text (string)

version()

Return a numerical representation of the LAMMPS version in use.

This is a wrapper around the lammps_version() function of the C-library interface.

Returns
version number

Return type
int

get_os_info()

Return a string with information about the OS and compiler runtime

This is a wrapper around the lammps_get_os_info() function of the C-library interface.

Returns
OS info string

Return type
string

get_mpi_comm()

Get the MPI communicator in use by the current LAMMPS instance

This is a wrapper around the lammps_get_mpi_comm() function of the C-library interface. It will return None if either the LAMMPS library was compiled without MPI support or the mpi4py Python module is not available.

Returns
MPI communicator

Return type
MPI_Comm

expand(*line*)

Expand a single LAMMPS string like an input line

This is a wrapper around the lammps_expand() function of the C-library interface.

Parameters
cmd (string) – a single lammps line

Returns
expanded string

Return type
string

file(*path*)

Read LAMMPS commands from a file.

This is a wrapper around the lammps_file() function of the C-library interface. It will open the file with the name/path *file* and process the LAMMPS commands line by line until the end. The function will return when the end of the file is reached.

Parameters
path (string) – Name of the file/path with LAMMPS commands

command(*cmd*)

Process a single LAMMPS input command from a string.

This is a wrapper around the lammps_command() function of the C-library interface.

Parameters
cmd (string) – a single lammps command

commands_list(*cmdlist*)

Process multiple LAMMPS input commands from a list of strings.

This is a wrapper around the lammps_commands_list() function of the C-library interface.

Parameters
cmdlist (list of strings) – a single lammps command

commands_string(*multicmd*)

Process a block of LAMMPS input commands from a string.

This is a wrapper around the lammps_commands_string() function of the C-library interface.

Parameters
multicmd (string) – text block of lammps commands

get_natoms()

Get the total number of atoms in the LAMMPS instance.

Will be precise up to 53-bit signed integer due to the underlying lammps_get_natoms() function returning a double.

Returns
number of atoms

Return type
int

extract_box()

Extract simulation box parameters

This is a wrapper around the lammps_extract_box() function of the C-library interface. Unlike in the C function, the result is returned as a list.

Returns
list of the extracted data: boxlo, boxhi, xy, yz, xz, periodicity, box_change

Return type
[3*double, 3*double, double, double, 3*int, int]

reset_box(*boxlo*, *boxhi*, *xy*, *yz*, *xz*)

Reset simulation box parameters

This is a wrapper around the lammps_reset_box() function of the C-library interface.

Parameters

- boxlo (list of 3 floating point numbers) – new lower box boundaries
- boxhi (list of 3 floating point numbers) – new upper box boundaries
- xy (float) – xy tilt factor
- yz (float) – yz tilt factor
- xz (float) – xz tilt factor

get_thermo(*name*)

Get current value of a thermo keyword

This is a wrapper around the lammps_get_thermo() function of the C-library interface.

Parameters
name (string) – name of thermo keyword

Returns
value of thermo keyword

Return type
double or None

property last_thermo_step

Get the last timestep where thermodynamic data was computed

Returns
the timestep or a negative number if there has not been any thermo output yet

Return type
int

last_thermo()

Get a dictionary of the last thermodynamic output

This is a wrapper around the lammps_last_thermo() function of the C-library interface. It collects the cached thermo data from the last timestep into a dictionary. The return value is None, if there has not been any thermo output yet.

Returns
a dictionary containing the last computed thermo output values

Return type
dict or None

extract_setting(*name*)

Query LAMMPS about global settings that can be expressed as an integer.

This is a wrapper around the lammps_extract_setting() function of the C-library interface. Its documentation includes a list of the supported keywords.

Parameters
name (string) – name of the setting

Returns
value of the setting

Return type
int

extract_global_datatype(*name*)

Retrieve global property datatype from LAMMPS

This is a wrapper around the lammps_extract_global_datatype() function of the C-library interface. Its documentation includes a list of the supported keywords. This function returns None if the keyword is not recognized. Otherwise it will return a positive integer value that corresponds to one of the *data type* constants defined in the lammps module.

Parameters
name (string) – name of the property

Returns
data type of global property, see *Data Types*

Return type
int

extract_global(*name*, *dtype=None*)

Query LAMMPS about global settings of different types.

This is a wrapper around the lammps_extract_global() function of the C-library interface. Since there are no pointers in Python, this method will - unlike the C function - return the value or a list of values. The lammps_extract_global() documentation includes a list of the supported keywords and their data types. Since Python needs to know the data type to be able to interpret the result, by default, this function will try to auto-detect the data type by asking the library. You can also force a specific data type. For that purpose the lammps module contains *data type* constants. This function returns None if either the keyword is not recognized, or an invalid data type constant is used.

Parameters

- name (string) – name of the property
- dtype (int, optional) – data type of the returned data (see *Data Types*)

Returns
value of the property or list of values or None

Return type
int, float, list, or NoneType

extract_pair_dimension(*name*)

Retrieve pair style property dimensionality from LAMMPS

Added in version 29Aug2024.

This is a wrapper around the lammps_extract_pair_dimension() function of the C-library interface. The list of supported keywords depends on the pair style. This function returns None if the keyword is not recognized.

Parameters
name (string) – name of the property

Returns
dimensionality of the extractable data (typically 0, 1, or 2)

Return type
int

extract_pair(*name*)

Extract pair style data from LAMMPS.

Added in version 29Aug2024.

This is a wrapper around the lammps_extract_pair() function of the C-library interface. Since there are no pointers in Python, this method will - unlike the C function - return the value or a list of values. Since Python needs to know the dimensionality to be able to interpret the result, this function will detect the dimensionality by asking the library. This function returns None if the keyword is not recognized.

Parameters
name (string) – name of the property

Returns
value of the property or list of values or None

Return type
float, list of float, list of list of floats, or NoneType

map_atom(*atomid*)

Map a global atom ID (aka tag) to the local atom index

This is a wrapper around the lammps_map_atom() function of the C-library interface.

Parameters
atomid (int) – atom ID

Returns
local index

Return type
int

extract_atom_datatype(*name*)

Retrieve per-atom property datatype from LAMMPS

This is a wrapper around the lammps_extract_atom_datatype() function of the C-library interface. Its documentation includes a list of the supported keywords. This function returns None if the keyword is not recognized. Otherwise it will return an integer value that corresponds to one of the *data type* constants defined in the lammps module.

Parameters
name (string) – name of the property

Returns
data type of per-atom property (see *Data Types*)

Return type
int

extract_atom_size(*name*, *dtype*)

Retrieve per-atom property dimensions from LAMMPS

This is a wrapper around the lammps_extract_atom_size() function of the C-library interface. Its documentation includes a list of the supported keywords. This function returns None if the keyword is not recognized. Otherwise it will return an integer value with the size of the per-atom vector or array. If *name* corresponds to a per-atom array, the *dtype* keyword must be either LMP_SIZE_ROWS or LMP_SIZE_COLS from the *type* constants defined in the lammps module. The return value is the requested size. If *name* corresponds to a per-atom vector the *dtype* keyword is ignored.

Parameters

- name (string) – name of the property
- type (int) – either LMP_SIZE_ROWS or LMP_SIZE_COLS for arrays, otherwise ignored

Returns
data type of per-atom property (see *Data Types*)

Return type
int

extract_atom(*name*, *dtype=None*)

Retrieve per-atom properties from LAMMPS

This is a wrapper around the lammps_extract_atom() function of the C-library interface. Its documentation includes a list of the supported keywords and their data types. Since Python needs to know the data type to be able to interpret the result, by default, this function will try to auto-detect the data type by asking the library. You can also force a specific data type by setting dtype to one of the *data type* constants defined in the lammps module. This function returns None if either the keyword is not recognized, or an invalid data type constant is used.

> **Note**
>
> While the returned vectors or arrays of per-atom data are dimensioned for the range [0:nmax] - as is the underlying storage - the data is usually only valid for the range of [0:nlocal], unless the property of interest is also updated for ghost atoms. In some cases, this depends on a LAMMPS setting, see for example *comm_modify vel yes*. The actual size can be determined by calling py:meth:*extract_atom_size() <lammps.lammps.extract_atom_size>*.

Parameters

- name (string) – name of the property
- dtype (int, optional) – data type of the returned data (see *Data Types*)

Returns

requested data or None

Return type

ctypes.POINTER(ctypes.c_int32), ctypes.POINTER(ctypes.POINTER(ctypes.c_int32)), ctypes.POINTER(ctypes.c_int64), ctypes.POINTER(ctypes.POINTER(ctypes.c_int64)), ctypes.POINTER(ctypes.c_double), ctypes.POINTER(ctypes.POINTER(ctypes.c_double)), or NoneType

extract_compute(*cid*, *cstyle*, *ctype*)

Retrieve data from a LAMMPS compute

This is a wrapper around the lammps_extract_compute() function of the C-library interface. This function returns None if either the compute id is not recognized, or an invalid combination of *cstyle* and *ctype* constants is used. The names and functionality of the constants are the same as for the corresponding C-library function. For requests to return a scalar or a size, the value is returned, otherwise a pointer.

Parameters

- cid (string) – compute ID
- cstyle (int) – style of the data retrieve (global, atom, or local), see *Style Constants*
- ctype (int) – type or size of the returned data (scalar, vector, or array), see *Type Constants*

Returns

requested data as scalar, pointer to 1d or 2d double array, or None

Return type

c_double, ctypes.POINTER(c_double), ctypes.POINTER(ctypes.POINTER(c_double)), or NoneType

extract_fix(*fid*, *fstyle*, *ftype*, *nrow=0*, *ncol=0*)

Retrieve data from a LAMMPS fix

This is a wrapper around the lammps_extract_fix() function of the C-library interface. This function returns None if either the fix id is not recognized, or an invalid combination of *fstyle* and *ftype* constants is used. The names and functionality of the constants are the same as for the corresponding C-library function. For requests to return a scalar or a size, the value is returned, also when accessing global vectors or arrays, otherwise a pointer.

> **Note**

When requesting global data, the fix data can only be accessed one item at a time without access to the whole vector or array. Thus this function will always return a scalar. To access vector or array elements the "nrow" and "ncol" arguments need to be set accordingly (they default to 0).

Parameters

- fid (string) – fix ID
- fstyle (int) – style of the data retrieve (global, atom, or local), see *Style Constants*
- ftype (int) – type or size of the returned data (scalar, vector, or array), see *Type Constants*
- nrow (int) – index of global vector element or row index of global array element
- ncol (int) – column index of global array element

Returns
requested data or None

Return type
c_double, ctypes.POINTER(c_double), ctypes.POINTER(ctypes.POINTER(c_double)), or NoneType

extract_variable(*name*, *group=None*, *vartype=None*)

Evaluate a LAMMPS variable and return its data

This function is a wrapper around the function lammps_extract_variable() of the C library interface, evaluates variable name and returns a copy of the computed data. The memory temporarily allocated by the C-interface is deleted after the data is copied to a Python variable or list. The variable must be either an equal-style (or equivalent) variable or an atom-style variable. The variable type can be provided as the vartype parameter, which may be one of several constants: LMP_VAR_EQUAL, LMP_VAR_ATOM, LMP_VAR_VECTOR, or LMP_VAR_STRING. If omitted or None, LAMMPS will determine its value for you based on a call to lammps_extract_variable_datatype() from the C library interface. The group parameter is only used for atom-style variables and defaults to the group "all".

Parameters

- name (string) – name of the variable to execute
- group (string, only for atom-style variables) – name of group for atom-style variable
- vartype (int) – type of variable, see *Variable Type Constants*

Returns
the requested data

Return type
c_double, (c_double), or NoneType

clearstep_compute()

Call 'lammps_clearstep_compute()' from Python

addstep_compute(*nextstep*)

Call 'lammps_addstep_compute()' from Python

addstep_compute_all(*nextstep*)

Call 'lammps_addstep_compute_all()' from Python

flush_buffers()

Flush output buffers

This is a wrapper around the lammps_flush_buffers() function of the C-library interface.

set_variable(*name*, *value*)

Set a new value for a LAMMPS string style variable

Deprecated since version 7Feb2024.

This is a wrapper around the lammps_set_variable() function of the C-library interface.

Parameters

- name (string) – name of the variable
- value (any. will be converted to a string) – new variable value

Returns
either 0 on success or -1 on failure

Return type
int

set_string_variable(*name*, *value*)

Set a new value for a LAMMPS string style variable

Added in version 7Feb2024.

This is a wrapper around the lammps_set_string_variable() function of the C-library interface.

Parameters

- name (string) – name of the variable
- value (any. will be converted to a string) – new variable value

Returns
either 0 on success or -1 on failure

Return type
int

set_internal_variable(*name*, *value*)

Set a new value for a LAMMPS internal style variable

Added in version 7Feb2024.

This is a wrapper around the lammps_set_internal_variable() function of the C-library interface.

Parameters

- name (string) – name of the variable
- value (float or compatible. will be converted to float) – new variable value

Returns
either 0 on success or -1 on failure

Return type
int

eval(*expr*)

Evaluate a LAMMPS immediate variable expression

Added in version 4Feb2025.

This function is a wrapper around the function lammps_eval() of the C library interface. It evaluates and expression like in immediate variables and returns the value.

Parameters
expr – immediate variable expression

Returns
the result of the evaluation

Return type
c_double

gather_bonds()

Retrieve global list of bonds

Added in version 28Jul2021.

This is a wrapper around the lammps_gather_bonds() function of the C-library interface.

This function returns a tuple with the number of bonds and a flat list of ctypes integer values with the bond type, bond atom1, bond atom2 for each bond.

Returns
a tuple with the number of bonds and a list of c_int or c_long

Return type
(int, 3*nbonds*c_tagint)

gather_angles()

Retrieve global list of angles

Added in version 8Feb2023.

This is a wrapper around the lammps_gather_angles() function of the C-library interface.

This function returns a tuple with the number of angles and a flat list of ctypes integer values with the angle type, angle atom1, angle atom2, angle atom3 for each angle.

Returns
a tuple with the number of angles and a list of c_int or c_long

Return type
(int, 4*nangles*c_tagint)

gather_dihedrals()

Retrieve global list of dihedrals

Added in version 8Feb2023.

This is a wrapper around the lammps_gather_dihedrals() function of the C-library interface.

This function returns a tuple with the number of dihedrals and a flat list of ctypes integer values with the dihedral type, dihedral atom1, dihedral atom2, dihedral atom3, dihedral atom4 for each dihedral.

Returns
a tuple with the number of dihedrals and a list of c_int or c_long

Return type
(int, 5*ndihedrals*c_tagint)

gather_impropers()

Retrieve global list of impropers

Added in version 8Feb2023.

This is a wrapper around the lammps_gather_impropers() function of the C-library interface.

This function returns a tuple with the number of impropers and a flat list of ctypes integer values with the improper type, improper atom1, improper atom2, improper atom3, improper atom4 for each improper.

Returns
a tuple with the number of impropers and a list of c_int or c_long

Return type
(int, 5*nimpropers*c_tagint)

encode_image_flags(*ix*, *iy*, *iz*)

convert 3 integers with image flags for x-, y-, and z-direction into a single integer like it is used internally in LAMMPS

This method is a wrapper around the lammps_encode_image_flags() function of library interface.

Parameters

- ix (int) – x-direction image flag
- iy (int) – y-direction image flag
- iz (int) – z-direction image flag

Returns
encoded image flags

Return type
lammps.c_imageint

decode_image_flags(*image*)

Convert encoded image flag integer into list of three regular integers.

This method is a wrapper around the lammps_decode_image_flags() function of library interface.

Parameters
image (lammps.c_imageint) – encoded image flags

Returns
list of three image flags in x-, y-, and z- direction

Return type
list of 3 int

create_atoms(*n*, *atomid*, *atype*, *x*, *v=None*, *image=None*, *shrinkexceed=False*)

Create N atoms from list of coordinates and properties

This function is a wrapper around the lammps_create_atoms() function of the C-library interface, and the behavior is similar except that the *v*, *image*, and *shrinkexceed* arguments are optional and default to *None*, *None*, and *False*, respectively. With *None* being equivalent to a NULL pointer in C.

The lists of coordinates, types, atom IDs, velocities, image flags can be provided in any format that may be converted into the required internal data types. Also the list may contain more than *N* entries, but not fewer. In the latter case, the function will return without attempting to create atoms. You may use the encode_image_flags method to properly combine three integers with image flags into a single integer.

Parameters

- n (int) – number of atoms for which data is provided
- atomid (list of lammps.tagint) – list of atom IDs with at least n elements or None
- atype (list of int) – list of atom types
- x (list of float) – list of coordinates for x-, y-, and z (flat list of 3n entries)
- v (list of float) – list of velocities for x-, y-, and z (flat list of 3n entries) or None (optional)
- image (list of lammps.imageint) – list of encoded image flags (optional)
- shrinkexceed (bool) – whether to expand shrink-wrap boundaries if atoms are outside the box (optional)

Returns
number of atoms created. 0 if insufficient or invalid data

Return type
int

create_molecule(*molid*, *jsonstr*)

Create new molecule template from string with JSON data

Added in version 22Jul2025.

This is a wrapper around the lammps_create_molecule() function of the library interface.

Parameters

- molid – molecule-id of the new molecule template
- jsonstr (string) – JSON data defining a new molecule template

property has_mpi_support

Report whether the LAMMPS shared library was compiled with a real MPI library or in serial.

This is a wrapper around the lammps_config_has_mpi_support() function of the library interface.

Returns
False when compiled with MPI STUBS, otherwise True

Return type
bool

property has_omp_support

Report whether the LAMMPS shared library was compiled with OpenMP enabled.

This is a wrapper around the lammps_config_has_omp_support() function of the library interface.

Returns
True when compiled with OpenMP enabled, otherwise False

Return type
bool

property is_running

Report whether being called from a function during a run or a minimization

Added in version 9Oct2020.

Various LAMMPS commands must not be called during an ongoing run or minimization. This property allows to check for that. This is a wrapper around the lammps_is_running() function of the library interface.

Returns
True when called during a run otherwise false

Return type
bool

set_show_error(*flag*)

Enable or disable direct printing of error messages in C++ code

Added in version 2Apr2025.

This function allows to enable or disable printing of error message directly in the C++ code. Disabling the printing avoids printing error messages twice when detecting and re-throwing them in Python code.

This is a wrapper around the lammps_set_show_error() function of the library interface.

Parameters
flag (int) – enable (1) or disable (0) printing of error message

Returns
previous setting of the flag

Return type
int

force_timeout()

Trigger an immediate timeout, i.e. a "soft stop" of a run.

Added in version 9Oct2020.

This function allows to cleanly stop an ongoing run or minimization at the next loop iteration. This is a wrapper around the lammps_force_timeout() function of the library interface.

property has_exceptions

Report whether the LAMMPS shared library was compiled with C++ exceptions handling enabled

This is a wrapper around the lammps_config_has_exceptions() function of the library interface.

Returns
state of C++ exception support

Return type
bool

property has_gzip_support

Report whether the LAMMPS shared library was compiled with support for reading and writing compressed files through gzip.

This is a wrapper around the lammps_config_has_gzip_support() function of the library interface.

Returns
state of gzip support

Return type
bool

property has_png_support

Report whether the LAMMPS shared library was compiled with support for writing images in PNG format.

This is a wrapper around the lammps_config_has_png_support() function of the library interface.

Returns
state of PNG support

Return type
bool

property has_jpeg_support

Report whether the LAMMPS shared library was compiled with support for writing images in JPEG format.

This is a wrapper around the lammps_config_has_jpeg_support() function of the library interface.

Returns
state of JPEG support

Return type
bool

property has_ffmpeg_support

State of support for writing movies with ffmpeg in the LAMMPS shared library

This is a wrapper around the lammps_config_has_ffmpeg_support() function of the library interface.

Returns
state of ffmpeg support

Return type
bool

property has_curl_support

Report whether the LAMMPS shared library was compiled with support for downloading files through libcurl.

This is a wrapper around the lammps_config_has_curl_support() function of the library interface.

Returns
state of CURL support

Return type
bool

has_package(*name*)

Report if the named package has been enabled in the LAMMPS shared library.

Added in version 3Nov2022.

This is a wrapper around the lammps_config_has_package() function of the library interface.

Parameters
name (string) – name of the package

Returns
state of package availability

Return type
bool

property accelerator_config

Return table with available accelerator configuration settings.

This is a wrapper around the lammps_config_accelerator() function of the library interface which loops over all known packages and categories and returns enabled features as a nested dictionary with all enabled settings as list of strings.

Returns
nested dictionary with all known enabled settings as list of strings

Return type
dictionary

property has_gpu_device

Availability of GPU package compatible device

This is a wrapper around the lammps_has_gpu_device() function of the C library interface.

Returns
True if a GPU package compatible device is present, otherwise False

Return type
bool

get_gpu_device_info()

Return a string with detailed information about any devices that are usable by the GPU package.

This is a wrapper around the lammps_get_gpu_device_info() function of the C-library interface.

Returns
GPU device info string

Return type
string

property installed_packages

List of the names of enabled packages in the LAMMPS shared library

This is a wrapper around the functions lammps_config_package_count() and lammps_config_package_name() of the library interface.

:return

has_style(*category*, *name*)

Returns whether a given style name is available in a given category

This is a wrapper around the function lammps_has_style() of the library interface.

Parameters

- category (string) – name of category
- name (string) – name of the style

Returns
true if style is available in given category

Return type
bool

available_styles(*category*)

Returns a list of styles available for a given category

This is a wrapper around the functions lammps_style_count() and lammps_style_name() of the library interface.

Parameters
category (string) – name of category

Returns
list of style names in given category

Return type
list

has_id(*category*, *name*)

Returns whether a given ID name is available in a given category

Added in version 9Oct2020.

This is a wrapper around the function lammps_has_id() of the library interface.

Parameters

- category (string) – name of category
- name (string) – name of the ID

Returns
true if ID is available in given category

Return type
bool

available_ids(*category*)

Returns a list of IDs available for a given category

Added in version 9Oct2020.

This is a wrapper around the functions lammps_id_count() and lammps_id_name() of the library interface.

Changed in version 22Jul2025.

This function has a different behavior for the "group" category: rather than only listing the available groups, it will return a full list with LMP_MAX_GROUP elements. This is because the list may have "holes" when groups are deleted. The returned list has either the name of the group or "None" for empty entries. This way, the value of 1 << idx is the groupbit that can be compared to the per-atom "mask" property to determine if an atom is member of a group.

Parameters
category (string) – name of category

Returns
list of id names in given category

Return type
list

available_plugins(*category=None*)

Returns a list of plugins available for a given category

Added in version 10Mar2021.

This is a wrapper around the functions lammps_plugin_count() and lammps_plugin_name() of the library interface.

Returns
list of style/name pairs of loaded plugins

Return type
list

set_fix_external_callback(*fix_id*, *callback*, *caller=None*)

Set the callback function for a fix external instance with a given fix ID.

Optionally also set a reference to the calling object.

This is a wrapper around the lammps_set_fix_external_callback() function of the C-library interface. However this is set up to call a Python function with the following arguments.

- object is the value of the "caller" argument
- ntimestep is the current timestep
- nlocal is the number of local atoms on the current MPI process
- tag is a 1d NumPy array of integers representing the atom IDs of the local atoms
- x is a 2d NumPy array of doubles of the coordinates of the local atoms
- f is a 2d NumPy array of doubles of the forces on the local atoms that will be added

Changed in version 28Jul2021.

Parameters

- fix_id – Fix-ID of a fix external instance
- callback – Python function that will be called from fix external
- caller – reference to some object passed to the callback function

Type
string

Type
function

Type
object, optional

fix_external_get_force(*fix_id*)

Get access to the array with per-atom forces of a fix external instance with a given fix ID.

Added in version 28Jul2021.

This is a wrapper around the lammps_fix_external_get_force() function of the C-library interface.

Parameters
fix_id – Fix-ID of a fix external instance

Type
string

Returns
requested data

Return type
ctypes.POINTER(ctypes.POINTER(ctypes.double))

fix_external_set_energy_global(*fix_id*, *eng*)

Set the global energy contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a wrapper around the lammps_fix_external_set_energy_global() function of the C-library interface.

Parameters

- fix_id – Fix-ID of a fix external instance
- eng – potential energy value to be added by fix external

Type
string

Type
float

fix_external_set_virial_global(*fix_id*, *virial*)

Set the global virial contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a wrapper around the lammps_fix_external_set_virial_global() function of the C-library interface.

Parameters

- fix_id – Fix-ID of a fix external instance
- eng – list of 6 floating point numbers with the virial to be added by fix external

Type
string

Type
float

fix_external_set_energy_peratom(*fix_id*, *eatom*)

Set the per-atom energy contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a wrapper around the lammps_fix_external_set_energy_peratom() function of the C-library interface.

Parameters

- fix_id – Fix-ID of a fix external instance
- eatom – list of potential energy values for local atoms to be added by fix external

Type
string

Type
float

fix_external_set_virial_peratom(*fix_id*, *vatom*)

Set the per-atom virial contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a wrapper around the lammps_fix_external_set_virial_peratom() function of the C-library interface.

Parameters

- fix_id – Fix-ID of a fix external instance
- vatom – list of natoms lists with 6 floating point numbers to be added by fix external

Type
string

Type
float

fix_external_set_vector_length(*fix_id*, *length*)

Set the vector length for a global vector stored with fix external for analysis

Added in version 28Jul2021.

This is a wrapper around the lammps_fix_external_set_vector_length() function of the C-library interface.

Parameters

- fix_id – Fix-ID of a fix external instance
- length – length of the global vector

Type
string

Type
int

fix_external_set_vector(*fix_id*, *idx*, *val*)

Store a global vector value for a fix external instance with the given ID.

Added in version 28Jul2021.

This is a wrapper around the lammps_fix_external_set_vector() function of the C-library interface.

Parameters

- fix_id – Fix-ID of a fix external instance
- idx – 1-based index of the value in the global vector
- val – value to be stored in the global vector

Type
string

Type
int

Type
float

get_neighlist(*idx*)

Returns an instance of NeighList which wraps access to the neighbor list with the given index

See lammps.numpy.get_neighlist() if you want to use NumPy arrays instead of c_int pointers.

Parameters
idx (int) – index of neighbor list

Returns
an instance of NeighList wrapping access to neighbor list data

Return type
NeighList

get_neighlist_size(*idx*)

Return the number of elements in neighbor list with the given index

Parameters
idx (int) – neighbor list index

Returns
number of elements in neighbor list with index idx

Return type
int

get_neighlist_element_neighbors(*idx*, *element*)

Return data of neighbor list entry

Parameters

- element (int) – neighbor list index
- element – neighbor list element index

Returns
tuple with atom local index, number of neighbors and array of neighbor local atom indices

Return type
(int, int, POINTER(c_int))

find_pair_neighlist(*style*, *exact=True*, *nsub=0*, *reqid=0*)

Find neighbor list index of pair style neighbor list

Search for a neighbor list requested by a pair style instance that matches "style". If exact is True, the pair style name must match exactly. If exact is False, the pair style name is matched against "style" as regular expression or sub-string. If the pair style is a hybrid pair style, the style is instead matched against the hybrid sub-styles. If the same pair style is used as sub-style multiple types, you must set nsub to a value n > 0 which indicates the nth instance of that sub-style to be used (same as for the pair_coeff command). The default value of 0 will fail to match in that case.

Once the pair style instance has been identified, it may have requested multiple neighbor lists. Those are uniquely identified by a request ID > 0 as set by the pair style. Otherwise the request ID is 0.

Parameters

- style (string) – name of pair style that should be searched for
- exact (bool, optional) – controls whether style should match exactly or only must be contained in pair style name, defaults to True
- nsub (int, optional) – match nsub-th hybrid sub-style, defaults to 0
- reqid (int, optional) – list request id, > 0 in case there are more than one, defaults to 0

Returns
neighbor list index if found, otherwise -1

Return type
int

find_fix_neighlist(*fixid*, *reqid=0*)

Find neighbor list index of fix neighbor list

The fix instance requesting the neighbor list is uniquely identified by the fix ID. In case the fix has requested multiple neighbor lists, those are uniquely identified by a request ID > 0 as set by the fix. Otherwise the request ID is 0 (the default).

Parameters

- fixid (string) – name of fix
- reqid (int, optional) – id of neighbor list request, in case there are more than one request, defaults to 0

Returns
neighbor list index if found, otherwise -1

Return type
int

find_compute_neighlist(*computeid*, *reqid=0*)

Find neighbor list index of compute neighbor list

The compute instance requesting the neighbor list is uniquely identified by the compute ID. In case the compute has requested multiple neighbor lists, those are uniquely identified by a request ID > 0 as set by the compute. Otherwise the request ID is 0 (the default).

Parameters

- computeid (string) – name of compute
- reqid (int, optional) – index of neighbor list request, in case there are more than one request, defaults to 0

Returns
neighbor list index if found, otherwise -1

Return type
int

class lammps.numpy_wrapper.numpy_wrapper(*lmp*)

lammps API NumPy Wrapper

This is a wrapper class that provides additional methods on top of an existing lammps instance. The methods transform raw ctypes pointers into NumPy arrays, which give direct access to the original data while protecting against out-of-bounds accesses.

There is no need to explicitly instantiate this class. Each instance of lammps has a numpy property that returns an instance.

Parameters
lmp (lammps) – instance of the lammps class

extract_atom(*name*, *dtype=None*, *nelem=None*, *dim=None*)

Retrieve per-atom properties from LAMMPS as NumPy arrays

This is a wrapper around the lammps.extract_atom() method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

Note

The returned vectors or arrays of per-atom data are dimensioned according to the return value of lammps.extract_atom_size(). Except for the "mass" property, the underlying storage will always be dimensioned for the range [0:nmax]. The actual usable data may be only in the range [0:nlocal] or [0:nlocal][0:dim]. Whether there is valid data in the range [nlocal:nlocal+nghost] or [nlocal:local+nghost][0:dim] depends on whether the property of interest is also updated for ghost atoms. Also the value of *dim* depends on the value of *name*. By using the optional *nelem* and *dim* parameters the dimensions of the returned NumPy array can be overridden. There is no check whether the number of elements chosen is valid.

Parameters

- name (string) – name of the property
- dtype (int, optional) – type of the returned data (see *Data Types*)
- nelem (int, optional) – number of elements in array

- dim (int, optional) – dimension of each element

Returns
requested data as NumPy array with direct access to C data or None

Return type
numpy.array or NoneType

extract_compute(*cid*, *cstyle*, *ctype*)

Retrieve data from a LAMMPS compute

This is a wrapper around the lammps.extract_compute() method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

Parameters

- cid (string) – compute ID
- cstyle (int) – style of the data retrieve (global, atom, or local), see *Style Constants*
- ctype (int) – type of the returned data (scalar, vector, or array), see *Type Constants*

Returns
requested data either as float, as NumPy array with direct access to C data, or None

Return type
float, numpy.array, or NoneType

extract_fix(*fid*, *fstyle*, *ftype*, *nrow=0*, *ncol=0*)

Retrieve data from a LAMMPS fix

This is a wrapper around the lammps.extract_fix() method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

Note

When requesting global data, the fix data can only be accessed one item at a time without access to the whole vector or array. Thus this function will always return a scalar. To access vector or array elements the "nrow" and "ncol" arguments need to be set accordingly (they default to 0).

Parameters

- fid (string) – fix ID
- fstyle (int) – style of the data retrieve (global, atom, or local), see *Style Constants*
- ftype (int) – type or size of the returned data (scalar, vector, or array), see *Type Constants*
- nrow (int) – index of global vector element or row index of global array element
- ncol (int) – column index of global array element

Returns
requested data

Return type
integer or double value, pointer to 1d or 2d double array or None

extract_variable(*name*, *group=None*, *vartype=0*)

Evaluate a LAMMPS variable and return its data

This function is a wrapper around the function lammps.extract_variable() method. It behaves the same as the original method, but returns NumPy arrays instead of ctypes pointers.

Parameters

- name (string) – name of the variable to execute
- group (string) – name of group for atom-style variable (ignored for equal-style variables)
- vartype (int) – type of variable, see *Variable Type Constants*

Returns
the requested data or None

Return type
c_double, numpy.array, or NoneType

gather_bonds()

Retrieve global list of bonds as a NumPy array

Added in version 28Jul2021.

This is a wrapper around lammps.gather_bonds(). It behaves the same as the original method, but returns a NumPy array instead of a ctypes list.

Returns
the requested data as a 2d-integer numpy array

Return type
numpy.array(nbonds,3)

gather_angles()

Retrieve global list of angles as a NumPy array

Added in version 8Feb2023.

This is a wrapper around lammps.gather_angles(). It behaves the same as the original method, but returns a NumPy array instead of a ctypes list.

Returns
the requested data as a 2d-integer numpy array

Return type
numpy.array(nangles,4)

gather_dihedrals()

Retrieve global list of dihedrals as a NumPy array

Added in version 8Feb2023.

This is a wrapper around lammps.gather_dihedrals(). It behaves the same as the original method, but returns a NumPy array instead of a ctypes list.

Returns
the requested data as a 2d-integer numpy array

Return type
numpy.array(ndihedrals,5)

gather_impropers()

Retrieve global list of impropers as a NumPy array

Added in version 8Feb2023.

This is a wrapper around lammps.gather_impropers(). It behaves the same as the original method, but returns a NumPy array instead of a ctypes list.

Returns
the requested data as a 2d-integer numpy array

Return type
numpy.array(nimpropers,5)

fix_external_get_force(*fix_id*)

Get access to the array with per-atom forces of a fix external instance with a given fix ID.

Changed in version 28Jul2021.

This function is a wrapper around the lammps.fix_external_get_force() method. It behaves the same as the original method, but returns a NumPy array instead of a ctypes pointer.

Parameters
fix_id – Fix-ID of a fix external instance

Type
string

Returns
requested data

Return type
numpy.array

fix_external_set_energy_peratom(*fix_id*, *eatom*)

Set the per-atom energy contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This function is an alternative to lammps.fix_external_set_energy_peratom() method. It behaves the same as the original method, but accepts a NumPy array instead of a list as argument.

Parameters

- fix_id – Fix-ID of a fix external instance
- eatom – per-atom potential energy

Type
string

Type
numpy.array

fix_external_set_virial_peratom(*fix_id*, *vatom*)

Set the per-atom virial contribution for a fix external instance with the given ID.

Added in version 28Jul2021.

This function is an alternative to lammps.fix_external_set_virial_peratom() method. It behaves the same as the original method, but accepts a NumPy array instead of a list as argument.

Parameters

- fix_id – Fix-ID of a fix external instance

- eatom – per-atom potential energy

Type
string

Type
numpy.array

get_neighlist(*idx*)

Returns an instance of NumPyNeighList which wraps access to the neighbor list with the given index

Parameters
idx (int) – index of neighbor list

Returns
an instance of NumPyNeighList wrapping access to neighbor list data

Return type
NumPyNeighList

get_neighlist_element_neighbors(*idx*, *element*)

Return data of neighbor list entry

This function is a wrapper around the function lammps.get_neighlist_element_neighbors() method. It behaves the same as the original method, but returns a NumPy array containing the neighbors instead of a ctypes pointer.

Parameters

- element (int) – neighbor list index
- element – neighbor list element index

Returns
tuple with atom local index and numpy array of neighbor local atom indices

Return type
(int, numpy.array)

iarray(*c_int_type*, *raw_ptr*, *nelem*, *dim=1*)

Convert ctypes pointer to an array of integers into a corresponding numpy array

This will cast the raw pointer into a 1-d or 2-d numpy array and set its shape

Parameters

- c_int_type – type of integer (c_int32 or c_int64)
- raw_ptr – ctypes pointer to the array data
- nelem – length of the leading dimension
- dim – length of the second dimension

Type
ctypes type

Type
POINTER(c_int_type)

Type
integer

Type
integer, optional

Returns
ctypes array converted to numpy style array with proper shape

Return type
numpy.array

darray(*raw_ptr*, *nelem*, *dim=1*)

Convert ctypes pointer to an array of doubles into a corresponding numpy array

This will cast the raw pointer into a 1-d or 2-d numpy array and set its shape

Parameters

- raw_ptr – ctypes pointer to the array data
- nelem – length of the leading dimension
- dim – length of the second dimension

Type
POINTER(c_double)

Type
integer

Type
integer, optional

Returns
ctypes array converted to numpy style array with proper shape

Return type
numpy.array

class lammps.ipython.wrapper(*lmp*)

lammps API IPython Wrapper

This is a wrapper class that provides additional methods on top of an existing lammps instance. It provides additional methods that allow create and/or embed visualizations created by native LAMMPS commands.

There is no need to explicitly instantiate this class. Each instance of lammps has a ipython property that returns an instance.

Parameters
lmp (lammps) – instance of the lammps class

image(*filename='snapshot.png'*, *group='all'*, *color='type'*, *diameter='type'*, *size=None*, *view=None*, *center=None*, *up=None*, *zoom=1.0*, *background_color='white'*)

Generate image using write_dump command and display it

See *dump image* for more information.

Parameters

- filename (string) – Name of the image file that should be generated. The extension determines whether it is PNG or JPEG
- group (string) – the group of atoms write_image should use
- color (string) – name of property used to determine color
- diameter (string) – name of property used to determine atom diameter
- size (tuple (width, height)) – dimensions of image
- view (tuple (theta, phi)) – view parameters

- center (tuple (flag, center_x, center_y, center_z)) – center parameters
- up (tuple (up_x, up_y, up_z)) – vector pointing to up direction
- zoom (float) – zoom factor
- background_color (string) – background color of scene

Returns
Image instance used to display image in notebook

Return type
IPython.core.display.Image

video(*filename*)

Load video from file

Can be used to visualize videos from *dump movie*.

Parameters
filename (string) – Path to video file

Returns
HTML Video Tag used by notebook to embed a video

Return type
IPython.display.HTML

2.4.2 Additional components of the lammps module

The lammps module additionally contains several constants and the NeighList class:

Data Types

LAMMPS_INT, LAMMPS_INT_2D, LAMMPS_DOUBLE, LAMMPS_DOUBLE_2D, LAMMPS_INT64, LAMMPS_INT64_2D, LAMMPS_STRING

Constants in the lammps module to indicate how to cast data when the C library function returns a void pointer. Used in lammps.extract_global() and lammps.extract_atom(). See _LMP_DATATYPE_CONST for the equivalent constants in the C library interface.

Style Constants

LMP_STYLE_GLOBAL, LMP_STYLE_ATOM, LMP_STYLE_LOCAL

Constants in the lammps module to select what style of data to request from computes or fixes. See _LMP_STYLE_CONST for the equivalent constants in the C library interface. Used in lammps.extract_compute(), lammps.extract_fix(), and their NumPy variants lammps.numpy.extract_compute() and lammps.numpy.extract_fix().

Type Constants

LMP_TYPE_SCALAR, LMP_TYPE_VECTOR, LMP_TYPE_ARRAY, LMP_SIZE_VECTOR, LMP_SIZE_ROWS, LMP_SIZE_COLS

Constants in the lammps module to select what type of data to request from computes or fixes. See _LMP_TYPE_CONST for the equivalent constants in the C library interface. Used in lammps.extract_compute(), lammps.extract_fix(), and their NumPy variants lammps.numpy.extract_compute() and lammps.numpy.extract_fix().

Variable Type Constants

LMP_VAR_EQUAL, LMP_VAR_ATOM

Constants in the lammps module to select what type of variable to query when calling lammps.extract_variable(). See also: *variable command*.

Classes representing internal objects

class lammps.NeighList(*lmp*, *idx*)

This is a wrapper class that exposes the contents of a neighbor list.

It can be used like a regular Python list. Each element is a tuple of:

- the atom local index
- its number of neighbors
- and a pointer to an c_int array containing local atom indices of its neighbors

Internally it uses the lower-level LAMMPS C-library interface.

Parameters

- lmp (lammps) – reference to instance of lammps
- idx (int) – neighbor list index

property size

Returns
number of elements in neighbor list

get(*element*)

Access a specific neighbor list entry. "element" must be a number from 0 to the size-1 of the list

Returns
tuple with atom local index, number of neighbors and ctypes pointer to neighbor's local atom indices

Return type
(int, int, ctypes.POINTER(c_int))

find(*iatom*)

Find the neighbor list for a specific (local) atom iatom. If there is no list for iatom, (-1, None) is returned.

Returns
tuple with number of neighbors and ctypes pointer to neighbor's local atom indices

Return type
(int, ctypes.POINTER(c_int))

class lammps.numpy_wrapper.NumPyNeighList(*lmp*, *idx*)

This is a wrapper class that exposes the contents of a neighbor list.

It can be used like a regular Python list. Each element is a tuple of:

- the atom local index
- a NumPy array containing the local atom indices of its neighbors

Internally it uses the lower-level LAMMPS C-library interface.

Parameters

- lmp (lammps) – reference to instance of lammps

- idx (int) – neighbor list index

get(*element*)

Access a specific neighbor list entry. "element" must be a number from 0 to the size-1 of the list

Returns
tuple with atom local index, numpy array of neighbor local atom indices

Return type
(int, numpy.array)

find(*iatom*)

Find the neighbor list for a specific (local) atom iatom. If there is no list for iatom, None is returned.

Returns
numpy array of neighbor local atom indices

Return type
numpy.array or None

2.5 Extending the Python interface

As noted previously, most of the lammps Python class methods correspond one-to-one with the functions in the LAMMPS library interface in src/library.cpp and library.h. This means you can extend the Python wrapper by following these steps:

- Add a new interface function to src/library.cpp and src/library.h.
- Rebuild LAMMPS as a shared library.
- Add a wrapper method to python/lammps/core.py for this interface function.
- Define the corresponding argtypes list and restype in the lammps.__init__() function.
- Re-install the shared library and the python module, if needed
- You should now be able to invoke the new interface function from a Python script.

2.6 Calling Python from LAMMPS

LAMMPS has several commands which can be used to invoke Python code directly from an input script:

- *python*
- *python-style variables*
- *equal-style and atom-style variables with formulas containing Python function wrappers*
- *fix python/invoke*
- *pair_style python*

The *python* command can be used to define and execute a Python function that you write the code for. The Python function can also be assigned to a LAMMPS python-style variable via the *variable* command. Each time the variable is evaluated, either in the LAMMPS input script itself, or by another LAMMPS command that uses the variable, this will trigger the Python function to be invoked.

The Python function can also be referenced in the formula used to define an *equal-style or atom-style variable*, using the syntax for a *Python function wrapper*. This make it easy to pass LAMMPS-related arguments to the Python function, as well as to invoke it whenever the equal- or atom-style variable is evaluated. For an atom-style variable it means the Python function can be invoked once per atom, using per-atom properties as arguments to the function.

The Python code for the function can be included directly in the input script or in an auxiliary file. The function can have arguments which are mapped to LAMMPS variables (also defined in the input script) and it can return a value to a LAMMPS variable. This is thus a mechanism for your input script to pass information to a piece of Python code, ask Python to execute the code, and return information to your input script.

Note that a Python function can be arbitrarily complex. It can import other Python modules, instantiate Python classes, call other Python functions, etc. The Python code that you provide can contain more code than the single function. It can contain other functions or Python classes, as well as global variables or other mechanisms for storing state between calls from LAMMPS to the function.

The Python function you provide can consist of "pure" Python code that only performs operations provided by standard Python. However, the Python function can also "call back" to LAMMPS through its Python-wrapped library interface, in the manner described in the *Python run* doc page. This means it can issue LAMMPS input script commands or query and set internal LAMMPS state. As an example, this can be useful in an input script to create a more complex loop with branching logic, than can be created using the simple looping and branching logic enabled by the *next* and *if* commands.

See the *python* page and the *variable* doc page for its python-style variables for more info, including examples of Python code you can write for both pure Python operations and callbacks to LAMMPS.

2.7 Output Readers

The Python package contains the lammps.formats module, which provides classes to post-process some of the output files generated by LAMMPS.

Output formats for LAMMPS python module Written by Richard Berger <richard.berger@outlook.com> and Axel Kohlmeyer <akohlmey@gmail.com>

class lammps.formats.LogFile(*filename*)

Reads LAMMPS log files and extracts the thermo information

It supports the line, multi, and yaml thermo output styles.

Parameters
filename (str) – path to log file

Variables

- runs – List of LAMMPS runs in log file. Each run is a dictionary with thermo fields as keys, storing the values over time
- errors – List of error lines in log file

class lammps.formats.AvgChunkFile(*filename*)

Reads files generated by fix ave/chunk

Parameters
filename (str) – path to ave/chunk file

Variables

- timesteps – List of timesteps stored in file
- total_count – total count over time
- chunks – List of chunks. Each chunk is a dictionary containing its ID, the coordinates, and the averaged quantities

2.8 Example Python scripts

The python/examples directory has Python scripts which show how Python can run LAMMPS, grab data, change it, and put it back into LAMMPS.

These are the Python scripts included as demos in the python/examples directory of the LAMMPS distribution, to illustrate the kinds of things that are possible when Python wraps LAMMPS. If you create your own scripts, send them to us and we can include them in the LAMMPS distribution.

trivial.py	read/run a LAMMPS input script through Python
demo.py	invoke various LAMMPS library interface routines
simple.py	run in parallel, similar to examples/COUPLE/simple/simple.cpp
split.py	same as simple.py but running in parallel on a subset of procs
gui.py	GUI go/stop/temperature-slider to control LAMMPS
plot.py	real-time temperature plot with GnuPlot via Pizza.py
viz_TOOL.py	real-time viz via some viz package
vizplotgui_TOOL.py	combination of viz_TOOL.py and plot.py and gui.py

For the viz_TOOL.py and vizplotgui_TOOL.py commands, replace TOOL with gl or atomeye or pymol or vmd, depending on what visualization package you have installed.

Note that for GL, you need to be able to run the Pizza.py GL tool, which is included in the pizza subdirectory. See the Pizza.py doc pages for more info:

- https://lammps.github.io/pizza/

Note that for AtomEye, you need version 3, and there is a line in the scripts that specifies the path and name of the executable. See the AtomEye web pages for more details:

- http://li.mit.edu/Archive/Graphics/A/
- http://li.mit.edu/Archive/Graphics/A3/A3.html

The latter link is to AtomEye 3 which has the scripting capability needed by these Python scripts.

Note that for PyMol, you need to have built and installed the open-source version of PyMol in your Python, so that you can import it from a Python script. See the PyMol web pages for more details:

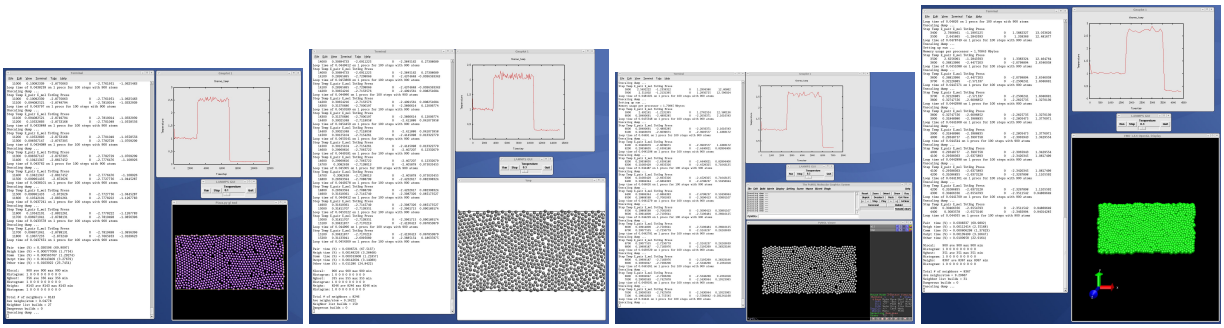
- https://www.pymol.org
- https://github.com/schrodinger/pymol-open-source

The latter link is to the open-source version.

Note that for VMD, you need a fairly current version (1.8.7 works for me) and there are some lines in the pizza/vmd.py script for 4 PIZZA variables that have to match the VMD installation on your system.

See the python/README file for instructions on how to run them and the source code for individual scripts for comments about what they do.

Here are screenshots of the vizplotgui_tool.py script in action for different visualization package options:



2.9 Using LAMMPS in IPython notebooks and Jupyter

If the LAMMPS Python package is installed for the same Python interpreter as IPython, you can use LAMMPS directly inside of an IPython notebook inside of Jupyter. Jupyter is a powerful integrated development environment (IDE) for many dynamic languages like Python, Julia and others, which operates inside of any web browser. Besides auto-completion and syntax highlighting it allows you to create formatted documents using Markup, mathematical formulas, graphics and animations intermixed with executable Python code. It is a great format for tutorials and showcasing your latest research.

The easiest way to install it is via pip from https://pypi.org/:

```
pip install --user jupyter
```

To launch an instance of Jupyter simply run the following command inside your Python environment:

```
jupyter notebook
```

2.9.1 Interactive Python Examples

Examples of IPython notebooks can be found in the python/examples/ipython subdirectory. They require LAMMPS to be compiled as shared library with PYTHON, PNG, JPEG and FFMPEG support.

To open these notebooks launch jupyter notebook index.ipynb inside this directory. The opened file provides an overview of the available examples.

- Example 1: Using LAMMPS with Python (simple.ipynb)
- Example 2: Analyzing LAMMPS thermodynamic data (thermo.ipynb)
- Example 3: Working with Per-Atom Data (atoms.ipynb)
- Example 4: Working with LAMMPS variables (variables.ipynb)
- Example 5: Validating a dihedral potential (dihedrals/dihedral.ipynb)
- Example 6: Running a Monte Carlo relaxation (montecarlo/mc.ipynb)

Note

Typically clicking a link in Jupyter will open a new tab, which might be blocked by your pop-up blocker.

2.10 Handling LAMMPS errors

LAMMPS and the LAMMPS library are compiled with *C++ exception support* to provide a better error handling experience. LAMMPS errors trigger throwing a C++ exception. These exceptions allow capturing errors on the C++ side and rethrowing them on the Python side. This way LAMMPS errors can be handled through the Python exception handling mechanism.

```
from lammps import lammps, MPIAbortException

lmp = lammps()

try:
  # LAMMPS will normally terminate itself and the running process if an error
  # occurs. This would kill the Python interpreter.  The library wrapper will
  # detect that an error has occurred and throw a Python exception

  lmp.command('unknown')
except MPIAbortException as ae:
  # Single MPI process got killed. This would normally be handled by an MPI abort
  pass
except Exception as e:
  # All (MPI) processes have reached this error
  pass
```

Warning

Capturing a LAMMPS exception in Python can still mean that the current LAMMPS process is in an illegal state and must be terminated. It is advised to save your data and terminate the Python instance as quickly as possible when running in parallel with MPI.

2.11 Troubleshooting

2.11.1 Testing if Python can launch LAMMPS

To test if LAMMPS is callable from Python, launch Python interactively and type:

```
>>> from lammps import lammps
>>> lmp = lammps()
```

If you get no errors, you're ready to use LAMMPS from Python. If the second command fails, the most common error to see is

```
OSError: Could not load LAMMPS dynamic library
```

which means Python was unable to load the LAMMPS shared library. This typically occurs if the system can't find the LAMMPS shared library or one of the auxiliary shared libraries it depends on, or if something about the library is incompatible with your Python. The error message should give you an indication of what went wrong.

If your shared library uses a suffix, such as liblammps_mpi.so, change the constructor call as follows (see *Creating or deleting a LAMMPS object* for more details):

```
>>> lmp = lammps(name='mpi')
```

You can also test the load directly in Python as follows, without first importing from the lammps module:

```
>>> from ctypes import CDLL
>>> CDLL("liblammps.so")
```

If an error occurs, carefully go through the steps in *Installing the LAMMPS Python Module and Shared Library* and on the *Build_basics* page about building a shared library.

If you are not familiar with Python, it is a powerful scripting and programming language which can do almost everything that compiled languages like C, C++, or Fortran can do in fewer lines of code. It also comes with a large collection of add-on modules for many purposes (either bundled or easily installed from Python code repositories). The major drawback is slower execution speed of the script code compared to compiled programming languages. But when the script code is interfaced to optimized compiled code, performance can be on par with a standalone executable, for as long as the scripting is restricted to high-level operations. Thus Python is also convenient to use as a "glue" language to "drive" a program through its library interface, or to hook multiple pieces of software together, such as a simulation code and a visualization tool, or to run a coupled multi-scale or multi-physics model.

See the *Coupling LAMMPS to other codes* page for more ideas about coupling LAMMPS to other codes. See the *LAMMPS Library Interfaces* page for a description of the LAMMPS library interfaces. That interface is exposed to Python either when calling LAMMPS from Python or when calling Python from a LAMMPS input script and then calling back to LAMMPS from Python code. The C-library interface is designed to be easy to add functionality to, thus the Python interface to LAMMPS is easy to extend as well.

If you create interesting Python scripts that run LAMMPS or interesting Python functions that can be called from a LAMMPS input script, that you think would be generally useful, please post them as a pull request to our GitHub site, and they can be added to the LAMMPS distribution or web page.

CHAPTER

THREE

MODIFYING & EXTENDING LAMMPS

LAMMPS has a modular design, so that it is easy to modify or extend with new functionality. In fact, about 95% of its source code is optional. The following pages give basic instructions on adding new features to LAMMPS. More in-depth explanations and documentation of individual functions and classes are given in *Information for Developers*.

If you add a new feature to LAMMPS and think it will be of general interest to other users, we encourage you to submit it for inclusion in LAMMPS. This process is explained in the following three pages:

- *how to prepare and submit your code*
- *requirements for submissions*
- *style guidelines*

A summary description of various types of styles in LAMMPS follows. A discussion of implementing specific styles from scratch is given in *writing new styles*.

3.1 Overview

The best way to add a new feature to LAMMPS is to find a similar feature and look at the corresponding source and header files to figure out what it does. You will need some knowledge of C++ to understand the high-level structure of LAMMPS and its class organization. Functions (class methods) that do actual computations are mostly written in C-style code and operate on simple C-style data structures (vectors and arrays). A high-level overview of the programming style choices in LAMMPS is *given elsewhere*.

Most of the new features described on the *Modify* doc page require you to write a new C++ derived class (excluding exceptions described below, this can often be done by making small edits to existing files). Creating a new class requires 2 files, a source code file (*.cpp) and a header file (*.h). The derived class must provide certain methods to work as a new option. Depending on how different your new feature is compared to existing features, you can either derive from the base class itself, or from a derived class that already exists. Enabling LAMMPS to invoke the new class is as simple as putting the two source files in the src directory and re-building LAMMPS.

The advantage of C++ and its object-orientation is that all the code and variables needed to define the new feature are in the 2 files you write. Thus, it should not make the rest of LAMMPS more complex or cause bugs through unwanted side effects.

Here is a concrete example. Suppose you write 2 files pair_foo.cpp and pair_foo.h that define a new class PairFoo which computes pairwise potentials described in the classic 1997 *paper* by Foo, *et al.* If you wish to invoke those potentials in a LAMMPS input script with a command like:

```
pair_style foo 0.1 3.5
```

then your pair_foo.h file should be structured as follows:

```
#ifdef PAIR_CLASS
// clang-format off
PairStyle(foo,PairFoo);
#else
// clang-format on
...
(class definition for PairFoo)
...
#endif
```

where "foo" is the style keyword in the pair_style command, and PairFoo is the class name defined in your pair_foo.cpp and pair_foo.h files.

When you re-build LAMMPS, your new pairwise potential becomes part of the executable and can be invoked with a pair_style command like the example above. Arguments like 0.1 and 3.5 can be defined and processed by your new class.

As illustrated by this example, many features referred to in the LAMMPS documentation are called a "style" of a particular command.

The *Modify page* lists all the common styles in LAMMPS, and discusses the header file for the base class that these styles derive from. Public variables in that file can be used and set by the derived classes, and may also be used by the base class. Sometimes they are also accessed by the rest of LAMMPS. Pure functions, which means functions declared as virtual in the base class header file and which are also set to 0, are functions you **must** implement in your new derived class to give it the functionality LAMMPS expects. Virtual functions that are not set to 0 are functions you may override or not. Those are usually defined with an empty function body.

Additionally, new output options can be added directly to the thermo.cpp, dump_custom.cpp, and variable.cpp files. These are also listed on the *Modify page*.

Here are additional guidelines for modifying LAMMPS and adding new functionality:

- Think about whether what you want to do would be better as a pre- or post-processing step. Many computations are more easily and more quickly done that way.
- Do not try to do anything within the timestepping of a run that is not parallel. For example, do not accumulate a bunch of data on a single processor and analyze it. That would run the risk of seriously degrading the parallel efficiency.
- If your new feature reads arguments or writes output, make sure you follow the unit conventions discussed by the *units* command.

(Foo) Foo, Morefoo, and Maxfoo, J of Classic Potentials, 75, 345 (1997).

3.2 Submitting new features for inclusion in LAMMPS

We encourage LAMMPS users to submit new features they write for LAMMPS to be included in the LAMMPS distribution and thus become easily accessible to all LAMMPS users. The LAMMPS source code is managed with git and public development is hosted on GitHub. You can monitor the repository to be notified of releases, follow the ongoing development, and comment on topics of interest to you.

This section contains general information regarding the preparation and submission of new features to LAMMPS. If you are new to development in LAMMPS, we recommend you read one of the tutorials on developing a new *pair style* or *fix style* which provide a friendly introduction to what LAMMPS development entails and common vocabulary used on this section.

3.2.1 Communication with the LAMMPS developers

For any larger modifications or programming project, you are encouraged to contact the LAMMPS developers ahead of time to discuss implementation strategies. That will make it easier to integrate your contribution and typically results in less work for everyone involved. You are also encouraged to search through the list of open issues on GitHub and submit a new issue for a planned feature, to avoid duplicating work (and possibly being scooped).

For informal communication with the LAMMPS developers, you may ask to join the LAMMPS developers on Slack. This slack work space is by invitation only. For access, please send an e-mail to slack@lammps.org explaining what part of LAMMPS you are working on. Only discussions related to LAMMPS development are tolerated in that work space, so this is **NOT** for people looking for help with compiling, installing, or using LAMMPS. Please post a message to the LAMMPS forum for those purposes.

3.2.2 Time and effort required

How quickly your contribution will be integrated can vary widely. It depends largely on how much effort is required by the LAMMPS developers to integrate and test it, if any and what kind of changes to the core code are required, how quickly you can address them, and how much interest the contribution is to the larger LAMMPS community. This process can be streamlined by following the *requirements* and *style guidelines*. A small, modular, well written contribution may be integrated within hours, but a complex change that requires a re-design of a core functionality in LAMMPS can take months before inclusion (though this is rare).

3.2.3 Submission procedure

All changes to LAMMPS (including those from LAMMPS developers) are integrated via pull requests on GitHub and cannot be merged without passing the automated testing and an approving review by a LAMMPS core developer. Before submitting your contribution, you should therefore first ensure that your added or modified code compiles and works correctly with the latest development version of LAMMPS and contains all bug fixes from it.

Once you have prepared everything, see the *LAMMPS GitHub Tutorial* page for instructions on how to submit your changes or new files through a GitHub pull request. If you are unable or unwilling to submit via GitHub yourself, you may also send patch files or full files to the LAMMPS developers and ask them to submit a pull request on GitHub on your behalf. If this is the case, create a gzipped tar file of all new or changed files or a corresponding patch file using 'diff -u' or 'diff -c' format and compress it with gzip. Please only use gzip compression, as this works well and is available on all platforms. This mode of submission may delay the integration as it depends more on the LAMMPS developers.

3.2.4 External contributions

If you prefer to do so, you can also develop and support your add-on feature **without** having it included in the LAMMPS distribution, for example as a download from a website of your own. See the External LAMMPS packages and tools page of the LAMMPS website for examples of groups that do this. We are happy to advertise your package and website from that page. Simply email the developers with info about your package, and we will post it there. We recommend naming external packages USER-<name> so they can be easily distinguished from packages in the LAMMPS distribution which do not have the USER- prefix.

3.2.5 Location of files: individual files and packages

We rarely accept new styles in the core src folder. Thus, please review the list of *available Packages* to see if your contribution should be added to one of them. It should fit into the general purpose of that package. If it does not fit well, it may be added to one of the EXTRA- packages or the MISC package.

However, if your project includes many related features that are not covered by one of the existing packages or is dependent on a library (bundled or external), it is best to create a new package with its own directory (with a name like FOO). In addition to your new files, the directory should contain a README text file containing your name and contact information and a brief description of what your new package does.

3.2.6 Changes to core LAMMPS files

If designed correctly, most additions do not require any changes to the core code of LAMMPS; they are simply add-on files that are compiled with the rest of LAMMPS. To make those styles work, you may need some trivial changes to the core code. An example of a trivial change is making a parent-class method "virtual" when you derive a new child class from it. If your features involve more substantive changes to the core LAMMPS files, it is particularly encouraged that you communicate with the LAMMPS developers early in development.

3.3 Requirements for contributions to LAMMPS

The following is a summary of the current requirements and recommendations for including contributed source code or documentation into the LAMMPS software distribution.

3.3.1 Motivation

The LAMMPS developers are committed to provide a software package that is versatile, reliable, high-quality, efficient, portable, and easy to maintain and modify. Achieving all of these goals is challenging since a large part of LAMMPS consists of contributed code from many different authors who may not be professionally trained programmers or familiar with the idiosyncrasies of maintaining a large software package. In addition, changes that interfere with the parallel efficiency of the core code must be avoided. As LAMMPS continues to grow and more features and functionality are added, it is necessary to follow established guidelines when accepting new contributions while also working at the same time to improve the existing code.

The following requirements and recommendations are provided as a guide. They indicate which individual requirements are strict, and which represent a preference and thus are negotiable or optional. Please feel free to contact the LAMMPS core developers in case you need additional explanations or clarifications, or you need assistance in implementing the (strict) requirements for your contributions. Requirements include:

- *Licensing requirements* (strict)
- *Integration testing* (strict)
- *Documentation* (strict)
- *Programming language standards* (strict)
- *Build system* (strict)
- *Command or style names* (strict)
- *Programming style requirements* (varied)
- *Examples* (preferred)
- *Error or warning messages and explanations* (preferred)
- *Citation reminder* (optional)
- *Testing* (optional)

3.3.2 Licensing requirements (strict)

Contributing authors agree when submitting a pull request that their contributions can be distributed under the LAMMPS license conditions. This is the GNU public license in version 2 (not 3 or later) for the publicly distributed versions, e.g. on the LAMMPS homepage or on GitHub. We also have a version of LAMMPS under LGPL 2.1 terms which is available on request; this will usually be the latest available or a previous stable version with a few LGPL 2.1 incompatible files removed. More details are found on the *LAMMPS open-source license page*.

Your new source files should have the LAMMPS copyright and GPL notice, followed by your name and email address at the top, like other user-contributed LAMMPS source files.

Contributions may be under a different license as long as that license does not conflict with the aforementioned terms. Contributions that use code with a conflicting license can be split into two parts:

1. the core parts (i.e. parts that must be in the *src* tree) that are licensed under compatible terms and bundled with the LAMMPS sources
2. an external library that must be downloaded and compiled (either separately or as part of the LAMMPS compilation)

Please note, that this split licensing mode may complicate including the contribution in binary packages.

3.3.3 Integration testing (strict)

Where possible we use available continuous integration tools to search for common programming mistakes, portability limitations, incompatible formatting, and undesired side effects. Contributed code must pass the automated tests on GitHub before it can be merged with the LAMMPS distribution. These tests compile LAMMPS in a variety of environments and settings and run the bundled unit tests. At the discretion of the LAMMPS developer managing the pull request, additional tests may be activated that test for "side effects" on running a collection of input decks and create consistent results. The translation of the documentation to HTML and PDF is also tested.

This means that contributed source code **must** compile with the most current version of LAMMPS with -DLAMMPS_BIGBIG in addition to the default setting of -DLAMMPS_SMALLBIG. The code needs to work correctly in both cases, and also in serial and parallel using MPI.

Some "disruptive" changes may break tests and require updates to the testing tools or scripts or tests themselves. This is rare. If in doubt, contact the LAMMPS developer that is assigned to the pull request.

3.3.4 Documentation (strict)

Contributions that add new styles or commands or augment existing ones must include the corresponding new or modified documentation in ReStructuredText format (.rst files in the doc/src/ folder). The documentation should be written in American English and the .rst file must only use ASCII characters, so it can be cleanly translated to PDF files (via sphinx and PDFLaTeX). Special characters may be included via embedded math expression typeset in a LaTeX subset.

When adding new commands, they need to be integrated into the sphinx documentation system, and the corresponding command tables and lists updated. When translating the documentation into html files there should be no warnings. When adding a new package, some lists describing packages must also be updated as well as a package specific description added. Likewise, if necessary, some package specific build instructions should be included.

As appropriate, the text files with the documentation can include inline mathematical expressions or figures (see doc/JPG for examples). Additional PDF files with further details may also be included; see doc/PDF for examples. The page should also include literature citations as appropriate; see the bottom of doc/fix_nh.rst for examples and the earlier part of the same file for how to format the cite itself. Citation labels must be unique across **all** .rst files. The "Restrictions" section of the page should indicate if your command is only available if LAMMPS is built with the appropriate package. See other command doc files for examples of how to do this.

Please run at least "make html" and "make spelling" from within the doc/src directory, and carefully inspect and proofread the resulting HTML format doc page before submitting your code. Upon submission of a pull request, checks for error free completion of the HTML and PDF build will be performed and also a spell check, a check for correct anchors and labels, and a check for completeness of references to all styles in their corresponding tables and lists is run. In case the spell check reports false positives, they can be added to the file doc/utils/sphinx-config/false_positives.txt

Contributions that add or modify the library interface or "public" APIs from the C++ code or the Fortran module must include suitable doxygen comments in the source and corresponding changes to the documentation sources for the "Programmer Guide" guide section of the LAMMPS manual.

If your feature requires some more complex steps and explanations to be used correctly or some external or bundled tools or scripts, we recommend that you also contribute a *Howto document* providing some more background information and some tutorial material. This can also be used to provide more in-depth explanations of models that require use of multiple commands.

As a rule-of-thumb, the more clear and self-explanatory you make your documentation, README files and examples, and the easier you make it for people to get started, the more likely it is that users will try out your new feature.

Programming language standards (strict)

The core of LAMMPS is written in C++17 in a style that can be mostly described as "C with classes". Advanced C++ features like operator overloading or excessive use of templates are avoided with the intent to keep the code readable to programmers that have limited C++ programming experience. C++ constructs are acceptable when they help improve the readability and reliability of the code, e.g. when using the *std::string* class instead of manipulating pointers and calling the string functions of the C library or when using *auto* to avoid redundant data type specifications. In addition, a collection of convenient *utility functions and classes* for recurring tasks and a collection of *platform neutral functions* for improved portability are provided. Containers from C++ standard library have to be used with caution, but *std::vector* can be useful and is compatible with efficient communication via MPI. Contributions with code requiring more recent C++ standards are only accepted as packages with the post C++17 standard code confined to the package so that it is optional.

Included Fortran code has to be compatible with the Fortran 2003 standard. Since not all platforms supported by LAMMPS provide good support for compiling Fortran files, it should be considered to rewrite these parts as C++ code, if possible, and thus allow for a wider adoption of the contribution. As of January 2023, all previously included Fortran code for the LAMMPS executable has been replaced by equivalent C++ code.

Python code currently must be compatible with Python 3.6. If a later version or Python is required, it needs to be documented.

Compatibility with older programming language standards is very important to maintain portability and availability of LAMMPS on many platforms. This applies especially to HPC cluster environments, which tend to be running older software stacks and where LAMMPS users may be required to use those older tools for access to advanced hardware features or not have the option to install newer compilers or libraries.

3.3.5 Build system (strict)

LAMMPS currently supports two build systems: one that is based on *traditional Makefiles* and one that is based on *CMake*. As of fall 2024, it is no longer required to support the traditional make build system. New packages may choose to only support building with CMake. Additions to existing packages must follow the requirements set by that package.

For a single pair of header and implementation files that are an independent feature, it is usually only required to add them to src/.gitignore.

For traditional make, if your contributed files or package depend on other LAMMPS style files or packages also being installed (e.g. because your file is a derived class from the other LAMMPS class), then an Install.sh file is also needed to check for those dependencies and modifications to src/Depend.sh to trigger the checks. See other README and Install.sh files in other directories as examples.

Similarly, for CMake support, changes may need to be made to cmake/CMakeLists.txt, some of the files in cmake/presets, and possibly a file with specific instructions needs to be added to cmake/Modules/Packages/. Please check out how this is handled for existing packages and ask the LAMMPS developers if you need assistance.

3.3.6 Command or style names, file names, and keywords (strict)

All user-visible command or style names should be all lower case and should only use letters, numbers, or forward slashes. They should be descriptive and initialisms should be avoided unless they are well established (e.g. lj for Lennard-Jones). For a compute style "some/name" the source files must be called compute_some_name.h and compute_some_name.cpp. The "include guard" in the header file would then be LMP_COMPUTE_SOME_NAME_H and the class name ComputeSomeName.

3.3.7 Programming style requirements (varied)

To maintain source code consistency across contributions from many people, there are various programming style requirements for contributions to LAMMPS. Some of these requirements are strict and must be followed, while others are only preferred and thus may be skipped. An in-depth discussion of the style guidelines is provided in the *programming style doc page*.

3.3.8 Examples (preferred)

For many new features, it is preferred that example scripts (simple, small, fast to complete on 1 CPU) are included that demonstrate the use of new or extended functionality. These are typically include under the examples or examples/PACKAGES directory and are further described on the *examples page*. Guidelines for input scripts include:

- commands that generate output should be commented out (except when the output is the sole purpose or the feature, e.g. for a new compute)
- commands like *log*, *echo*, *package*, *processors*, *suffix* may **not** be used in the input file (exception: "processors * * 1" or similar is acceptable when used to avoid unwanted domain decomposition of empty volumes)
- outside of the log files, no generated output should be included
- custom thermo_style settings may not include output measuring CPU or other time as it complicates comparisons between different runs
- input files should be named in.name, data files should be named data.name and log files should be named log.version.name.<compiler>.<ncpu>
- the total file size of all the inputs and outputs should be small
- where possible, potential files from the "potentials" folder or data file from other folders should be re-used through symbolic links

3.3.9 Error or warning messages and explanations (preferred)

Changed in version 4May2022.

Starting with LAMMPS version 4 May 2022, the LAMMPS developers have agreed on a new policy for error and warning messages.

Previously, all error and warning strings were supposed to be listed in the class header files with an explanation. Those would then be regularly "harvested" and transferred to alphabetically sorted lists in the manual. To avoid excessively long lists and to reduce effort, this came with a requirement to have rather generic error messages (e.g. "Illegal ... command"). To identify the specific cause, the name of the source file and the line number of the error location would be printed, so that one could look up the cause by reading the source code.

The new policy encourages more specific error messages that ideally indicate the cause directly, and requiring no further lookup. This is aided by the {fmt} library enabling Error class methods that take a variable number of arguments and an error text that will be treated like a {fmt} syntax format string. Error messages should still preferably be kept to a single line or two lines at most.

For more complex explanations or errors that have multiple possible reasons, a paragraph should be added to the *Error_details* page with an error code reference (e.g. .. _err0001:) then the utility function utils::errorurl() can

be used to generate a URL that will directly lead to that paragraph. An error for missing arguments can be easily generated using the utils::missing_cmd_args() convenience function. An example for this approach would be the src/read_data.cpp and src/atom.cpp files that implement the *read_data* and *atom_modify* commands and that may create *"Unknown identifier in data file"* errors that may have multiple possible reasons which complicates debugging, and thus require some additional explanation.

The transformation of existing LAMMPS code to this new scheme is ongoing. Given the size of the LAMMPS code base, it will take a significant amount of time to complete. For new code, however, following the new approach is strongly preferred. The expectation is that the new scheme will make understanding errors easier for LAMMPS users, developers, and maintainers.

3.3.10 Citation reminder (optional)

If there is a paper of yours describing your feature (either the algorithm/science behind the feature itself, or its initial usage, or its implementation in LAMMPS), you can add the citation to the *.cpp source file. See src/DIFFRACTION/compute_saed.cpp for an example. A BibTeX format citation is stored in a string variable at the top of the file, and a single line of code registering this variable is added to the constructor of the class. When your feature is used, then LAMMPS (by default) will print the brief info and the DOI in the first line to the screen and the full citation to the log file.

If there is additional functionality (which may have been added later) described in a different publication, additional citation descriptions may be added so long as they are only registered when the corresponding keyword activating this functionality is used.

With these options, it is possible to have LAMMPS output a specific citation reminder whenever a user invokes your feature from their input script. Please note that you should *only* use this for the *most* relevant paper for a feature and a publication that you or your group authored. E.g. adding a citation in the source code for a paper by Nose and Hoover if you write a fix that implements their integrator is not the intended usage. That kind of citation should just be included in the documentation page you provide describing your contribution. If you are not sure what the best option would be, please contact the LAMMPS developers for advice.

3.3.11 Testing (optional)

If your contribution contains new utility functions or a supporting class (i.e. anything that does not depend on a LAMMPS object), new unit tests should be added to a suitable folder in the unittest tree. When adding a new LAMMPS style computing forces or selected fixes, a .yaml file with a test configuration and reference data should be added for the styles where a suitable tester program already exists (e.g. pair styles, bond styles, etc.). Please see *this section in the manual* for more information on how to enable, run, and expand testing.

3.4 LAMMPS programming style

The aim of the LAMMPS developers is to use a consistent programming style and naming conventions across the entire code base, as this helps with maintenance, debugging, and understanding the code, both for developers and users. This page provides a list of standard style choices used in LAMMPS. Some of these standards are required, while others are just preferred. Following these conventions will make it much easier to integrate your contribution. If you are uncertain, please ask.

The files *pair_lj_cut.h*, *pair_lj_cut.cpp*, *utils.h*, and *utils.cpp* may serve as representative examples.

3.4.1 Include files (varied)

- Header files that define a new LAMMPS style (i.e. that have a SomeStyle(some/name,SomeName); macro in them) should only use the include file for the base class and otherwise use forward declarations and pointers; when interfacing to a library use the PIMPL (pointer to implementation) approach where you have a pointer to a struct that contains all library specific data (and thus requires the library header) but use a forward declaration

and define the struct only in the implementation file. This is a **strict** requirement since this is where type clashes between packages and hard-to-find bugs have regularly manifested in the past.

- Header files, especially those defining a "style", should only use the absolute minimum number of include files and **must not** contain any using statements. Typically, that would only be the header for the base class. Instead, any include statements should be put in the corresponding implementation files and forward declarations be used. For implementation files, the "include what you use" principle should be employed. However, there is the notable exception that when the pointers.h header is included (or the header of one of the classes derived from it), certain headers will *always* be included and thus do not need to be explicitly specified. These are: *mpi.h*, *cstddef*, *cstdio*, *cstdlib*, *string*, *utils.h*, *vector*, *fmt/format.h*, *climits*, *cinttypes*. This also means any such file can assume that *FILE*, *NULL*, and *INT_MAX* are defined.
- Class members variables should not be initialized in the header file, but instead should be initialized either in the initializer list of the constructor or explicitly assigned in the body of the constructor. If the member variable is relevant to the functionality of a class (for example when it stores a value from a command-line argument), the member variable declaration is followed by a brief comment explaining its purpose and what its values can be. Class members that are pointers should always be initialized to nullptr in the initializer list of the constructor. This reduces clutter in the header and avoids accessing uninitialized pointers, which leads to hard to debug issues, class members are often implicitly initialized to NULL on the first use (but *not* after a *clear command*). Please see the files reset_atoms_mol.h and reset_atoms_mol.cpp as an example.
- System headers or headers from installed libraries are included with angular brackets (example: #include <vector>), while local include files use double quotes (example: #include "atom.h")
- When including system header files from the C library use the C++-style names (<cstdlib> or <cstring>) instead of the C-style names (<stdlib.h> or <string.h>)
- The order of #include statements in a file some_name.cpp that implements a class SomeName defined in a header file some_name.h should be as follows:
  - #include "some_name.h" followed by an empty line
  - LAMMPS include files e.g. #include "comm.h" or #include "modify.h" in alphabetical order followed by an empty line
  - System header files from the C++ or C standard library followed by an empty line
  - using namespace LAMMPS_NS or other namespace imports.

3.4.2 Whitespace (preferred)

Source files should not contain TAB characters unless required by the syntax (e.g. in makefiles) and no trailing whitespace. Text files should have Unix-style line endings (LF-only). Git will automatically convert those in both directions when running on Windows; use dos2unix on Linux machines to convert files to Unix-style line endings. The last line of text files include a line ending.

You can check for these issues with the python scripts in the *"tools/coding_standard"* folder. When run normally with a source file or a source folder as argument, they will list all non-conforming lines. By adding the *-f* flag to the command line, they will modify the flagged files to try to remove the detected issues.

3.4.3 Constants (strongly preferred)

Global or per-file constants should be declared as *static constexpr* variables rather than via the pre-processor with *#define*. The name of constants should be all uppercase. This has multiple advantages:

- constants are easily identified as such by their all upper case name
- rather than a pure text substitution during pre-processing, *constexpr variables* have a type associated with them and are processed later in the parsing process where the syntax checks and type specific processing (e.g. via overloads) can be applied to them.

- compilers can emit a warning if the constant is not used and thus can be removed (we regularly check for and remove dead code like this)
- there are no unexpected substitutions and thus confusing syntax errors when compiling leading to, for instance, conflicts so that LAMMPS cannot be compiled with certain combinations of packages (this *has* happened multiple times in the past).

Pre-processor defines should be limited to macros (but consider C++ templates) and conditional compilation. If a pre-processor define must be used, it should be defined at the top of the .cpp file after the include statements and at all cost it should be avoided to put them into header files.

Some sets of commonly used constants are provided in the MathConst and EwaldConst namespaces and implemented in the files math_const.h and ewald_const.h, respectively.

There are always exceptions, special cases, and legacy code in LAMMPS, so please contact the LAMMPS developers if you are not sure.

3.4.4 Placement of braces (strongly preferred)

For new files added to the "src" tree, a clang-format configuration file is provided under the name *.clang-format*. This file is compatible with clang-format version 8 and later. With that file present, files can be reformatted according to the configuration with a command like: *clang-format -i new-file.cpp*. Ideally, this is done while writing the code or before a pull request is submitted. Blocks of code where the reformatting from clang-format yields hard-to-read or otherwise undesirable output may be protected with placing a pair *// clang-format off* and *// clang-format on* comments around that block.

3.4.5 Miscellaneous standards (varied)

- I/O is done via the C-style stdio library and **not** iostreams.
- Do not use so-called "alternative tokens" like and, or, not and similar, but rather use the corresponding operators &&, ||, and !. The alternative tokens are not available by default on all compilers.
- Output to the screen and the logfile should use the corresponding FILE pointers and only be done on MPI rank 0. Use the utils::logmesg() convenience function where possible.
- Usage of C++ *virtual*, *override*, *final* keywords: Please follow the C++ Core Guideline C.128. That means, you should only use *virtual* to declare a new virtual function, *override* to indicate you are overriding an existing virtual function, and *final* to prevent any further overriding.
- Trivial destructors: Do not write destructors when they are empty and *default*.

```
// don't write destructors for A or B like this

class A : protected Pointers {
 public:
  A();
  ~A() override {}
};

class B : protected Pointers {
 public:
  B();
  ~B() override = default;
};

// instead, let the compiler create the implicit default destructor by not writing it
```

(continues on next page)

(continued from previous page)

```
class A : protected Pointers {
 public:
   A();
};

class B : protected Pointers {
 public:
   B();
};
```

- Please use clang-format only to reformat files that you have contributed. For header files containing a SomeStyle(keyword, ClassName) macros it is required to have this macro embedded with a pair of // clang-format off, // clang-format on comments and the line must be terminated with a semicolon (;). Example:

```
#ifdef COMMAND_CLASS
// clang-format off
CommandStyle(run,Run);
// clang-format on
#else

#ifndef LMP_RUN_H
[...]
```

  You may also use // clang-format on/off throughout your files to protect individual sections from being reformatted.

- All files should have 0644 permissions, i.e. writable by the user only and readable by all and no executable permissions. Executable permissions (0755) should only be for shell scripts or python or similar scripts for interpreted script languages.

3.5 Atom styles

Classes that define an *atom style* are derived from the AtomVec class and managed by the Atom class. The atom style determines what attributes are associated with an atom and communicated when it is a ghost atom or migrates to a new processor. A new atom style can be created if one of the existing atom styles does not define all the attributes you need to store and communicate with atoms.

The file atom_vec_atomic.cpp is the simplest example of an atom style. Examining the code for others will make these instructions more clear.

Note that the *atom style hybrid* command can be used to define atoms or particles which have the union of properties of individual styles. Also the *fix property/atom* command can be used to add a single property (e.g. charge or a molecule ID) to a style that does not have it. It can also be used to add custom properties to an atom, with options to communicate them with ghost atoms or read them from a data file. Other LAMMPS commands can access these custom properties, as can new pair, fix, compute styles that are written to work with these properties. For example, the *set* command can be used to set the values of custom per-atom properties from an input script. All of these methods are less work than writing and testing(!) code for a new atom style.

If you follow these directions your new style will automatically work in tandem with others via the *atom_style hybrid* command.

The first step is to define a set of string lists in the constructor of the new derived class. Each list will have zero or more comma-separated strings that correspond to the variable names used in the atom.h header file for per-atom properties.

Note that some represent per-atom vectors (q, molecule) while other are per-atom arrays (x,v). For all but the last two lists you do not need to specify any of (id,type,x,v,f). Those are included automatically as needed in the other lists.

fields_grow	full list of properties which is allocated and stored
fields_copy	list of properties to copy atoms are rearranged on-processor
fields_comm	list of properties communicated to ghost atoms every step
fields_comm_vel	additional properties communicated if *comm_modify vel* is used
fields_reverse	list of properties summed from ghost atoms every step
fields_border	list of properties communicated with ghost atoms every reneighboring step
fields_border_vel	additional properties communicated if *comm_modify vel* is used
fields_exchange	list of properties communicated when an atom migrates to another processor
fields_restart	list of properties written/read to/from a restart file
fields_create	list of properties defined when an atom is created by *create_atoms*
fields_data_atom	list of properties (in order) in the Atoms section of a data file, as read by *read_data*
fields_data_vel	list of properties (in order) in the Velocities section of a data file, as read by *read_data*

In these lists you can list variable names which LAMMPS already defines (in some other atom style), or you can create new variable names. You should not re-use a LAMMPS variable in your atom style that is used for something with a different meaning in another atom style. If the meaning is related, but interpreted differently by your atom style, then using the same variable name means a user must not use your style and the other style together in a *atom_style hybrid* command. Because there will only be one value of the variable and different parts of LAMMPS will then likely use it differently. LAMMPS has no way of checking for this.

If you are defining new variable names then make them descriptive and unique to your new atom style. For example choosing "e" for energy is a bad choice; it is too generic. A better choice would be "e_foo", where "foo" is specific to your style.

If any of the variable names in your new atom style do not exist in LAMMPS, you need to add them to the src/atom.h and atom.cpp files.

Search for the word "customize" or "customization" in these 2 files to see where to add your variable. Adding a flag to the 2nd customization section in atom.h is only necessary if your code (e.g. a pair style) needs to check that a per-atom property is defined. These flags should also be set in the constructor of the atom style child class.

In atom.cpp, aside from the constructor and destructor, there are 3 methods that a new variable name or flag needs to be added to.

In Atom::peratom_create() when using the Atom::add_peratom() method, a cols argument of 0 is for per-atom vectors, a length > 1 is for per-atom arrays. Note the use of the extra per-thread flag and the add_peratom_vary() method when the last dimension of the array is variable-length.

Adding the variable name to Atom::extract() enables the per-atom data to be accessed through the *LAMMPS library interface* by a calling code, including from *Python*.

The constructor of the new atom style will also typically set a few flags which are defined at the top of atom_vec.h. If these are unclear, see how other atom styles use them.

The grow_pointers() method is also required to make a copy of peratom data pointers, as explained in the code.

There are a number of other optional methods which your atom style can implement. These are only needed if you need to do something out-of-the-ordinary which the default operation of the AtomVec parent class does not take care of. The best way to figure out why they are sometimes useful is to look at how other atom styles use them.

- process_args = use if the atom style has arguments
- init = called before each run
- force_clear = called before force computations each timestep

A few atom styles define "bonus" data associated with some or all of their particles, such as *atom_style ellipsoid or tri*. These methods work with that data:

- copy_bonus
- clear_bonus
- pack_comm_bonus
- unpack_comm_bonus
- pack_border_bonus
- unpack_border_bonus
- pack_exchange_bonus
- unpack_exchange_bonus
- size_restart_bonus
- pack_restart_bonus
- unpack_restart_bonus
- data_atom_bonus
- memory_usage_bonus

The *atom_style body* command can define a particle geometry with an arbitrary number of values. This method reads it from a data file:

- data_body

These methods are called before or after operations handled by the parent AtomVec class. They allow an atom style to do customized operations on the per-atom values. For example *atom_style sphere* reads a diameter and density of each particle from a data file. But these need to be converted internally to a radius and mass. That operation is done in the data_atom_post() method.

- pack_restart_pre
- pack_restart_post
- unpack_restart_init
- create_atom_post
- data_atom_post
- pack_data_pre
- pack_data_post

These methods enable the *compute property/atom* command to access per-atom variables it does not already define as arguments, so that they can be written to a dump file or used by other LAMMPS commands.

- property_atom
- pack_property_atom

3.6 Pair styles

Classes that compute pairwise non-bonded interactions are derived from the Pair class. In LAMMPS, pairwise force calculations include many-body potentials such as EAM, Tersoff, or ReaxFF where particles interact without an explicit bond topology but include interactions beyond pairwise non-bonded contributions. New styles can be created to add support for additional pair potentials to LAMMPS. When the modifications are small, sometimes it is more effective to

derive from an existing pair style class. This latter approach is also used by *Accelerator packages* where the accelerated style names differ from their base classes by an appended suffix.

The file src/pair_lj_cut.cpp is an example of a Pair class with a very simple potential function. It includes several optional methods to enable its use with *run_style respa* and *compute group/group*. *Writing new pair styles* contains a detailed discussion of writing new pair styles from scratch, and how simple and more complex pair styles can be implemented with examples from existing pair styles.

Here is a brief list of some the class methods in the Pair class that *must* be or *may* be overridden in a derived class for a new pair style.

Required	"pure" methods that *must* be overridden in a derived class
compute	workhorse routine that computes pairwise interactions
settings	processes the arguments to the pair_style command
coeff	set coefficients for one i,j type pair, called from pair_coeff

Optional	methods that have a default or dummy implementation
init_one	perform initialization for one i,j type pair
init_style	style initialization: request neighbor list(s), error checks
init_list	Neighbor class callback function to pass neighbor list to pair style
single	force/r and energy of a single pairwise interaction between two atoms
compute_inner/middle/outer	versions of compute used by rRESPA
compute_atomic_energy	energy of one atom, equivalent to per-atom energy
memory_usage	return estimated amount of memory used by the pair style
modify_params	process arguments to pair_modify command
extract	provide access to internal scalar or per-type data like cutoffs
extract_peratom	provide access to internal per-atom data
setup	initialization at the beginning of a run
finish	called at the end of a run, e.g. to print
write & read_restart	write/read i,j pair coeffs to restart files
write & read_restart_settings	write/read global settings to restart files
write_data	write Pair Coeffs section to data file
write_data_all	write PairIJ Coeffs section to data file
pack & unpack_forward_comm	copy data to and from buffer if style uses forward communication
pack & unpack_reverse_comm	copy data to and from buffer if style uses reverse communication
reinit	reset all type-based parameters, called by fix adapt for example
reset_dt	called when the time step is changed by timestep or fix reset/dt

Here is a list of flags or settings that should be set in the constructor of the derived pair class when they differ from the default setting.

Name of flag	Description	default
single_enable	1 if single() method is implemented, 0 if missing	1
respa_enable	1 if pair style has compute_inner/middle/outer()	0
restartinfo	1 if pair style writes its settings to a restart	1
one_coeff	1 if only a pair_coeff * * command is allowed	0
manybody_flag	1 if pair style is a manybody potential	0
unit_convert_flag	value != 0 indicates support for unit conversion	0
no_virial_fdotr_compute	1 if pair style does not call virial_fdotr_compute()	0
writedata	1 if write_data() and write_data_all() are implemented	0
comm_forward	size of buffer (in doubles) for forward communication	0
comm_reverse	size of buffer (in doubles) for reverse communication	0
ghostneigh	1 if cutghost is set and style uses neighbors of ghosts	0
finitecutflag	1 if cutoff depends on diameter of atoms	0
reinitflag	1 if style has reinit() and is compatible with fix adapt	0
ewaldflag	1 if compatible with kspace_style ewald	0
pppmflag	1 if compatible with kspace_style pppm	0
msmflag	1 if compatible with kspace_style msm	0
dispersionflag	1 if compatible with ewald/disp or pppm/disp	0
tip4pflag	1 if compatible with kspace_style pppm/tip4p	0
dipoleflag	1 if compatible with dipole kspace_style	0
spinflag	1 if compatible with spin kspace_style	0
atomic_energy_enable	1 if compute_atomic_energy() routine exists	0

3.7 Bond, angle, dihedral, improper styles

Classes that compute molecular interactions are derived from the Bond, Angle, Dihedral, and Improper classes. New styles can be created to add new potentials to LAMMPS.

Bond_harmonic.cpp is the simplest example of a bond style. Ditto for the harmonic forms of the angle, dihedral, and improper style commands.

Here is a brief description of common methods you define in your new derived class. See bond.h, angle.h, dihedral.h, and improper.h for details and specific additional methods.

Required	"pure" methods that *must* be overridden in a derived class
compute	compute the molecular interactions for all listed items
coeff	set coefficients for one type
equilibrium_distance	length of bond, used by SHAKE (bond styles only)
equilibrium_angle	opening of angle, used by SHAKE (angle styles only)
write & read_restart	writes/reads coeffs to restart files
single	force/r (bond styles only) and energy of a single bond or angle

Optional	methods that have a default or dummy implementation
init	check if all coefficients are set, calls init_style()
init_style	check if style specific conditions are met
settings	apply global settings for all types
write & read_restart_settings	writes/reads global style settings to restart files
write_data	write corresponding Coeffs section(s) in data file
memory_usage	tally memory allocated by the style
extract	provide access to internal data (bond or angle styles only)
reinit	reset all type-based parameters, called by fix adapt (bonds only)
pack & unpack_forward_comm	copy data to and from buffer in forward communication (bonds only)
pack & unpack_reverse_comm	copy data to and from buffer in reverse communication (bonds only)

Here is a list of flags or settings that should be set in the constructor of the derived class when they differ from the default setting.

Name of flag	Description	default
writedata	1 if write_data() is implemented	1
single_extra	number of extra single values calculated (bond styles only)	0
partial_flag	1 if bond type can be set to 0 and deleted (bond styles only)	0
reinitflag	1 if style has reinit() and is compatible with fix adapt	1
comm_forward	size of buffer (in doubles) for forward communication (bond styles only)	0
comm_reverse	size of buffer (in doubles) for reverse communication (bond styles only)	0
comm_reverse_off	size of buffer for reverse communication with newton off (bond styles only)	0

3.8 Compute styles

Classes that compute scalar and vector quantities like temperature and the pressure tensor, as well as classes that compute per-atom quantities like kinetic energy and the centro-symmetry parameter are derived from the Compute class. New styles can be created to add new calculations to LAMMPS.

The src/compute_temp.cpp file is a simple example of computing a scalar temperature. The src/compute_ke_atom.cpp file is a simple example of computing per-atom kinetic energy.

Here is a brief description of methods you define in your new derived class. See src/compute.h for additional details.

post_constructor	perform tasks that cannot be run in the constructor (optional)
init	perform one time setup (required)
init_list	neighbor list setup, if needed (optional)
compute_scalar	compute a scalar quantity (optional)
compute_vector	compute a vector of quantities (optional)
compute_peratom	compute one or more quantities per atom (optional)
compute_local	compute one or more quantities per processor (optional)
pack_comm	pack a buffer with items to communicate (optional)
unpack_comm	unpack the buffer (optional)
pack_reverse	pack a buffer with items to reverse communicate (optional)
unpack_reverse	unpack the buffer (optional)
remove_bias	remove velocity bias from one atom (optional)
remove_bias_all	remove velocity bias from all atoms in group (optional)
restore_bias	restore velocity bias for one atom after remove_bias (optional)
restore_bias_all	same as before, but for all atoms in group (optional)
pair_tally_callback	callback function for *tally*-style computes (optional).
modify_param	called when a compute_modify request is executed (optional)
memory_usage	tally memory usage (optional)

Tally-style computes are a special case, as their computation is done in two stages: the callback function is registered with the pair style and then called from the Pair::ev_tally() function, which is called for each pair after force and energy has been computed for this pair. Then the tallied values are retrieved with the standard compute_scalar or compute_vector or compute_peratom methods. The *compute styles in the TALLY package* provide *examples* for utilizing this mechanism.

3.9 Fix styles

In LAMMPS, a "fix" is any operation that is computed during timestepping that alters some property of the system. Essentially everything that happens during a simulation besides force computation, neighbor list construction, and output, is a "fix". This includes time integration (update of coordinates and velocities), force constraints or boundary conditions (SHAKE or walls), and diagnostics (compute a diffusion coefficient). New styles can be created to add new options to LAMMPS.

The file src/fix_setforce.cpp is a simple example of setting forces on atoms to prescribed values. There are dozens of fix options already in LAMMPS; choose one as a template that is similar to what you want to implement. There also is a detailed discussion of *how to write new fix styles* in LAMMPS.

Here is a brief description of methods you can define in your new derived class. See src/fix.h for additional details.

post_constructor	perform tasks that cannot be run in the constructor (optional)
setmask	determines when the fix is called during the timestep (required)
init	initialization before a run (optional)
init_list	store pointer to neighbor list; called by neighbor list code (optional)
setup_pre_exchange	called before atom exchange in setup (optional)
setup_pre_force	called before force computation in setup (optional)
setup	called immediately before the first timestep and after forces are computed (optional)
min_setup_pre_force	like setup_pre_force, but for minimizations instead of MD runs (optional)
min_setup	like setup, but for minimizations instead of MD runs (optional)
initial_integrate	called at very beginning of each timestep (optional)
pre_exchange	called before atom exchange on re-neighboring steps (optional)
pre_neighbor	called before neighbor list build (optional)

continues on next page

Table 1 – continued from previous page

pre_force	called before pair & molecular forces are computed (optional)
post_force	called after pair & molecular forces are computed and communicated (optional)
final_integrate	called at end of each timestep (optional)
end_of_step	called at very end of timestep (optional)
write_restart	dumps fix info to restart file (optional)
restart	uses info from restart file to re-initialize the fix (optional)
grow_arrays	allocate memory for atom-based arrays used by fix (optional)
copy_arrays	copy atom info when an atom migrates to a new processor (optional)
pack_exchange	store atom's data in a buffer (optional)
unpack_exchange	retrieve atom's data from a buffer (optional)
pack_restart	store atom's data for writing to restart file (optional)
unpack_restart	retrieve atom's data from a restart file buffer (optional)
size_restart	size of atom's data (optional)
maxsize_restart	max size of atom's data (optional)
setup_pre_force_respa	same as setup_pre_force, but for rRESPA (optional)
initial_integrate_respa	same as initial_integrate, but for rRESPA (optional)
post_integrate_respa	called after the first half integration step is done in rRESPA (optional)
pre_force_respa	same as pre_force, but for rRESPA (optional)
post_force_respa	same as post_force, but for rRESPA (optional)
final_integrate_respa	same as final_integrate, but for rRESPA (optional)
min_pre_force	called after pair & molecular forces are computed in minimizer (optional)
min_post_force	called after pair & molecular forces are computed and communicated in minimizer (optional)
min_store	store extra data for linesearch based minimization on a LIFO stack (optional)
min_pushstore	push the minimization LIFO stack one element down (optional)
min_popstore	pop the minimization LIFO stack one element up (optional)
min_clearstore	clear minimization LIFO stack (optional)
min_step	reset or move forward on line search minimization (optional)
min_dof	report number of degrees of freedom *added* by this fix in minimization (optional)
max_alpha	report maximum allowed step size during linesearch minimization (optional)
pack_comm	pack a buffer to communicate a per-atom quantity (optional)
unpack_comm	unpack a buffer to communicate a per-atom quantity (optional)
pack_reverse_comm	pack a buffer to reverse communicate a per-atom quantity (optional)
unpack_reverse_comm	unpack a buffer to reverse communicate a per-atom quantity (optional)
dof	report number of degrees of freedom *removed* by this fix during MD (optional)
compute_scalar	return a global scalar property that the fix computes (optional)
compute_vector	return a component of a vector property that the fix computes (optional)
compute_array	return a component of an array property that the fix computes (optional)
deform	called when the box size is changed (optional)
reset_target	called when a change of the target temperature is requested during a run (optional)
reset_dt	is called when a change of the time step is requested during a run (optional)
modify_param	called when a fix_modify request is executed (optional)
memory_usage	report memory used by fix (optional)
thermo	compute quantities for thermodynamic output (optional)

Typically, only a small fraction of these methods are defined for a particular fix. Setmask is mandatory, as it determines when the fix will be invoked during *the evolution of a timestep*. Fixes that perform time integration (*nve*, *nvt*, *npt*) implement initial_integrate() and final_integrate() to perform velocity Verlet updates. Fixes that constrain forces implement post_force().

Fixes that perform diagnostics typically implement end_of_step(). For an end_of_step fix, one of your fix arguments must be the variable "nevery" which is used to determine when to call the fix and you must set this variable in the constructor of your fix. By convention, this is the first argument the fix defines (after the ID, group-ID, style).

If the fix needs to store information for each atom that persists from timestep to timestep, it can manage that memory and migrate the info with the atoms as they move from processors to processor by implementing the grow_arrays, copy_arrays, pack_exchange, and unpack_exchange methods. Similarly, the pack_restart and unpack_restart methods can be implemented to store information about the fix in restart files. If you wish an integrator or force constraint fix to work with rRESPA (see the *run_style* command), the initial_integrate, post_force_integrate, and final_integrate_respa methods can be implemented. The thermo method enables a fix to contribute values to thermodynamic output, as printed quantities and/or to be summed to the potential energy of the system.

3.10 Input script command style

New commands can be added to LAMMPS input scripts by adding new classes that are derived from the Command class and thus must have a "command" method. For example, the create_atoms, read_data, velocity, and run commands are all implemented in this fashion. When such a command is encountered in the LAMMPS input script, LAMMPS simply creates a class instance with the corresponding name, invokes the "command" method of the class, and passes it the arguments from the input script. The command method can perform whatever operations it wishes on LAMMPS data structures.

The single method your new class must define is as follows:

command	operations performed by the new command

Of course, the new class can define other methods and variables as needed.

3.11 Dump styles

Classes that dump per-atom info to files are derived from the Dump class. To dump new quantities or in a new format, a new derived dump class can be added, but it is typically simpler to modify the DumpCustom class contained in the dump_custom.cpp file.

Dump_atom.cpp is a simple example of a derived dump class.

Here is a brief description of methods you define in your new derived class. See dump.h for details.

write_header	write the header section of a snapshot of atoms
count	count the number of lines a processor will output
pack	pack a proc's output data into a buffer
write_data	write a proc's data to a file

See the *dump* command and its *custom* style for a list of keywords for atom information that can already be dumped by DumpCustom. It includes options to dump per-atom info from Compute classes, so adding a new derived Compute class is one way to calculate new quantities to dump.

Note that new keywords for atom properties are not typically added to the *dump custom* command. Instead they are added to the *compute property/atom* command.

3.12 Kspace styles

Classes that compute long-range Coulombic interactions via K-space representations (Ewald, PPPM) are derived from the KSpace class. New styles can be created to add new K-space options to LAMMPS.

Ewald.cpp is an example of computing K-space interactions.

Here is a brief description of methods you define in your new derived class. See kspace.h for details.

init	initialize the calculation before a run
setup	computation before the first timestep of a run
compute	every-timestep computation
memory_usage	tally of memory usage

3.13 Minimization styles

Classes that perform energy minimization derived from the Min class. New styles can be created to add new minimization algorithms to LAMMPS.

Min_cg.cpp is an example of conjugate gradient minimization.

Here is a brief description of methods you define in your new derived class. See min.h for details.

init	initialize the minimization before a run
run	perform the minimization
memory_usage	tally of memory usage

3.14 Region styles

Classes that define geometric regions are derived from the Region class. Regions are used elsewhere in LAMMPS to group atoms, delete atoms to create a void, insert atoms in a specified region, etc. New styles can be created to add new region shapes to LAMMPS.

Region_sphere.cpp is an example of a spherical region.

Here is a brief description of methods you define in your new derived class. See region.h for details.

inside	determine whether a point is in the region
surface_interior	determine if a point is within a cutoff distance inside of surface
surface_exterior	determine if a point is within a cutoff distance outside of surface
shape_update	change region shape if set by time-dependent variable

3.15 Body styles

Classes that define body particles are derived from the Body class. Body particles can represent complex entities, such as surface meshes of discrete points, collections of sub-particles, deformable objects, etc.

See the *Howto body* page for an overview of using body particles and the various body styles LAMMPS supports. New styles can be created to add new kinds of body particles to LAMMPS.

Body_nparticle.cpp is an example of a body particle that is treated as a rigid body containing N sub-particles.

Here is a brief description of methods you define in your new derived class. See body.h for details.

data_body	process a line from the Bodies section of a data file
noutrow	number of sub-particles output is generated for
noutcol	number of values per-sub-particle output is generated for
output	output values for the Mth sub-particle
pack_comm_body	body attributes to communicate every timestep
unpack_comm_body	unpacking of those attributes
pack_border_body	body attributes to communicate when reneighboring is done
unpack_border_body	unpacking of those attributes

3.16 Granular Sub-Model styles

In granular models, particles are spheres with a finite radius and rotational degrees of freedom as further described in the *Howto granular page*. Interactions between pair of particles or particles and walls may therefore depend on many different modes of motion as described in *pair granular* and *fix wall/gran*. In both cases, the exchange of forces, torques, and heat flow between two types of bodies is defined using a GranularModel class. The GranularModel class organizes the details of an interaction using a series of granular sub-models each of which describe a particular interaction mode (e.g. normal forces or rolling friction). From a parent GranSubMod class, several types of sub-model classes are derived:

- GranSubModNormal: normal force sub-model
- GranSubModDamping: normal damping sub-model
- GranSubModTangential: tangential forces and sliding friction sub-model
- GranSubModRolling: rolling friction sub-model
- GranSubModTwisting: twisting friction sub-model
- GranSubModHeat: heat conduction sub-model

For each type of sub-model, more classes are further derived, each describing a specific implementation. For instance, from the GranSubModNormal class the GranSubModNormalHooke, GranSubModNormalHertz, and GranSubModNormalJKR classes are derived which calculate Hookean, Hertzian, or JKR normal forces, respectively. This modular structure simplifies the addition of new granular contact models as one only needs to create a new GranSubMod class without having to modify the more complex PairGranular, FixGranWall, and GranularModel classes. Most GranSubMod methods are also already defined by the parent classes so new contact models typically only require edits to a few relevant methods (e.g. methods that define coefficients and calculate forces).

Each GranSubMod class has a pointer to both the LAMMPS class and the GranularModel class which owns it, lmp and gm, respectively. The GranularModel class includes several public variables that describe the geometry/dynamics of the contact such as

xi and xj	Positions of the two contacting bodies
vi and vj	Velocities of the two contacting bodies
omegai and omegaj	Angular velocities of the two contacting bodies
dx and nx	The displacement and normalized displacement vectors
r, rsq, and rinv	The distance, distance squared, and inverse distance
radsum	The sum of particle radii
vr, vn, and vt	The relative velocity vector and its normal and tangential components
wr	The relative rotational velocity

These quantities, among others, are calculated in the GranularModel->check_contact() and GranularModel->calculate_forces() methods which can be referred to for more details.

To create a new GranSubMod class, it is recommended that one first looks at similar GranSubMod classes. All GranSubMod classes share several general methods which may need to be defined

mix_coeff()	Optional method to define how coefficients are mixed for different atom types. By default, coefficients are mixed using a geometric mean.
coeffs_to_local()	Parses coefficients to define local variables. Run once at model construction.
init()	Optional method to define local variables after other GranSubMod types were created. For instance, this method may be used by a tangential model that derives parameters from the normal model.

The Normal, Damping, Tangential, Twisting, and Rolling sub-models also have a calculate_forces() method which calculate the respective forces/torques. Correspondingly, the Heat sub-model has a calculate_heat() method. Lastly, the Normal sub-model has a few extra optional methods:

touch()	Tests whether particles are in contact. By default, when particles overlap.
pulloff_distance()	Returns the distance at which particles stop interacting. By default, when particles no longer overlap.
calculate_radius()	Returns the radius of the contact. By default, the radius of the geometric cross section.
set_fncrit()	Defines the critical force to break the contact used by some tangential, rolling, and twisting sub-models. By default, the current total normal force including damping.

As an example, say one wanted to create a new normal force option that consisted of a Hookean force with a piecewise stiffness. This could be done by adding a new set of files gran_sub_mod_custom.h:

```
#ifdef GRAN_SUB_MOD_CLASS
// clang-format off
GranSubModStyle(hooke/piecewise,GranSubModNormalHookePiecewise,NORMAL);
// clang-format on
#else

#ifndef GRAN_SUB_MOD_CUSTOM_H
#define GRAN_SUB_MOD_CUSTOM_H

#include "gran_sub_mod.h"
#include "gran_sub_mod_normal.h"

namespace LAMMPS_NS {
namespace Granular_NS {
  class GranSubModNormalHookePiecewise : public GranSubModNormal {
   public:
    GranSubModNormalHookePiecewise(class GranularModel *, class LAMMPS *);
    void coeffs_to_local() override;
    double calculate_forces() override;
   protected:
    double k1, k2, delta_switch;
  };
}    // namespace Granular_NS
}    // namespace LAMMPS_NS

#endif /*GRAN_SUB_MOD_CUSTOM_H */
#endif /*GRAN_SUB_MOD_CLASS_H */
```

and gran_sub_mod_custom.cpp

```
#include "gran_sub_mod_custom.h"
#include "gran_sub_mod_normal.h"
#include "granular_model.h"

using namespace LAMMPS_NS;
using namespace Granular_NS;

GranSubModNormalHookePiecewise::GranSubModNormalHookePiecewise(GranularModel *gm,␣
↪LAMMPS *lmp) :
    GranSubModNormal(gm, lmp)
{
  num_coeffs = 4;
}

/* ---------------------------------------------------------------------- */

void GranSubModNormalHookePiecewise::coeffs_to_local()
{
  k1 = coeffs[0];
  k2 = coeffs[1];
  damp = coeffs[2];
  delta_switch = coeffs[3];
}

/* ---------------------------------------------------------------------- */

double GranSubModNormalHookePiecewise::calculate_forces()
{
  double Fne;
  if (gm->delta >= delta_switch) {
    Fne = k1 * delta_switch + k2 * (gm->delta - delta_switch);
  } else {
    Fne = k1 * gm->delta;
  }
  return Fne;
}
```

3.17 Thermodynamic output options

The Thermo class computes and prints thermodynamic information to the screen and log file; see the files thermo.cpp and thermo.h.

There are four styles defined in thermo.cpp: "one", "multi", "yaml", and "custom". The "custom" style allows the user to explicitly list keywords for individual quantities to print when thermodynamic output is generated. The others have a fixed list of keywords. See the *thermo_style* command for a list of available quantities. The formatting of the "custom" style defaults to the "one" style, but can be adapted using *thermo_modify line*.

The thermo styles (one, multi, etc) are defined by lists of keywords with associated formats for integer and floating point numbers and identified by an enumerator constant. Adding a new style thus mostly requires defining a new list of keywords and the associated formats and then inserting the required output processing where the enumerators are identified. Search for the word "CUSTOMIZATION" with references to "thermo style" in the thermo.cpp file to see the locations where code will need to be added. The member function Thermo::header() prints output at the very

beginning of a thermodynamic output block and can be used to print column headers or other front matter. The member function Thermo::footer() prints output at the end of a thermodynamic output block. The formatting of the output is done by assembling a "line" (which may span multiple lines if the style inserts newline characters ("n" as in the "multi" style).

New thermodynamic keywords can also be added to thermo.cpp to compute new quantities for output. Search for the word "CUSTOMIZATION" with references to "keyword" in thermo.cpp to see the several locations where code will need to be added. Effectively, you need to define a member function that computes the property, add an if statement in Thermo::parse_fields() where the corresponding header string for the keyword and the function pointer is registered by calling the Thermo::addfield() method, and add an if statement in Thermo::evaluate_keyword() which is called from the Variable class when a thermo keyword is encountered.

Note

The third argument to Thermo::addfield() is a flag indicating whether the function for the keyword computes a floating point (FLOAT), regular integer (INT), or big integer (BIGINT) value. This information is used for formatting the thermodynamic output. Inside the function the result must then be stored either in the dvalue, ivalue or bivalue member variable, respectively.

Since the *thermo_style custom* command allows to use output of quantities calculated by *fixes*, *computes*, and *variables*, it may often be simpler to compute what you wish via one of those constructs, rather than by adding a new keyword to the thermo_style command.

3.18 Variable options

The Variable class computes and stores *variable* information in LAMMPS; see the file variable.cpp. The value associated with a variable can be periodically printed to the screen via the *print*, *fix print*, or *thermo_style custom* commands. Variables of style "equal" can compute complex equations that involve the following types of arguments:

```
thermo keywords = ke, vol, atoms, ...
other variables = v_a, v_myvar, ...
math functions = div(x,y), mult(x,y), add(x,y), ...
group functions = mass(group), xcm(group,x), ...
atom values = x[123], y[3], vx[34], ...
compute values = c_mytemp[0], c_thermo_press[3], ...
```

Adding keywords for the *thermo_style custom* command (which can then be accessed by variables) is discussed in the *Modify thermo* documentation.

Adding a new math function of one or two arguments can be done by editing one section of the Variable::evaluate() method. Search for the word "customize" to find the appropriate location.

Adding a new group function can be done by editing one section of the Variable::evaluate() method. Search for the word "customize" to find the appropriate location. You may need to add a new method to the Group class as well (see the group.cpp file).

Accessing a new atom-based vector can be done by editing one section of the Variable::evaluate() method. Search for the word "customize" to find the appropriate location.

Adding new *compute styles* (whose calculated values can then be accessed by variables) is discussed in the *Modify compute* documentation.

CHAPTER

FOUR

INFORMATION FOR DEVELOPERS

This section describes the internal structure and basic algorithms of the LAMMPS code. This is a work in progress and additional information will be added incrementally depending on availability of time and requests from the LAMMPS user community.

4.1 Source files

The source files of the LAMMPS code are found in two directories of the distribution: src and lib. Most of the code is written in C++ but there are small a number of files in several other languages like C, Fortran, Shell script, or Python.

The core of the code is located in the src folder and its subdirectories. A sizable number of these files are in the src directory itself, but there are plenty of *packages*, which can be included or excluded when LAMMPS is built. See the *Include packages in build* section of the manual for more information about that part of the build process. LAMMPS currently supports building with *conventional makefiles* and through *CMake*. Those procedures differ in how packages are enabled or disabled for inclusion into a LAMMPS binary, so they cannot be mixed. The source files for each package are in all-uppercase subdirectories of the src folder, for example src/MOLECULE or src/EXTRA-MOLECULE. The src/STUBS subdirectory is not a package but contains a dummy MPI library, that is used when building a serial version of the code. The src/MAKE directory and its subdirectories contain makefiles with settings and flags for a variety of configuration and machines for the build process with traditional makefiles.

The lib directory contains the source code for several supporting libraries or files with configuration settings to use globally installed libraries, that are required by some optional packages. They may include python scripts that can transparently download additional source code on request. Each subdirectory, like lib/colvars or lib/gpu, contains the source files, some of which are in different languages such as Fortran or CUDA. These libraries included in the LAMMPS build, if the corresponding package is installed.

LAMMPS C++ source files almost always come in pairs, such as src/run.cpp (implementation file) and src/run.h (header file). Each pair of files defines a C++ class, for example the LAMMPS_NS::Run class, which contains the code invoked by the *run* command in a LAMMPS input script. As this example illustrates, source file and class names often have a one-to-one correspondence with a command used in a LAMMPS input script. Some source files and classes do not have a corresponding input script command, for example src/force.cpp and the LAMMPS_NS::Force class. They are discussed in the next section.

The names of all source files are in lower case and may use the underscore character '_' to separate words. Apart from bundled, externally maintained libraries, which may have different conventions, all C and C++ header files have a .h extension, all C++ files have a .cpp extension, and C files a .c extension. A few C++ classes and utility functions are implemented with only a .h file. Examples are the Pointers and Commands classes or the MathVec functions.

4.2 Class topology

Though LAMMPS has a lot of source files and classes, its class topology is not very deep, which can be seen from the *LAMMPS class topology* figure. In that figure, each name refers to a class and has a pair of associated source files in the src folder, for example the class LAMMPS_NS::Memory corresponds to the files memory.cpp and memory.h, or the class LAMMPS_NS::AtomVec corresponds to the files atom_vec.cpp and atom_vec.h. Full lines in the figure represent compositing: that is, the class at the base of the arrow holds a pointer to an instance of the class at the tip. Dashed lines instead represent inheritance: the class at the tip of the arrow is derived from the class at the base. Classes with a red boundary are not instantiated directly, but they represent the base classes for "styles". Those "styles" make up the bulk of the LAMMPS code and only a few representative examples are included in the figure, so it remains readable.

The LAMMPS_NS::LAMMPS class is the topmost class and represents what is generally referred to as an "instance of LAMMPS". It is a composite holding pointers to instances of other core classes providing the core functionality of the MD engine in LAMMPS and through them abstractions of the required operations. The constructor of the LAMMPS class will instantiate those instances, process the command-line flags, initialize MPI (if not already done) and set up file pointers for input and output. The destructor will shut everything down and free all associated memory. Thus code for the standalone LAMMPS executable in main.cpp simply initializes MPI, instantiates a single instance of LAMMPS while passing it the command-line flags and input script. It deletes the LAMMPS instance after the method reading the input returns and shuts down the MPI environment before it exits the executable.

The LAMMPS_NS::Pointers class is not shown in the *LAMMPS class topology* figure for clarity. It holds references to many of the members of the *LAMMPS_NS::LAMMPS*, so that all classes derived from LAMMPS_NS::Pointers have direct access to those references. From the class topology all classes with blue boundary are referenced in the Pointers class and all classes in the second and third columns, that are not listed as derived classes, are instead derived from LAMMPS_NS::Pointers. To initialize the pointer references in Pointers, a pointer to the LAMMPS class instance needs to be passed to the constructor. All constructors for classes derived from it, must do so and thus pass that pointer to the constructor for LAMMPS_NS::Pointers. The default constructor for LAMMPS_NS::Pointers is disabled to enforce this.

Since all storage is supposed to be encapsulated (there are a few exceptions), the LAMMPS class can also be instantiated multiple times by a calling code. Outside the aforementioned exceptions, those LAMMPS instances can be used alternately. As of the time of this writing (early 2023) LAMMPS is not yet sufficiently thread-safe for concurrent execution. When running in parallel with MPI, care has to be taken, that suitable copies of communicators are used to not create conflicts between different instances.

The LAMMPS class currently holds instances of 19 classes representing the core functionality. There are a handful of virtual parent classes in LAMMPS that define what LAMMPS calls styles. These are shaded red in the *LAMMPS class topology* figure. Each of these are parents of a number of child classes that implement the interface defined by the parent class. There are two main categories of these styles: some may only have one instance active at a time (e.g. atom, pair, bond, angle, dihedral, improper, kspace, comm) and there is a dedicated pointer variable for each of them in the corresponding composite class. Setups that require a mix of different such styles have to use a *hybrid* class instance that acts as a proxy, and manages and forwards calls to the corresponding sub-style class instances for the designated subset of atoms or data. The composite class may also have lists of class instances, e.g. Modify handles lists of compute and fix styles, while Output handles a list of dump class instances.

The exception to this scheme are the command style classes. These implement specific commands that can be invoked before, after, or in between runs. For these an instance of the class is created, its command() method called and then, after completion, the class instance deleted. Examples for this are the create_box, create_atoms, minimize, run, set, or velocity command styles.

For all those styles, certain naming conventions are employed: for the fix nve command the class is called FixNVE and the source files are fix_nve.h and fix_nve.cpp. Similarly, for fix ave/time we have FixAveTime and fix_ave_time.h and fix_ave_time.cpp. Style names are lower case and without spaces or special characters. A suffix or words are appended with a forward slash '/' which denotes a variant of the corresponding class without the suffix. To connect the style name and the class name, LAMMPS uses macros like: AtomStyle(), PairStyle(), BondStyle(), RegionStyle(), and so on in the corresponding header file. During configuration or compilation, files with the pattern style_<name>.

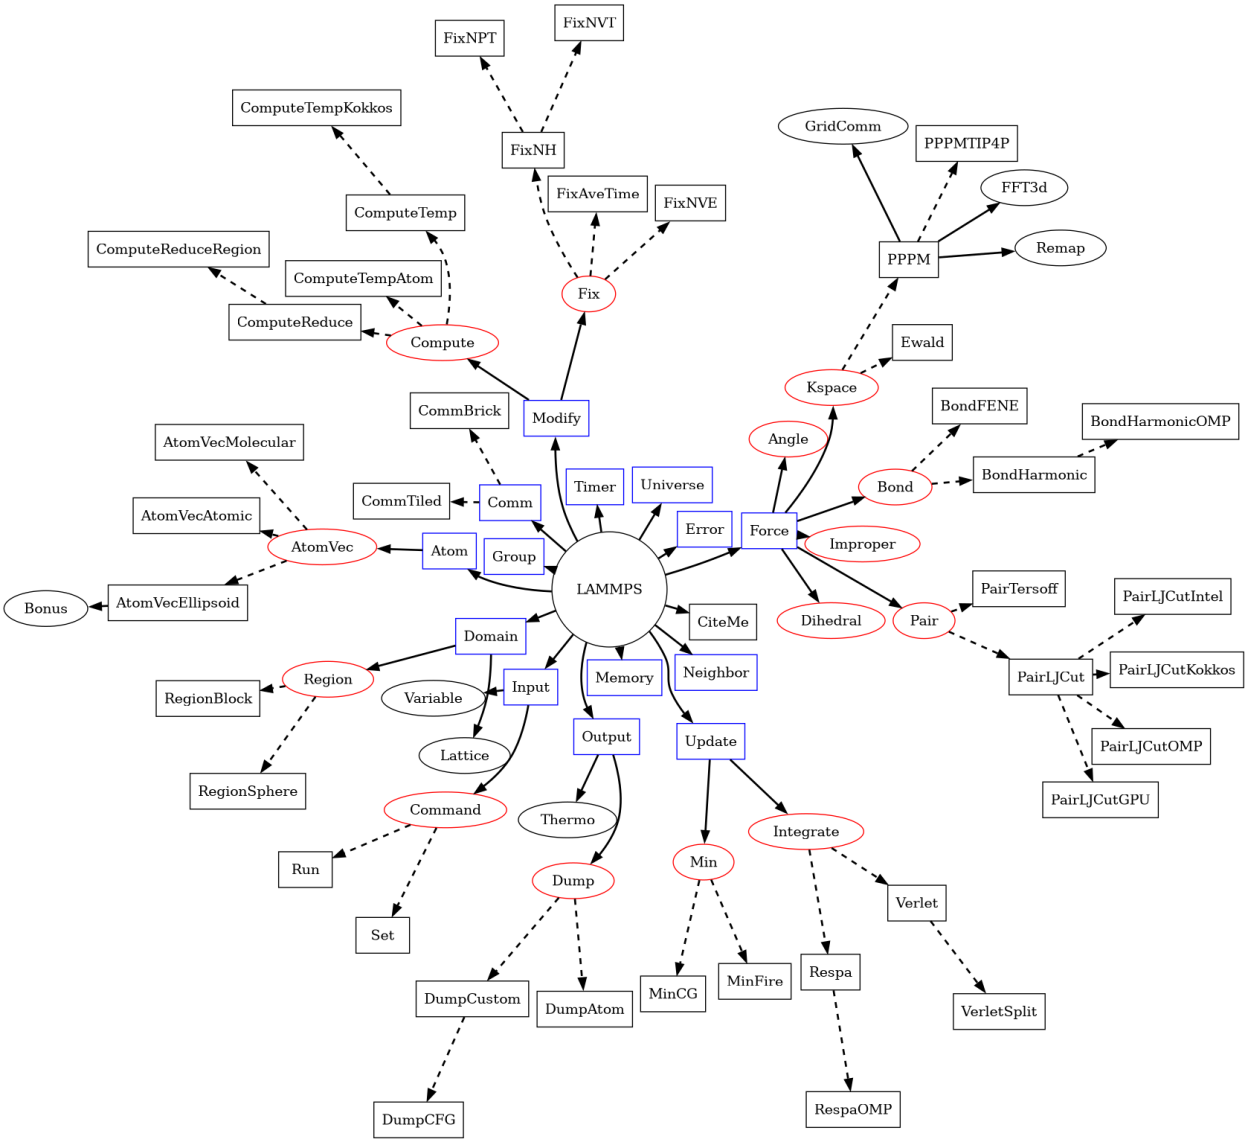


Fig. 1: LAMMPS class topology

This figure shows relations of base classes of the LAMMPS simulation package. Full lines indicate that a class holds an instance of the class it is pointing to; dashed lines point to derived classes that are given as examples of what classes may be instantiated during a LAMMPS run based on the input commands and accessed through the API define by their respective base classes. At the core is the LAMMPS class, which holds pointers to class instances with specific purposes. Those may hold instances of other classes, sometimes directly, or only temporarily, sometimes as derived classes or derived classes of derived classes, which may also hold instances of other classes.

h are created that consist of a list of include statements including all headers of all styles of a given type that are currently enabled (or "installed").

More details on individual classes in the *LAMMPS class topology* are as follows:

- The Memory class handles allocation of all large vectors and arrays.
- The Error class prints all (terminal) error and warning messages.
- The Universe class sets up one or more partitions of processors so that one or multiple simulations can be run, on the processors allocated for a run, e.g. by the mpirun command.
- The Input class reads and processes input (strings and files), stores variables, and invokes *commands*.
- Command style classes are derived from the Command class. They provide input script commands that perform one-time operations before/after/between simulations or which invoke a simulation. They are usually instantiated from within the Input class, its command method invoked, and then immediately destructed.
- The Finish class is instantiated to print statistics to the screen after a simulation is performed, by commands like run and minimize.
- The Special class walks the bond topology of a molecular system to find first, second, third neighbors of each atom. It is invoked by several commands, like *read_data*, *read_restart*, or *replicate*.
- The Atom class stores per-atom properties associated with atom styles. More precisely, they are allocated and managed by a class derived from the AtomVec class, and the Atom class simply stores pointers to them. The classes derived from AtomVec represent the different atom styles, and they are instantiated through the *atom_style* command.
- The Update class holds instances of an integrator and a minimizer class. The Integrate class is a parent style for the Verlet and r-RESPA time integrators, as defined by the *run_style* command. The Min class is a parent style for various energy minimizers.
- The Neighbor class builds and stores neighbor lists. The NeighList class stores a single list (for all atoms). A NeighRequest class instance is created by pair, fix, or compute styles when they need a particular kind of neighbor list and use the NeighRequest properties to select the neighbor list settings for the given request. There can be multiple instances of the NeighRequest class. The Neighbor class will try to optimize how the requests are processed. Depending on the NeighRequest properties, neighbor lists are constructed from scratch, aliased, or constructed by post-processing an existing list into sub-lists.
- The Comm class performs inter-processor communication, typically of ghost atom information. This usually involves MPI message exchanges with 6 neighboring processors in the 3d logical grid of processors mapped to the simulation box. There are two *communication styles*, enabling different ways to perform the domain decomposition.
- The Irregular class is used, when atoms may migrate to arbitrary processors.
- The Domain class stores the simulation box geometry, as well as geometric Regions and any user definition of a Lattice. The latter are defined by the *region* and *lattice* commands in an input script.
- The Force class computes various forces between atoms. The Pair parent class is for non-bonded or pairwise forces, which in LAMMPS also includes many-body forces such as the Tersoff 3-body potential if those are computed by walking pairwise neighbor lists. The Bond, Angle, Dihedral, Improper parent classes are styles for bonded interactions within a static molecular topology. The KSpace parent class is for computing long-range Coulombic interactions. One of its child classes, PPPM, uses the FFT3D and Remap classes to redistribute and communicate grid-based information across the parallel processors.
- The Modify class stores lists of class instances derived from the *Fix* and *Compute* base classes.
- The Group class manipulates groups that atoms are assigned to via the *group* command. It also has functions to compute various attributes of groups of atoms.

- The Output class is used to generate 3 kinds of output from a LAMMPS simulation: thermodynamic information printed to the screen and log file, dump file snapshots, and restart files. These correspond to the *Thermo*, *Dump*, and *WriteRestart* classes respectively. The Dump class is a base class, with several derived classes implementing various dump style variants.
- The Timer class logs timing information, output at the end of a run.

4.3 Code design

This section explains some code design choices in LAMMPS with the goal of helping developers write new code similar to the existing code. Please see the section on *Requirements for contributed code* for more specific recommendations and guidelines. While that section is organized more in the form of a checklist for code contributors, the focus here is on overall code design strategy, choices made between possible alternatives, and discussing some relevant C++ programming language constructs.

Historically, the basic design philosophy of the LAMMPS C++ code was a "C with classes" style. The motivation was to make it easy to modify LAMMPS for people without significant training in C++ programming. Data structures and code constructs were used that resemble the previous implementation(s) in Fortran. A contributing factor to this choice was that at the time, C++ compilers were often not mature and some advanced features contained bugs or did not function as the standard required. There were also disagreements between compiler vendors as to how to interpret the C++ standard documents.

However, C++ compilers and the C++ programming language have advanced significantly. In 2020, the LAMMPS developers decided to require the C++11 standard as the minimum C++ language standard for LAMMPS. Since then, we have begun to replace C-style constructs with equivalent C++ functionality. This was taken either from the C++ standard library or implemented as custom classes or functions. The goal is to improve readability of the code and to increase code reuse through abstraction of commonly used functionality. In summer 2025, after the 22 July 2025 stable release, the minimum required C++ language standard was raised to C++17.

Note

Please note that as of summer 2025 there is still a sizable chunk of legacy code in LAMMPS that has not yet been refactored to reflect these style conventions in full. LAMMPS has a large code base and many contributors. There is also a hierarchy of precedence in which the code is adapted. Highest priority has been the code in the src folder, followed by code in packages in order of their popularity and complexity (simpler code gets adapted sooner), followed by code in the lib folder. Source code that is downloaded from external packages or libraries during compilation is not subject to the conventions discussed here.

4.3.1 Object-oriented code

LAMMPS is designed to be an object-oriented code. Each simulation is represented by an instance of the LAMMPS class. When running in parallel, each MPI process creates such an instance. This can be seen in the main.cpp file where the core steps of running a LAMMPS simulation are the following 3 lines of code:

```
LAMMPS *lammps = new LAMMPS(argc, argv, lammps_comm);
lammps->input->file();
delete lammps;
```

The first line creates a LAMMPS class instance and passes the command line arguments and the global communicator to its constructor. The second line triggers the LAMMPS instance to process the input (either from standard input or a provided input file) until the simulation ends. The third line deletes the LAMMPS instance. The remainder of the main.cpp file has code for error handling, MPI configuration, and other special features.

The basic LAMMPS class hierarchy which is created by the LAMMPS class constructor is shown in *LAMMPS class topology*. When input commands are processed, additional class instances are created, or deleted, or replaced. Like-

wise, specific member functions of specific classes are called to trigger actions such as creating atoms, computing forces, computing properties, time-propagating the system, or writing output.

Compositing and Inheritance

LAMMPS makes extensive use of the object-oriented programming (OOP) principles of *compositing* and *inheritance*. Classes like the LAMMPS class are a **composite** containing pointers to instances of other classes like Atom, Comm, Force, Neighbor, Modify, and so on. Each of these classes implements certain functionality by storing and manipulating data related to the simulation and providing member functions that trigger certain actions. Some of those classes like Force are themselves composites, containing instances of classes describing different force interactions. Similarly, the Modify class contains a list of Fix and Compute classes. If the input commands that correspond to these classes include the word *style*, then LAMMPS stores only a single instance of that class. E.g. *atom_style*, *comm_style*, *pair_style*, *bond_style*. If the input command does **not** include the word *style*, then there may be many instances of that class defined, for example *region*, *fix*, *compute*, *dump*.

Inheritance enables creation of *derived* classes that can share common functionality in their base class while providing a consistent interface. The derived classes replace (dummy or pure) functions in the base class. The higher level classes can then call those methods of the instantiated classes without having to know which specific derived class variant was instantiated. In LAMMPS these derived classes are often referred to as "styles", e.g. pair styles, fix styles, atom styles and so on.

This is the origin of the flexibility of LAMMPS. For example, pair styles implement a variety of different non-bonded interatomic potentials functions. All details for the implementation of a potential are stored and executed in a single class.

As mentioned above, there can be multiple instances of classes derived from the Fix or Compute base classes. They represent a different facet of LAMMPS' flexibility, as they provide methods which can be called at different points within a timestep, as explained in the *How a timestep works* doc page. This allows the input script to tailor how a specific simulation is run, what diagnostic computations are performed, and how the output of those computations is further processed or output.

Additional code sharing is possible by creating derived classes from the derived classes (e.g., to implement an accelerated version of a pair style) where only a subset of the derived class methods are replaced with accelerated versions.

Polymorphism

Polymorphism and dynamic dispatch are another OOP feature that play an important role in how LAMMPS selects what code to execute. In a nutshell, this is a mechanism where the decision of which member function to call from a class is determined at runtime and not when the code is compiled. To enable it, the function has to be declared as virtual and all corresponding functions in derived classes should use the override property. Below is a brief example.

```
class Base {
public:
 virtual ~Base() = default;
 void call();
 void normal();
 virtual void poly();
};

void Base::call() {
 normal();
 poly();
}

class Derived : public Base {
public:
```

(continues on next page)

(continued from previous page)

```
 ~Derived() override = default;
 void normal();
 void poly() override;
};

// [....]

Base *base1 = new Base();
Base *base2 = new Derived();

base1->call();
base2->call();
```

The difference in behavior of the normal() and the poly() member functions is which of the two member functions is called when executing *base1->call()* versus *base2->call()*. Without polymorphism, a function within the base class can only call member functions within the same scope: that is, Base::call() will always call Base::normal(). But for the *base2->call()* case, the call of the virtual member function will be dispatched to Derived::poly() instead. This mechanism results in calling functions that are within the scope of the class that was used to *create* the instance, even if they are assigned to a pointer for their base class. This is the desired behavior, and this way LAMMPS can even use styles that are loaded at runtime from a shared object file with the *plugin command*.

A special case of virtual functions are so-called pure functions. These are virtual functions that are initialized to 0 in the class declaration (see example below).

```
class Base {
public:
 virtual void pure() = 0;
};
```

This has the effect that an instance of the base class cannot be created and that derived classes **must** implement these functions. Many of the functions listed with the various class styles in the section *Modifying & extending LAMMPS* are pure functions. The motivation for this is to define the interface or API of the functions, but defer their implementation to the derived classes.

However, there are downsides to this. For example, calls to virtual functions from within a constructor, will *not* be in the scope of the derived class, and thus it is good practice to either avoid calling them or to provide an explicit scope such as Base::poly() or Derived::poly(). Furthermore, any destructors in classes containing virtual functions should be declared virtual too, so they will be processed in the expected order before types are removed from dynamic dispatch.

Important Notes

In order to be able to detect incompatibilities at compile time and to avoid unexpected behavior, it is crucial that all member functions that are intended to replace a virtual or pure function use the override property keyword. For the same reason, the use of overloads or default arguments for virtual functions should be avoided, as they lead to confusion over which function is supposed to override which, and which arguments need to be declared.

Style Factories

In order to create class instances for different styles, LAMMPS often uses a programming pattern called *Factory*. Those are functions that create an instance of a specific derived class, say PairLJCut and return a pointer to the type of the common base class of that style, Pair in this case. To associate the factory function with the style keyword, a std::map class is used with function pointers indexed by their keyword (for example "lj/cut" for PairLJCut and "morse" for PairMorse). A couple of typedefs help keep the code readable, and a template function is used to implement the actual

factory functions for the individual classes. Below is an example of such a factory function from the Force class as declared in force.h and implemented in force.cpp. The file style_pair.h is generated during compilation and includes all main header files (i.e. those starting with pair_) of pair styles and then the macro PairStyle() will associate the style name "lj/cut" with a factory function creating an instance of the PairLJCut class.

```
// from force.h
typedef Pair *(*PairCreator)(LAMMPS *);
typedef std::map<std::string, PairCreator> PairCreatorMap;
PairCreatorMap *pair_map;

// from force.cpp
template <typename S, typename T> static S *style_creator(LAMMPS *lmp)
{
  return new T(lmp);
}

// [...]

pair_map = new PairCreatorMap();

#define PAIR_CLASS
#define PairStyle(key, Class) (*pair_map)[#key] = &style_creator<Pair, Class>;
#include "style_pair.h"
#undef PairStyle
#undef PAIR_CLASS

// from pair_lj_cut.h

#ifdef PAIR_CLASS
PairStyle(lj/cut,PairLJCut);
#else
// [...]
```

Similar code constructs are present in other files like modify.cpp and modify.h or neighbor.cpp and neighbor.h. Those contain similar macros and include style_*.h files for creating class instances of styles they manage.

4.3.2 I/O and output formatting

C-style stdio versus C++ style iostreams

LAMMPS uses the *stdio <https://en.cppreference.com/w/cpp/io/c.html>* library of the standard C library for reading from and writing to files and console instead of C++ iostreams. This is mainly motivated by better performance, better control over formatting, and less effort to achieve specific formatting.

Since mixing "stdio" and "iostreams" can lead to unexpected behavior, use of the latter is strongly discouraged. Output to the screen should *not* use the predefined stdout FILE pointer, but rather the screen and logfile FILE pointers managed by the LAMMPS class. Furthermore, output should generally only be done by MPI rank 0 (comm->me == 0). Output that is sent to both screen and logfile should use the utils::logmesg() convenience function.

We discourage the use of stringstreams because the bundled {fmt} library and the customized tokenizer classes provide the same functionality in a cleaner way with better performance. This also helps maintain a consistent programming syntax with code from many different contributors.

Formatting with the {fmt} library

The LAMMPS source code includes a copy of the {fmt} library, which is preferred over formatting with the "printf()" family of functions. The primary reason is that it allows a typesafe default format for any type of supported data. This is particularly useful for formatting integers of a given size (32-bit or 64-bit) which may require different format strings depending on compile time settings or compilers/operating systems. Furthermore, {fmt} gives better performance, has more functionality, a familiar formatting syntax that has similarities to format() in Python, and provides a facility that can be used to integrate format strings and a variable number of arguments into custom functions in a much simpler way than the varargs mechanism of the C library. Finally, {fmt} has been included into the C++20 language standard as std::format(), so changes to adopt it are future-proof, for as long as they are not using any extensions that are not (yet) included into C++.

The long-term plan is to switch to using std::format() instead of fmt::format() when the minimum C++ standard required for LAMMPS will be set to C++20. See the *basic build instructions* for more details.

Formatted strings are frequently created by calling the fmt::format() function, which will return a string as a std::string class instance. In contrast to the % placeholder in printf(), the {fmt} library uses {} to embed format descriptors. In the simplest case, no additional characters are needed, as {fmt} will choose the default format based on the data type of the argument. Otherwise, the utils::print() function may be used instead of printf() or fprintf(). The equivalent std::print() function will become available in C++ 23. In addition, several LAMMPS output functions, that originally accepted a single string as argument have been overloaded to accept a format string with optional arguments as well (e.g., Error::all(), Error::one(), utils::logmesg()).

Summary of the {fmt} format syntax

The syntax of the format string is "{[<argument id>][:<format spec>]}", where either the argument id or the format spec (separated by a colon ':') is optional. The argument id is usually a number starting from 0 that is the index to the arguments following the format string. By default, these are assigned in order (i.e. 0, 1, 2, 3, 4 etc.). The most common case for using argument id would be to use the same argument in multiple places in the format string without having to provide it as an argument multiple times. The argument id is rarely used in the LAMMPS source code.

More common is the use of a format specifier, which starts with a colon. This may optionally be followed by a fill character (default is ' '). If provided, the fill character **must** be followed by an alignment character ('<', '^', '>' for left, centered, or right alignment (default)). The alignment character may be used without a fill character. The next important format parameter would be the minimum width, which may be followed by a dot '.' and a precision for floating point numbers. The final character in the format string would be an indicator for the "presentation", i.e. 'd' for decimal presentation of integers, 'x' for hexadecimal, 'o' for octal, 'c' for character etc. This mostly follows the "printf()" scheme, but without requiring an additional length parameter to distinguish between different integer widths. The {fmt} library will detect those and adapt the formatting accordingly. For floating point numbers there are correspondingly, 'g' for generic presentation, 'e' for exponential presentation, and 'f' for fixed point presentation.

The format string "{:8}" would thus represent *any* type argument and be replaced by at least 8 characters; "{:<8}" would do this as left aligned, "{:^8}" as centered, "{:>8}" as right aligned. If a specific presentation is selected, the argument type must be compatible or else the {fmt} formatting code will throw an exception. Some format string examples are given below:

```
auto mesg = fmt::format("  CPU time: {:4d}:{:02d}:{:02d}\n", cpuh, cpum, cpus);
mesg = fmt::format("{:<8s}| {:<10.5g} | {:<10.5g} | {:<10.5g} |{:6.1f} |{:6.2f}\n",
                   label, time_min, time, time_max, time_sq, tmp);
utils::logmesg(lmp,"{:>6} = max # of 1-2 neighbors\n",maxall);
utils::logmesg(lmp,"Lattice spacing in x,y,z = {:.8} {:.8} {:.8}\n",
               xlattice,ylattice,zlattice);
```

which will create the following output lines:

```
CPU time:    0:02:16
Pair    | 2.0133     | 2.0133     | 2.0133     |   0.0 | 84.21
   4 = max # of 1-2 neighbors
Lattice spacing in x,y,z = 1.6795962 1.6795962 1.6795962
```

Finally, a special feature of the {fmt} library is that format parameters like the width or the precision may be also provided as arguments. In that case a nested format is used where a pair of curly braces (with an optional argument id) "{}" are used instead of the value, for example "{:{}d}" will consume two integer arguments, the first will be the value shown and the second the minimum width.

For more details and examples, please consult the {fmt} syntax documentation website. Since we plan to eventually transition from {fmt} to using std::format() of the C++ standard library, it is advisable to avoid using any extensions beyond what the C++20 standard offers.

4.3.3 JSON format input and output

Since LAMMPS version 12 June 2025, the LAMMPS source code includes a copy of the header-only JSON C++ library from https://json.nlohmann.me/. Same as with the {fmt} library described above some modification to the namespace has been made to avoid collisions with other uses of the same library, which may use a different, incompatible version. To have a uniform interface with other parts of LAMMPS, you should be using #include "json.h" or #include "json_fwd.h" (in header files). See the implementation of the *molecule command* for an example of using this library.

4.3.4 Memory management

Dynamical allocation of small data and objects can be done with the C++ commands "new" and "delete/delete[]". Large data should use the member functions of the Memory class, most commonly, Memory::create(), Memory::grow(), and Memory::destroy(), which provide variants for vectors, 2d arrays, 3d arrays, etc. These can also be used for small data.

The use of malloc(), calloc(), realloc() and free() directly is strongly discouraged. To simplify adapting legacy code into the LAMMPS code base the member functions Memory::smalloc(), Memory::srealloc(), and Memory::sfree() are available, which perform additional error checks for safety.

Use of these custom memory allocation functions is motivated by the following considerations:

- Memory allocation failures on *any* MPI rank during a parallel run will trigger an immediate abort of the entire parallel calculation.
- A failing "new" will trigger an exception, which is also captured by LAMMPS and triggers a global abort.
- Allocation of multidimensional arrays will be done in a C compatible fashion, but such that the storage of the actual data is stored in one large contiguous block. Thus, when MPI communication is needed, the data can be communicated directly (similar to Fortran arrays).
- The "destroy()" and "sfree()" functions may safely be called on NULL pointers.
- The "destroy()" functions will nullify the pointer variables, thus making "use after free" errors easy to detect.
- It is possible to use a larger than default memory alignment (not on all operating systems, since the allocated storage pointers must be compatible with free() for technical reasons).

In the practical implementation of code this means, that any pointer variables, that are class members should be initialized to a nullptr value in their respective constructors. That way, it is safe to call Memory::destroy() or delete[] on them before *any* allocation outside the constructor. This helps prevent memory leaks.

4.4 Parallel algorithms

LAMMPS is designed to enable running simulations in parallel using the MPI parallel communication standard with distributed data via domain decomposition. The parallelization aims to be efficient, and resulting in good strong scaling (= good speedup for the same system) and good weak scaling (= the computational cost of enlarging the system is proportional to the system size). Additional parallelization using GPUs or OpenMP can also be applied within the subdomain assigned to an MPI process. For clarity, most of the following illustrations show the 2d simulation case. The underlying algorithms in those cases, however, apply to both 2d and 3d cases equally well.

Note

The text and most of the figures in this chapter were adapted for the manual from the section on parallel algorithms in the *new LAMMPS paper*.

4.4.1 Partitioning

The underlying spatial decomposition strategy used by LAMMPS for distributed-memory parallelism is set with the *comm_style command* and can be either "brick" (a regular grid) or "tiled".

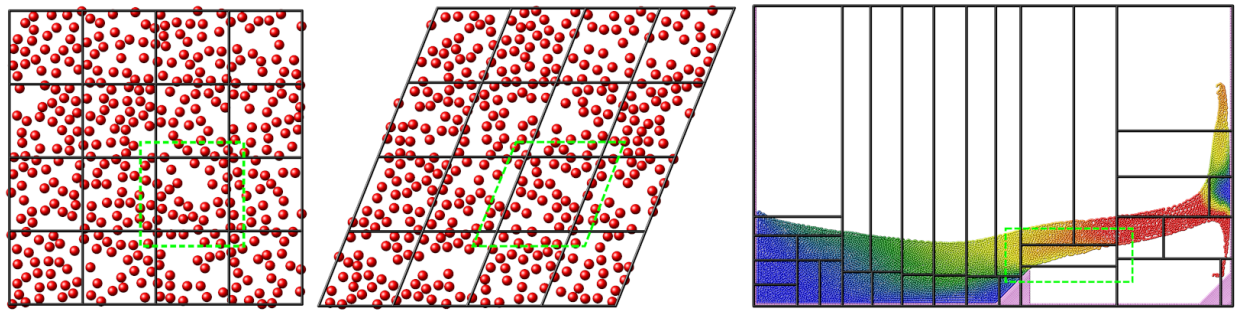

Fig. 2: Domain decomposition schemes

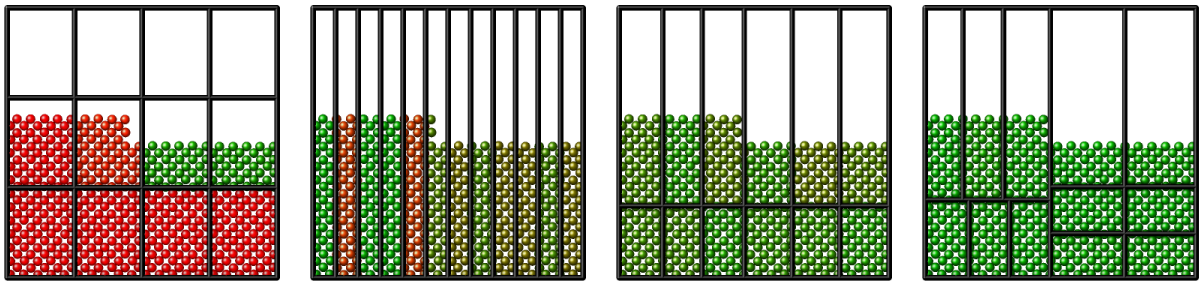
This figure shows the different kinds of domain decomposition used for MPI parallelization: "brick" on the left with an orthogonal (left) and a triclinic (middle) simulation domain, and a "tiled" decomposition (right). The black lines show the division into subdomains, and the contained atoms are "owned" by the corresponding MPI process. The green dashed lines indicate how subdomains are extended with "ghost" atoms up to the communication cutoff distance.

The LAMMPS simulation box is a 3d or 2d volume, which can be of orthogonal or triclinic shape, as illustrated in the *Domain decomposition schemes* figure for the 2d case. Orthogonal means the box edges are aligned with the x, y, z Cartesian axes, and the box faces are thus all rectangular. Triclinic allows for a more general parallelepiped shape in which edges are aligned with three arbitrary vectors and the box faces are parallelograms. In each dimension, box faces can be periodic, or non-periodic with fixed or shrink-wrapped boundaries. In the fixed case, atoms which move outside the face are deleted; shrink-wrapped means the position of the box face adjusts continuously to enclose all the atoms.

For distributed-memory MPI parallelism, the simulation box is spatially decomposed (partitioned) into non-overlapping subdomains which fill the box. The default partitioning, "brick", is most suitable when atom density is roughly uniform, as shown in the left-side images of the *Domain decomposition schemes* figure. The subdomains comprise a regular grid, and all subdomains are identical in size and shape. Both the orthogonal and triclinic boxes can deform continuously during a simulation, e.g. to compress a solid or shear a liquid, in which case the processor subdomains likewise deform.

For models with non-uniform density, the number of particles per processor can be load-imbalanced with the default partitioning. This reduces parallel efficiency, as the overall simulation rate is limited by the slowest processor, i.e. the one with the largest computational load. For such models, LAMMPS supports multiple strategies to reduce the load imbalance:

- The processor grid decomposition is by default based on the simulation cell volume and tries to optimize the volume to surface ratio for the subdomains. This can be changed with the *processors command*.
- The parallel planes defining the size of the subdomains can be shifted with the *balance command*. Which can be done in addition to choosing a more optimal processor grid.
- The recursive bisectioning algorithm in combination with the "tiled" communication style can produce a partitioning with equal numbers of particles in each subdomain.



The pictures above demonstrate different decompositions for a 2d system with 12 MPI ranks. The atom colors indicate the load imbalance of each subdomain, with green being optimal and red the least optimal.

Due to the vacuum in the system, the default decomposition is unbalanced, with several MPI ranks without atoms (left). By forcing a 1x12x1 processor grid, every MPI rank does computations now, but the number of atoms per subdomain is still uneven, and the thin slice shape increases the amount of communication between subdomains (center left). With a 2x6x1 processor grid and shifting the subdomain divisions, the load imbalance is further reduced and the amount of communication required between subdomains is less (center right). And using the recursive bisectioning leads to further improved decomposition (right).

4.4.2 Communication

Following the selected partitioning scheme, all per-atom data is distributed across the MPI processes, which allows LAMMPS to handle very large systems provided it uses a correspondingly large number of MPI processes. To be able to compute the short-range interactions, MPI processes need not only access to the data of atoms they "own" but also information about atoms from neighboring subdomains, in LAMMPS referred to as "ghost" atoms. These are copies of atoms storing required per-atom data for up to the communication cutoff distance. The green dashed-line boxes in the *Domain decomposition schemes* figure illustrate the extended ghost-atom subdomain for one processor.

This approach is also used to implement periodic boundary conditions: atoms that lie within the cutoff distance across a periodic boundary are also stored as ghost atoms and taken from the periodic replication of the subdomain, which may be the same subdomain, e.g. if running in serial. As a consequence of this, force computation in LAMMPS is not subject to minimum image conventions and thus cutoffs may be larger than half the simulation domain.

Efficient communication patterns are needed to update the "ghost" atom data, since that needs to be done at every MD time step or minimization step. The diagrams of the *ghost atom communication* figure illustrate how ghost atom communication is performed in two stages for a 2d simulation (three in 3d) for both a regular and irregular partitioning of the simulation box. For the regular case (left) atoms are exchanged first in the x-direction, then in y, with four neighbors in the grid of processor subdomains.

In the x stage, processor ranks 1 and 2 send owned atoms in their red-shaded regions to rank 0 (and vice versa). Then in the y stage, ranks 3 and 4 send atoms in their blue-shaded regions to rank 0, which includes ghost atoms they received in the x stage. Rank 0 thus acquires all its ghost atoms; atoms in the solid blue corner regions are communicated twice before rank 0 receives them.

For the irregular case (right) the two stages are similar, but a processor can have more than one neighbor in each direction. In the x stage, MPI ranks 1,2,3 send owned atoms in their red-shaded regions to rank 0 (and vice versa). These include only atoms between the lower and upper y-boundary of rank 0's subdomain. In the y stage, ranks 4,5,6 send atoms in their blue-shaded regions to rank 0. This may include ghost atoms they received in the x stage, but only

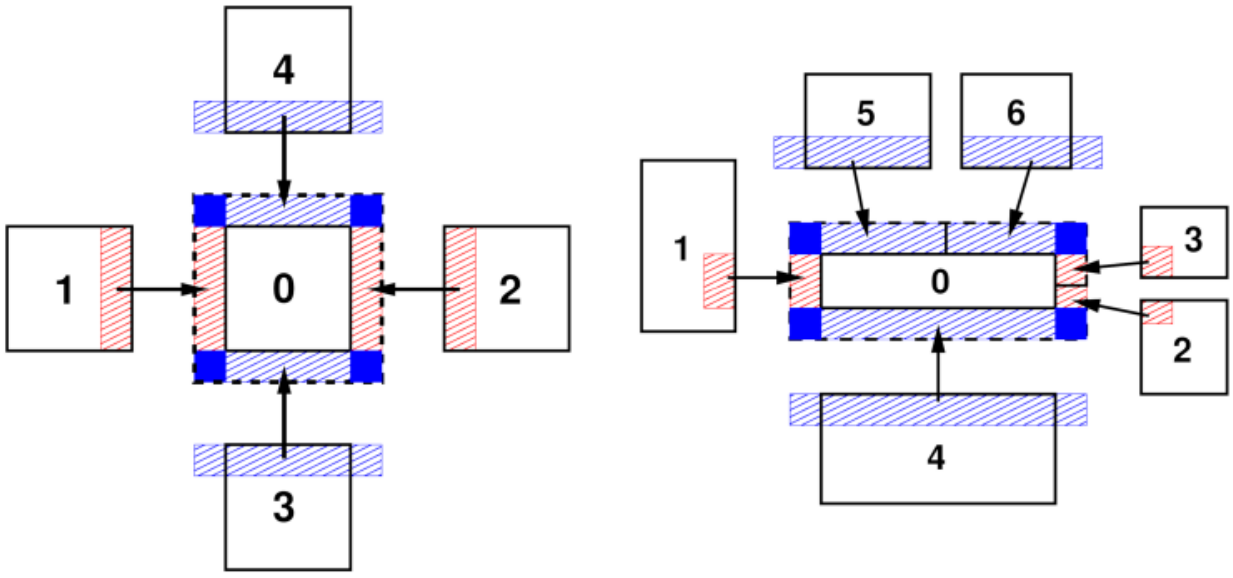


Fig. 3: ghost atom communication

This figure shows the ghost atom communication patterns between subdomains for "brick" (left) and "tiled" communication styles for 2d simulations. The numbers indicate MPI process ranks. Here the subdomains are drawn spatially separated for clarity. The dashed-line box is the extended subdomain of processor 0 which includes its ghost atoms. The red- and blue-shaded boxes are the regions of communicated ghost atoms.

if they are needed by rank 0 to fill its extended ghost atom regions in the +/-*y* directions (blue rectangles). Thus, in this case, ranks 5 and 6 do not include ghost atoms they received from each other (in the *x* stage) in the atoms they send to rank 0. The key point is that while the pattern of communication is more complex in the irregular partitioning case, it can still proceed in two stages (three in 3d) via atom exchanges with only neighboring processors.

When attributes of owned atoms are sent to neighboring processors to become attributes of their ghost atoms, LAMMPS calls this a "forward" communication. On timesteps when atoms migrate to new owning processors and neighbor lists are rebuilt, each processor creates a list of its owned atoms which are ghost atoms in each of its neighbor processors. These lists are used to pack per-atom coordinates (for example) into message buffers in subsequent steps until the next reneighboring.

A "reverse" communication is when computed ghost atom attributes are sent back to the processor who owns the atom. This is used (for example) to sum partial forces on ghost atoms to the complete force on owned atoms. The order of the two stages described in the *ghost atom communication* figure is inverted, and the same lists of atoms are used to pack and unpack message buffers with per-atom forces. When a received buffer is unpacked, the ghost forces are summed to owned atom forces. As in forward communication, forces on atoms in the four blue corners of the diagrams are sent, received, and summed twice (once at each stage) before owning processors have the full force.

These two operations are used in many places within LAMMPS aside from exchange of coordinates and forces, for example by manybody potentials to share intermediate per-atom values, or by rigid-body integrators to enable each atom in a body to access body properties. Here are additional details about how these communication operations are performed in LAMMPS:

- When exchanging data with different processors, forward and reverse communication is done using MPI_Send() and MPI_IRecv() calls. If a processor is "exchanging" atoms with itself, only the pack and unpack operations are performed, e.g. to create ghost atoms across periodic boundaries when running on a single processor.
- For forward communication of owned atom coordinates, periodic box lengths are added and subtracted when the receiving processor is across a periodic boundary from the sender. There is then no need to apply a minimum image convention when calculating distances between atom pairs when building neighbor lists or computing forces.

- The cutoff distance for exchanging ghost atoms is typically equal to the neighbor cutoff. But it can also set to a larger value if needed, e.g. half the diameter of a rigid body composed of multiple atoms or over 3x the length of a stretched bond for dihedral interactions. It can also exceed the periodic box size. For the regular communication pattern (left), if the cutoff distance extends beyond a neighbor processor's subdomain, then multiple exchanges are performed in the same direction. Each exchange is with the same neighbor processor, but buffers are packed/unpacked using a different list of atoms. For forward communication, in the first exchange, a processor sends only owned atoms. In subsequent exchanges, it sends ghost atoms received in previous exchanges. For the irregular pattern (right) overlaps of a processor's extended ghost-atom subdomain with all other processors in each dimension are detected.

4.4.3 Neighbor lists

To compute forces efficiently, each processor creates a Verlet-style neighbor list which enumerates all pairs of atoms *i,j* (*i* = owned, *j* = owned or ghost) with separation less than the applicable neighbor list cutoff distance. In LAMMPS, the neighbor lists are stored in a multiple-page data structure; each page is a contiguous chunk of memory which stores vectors of neighbor atoms *j* for many *i* atoms. This allows pages to be incrementally allocated or deallocated in blocks as needed. Neighbor lists typically consume the most memory of any data structure in LAMMPS. The neighbor list is rebuilt (from scratch) once every few timesteps, then used repeatedly each step for force or other computations. The neighbor cutoff distance is $R_n = R_f + \Delta_s$, where R_f is the (largest) force cutoff defined by the interatomic potential for computing short-range pairwise or manybody forces and Δ_s is a "skin" distance that allows the list to be used for multiple steps assuming that atoms do not move very far between consecutive time steps. Typically, the code triggers reneighboring when any atom has moved half the skin distance since the last reneighboring; this and other options of the neighbor list rebuild can be adjusted with the *neigh_modify* command.

On steps when reneighboring is performed, atoms which have moved outside their owning processor's subdomain are first migrated to new processors via communication. Periodic boundary conditions are also (only) enforced on these steps to ensure each atom is re-assigned to the correct processor. After migration, the atoms owned by each processor are stored in a contiguous vector. Periodically, each processor spatially sorts owned atoms within its vector to reorder it for improved cache efficiency in force computations and neighbor list building. For that, atoms are spatially binned and then reordered so that atoms in the same bin are adjacent in the vector. Atom sorting can be disabled or its settings modified with the *atom_modify* command.

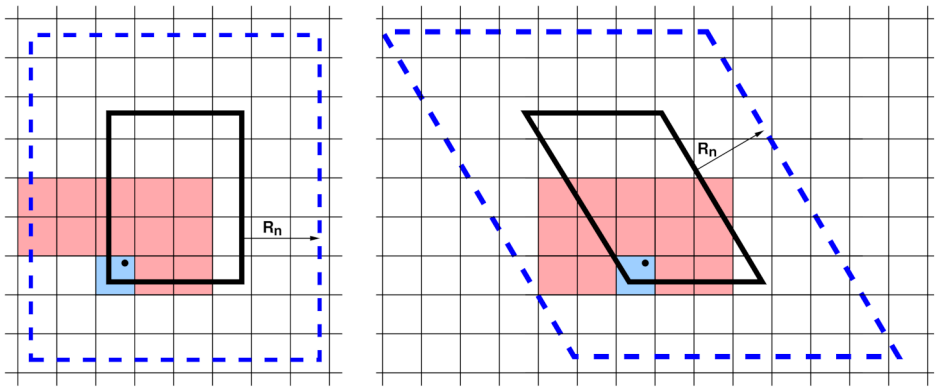

Fig. 4: neighbor list stencils

A 2d simulation subdomain (thick black line) and the corresponding ghost atom cutoff region (dashed blue line) for both orthogonal (left) and triclinic (right) domains. A regular grid of neighbor bins (thin lines) overlays the entire simulation domain and need not align with subdomain boundaries; only the portion overlapping the augmented subdomain is shown. In the triclinic case, it overlaps the bounding box of the tilted rectangle. The blue- and red-shaded bins represent a stencil of bins searched to find neighbors of a particular atom (black dot).

To build a local neighbor list in linear time, the simulation domain is overlaid (conceptually) with a regular 3d (or 2d) grid of neighbor bins, as shown in the *neighbor list stencils* figure for 2d models and a single MPI processor's subdomain. Each processor stores a set of neighbor bins which overlap its subdomain, extended by the neighbor cutoff

distance R_n. As illustrated, the bins need not align with processor boundaries; an integer number in each dimension is fit to the size of the entire simulation box.

Most often, LAMMPS builds what is called a "half" neighbor list where each *i,j* neighbor pair is stored only once, with either atom *i* or *j* as the central atom. The build can be done efficiently by using a pre-computed "stencil" of bins around a central origin bin which contains the atom whose neighbors are being searched for. A stencil is simply a list of integer offsets in *x,y,z* of nearby bins surrounding the origin bin which are close enough to contain any neighbor atom *j* within a distance R_n from any atom *i* in the origin bin. Note that for a half neighbor list, the stencil can be asymmetric, since each atom only need store half its nearby neighbors.

These stencils are illustrated in the figure for a half list and a bin size of $\frac{1}{2}R_n$. There are 13 red+blue stencil bins in 2d (for the orthogonal case, 15 for triclinic). In 3d there would be 63, 13 in the plane of bins that contain the origin bin and 25 in each of the two planes above it in the *z* direction (75 for triclinic). The triclinic stencil has extra bins because the bins tile the bounding box of the entire triclinic domain, and thus are not periodic with respect to the simulation box itself. The stencil and logic for determining which *i,j* pairs to include in the neighbor list are altered slightly to account for this.

To build a neighbor list, a processor first loops over its "owned" plus "ghost" atoms and assigns each to a neighbor bin. This uses an integer vector to create a linked list of atom indices within each bin. It then performs a triply-nested loop over its owned atoms *i*, the stencil of bins surrounding atom *i*'s bin, and the *j* atoms in each stencil bin (including ghost atoms). If the distance $r_{ij} < R_n$, then atom *j* is added to the vector of atom *i*'s neighbors.

Here are additional details about neighbor list build options LAMMPS supports:

- The choice of bin size is an option; a size half of R_n has been found to be optimal for many typical cases. Smaller bins incur additional overhead to loop over; larger bins require more distance calculations. Note that for smaller bin sizes, the 2d stencil in the figure would be of a more semicircular shape (hemispherical in 3d), with bins near the corners of the square eliminated due to their distance from the origin bin.
- Depending on the interatomic potential(s) and other commands used in an input script, multiple neighbor lists and stencils with different attributes may be needed. This includes lists with different cutoff distances, e.g. for force computation versus occasional diagnostic computations such as a radial distribution function, or for the r-RESPA time integrator which can partition pairwise forces by distance into subsets computed at different time intervals. It includes "full" lists (as opposed to half lists) where each *i,j* pair appears twice, stored once with *i* and *j*, and which use a larger symmetric stencil. It also includes lists with partial enumeration of ghost atom neighbors. The full and ghost-atom lists are used by various manybody interatomic potentials. Lists may also use different criteria for inclusion of a pairwise interaction. Typically, this simply depends only on the distance between two atoms and the cutoff distance. But for finite-size coarse-grained particles with individual diameters (e.g. polydisperse granular particles), it can also depend on the diameters of the two particles.
- When using *pair style hybrid* multiple sub-lists of the master neighbor list for the full system need to be generated, one for each sub-style, which contains only the *i,j* pairs needed to compute interactions between subsets of atoms for the corresponding potential. This means, not all *i* or *j* atoms owned by a processor are included in a particular sub-list.
- Some models use different cutoff lengths for pairwise interactions between different kinds of particles, which are stored in a single neighbor list. One example is a solvated colloidal system with large colloidal particles where colloid/colloid, colloid/solvent, and solvent/solvent interaction cutoffs can be dramatically different. Another is a model of polydisperse finite-size granular particles; pairs of particles interact only when they are in contact with each other. Mixtures with particle size ratios as high as 10-100x may be used to model realistic systems. Efficient neighbor list building algorithms for these kinds of systems are available in LAMMPS. They include a method which uses different stencils for different cutoff lengths and trims the stencil to only include bins that straddle the cutoff sphere surface. More recently a method which uses both multiple stencils and multiple bin sizes was developed; it builds neighbor lists efficiently for systems with particles of any size ratio, though other considerations (timestep size, force computations) may limit the ability to model systems with huge polydispersity.
- For small and sparse systems and as a fallback method, LAMMPS also supports neighbor list construction without binning by using a full $O(N^2)$ loop over all *i,j* atom pairs in a subdomain when using the *neighbor nsq* command.

- Dependent on the "pair" setting of the *newton* command, the "half" neighbor lists may contain **all** pairs of atoms where atom *j* is a ghost atom (i.e. when the newton pair setting is *off*). For the newton pair *on* setting the atom *j* is only added to the list if its *z* coordinate is larger, or if equal the *y* coordinate is larger, and that is equal, too, the *x* coordinate is larger. For homogeneously dense systems, that will result in picking neighbors from a same size sector in always the same direction relative to the "owned" atom, and thus it should lead to similar length neighbor lists and reduce the chance of a load imbalance.

4.4.4 Long-range interactions

For charged systems, LAMMPS can compute long-range Coulombic interactions via the FFT-based particle-particle/particle-mesh (PPPM) method implemented in *kspace style pppm and its variants*. For that Coulombic interactions are partitioned into short- and long-range components. The short-ranged portion is computed in real space as a loop over pairs of charges within a cutoff distance, using neighbor lists. The long-range portion is computed in reciprocal space using a kspace style. For the PPPM implementation the simulation cell is overlaid with a regular FFT grid in 3d. It proceeds in several stages:

a) each atom's point charge is interpolated to nearby FFT grid points,

b) a forward 3d FFT is performed,

c) a convolution operation is performed in reciprocal space,

d) one or more inverse 3d FFTs are performed, and

e) electric field values from grid points near each atom are interpolated to compute its forces.

For any of the spatial-decomposition partitioning schemes each processor owns the brick-shaped portion of FFT grid points contained within its subdomain. The two interpolation operations use a stencil of grid points surrounding each atom. To accommodate the stencil size, each processor also stores a few layers of ghost grid points surrounding its brick. Forward and reverse communication of grid point values is performed similar to the corresponding *atom data communication*. In this case, electric field values on owned grid points are sent to neighboring processors to become ghost point values. Likewise charge values on ghost points are sent and summed to values on owned points.

For triclinic simulation boxes, the FFT grid planes are parallel to the box faces, but the mapping of charge and electric field values to/from grid points is done in reduced coordinates where the tilted box is conceptually a unit cube, so that the stencil and FFT operations are unchanged. However the FFT grid size required for a given accuracy is larger for triclinic domains than it is for orthogonal boxes.

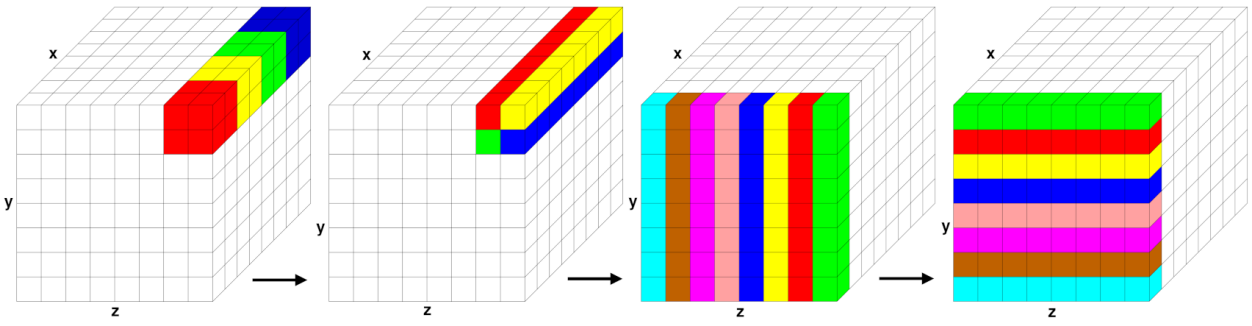

Fig. 5: Parallel FFT in PPPM

Stages of a parallel FFT for a simulation domain overlaid with an 8x8x8 3d FFT grid, partitioned across 64 processors. Within each of the 4 diagrams, grid cells of the same color are owned by a single processor; for simplicity, only cells owned by 4 or 8 of the 64 processors are colored. The two images on the left illustrate brick-to-pencil communication. The two images on the right illustrate pencil-to-pencil communication, which in this case transposes the *y* and *z* dimensions of the grid.

Parallel 3d FFTs require substantial communication relative to their computational cost. A 3d FFT is implemented by a series of 1d FFTs along the *x*-, *y*-, and *z*-direction of the FFT grid. Thus, the FFT grid cannot be decomposed like

atoms into 3 dimensions for parallel processing of the FFTs but only in 1 (as planes) or 2 (as pencils) dimensions and in between the steps the grid needs to be transposed to have the FFT grid portion "owned" by each MPI process complete in the direction of the 1d FFTs it has to perform. LAMMPS uses the pencil-decomposition algorithm as shown in the *Parallel FFT in PPPM* figure.

Initially (far left), each processor owns a brick of same-color grid cells (actually grid points) contained within in its subdomain. A brick-to-pencil communication operation converts this layout to 1d pencils in the x-dimension (center left). Again, cells of the same color are owned by the same processor. Each processor can then compute a 1d FFT on each pencil of data it wholly owns using a call to the configured FFT library. A pencil-to-pencil communication then converts this layout to pencils in the y dimension (center right) which effectively transposes the x and y dimensions of the grid, followed by 1d FFTs in y. A final transpose of pencils from y to z (far right) followed by 1d FFTs in z completes the forward FFT. The data is left in a z-pencil layout for the convolution operation. One or more inverse FFTs then perform the sequence of 1d FFTs and communication steps in reverse order; the final layout of resulting grid values is the same as the initial brick layout.

Each communication operation within the FFT (brick-to-pencil or pencil-to-pencil or pencil-to-brick) converts one tiling of the 3d grid to another, where a tiling in this context means an assignment of a small brick-shaped subset of grid points to each processor, the union of which comprise the entire grid. The parallel fftMPI library written for LAMMPS allows arbitrary definitions of the tiling so that an irregular partitioning of the simulation domain can use it directly. Transforming data from one tiling to another is implemented in *fftMPI* using point-to-point communication, where each processor sends data to a few other processors, since each tile in the initial tiling overlaps with a handful of tiles in the final tiling.

The transformations could also be done using collective communication across all P processors with a single call to $\mathrm{MPI_Alltoall()}$, but this is typically much slower. However, for the specialized brick and pencil tiling illustrated in *Parallel FFT in PPPM* figure, collective communication across the entire MPI communicator is not required. In the example, an 8^3 grid with 512 grid cells is partitioned across 64 processors; each processor owns a 2x2x2 3d brick of grid cells. The initial brick-to-pencil communication (upper left to upper right) only requires collective communication within subgroups of 4 processors, as illustrated by the 4 colors. More generally, a brick-to-pencil communication can be performed by partitioning P processors into $P^{\frac{2}{3}}$ subgroups of $P^{\frac{1}{3}}$ processors each. Each subgroup performs collective communication only within its subgroup. Similarly, pencil-to-pencil communication can be performed by partitioning P processors into $P^{\frac{1}{2}}$ subgroups of $P^{\frac{1}{2}}$ processors each. This is illustrated in the figure for the $y \Rightarrow z$ communication (center). An eight-processor subgroup owns the front yz plane of data and performs collective communication within the subgroup to transpose from a y-pencil to z-pencil layout.

LAMMPS invokes point-to-point communication by default, but also provides the option of partitioned collective communication when using a *kspace_modify collective yes* command to switch to that mode. In the latter case, the code detects the size of the disjoint subgroups and partitions the single P-size communicator into multiple smaller communicators, each of which invokes collective communication. Testing on a large IBM Blue Gene/Q machine at Argonne National Labs showed a significant improvement in FFT performance for large processor counts; partitioned collective communication was faster than point-to-point communication or global collective communication involving all P processors.

Here are some additional details about FFTs for long-range and related grid/particle operations that LAMMPS supports:

- The fftMPI library allows each grid dimension to be a multiple of small prime factors (2,3,5), and allows any number of processors to perform the FFT. The resulting brick and pencil decompositions are thus not always as well-aligned, but the size of subgroups of processors for the two modes of communication (brick/pencil and pencil/pencil) still scale as $O(P^{\frac{1}{3}})$ and $O(P^{\frac{1}{2}})$.
- For efficiency in performing 1d FFTs, the grid transpose operations illustrated in Figure *Parallel FFT in PPPM* also involve reordering the 3d data so that a different dimension is contiguous in memory. This reordering can be done during the packing or unpacking of buffers for MPI communication.
- For large systems and particularly many MPI processes, the dominant cost for parallel FFTs is often the communication, not the computation of 1d FFTs, even though the latter scales as $N \log(N)$ in the number of grid points N per grid direction. This is due to the fact that only a 2d decomposition into pencils is possible while atom data (and their corresponding short-range force and energy computations) can be decomposed efficiently in 3d.

Reducing the number of MPI processes involved in the MPI communication will reduce this kind of overhead. By using a *hybrid MPI + OpenMP parallelization* it is still possible to use all processes for parallel computation. It will use OpenMP parallelization inside the MPI domains. While that may have a lower parallel efficiency for some part of the computation, that can be less than the communication overhead in the 3d FFTs.

As an alternative, it is also possible to start a *multi-partition* calculation and then use the *verlet/split integrator* to perform the PPPM computation on a dedicated, separate partition of MPI processes. This uses an integer "1:*p*" mapping of *p* subdomains of the atom decomposition to one subdomain of the FFT grid decomposition and where pairwise non-bonded and bonded forces and energies are computed on the larger partition and the PPPM kspace computation concurrently on the smaller partition.

- LAMMPS also implements PPPM-based solvers for other long-range interactions, dipole and dispersion (Lennard-Jones), which can be used in conjunction with long-range Coulombics for point charges.
- LAMMPS implements a GridComm class which overlays the simulation domain with a regular grid, partitions it across processors in a manner consistent with processor subdomains, and provides methods for forward and reverse communication of owned and ghost grid point values. It is used for PPPM as an FFT grid (as outlined above) and also for the MSM algorithm, which uses a cascade of grid sizes from fine to coarse to compute long-range Coulombic forces. The GridComm class is also useful for models where continuum fields interact with particles. For example, the two-temperature model (TTM) defines heat transfer between atoms (particles) and electrons (continuum gas) where spatial variations in the electron temperature are computed by finite differences of a discretized heat equation on a regular grid. The *fix ttm/grid* command uses the GridComm class internally to perform its grid operations on a distributed grid instead of the original *fix ttm* which uses a replicated grid.

4.4.5 OpenMP Parallelism

The styles in the INTEL, KOKKOS, and OPENMP packages offer to use OpenMP thread parallelism to predominantly distribute loops over local data and thus follow an orthogonal parallelization strategy to the decomposition into spatial domains used by the *MPI partitioning*. For clarity, this section discusses only the implementation in the OPENMP package, as it is the simplest. The INTEL and KOKKOS packages offer additional options and are more complex since they support more features and different hardware like co-processors or GPUs.

One of the key decisions when implementing the OPENMP package was to keep the changes to the source code small, so that it would be easier to maintain the code and keep it in sync with the non-threaded standard implementation. This is achieved by a) making the OPENMP version a derived class from the regular version (e.g. PairLJCutOMP from PairLJCut) and only overriding methods that are multi-threaded or need to be modified to support multi-threading (similar to what was done in the OPT package), b) keeping the structure in the modified code very similar so that side-by-side comparisons are still useful, and c) offloading additional functionality and multi-thread support functions into three separate classes ThrOMP, ThrData, and FixOMP. ThrOMP provides additional, multi-thread aware functionality not available in the corresponding base class (e.g. Pair for PairLJCutOMP) like multi-thread aware variants of the "tally" functions. Those functions are made available through multiple inheritance, so those new functions have to have unique names to avoid ambiguities; typically _thr is appended to the name of the function. ThrData is a class that manages per-thread data structures. It is used instead of extending the corresponding storage to per-thread arrays to avoid slowdowns due to "false sharing" when multiple threads update adjacent elements in an array and thus force the CPU cache lines to be reset and re-fetched. FixOMP finally manages the "multi-thread state" like settings and access to per-thread storage, it is activated by the *package omp* command.

Avoiding data races

A key problem when implementing thread parallelism in an MD code is to avoid data races when updating accumulated properties like forces, energies, and stresses. When interactions are computed, they always involve multiple atoms and thus there are race conditions when multiple threads want to update per-atom data of the same atoms. Five possible strategies have been considered to avoid this:

1. Restructure the code so that there is no overlapping access possible when computing in parallel, e.g. by breaking lists into multiple parts and synchronizing threads in between.

2. Have each thread be "responsible" for a specific group of atoms and compute these interactions multiple times, once on each thread that is responsible for a given atom, and then have each thread only update the properties of this atom.
3. Use mutexes around functions and regions of code where the data race could happen.
4. Use atomic operations when updating per-atom properties.
5. Use replicated per-thread data structures to accumulate data without conflicts and then use a reduction to combine those results into the data structures used by the regular style.

Option 5 was chosen for the OPENMP package because it would retain the performance for the case of a single thread and the code would be more maintainable. Option 1 would require extensive code changes, particularly to the neighbor list code; option 2 would have incurred a 2x or more performance penalty for the serial case; option 3 causes significant overhead and would enforce serialization of operations in inner loops and thus defeat the purpose of multi-threading; option 4 slows down the serial case although not quite as bad as option 2. The downside of option 5 is that the overhead of the reduction operations grows with the number of threads used, so there would be a crossover point where options 2 or 4 would result in faster executing. That is why option 2 for example is used in the GPU package because a GPU is a processor with a massive number of threads. However, since the MPI parallelization is generally more effective for typical MD systems, the expectation is that thread parallelism is only used for a smaller number of threads (2-8). At the time of its implementation, that number was equivalent to the number of CPU cores per CPU socket on high-end supercomputers.

Thus arrays like the force array are dimensioned to the number of atoms times the number of threads when enabling OpenMP support, and inside the compute functions a pointer to a different chunk is obtained by each thread. Similarly, accumulators like potential energy or virial are kept in per-thread instances of the ThrData class and then only reduced and stored in their global counterparts at the end of the force computation.

Loop scheduling

Multi-thread parallelization is applied by distributing (outer) loops statically across threads. Typically, this would be the loop over local atoms *i* when processing *i,j* pairs of atoms from a neighbor list. The design of the neighbor list code results in atoms having a similar number of neighbors for homogeneous systems and thus load imbalances across threads are not common and typically happen for systems where also the MPI parallelization would be unbalanced, which would typically have a more pronounced impact on the performance. This same loop scheduling scheme can also be applied to the reduction operations on per-atom data to try and reduce the overhead of the reduction operation.

Neighbor list parallelization

In addition to the parallelization of force computations, also the generation of the neighbor lists is parallelized. As explained previously, neighbor lists are built by looping over "owned" atoms and storing the neighbors in "pages". In the OPENMP variants of the neighbor list code, each thread operates on a different chunk of "owned" atoms and allocates and fills its own set of pages with neighbor list data. This is achieved by each thread keeping its own instance of the MyPage page allocator class.

4.5 Accessing per-atom data

This page discusses how per-atom data is managed in LAMMPS, how it can be accessed, what communication patterns apply, and some of the utility functions that exist for a variety of purposes.

4.5.1 Owned and ghost atoms

As described on the *parallel partitioning algorithms* page, LAMMPS uses a domain decomposition of the simulation domain, either in a *brick* or *tiled* manner. Each MPI process *owns* exactly one subdomain and the atoms within it. To compute forces for tuples of atoms that are spread across sub-domain boundaries, also a "halo" of *ghost* atoms are maintained within the communication cutoff distance of its subdomain.

The total number of atoms is stored in *Atom::natoms* (within any typical class this can be referred to at *atom->natoms*). The number of *owned* (or "local" atoms) are stored in *Atom::nlocal*; the number of *ghost* atoms is stored in *Atom::nghost*. The sum of *Atom::nlocal* over all MPI processes should be *Atom::natoms*. This is by default regularly checked by the Thermo class, and if the sum does not match, LAMMPS stops with a "lost atoms" error. For convenience also the property *Atom::nmax* is available, this is the maximum of *Atom::nlocal* + *Atom::nghost* across all MPI processes.

Per-atom properties are either managed by the atom style, individual classes, or as custom arrays by the individual classes. If only access to *owned* atoms is needed, they are usually allocated to be of size *Atom::nlocal*, otherwise of size *Atom::nmax*. Please note that not all per-atom properties are available or updated on *ghost* atoms. For example, per-atom velocities are only updated with *comm_modify vel yes*.

4.5.2 Atom indexing

When referring to individual atoms, they may be indexed by their local *index*, their index in their *Atom::x* array. This is densely populated containing first all *owned* atoms (index < *Atom::nlocal*) and then all *ghost* atoms. The order of atoms in these arrays can change due to atoms migrating between between subdomains, atoms being added or deleted, or atoms being sorted for better cache efficiency. Atoms are globally uniquely identified by their *atom ID*. There may be multiple atoms with the same atom ID present, but only one of them may be an *owned* atom.

To find the local *index* of an atom, when the *atom ID* is known, the *Atom::map()* function may be used. It will return the local atom index or -1. If the returned value is between 0 (inclusive) and *Atom::nlocal* (exclusive) it is an *owned* or "local" atom; for larger values the atom is present as a ghost atom; for a value of -1, the atom is not present on the current subdomain at all.

If multiple atoms with the same tag exist in the same subdomain, they can be found via the *Atom::sametag* array. It points to the next atom index with the same tag or -1 if there are no more atoms with the same tag. The list will be exhaustive when starting with an index of an *owned* atom, since the atom IDs are unique, so there can only be one such atom. Example code to count atoms with same atom ID in a subdomain:

```
for (int i = 0; i < atom->nlocal; ++i) {
  int count = 0;
  while (sametag[i] >= 0) {
    i = sametag[i];
    ++count;
  }
  printf("Atom ID: %ld is present %d times\n", atom->tag[i], count);
}
```

4.5.3 Atom class versus AtomVec classes

The *Atom* class contains all kinds of flags and counters about atoms in the system and that includes pointers to **all** per-atom properties available for atoms. However, only a subset of these pointers are non-NULL and which those are depends on the atom style. For each atom style there is a corresponding *AtomVecXXX* class derived from the *AtomVec* base class, where the XXX indicates the atom style. This *AtomVecXXX* class will update the counters and per-atom pointers if atoms are added or removed to the system or migrate between subdomains.

4.6 Communication patterns

This page describes various inter-processor communication operations provided by LAMMPS, mostly in the core *Comm* class. These are operations for common tasks implemented using MPI library calls. They are used by other classes to perform communication of different kinds. These operations are useful to know about when writing new code for LAMMPS that needs to communicate data between processors.

4.6.1 Owned and ghost atoms

As described on the *parallel partitioning algorithms* page, LAMMPS spatially decomposes the simulation domain, either in a *brick* or *tiled* manner. Each processor (MPI task) owns atoms within its subdomain and additionally stores ghost atoms within a cutoff distance of its subdomain.

Forward and reverse communication

As described on the *parallel communication algorithms* page, the most common communication operations are first, *forward communication* which sends owned atom information from each processor to nearby processors to store with their ghost atoms. The need to do this communication arises when data from the owned atoms is updated (e.g. their positions) and this updated information needs to be **copied** to the corresponding ghost atoms.

And second, *reverse communication*, which sends ghost atom information from each processor to the owning processor to **accumulate** (sum) the values with the corresponding owned atoms. The need for this arises when data is computed and also stored with ghost atoms (e.g. forces when using a "half" neighbor list) and thus those terms need to be added to their corresponding atoms on the process where they are "owned" atoms. Please note, that with the *newton off* setting this does not happen and the neighbor lists are constructed so that these interactions are computed on both MPI processes containing one of the atoms and only the data pertaining to the local atom is stored.

The time-integration classes in LAMMPS invoke these operations each timestep via the *forward_comm()* and *reverse_comm()* methods in the *Comm* class. Which per-atom data is communicated depends on the currently used *atom style* and whether *comm_modify vel* setting is "no" (default) or "yes".

Similarly, *Pair* style classes can invoke the *forward_comm(this)* and *reverse_comm(this)* methods in the *Comm* class to perform the same operations on per-atom data that is generated and stored within the pair style class. Note that this function requires passing the this pointer as the first argument to enable the *Comm* class to call the "pack" and "unpack" functions discussed below. An example of the use of these functions are many-body pair styles like the embedded-atom method (EAM) which compute intermediate values in the first part of the compute() function that need to be stored by both owned and ghost atoms for the second part of the force computation. The *Comm* class methods perform the MPI communication for buffers of per-atom data. They "call back" to the *Pair* class, so it can *pack* or *unpack* the buffer with data the *Pair* class owns. There are 4 such methods that the *Pair* class must define, assuming it uses both forward and reverse communication:

- pack_forward_comm()
- unpack_forward_comm()
- pack_reverse_comm()
- unpack_reverse_comm()
