#### 4.407 std::\_\_atomic\_flag\_base Struct Reference

Inheritance diagram for std::\_\_atomic\_flag\_base:

##### Public Attributes

- `__atomic_flag_data_type _M_i`

#### 4.407.1 Detailed Description

Base type for atomic\_flag.

Base type is POD with data, allowing atomic\_flag to derive from it and meet the standard layout type requirement. In addition to compatibility with a C interface, this allows different implementations of atomic\_flag to use the same atomic operation functions, via a standard conversion to the \_\_atomic\_flag\_base argument.

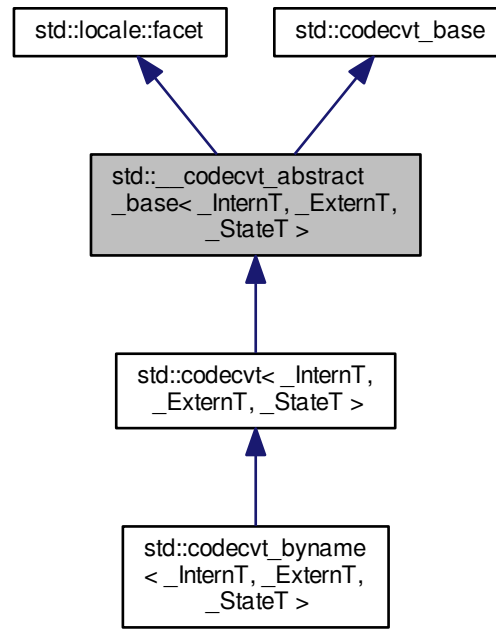

Definition at line 261 of file atomic\_base.h.

## 4.408.1 Detailed Description

```
template<typename _InternT, typename _ExternT, typename _StateT>class std::__codecvt_abstract_base< _InternT, _ExternT, _↔
StateT >
```

Common base for codecvt functions.

This template class provides implementations of the public functions that forward to the protected virtual functions.

This template also provides abstract stubs for the protected virtual functions.

Definition at line 68 of file codecvt.h.

## 4.408.2 Member Function Documentation

4.408.2.1 `template<typename _InternT, typename _ExternT, typename _StateT> virtual result std::__codecvt_abstract_↔  
base< _InternT, _ExternT, _StateT >::do_out ( state_type & __state, const intern_type * __from, const intern_type *  
__from_end, const intern_type *& __from_next, extern_type * __to, extern_type * __to_end, extern_type *& __to_next )  
const [protected],[pure virtual]`

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This function is a hook for derived classes to change the value returned.

See also

out for more information.

Implemented in [std::codecvt< wchar\\_t, char, mbstate\\_t >](#), [std::codecvt< char, char, mbstate\\_t >](#), [std::codecvt< \\_↔\\_InternT, \\_ExternT, \\_StateT >](#), and [std::codecvt< \\_InternT, \\_ExternT, encoding\\_state >](#).

Referenced by [std::\\_\\_codecvt\\_abstract\\_base< \\_InternT, \\_ExternT, encoding\\_state >::out\(\)](#).

```
4.408.2.2 template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<
    _InternT, _ExternT, _StateT >::in ( state_type & __state, const extern_type * __from, const extern_type * __from_end,
    const extern_type *& __from_next, intern_type * __to, intern_type * __to_end, intern_type *& __to_next ) const
    [inline]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

#### Returns

`codecvt_base::result`.

Definition at line 196 of file `codecvt.h`.

```
4.408.2.3 template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<
    _InternT, _ExternT, _StateT >::out ( state_type & __state, const intern_type * __from, const intern_type * __from_end,
    const intern_type *& __from_next, extern_type * __to, extern_type * __to_end, extern_type *& __to_next ) const
    [inline]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the

character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

#### Returns

`codecvt_base::result`.

Definition at line 116 of file `codecvt.h`.

```
4.408.2.4 template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<
    _InternT, _ExternT, _StateT>::unshift ( state_type & __state, extern_type * __to, extern_type * __to_end, extern_type
    *& __to_next ) const [inline]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

#### Returns

`codecvt_base::result`.

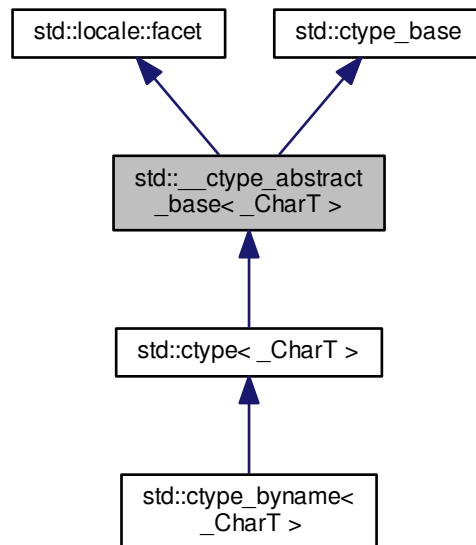

Definition at line 155 of file `codecvt.h`.

#### 4.409.1 Detailed Description

```
template<typename _CharT>class std::__ctype_abstract_base<_CharT>
```

Common base for ctype facet.

This template class provides implementations of the public functions that forward to the protected virtual functions.

This template also provides abstract stubs for the protected virtual functions.

Definition at line 143 of file locale\_facets.h.

## 4.409.2 Member Typedef Documentation

## 4.409.2.1 template&lt;typename \_CharT&gt; typedef \_CharT std::\_\_ctype\_abstract\_base&lt;\_CharT&gt;::char\_type

Typedef for the template parameter.

Definition at line 148 of file locale\_facets.h.

## 4.409.3 Member Function Documentation

## 4.409.3.1 template&lt;typename \_CharT&gt; virtual bool std::\_\_ctype\_abstract\_base&lt;\_CharT&gt;::do\_is ( mask \_\_m, char\_type \_\_c ) const [protected], [pure virtual]

Test char\_type classification.

This function finds a mask M for c and compares it to mask m.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

## Parameters

<code>__c</code>	The char_type to find the mask of.
<code>__m</code>	The mask to compare against.

## Returns

$(M \& \text{__m}) \neq 0$ .

Implemented in [std::ctype<wchar\\_t>](#), and [std::ctype<\\_CharT>](#).

Referenced by [std::\\_\\_ctype\\_abstract\\_base<wchar\\_t>::is\(\)](#).

## 4.409.3.2 template&lt;typename \_CharT&gt; virtual const char\_type\* std::\_\_ctype\_abstract\_base&lt;\_CharT&gt;::do\_is ( const char\_type \* \_\_lo, const char\_type \* \_\_hi, mask \* \_\_vec ) const [protected], [pure virtual]

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the input.

do\_is() is a hook for a derived facet to change the behavior of classifying. do\_is() must always return the same result for the same input.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

## Returns

`__hi`.

Implemented in [std::ctype<wchar\\_t>](#), and [std::ctype<\\_CharT>](#).

## 4.409.3.3 template&lt;typename \_CharT&gt; virtual char std::\_\_ctype\_abstract\_base&lt;\_CharT&gt;::do\_narrow ( char\_type \_\_c, char \_\_dfault ) const [protected], [pure virtual]

Narrow char\_type to char.

This virtual function converts the argument to char using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

<code>__c</code>	The <code>char_type</code> to convert.
<code>__dfault</code>	Char to return if conversion fails.

#### Returns

The converted char.

Implemented in `std::ctype< wchar_t >`, and `std::ctype< _CharT >`.

Referenced by `std::__ctype_abstract_base< wchar_t >::narrow()`.

4.409.3.4 `template<typename _CharT> virtual const char_type* std::__ctype_abstract_base< _CharT >::do_narrow (const char_type * __lo, const char_type * __hi, char __dfault, char * __to ) const [protected], [pure virtual]`

Narrow `char_type` array to char.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__dfault` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

Implemented in `std::ctype< wchar_t >`, and `std::ctype< _CharT >`.

4.409.3.5 `template<typename _CharT> virtual const char_type* std::__ctype_abstract_base< _CharT >::do_scan_is (mask __m, const char_type * __lo, const char_type * __hi ) const [protected], [pure virtual]`

Find `char_type` matching mask.

This function searches for and returns the first `char_type` `c` in `[__lo,__hi)` for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

Pointer to a matching `char_type` if found, else `__hi`.

Implemented in [std::ctype<wchar\\_t>](#), and [std::ctype<\\_CharT>](#).

Referenced by `std::__ctype_abstract_base<wchar_t>::scan_is()`.

4.409.3.6 `template<typename _CharT> virtual const char_type* std::__ctype_abstract_base<_CharT>::do_scan_not ( mask __m, const char_type * __lo, const char_type * __hi ) const` `[protected], [pure virtual]`

Find `char_type` not matching mask.

This function searches for and returns a pointer to the first `char_type` `c` of `[lo,hi)` for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

Pointer to a non-matching `char_type` if found, else `__hi`.

Implemented in [std::ctype<wchar\\_t>](#), and [std::ctype<\\_CharT>](#).

Referenced by `std::__ctype_abstract_base<wchar_t>::scan_not()`.

4.409.3.7 `template<typename _CharT> virtual char_type std::__ctype_abstract_base<_CharT>::do_tolower ( char_type __c ) const` `[protected], [pure virtual]`

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

## Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

## Returns

The lowercase `char_type` if convertible, else `__c`.

Implemented in [std::ctype<wchar\\_t>](#), and [std::ctype<\\_CharT>](#).

Referenced by `std::__ctype_abstract_base<wchar_t>::tolower()`.

**4.409.3.8** `template<typename _CharT> virtual const char_type* std::__ctype_abstract_base<_CharT>::do_tolower (char_type * __lo, const char_type * __hi) const` [protected], [pure virtual]

Convert array to lowercase.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

#### Returns

`__hi`.

Implemented in `std::ctype<wchar_t>`, and `std::ctype<_CharT>`.

**4.409.3.9** `template<typename _CharT> virtual char_type std::__ctype_abstract_base<_CharT>::do_toupper (char_type __c) const` [protected], [pure virtual]

Convert to uppercase.

This virtual function converts the `char_type` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

#### Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

#### Returns

The uppercase `char_type` if convertible, else `__c`.

Implemented in `std::ctype<wchar_t>`, and `std::ctype<_CharT>`.

Referenced by `std::__ctype_abstract_base<wchar_t>::toupper()`.

**4.409.3.10** `template<typename _CharT> virtual const char_type* std::__ctype_abstract_base<_CharT>::do_toupper (char_type * __lo, const char_type * __hi) const` [protected], [pure virtual]

Convert array to uppercase.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

Implemented in [std::ctype<wchar\\_t>](#), and [std::ctype<\\_CharT>](#).

**4.409.3.11** `template<typename _CharT> virtual char_type std::__ctype_abstract_base<_CharT>::do_widen ( char __c )  
const [protected], [pure virtual]`

Widen char.

This virtual function converts the char to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

## Returns

The converted char\_type

Implemented in [std::ctype<wchar\\_t>](#), and [std::ctype<\\_CharT>](#).

Referenced by `std::__ctype_abstract_base<wchar_t>::widen()`.

**4.409.3.12** `template<typename _CharT> virtual const char* std::__ctype_abstract_base<_CharT>::do_widen ( const char  
* __lo, const char * __hi, char_type * __to ) const [protected], [pure virtual]`

Widen char array.

This function converts each char in the input to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

<code>__lo</code>	Pointer to start range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

## Returns

`__hi`.

Implemented in [std::ctype<wchar\\_t>](#), and [std::ctype<\\_CharT>](#).

**4.409.3.13** `template<typename _CharT> bool std::__ctype_abstract_base<_CharT>::is ( mask __m, char_type __c )  
const [inline]`

Test char\_type classification.

This function finds a mask M for \_\_c and compares it to mask \_\_m. It does so by returning the value of ctype<char\_type>::do\_is().

#### Parameters

<code>__c</code>	The char_type to compare the mask of.
<code>__m</code>	The mask to compare against.

#### Returns

$(M \& \text{__m}) \neq 0$ .

Definition at line 162 of file locale\_facets.h.

**4.409.3.14** `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::is ( const char_type  
* __lo, const char_type * __hi, mask * __vec ) const [inline]`

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char\_type>::do\_is().

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

#### Returns

`__hi`.

Definition at line 179 of file locale\_facets.h.

**4.409.3.15** `template<typename _CharT> char std::__ctype_abstract_base<_CharT>::narrow ( char_type __c, char  
__dfault ) const [inline]`

Narrow char\_type to char.

This function converts the char\_type to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_c).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

<code>__c</code>	The char_type to convert.
<code>__dfault</code>	Char to return if conversion fails.

#### Returns

The converted char.

Definition at line 324 of file locale\_facets.h.

4.409.3.16 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::narrow ( const char_type * __lo, const char_type * __hi, char __dfault, char * __to ) const [inline]`

Narrow array to char array.

This function converts each `char_type` in the input to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `char_type` in the input that cannot be converted, *dfault* is used instead. It does so by returning `ctype<char_type>::do_narrow(__lo, __hi, __dfault, __to)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

Definition at line 346 of file `locale_facets.h`.

4.409.3.17 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::scan_is ( mask __m, const char_type * __lo, const char_type * __hi ) const [inline]`

Find `char_type` matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is true. It does so by returning `ctype<char_type>::do_scan_is()`.

#### Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

#### Returns

Pointer to matching `char_type` if found, else `__hi`.

Definition at line 195 of file `locale_facets.h`.

4.409.3.18 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::scan_not ( mask __m, const char_type * __lo, const char_type * __hi ) const [inline]`

Find `char_type` not matching a mask.

This function searches for and returns the first `char_type` `c` in `[lo,hi)` for which `is(m,c)` is false. It does so by returning `ctype<char_type>::do_scan_not()`.

#### Parameters

<code>__m</code>	The mask to compare against.
------------------	------------------------------

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

**Returns**

Pointer to non-matching char if found, else `__hi`.

Definition at line 211 of file `locale_facets.h`.

```
4.409.3.19 template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::tolower ( char_type __c )
          const [inline]
```

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_tolower(c)`.

**Parameters**

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

**Returns**

The lowercase `char_type` if convertible, else `__c`.

Definition at line 254 of file `locale_facets.h`.

```
4.409.3.20 template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::tolower ( char_type
          * __lo, const char_type * __hi ) const [inline]
```

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

**Returns**

`__hi`.

Definition at line 269 of file `locale_facets.h`.

```
4.409.3.21 template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::toupper ( char_type __c )
          const [inline]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

## Parameters

<code>__c</code>	The char_type to convert.
------------------	---------------------------

## Returns

The uppercase char\_type if convertible, else `__c`.

Definition at line 225 of file locale\_facets.h.

**4.409.3.22** `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::toupper ( char_type * __lo, const char_type * __hi ) const [inline]`

Convert array to uppercase.

This function converts each char\_type in the range [lo,hi) to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

Definition at line 240 of file locale\_facets.h.

**4.409.3.23** `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::widen ( char __c ) const [inline]`

Widen char to char\_type.

This function converts the char argument to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

## Returns

The converted char\_type.

Definition at line 286 of file locale\_facets.h.

**4.409.3.24** `template<typename _CharT> const char* std::__ctype_abstract_base<_CharT>::widen ( const char * __lo, const char * __hi, char_type * __to ) const [inline]`

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

## Returns

`__hi`.

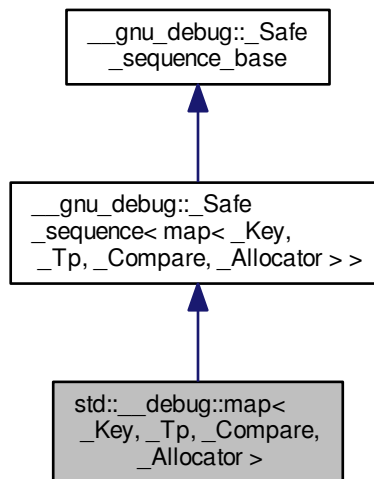

Definition at line 305 of file `locale_facets.h`.

#### 4.410.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Allocator = std::allocator<std::pair<const _Key, _Tp> >>> class std::__debug::map< _Key, _Tp, _Compare, _Allocator >
```

Class std::map with safety/checking/debug instrumentation.

Definition at line 43 of file debug/map.h.

#### 4.410.2 Member Function Documentation

4.410.2.1 void \_\_gnu\_debug::Safe\_sequence\_base::M\_attach ( \_Safe\_iterator\_base \* \_\_it, bool \_\_constant )  
[inherited]

Attach an iterator to this sequence.

4.410.2.2 void \_\_gnu\_debug::Safe\_sequence\_base::M\_attach\_single ( \_Safe\_iterator\_base \* \_\_it, bool \_\_constant ) throw()  
[inherited]

Likewise but not thread safe.

4.410.2.3 void \_\_gnu\_debug::Safe\_sequence\_base::M\_detach ( \_Safe\_iterator\_base \* \_\_it ) [inherited]

Detach an iterator from this sequence

4.410.2.4 void \_\_gnu\_debug::Safe\_sequence\_base::M\_detach\_all ( ) [protected], [inherited]

Detach all iterators, leaving them singular.

Referenced by \_\_gnu\_debug::Safe\_sequence\_base::~~Safe\_sequence\_base().

4.410.2.5 void \_\_gnu\_debug::Safe\_sequence\_base::M\_detach\_single ( \_Safe\_iterator\_base \* \_\_it ) throw ( ) [inherited]

Likewise but not thread safe.

4.410.2.6 void \_\_gnu\_debug::Safe\_sequence\_base::M\_detach\_singular ( ) [protected], [inherited]

Detach all singular iterators.

#### Postcondition

for all iterators i attached to this sequence, i->\_M\_version == \_M\_version.

4.410.2.7 \_\_gnu\_cxx::mutex& \_\_gnu\_debug::Safe\_sequence\_base::M\_get\_mutex ( ) throw ( ) [protected], [inherited]

For use in \_Safe\_sequence.

4.410.2.8 void \_\_gnu\_debug::Safe\_sequence\_base::M\_invalidate\_all ( ) const [inline], [inherited]

Invalidates all iterators.

Definition at line 233 of file safe\_base.h.

4.410.2.9 void \_\_gnu\_debug::Safe\_sequence< map<\_Key, \_Tp, \_Compare, \_Allocator > >::M\_invalidate\_if ( \_Predicate \_\_pred ) [inherited]

Invalidates all iterators x that reference this sequence, are not singular, and for which \_\_pred(x) returns true. \_\_pred will be invoked with the normal iterators nested in the safe ones.

4.410.2.10 void \_\_gnu\_debug::Safe\_sequence\_base::M\_revalidate\_singular ( ) [protected], [inherited]

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.410.2.11 void \_\_gnu\_debug::Safe\_sequence\_base::M\_swap ( \_Safe\_sequence\_base & \_\_x ) [protected], [inherited]

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.410.2.12 void \_\_gnu\_debug::Safe\_sequence< map<\_Key, \_Tp, \_Compare, \_Allocator > >::M\_transfer\_from\_if ( \_Safe\_sequence< map<\_Key, \_Tp, \_Compare, \_Allocator > > & \_\_from, \_Predicate \_\_pred ) [inherited]

Transfers all iterators x that reference from sequence, are not singular, and for which \_\_pred(x) returns true. \_\_pred will be invoked with the normal iterators nested in the safe ones.

#### 4.410.3 Member Data Documentation

#### 4.411.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Allocator = std::allocator<std::pair<const _Key, _Tp>>> class std::__debug::multimap<_Key, _Tp, _Compare, _Allocator>
```

Class std::multimap with safety/checking/debug instrumentation.

Definition at line 43 of file debug/multimap.h.

## 4.411.2 Member Function Documentation

4.411.2.1 void \_\_gnu\_debug::Safe\_sequence\_base::M\_attach ( \_Safe\_iterator\_base \* \_\_it, bool \_\_constant )  
[inherited]

Attach an iterator to this sequence.

4.411.2.2 void \_\_gnu\_debug::Safe\_sequence\_base::M\_attach\_single ( \_Safe\_iterator\_base \* \_\_it, bool \_\_constant ) throw  
[inherited]

Likewise but not thread safe.

4.411.2.3 void \_\_gnu\_debug::Safe\_sequence\_base::M\_detach ( \_Safe\_iterator\_base \* \_\_it ) [inherited]

Detach an iterator from this sequence

4.411.2.4 void \_\_gnu\_debug::Safe\_sequence\_base::M\_detach\_all ( ) [protected],[inherited]

Detach all iterators, leaving them singular.

Referenced by \_\_gnu\_debug::Safe\_sequence\_base::~~Safe\_sequence\_base().

4.411.2.5 void \_\_gnu\_debug::Safe\_sequence\_base::M\_detach\_single ( \_Safe\_iterator\_base \* \_\_it ) throw  
[inherited]

Likewise but not thread safe.

4.411.2.6 void \_\_gnu\_debug::Safe\_sequence\_base::M\_detach\_singular ( ) [protected],[inherited]

Detach all singular iterators.

## Postcondition

for all iterators i attached to this sequence, i->\_M\_version == \_M\_version.

4.411.2.7 \_\_gnu\_cxx::mutex& \_\_gnu\_debug::Safe\_sequence\_base::M\_get\_mutex ( ) throw [protected],  
[inherited]

For use in \_Safe\_sequence.

4.411.2.8 void \_\_gnu\_debug::Safe\_sequence\_base::M\_invalidate\_all ( ) const [inline],[inherited]

Invalidates all iterators.

Definition at line 233 of file safe\_base.h.

4.411.2.9 void \_\_gnu\_debug::Safe\_sequence< multimap<\_Key,\_Tp,\_Compare,\_Allocator> >::M\_invalidate\_if ( \_Predicate \_\_pred ) [inherited]

Invalidates all iterators x that reference this sequence, are not singular, and for which \_\_pred(x) returns true. \_\_pred will be invoked with the normal iterators nested in the safe ones.

4.411.2.10 void \_\_gnu\_debug::Safe\_sequence\_base::M\_revalidate\_singular ( ) [protected],[inherited]

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

4.411.2.11 `void __gnu_debug::Safe_sequence_base::M_swap ( _Safe_sequence_base & __x )` [protected],  
[inherited]

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

4.411.2.12 `void __gnu_debug::Safe_sequence< multimap< _Key, _Tp, _Compare, _Allocator > >::M_transfer_from_if`  
( `_Safe_sequence< multimap< _Key, _Tp, _Compare, _Allocator > > & __from, _Predicate __pred` )  
[inherited]

Transfers all iterators `x` that reference `from` sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

#### 4.411.3 Member Data Documentation

4.411.3.1 `_Safe_iterator_base* __gnu_debug::Safe_sequence_base::M_const_iterators` [inherited]

The list of constant iterators that reference this container.

Definition at line 184 of file `safe_base.h`.

4.411.3.2 `_Safe_iterator_base* __gnu_debug::Safe_sequence_base::M_iterators` [inherited]

The list of mutable iterators that reference this container.

Definition at line 181 of file `safe_base.h`.

4.411.3.3 `unsigned int __gnu_debug::Safe_sequence_base::M_version` [mutable],[inherited]

The container version number. This number may never be 0.

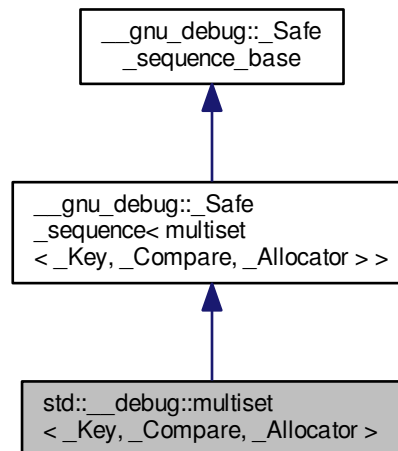

Definition at line 187 of file `safe_base.h`.

## 4.412.1 Detailed Description

template<typename \_Key, typename \_Compare = std::less<\_Key>, typename \_Allocator = std::allocator<\_Key>>class std::\_\_debug::multiset<\_Key, \_Compare, \_Allocator>

Class std::multiset with safety/checking/debug instrumentation.

Definition at line 43 of file debug/multiset.h.

## 4.412.2 Member Function Documentation

4.412.2.1 void [\\_\\_gnu\\_debug::Safe\\_sequence\\_base::M\\_attach](#) ( [\\_Safe\\_iterator\\_base](#) \* \_\_it, bool \_\_constant )  
[inherited]

Attach an iterator to this sequence.

4.412.2.2 void [\\_\\_gnu\\_debug::Safe\\_sequence\\_base::M\\_attach\\_single](#) ( [\\_Safe\\_iterator\\_base](#) \* \_\_it, bool \_\_constant ) throw()  
[inherited]

Likewise but not thread safe.

4.412.2.3 void [\\_\\_gnu\\_debug::Safe\\_sequence\\_base::M\\_detach](#) ( [\\_Safe\\_iterator\\_base](#) \* \_\_it ) [inherited]

Detach an iterator from this sequence

4.412.2.4 void [\\_\\_gnu\\_debug::Safe\\_sequence\\_base::M\\_detach\\_all](#) ( ) [protected], [inherited]

Detach all iterators, leaving them singular.

Referenced by [\\_\\_gnu\\_debug::Safe\\_sequence\\_base::~~Safe\\_sequence\\_base\(\)](#).

4.412.2.5 void [\\_\\_gnu\\_debug::Safe\\_sequence\\_base::M\\_detach\\_single](#) ( [\\_Safe\\_iterator\\_base](#) \* \_\_it ) throw()  
[inherited]

Likewise but not thread safe.

4.412.2.6 void [\\_\\_gnu\\_debug::Safe\\_sequence\\_base::M\\_detach\\_singular](#) ( ) [protected], [inherited]

Detach all singular iterators.

**Postcondition**

for all iterators *i* attached to this sequence, *i*->\_M\_version == \_M\_version.

**4.412.2.7** `__gnu_cxx::__mutex& __gnu_debug::Safe_sequence_base::M_get_mutex ( ) throw` `[protected]`,  
`[inherited]`

For use in `_Safe_sequence`.

**4.412.2.8** `void __gnu_debug::Safe_sequence_base::M_invalidate_all ( ) const` `[inline]`, `[inherited]`

Invalidates all iterators.

Definition at line 233 of file `safe_base.h`.

**4.412.2.9** `void __gnu_debug::Safe_sequence< multiset< _Key, _Compare, _Allocator > >::M_invalidate_if ( _Predicate __pred )` `[inherited]`

Invalidates all iterators *x* that reference this sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

**4.412.2.10** `void __gnu_debug::Safe_sequence_base::M_revalidate_singular ( )` `[protected]`, `[inherited]`

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

**4.412.2.11** `void __gnu_debug::Safe_sequence_base::M_swap ( _Safe_sequence_base & __x )` `[protected]`,  
`[inherited]`

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

**4.412.2.12** `void __gnu_debug::Safe_sequence< multiset< _Key, _Compare, _Allocator > >::M_transfer_from_if ( _Safe_sequence< multiset< _Key, _Compare, _Allocator > > & __from, _Predicate __pred )` `[inherited]`

Transfers all iterators *x* that reference `from` sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

**4.412.3 Member Data Documentation**

**4.412.3.1** `_Safe_iterator_base* __gnu_debug::Safe_sequence_base::M_const_iterators` `[inherited]`

The list of constant iterators that reference this container.

Definition at line 184 of file `safe_base.h`.

**4.412.3.2** `_Safe_iterator_base* __gnu_debug::Safe_sequence_base::M_iterators` `[inherited]`

The list of mutable iterators that reference this container.

Definition at line 181 of file `safe_base.h`.

**4.412.3.3** `unsigned int __gnu_debug::Safe_sequence_base::M_version` `[mutable]`, `[inherited]`

The container version number. This number may never be 0.

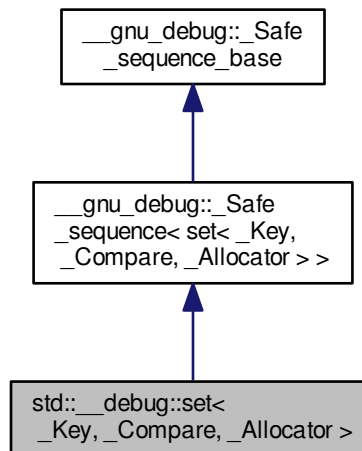

Definition at line 187 of file `safe_base.h`.

The documentation for this class was generated from the following file:

## 4.413.1 Detailed Description

template<typename [\\_Key](#), typename [\\_Compare](#) = [std::less<\\_Key>](#), typename [\\_Allocator](#) = [std::allocator<\\_Key>](#)>>class [std::\\_\\_debug::set<\\_Key, \\_Compare, \\_Allocator>](#)

Class [std::set](#) with safety/checking/debug instrumentation.

Definition at line 43 of file [debug/set.h](#).

## 4.413.2 Member Function Documentation

4.413.2.1 void [\\_\\_gnu\\_debug::Safe\\_sequence\\_base::M\\_attach](#) ( [\\_Safe\\_iterator\\_base](#) \* \_\_it, bool \_\_constant )  
[[inherited](#)]

Attach an iterator to this sequence.

4.413.2.2 void [\\_\\_gnu\\_debug::Safe\\_sequence\\_base::M\\_attach\\_single](#) ( [\\_Safe\\_iterator\\_base](#) \* \_\_it, bool \_\_constant ) throw()  
[[inherited](#)]

Likewise but not thread safe.

4.413.2.3 void [\\_\\_gnu\\_debug::Safe\\_sequence\\_base::M\\_detach](#) ( [\\_Safe\\_iterator\\_base](#) \* \_\_it ) [[inherited](#)]

Detach an iterator from this sequence

4.413.2.4 void [\\_\\_gnu\\_debug::Safe\\_sequence\\_base::M\\_detach\\_all](#) ( ) [[protected](#)], [[inherited](#)]

Detach all iterators, leaving them singular.

Referenced by [\\_\\_gnu\\_debug::Safe\\_sequence\\_base::~~Safe\\_sequence\\_base\(\)](#).

4.413.2.5 void [\\_\\_gnu\\_debug::Safe\\_sequence\\_base::M\\_detach\\_single](#) ( [\\_Safe\\_iterator\\_base](#) \* \_\_it ) throw()  
[[inherited](#)]

Likewise but not thread safe.

4.413.2.6 void [\\_\\_gnu\\_debug::Safe\\_sequence\\_base::M\\_detach\\_singular](#) ( ) [[protected](#)], [[inherited](#)]

Detach all singular iterators.

**Postcondition**

for all iterators *i* attached to this sequence, *i*->\_M\_version == \_M\_version.

**4.413.2.7** `__gnu_cxx::__mutex& __gnu_debug::Safe_sequence_base::M_get_mutex ( ) throw` `[protected]`,  
`[inherited]`

For use in `_Safe_sequence`.

**4.413.2.8** `void __gnu_debug::Safe_sequence_base::M_invalidate_all ( ) const` `[inline]`, `[inherited]`

Invalidates all iterators.

Definition at line 233 of file `safe_base.h`.

**4.413.2.9** `void __gnu_debug::Safe_sequence< set< _Key, _Compare, _Allocator > >::M_invalidate_if ( _Predicate  
__pred )` `[inherited]`

Invalidates all iterators *x* that reference this sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

**4.413.2.10** `void __gnu_debug::Safe_sequence_base::M_revalidate_singular ( )` `[protected]`, `[inherited]`

Revalidates all attached singular iterators. This method may be used to validate iterators that were invalidated before (but for some reason, such as an exception, need to become valid again).

**4.413.2.11** `void __gnu_debug::Safe_sequence_base::M_swap ( _Safe_sequence_base & __x )` `[protected]`,  
`[inherited]`

Swap this sequence with the given sequence. This operation also swaps ownership of the iterators, so that when the operation is complete all iterators that originally referenced one container now reference the other container.

**4.413.2.12** `void __gnu_debug::Safe_sequence< set< _Key, _Compare, _Allocator > >::M_transfer_from_if (`  
`_Safe_sequence< set< _Key, _Compare, _Allocator > > & __from, _Predicate __pred )` `[inherited]`

Transfers all iterators *x* that reference `from` sequence, are not singular, and for which `__pred(x)` returns true. `__pred` will be invoked with the normal iterators nested in the safe ones.

**4.413.3 Member Data Documentation**

**4.413.3.1** `_Safe_iterator_base* __gnu_debug::Safe_sequence_base::M_const_iterators` `[inherited]`

The list of constant iterators that reference this container.

Definition at line 184 of file `safe_base.h`.

**4.413.3.2** `_Safe_iterator_base* __gnu_debug::Safe_sequence_base::M_iterators` `[inherited]`

The list of mutable iterators that reference this container.

Definition at line 181 of file `safe_base.h`.

**4.413.3.3** `unsigned int __gnu_debug::Safe_sequence_base::M_version` `[mutable]`, `[inherited]`

The container version number. This number may never be 0.

Definition at line 187 of file `safe_base.h`.

#### 4.414 std::\_\_detail::\_Automaton Class Reference

Inheritance diagram for std::\_\_detail::\_Automaton:

##### Public Types

- typedef unsigned int **\_SizeT**

##### Public Member Functions

- virtual \_SizeT **\_M\_sub\_count** () const =0

##### 4.414.1 Detailed Description

Base class for, um, automata. Could be an NFA or a DFA. Your choice.

Definition at line 43 of file regex\_nfa.h.

The documentation for this class was generated from the following file:

- [regex\\_nfa.h](#)

#### 4.415 std::\_\_detail::\_Before\_begin< \_NodeAlloc > Struct Template Reference

Inherits `_NodeAlloc`.

##### Public Member Functions

- **\_Before\_begin** (const [\\_Before\\_begin](#) &)=default
- **\_Before\_begin** ([\\_Before\\_begin](#) &&)=default
- template<typename `_Alloc` > **\_Before\_begin** (`_Alloc` &&`_a`)

## Public Attributes

- [\\_Hash\\_node\\_base](#) **\_M\_node**

## 4.415.1 Detailed Description

```
template<typename _NodeAlloc>struct std::__detail::_Before_begin< _NodeAlloc >
```

This type is to combine a `_Hash_node_base` instance with an allocator instance through inheritance to benefit from EBO when possible.

Definition at line 1652 of file `hashtable_policy.h`.

The documentation for this struct was generated from the following file:

- [hashtable\\_policy.h](#)

4.416 `std::__detail::_CharMatcher< _InIterT, _TraitsT >` Struct Template Reference

## Public Types

- typedef `_TraitsT::char_type` **char\_type**

## Public Member Functions

- **\_CharMatcher** (`char_type __c`, `const _TraitsT &__t=_TraitsT()`)
- **operator()** (`const \_PatternCursor &__pc`) `const`

## Public Attributes

- `char_type` **\_M\_c**
- `const _TraitsT &` **\_M\_traits**

## 4.416.1 Detailed Description

```
template<typename _InIterT, typename _TraitsT>struct std::__detail::_CharMatcher< _InIterT, _TraitsT >
```

Matches a single character.

Definition at line 129 of file `regex_nfa.h`.

The documentation for this struct was generated from the following file:

- [regex\\_nfa.h](#)

4.417 `std::__detail::_Compiler< _InIter, _TraitsT >` Class Template Reference

## 4.417.1 Detailed Description

```
template<typename _InIter, typename _TraitsT>class std::__detail::__Compiler< _InIter, _TraitsT >
```

Builds an NFA from an input iterator interval.

Definition at line 634 of file `regex_compiler.h`.

The documentation for this class was generated from the following file:

- [regex\\_compiler.h](#)

## 4.418 std::\_\_detail::\_\_Default\_ranged\_hash Struct Reference

## 4.418.1 Detailed Description

Default ranged hash function H. In principle it should be a function object composed from objects of type H1 and H2 such that  $h(k, N) = h2(h1(k), N)$ , but that would mean making extra copies of h1 and h2. So instead we'll just use a tag to tell class template hashtable to do that composition.

Definition at line 353 of file `hashtable_policy.h`.

The documentation for this struct was generated from the following file:

- [hashtable\\_policy.h](#)

##### 4.427.1 Detailed Description

Executes a regular expression NFA/DFA over a range using a variant of the parallel execution algorithm featured in the grep utility, modified to use Laurikari tags.

Definition at line 110 of file regex\_grep\_matcher.h.

The documentation for this class was generated from the following file:

- [regex\\_grep\\_matcher.h](#)

#### 4.428 std::\_\_detail::\_Hash\_code\_base< \_Key, \_Value, \_ExtractKey, \_H1, \_H2, \_Hash, \_\_cache\_hash\_code > Struct Template Reference

##### 4.428.1 Detailed Description

```
template<typename _Key, typename _Value, typename _ExtractKey, typename _H1, typename _H2, typename _Hash, bool __cache_hash_code> struct std::__detail::_Hash_code_base< _Key, _Value, _ExtractKey, _H1, _H2, _Hash, __cache_hash_code >
```

Primary class template `_Hash_code_base`.

Encapsulates two policy issues that aren't quite orthogonal. (1) the difference between using a ranged hash function and using the combination of a hash function and a range-hashing function. In the former case we don't have such things as hash codes, so we have a dummy type as placeholder. (2) Whether or not we cache hash codes. Caching hash codes is meaningless if we have a ranged hash function.

We also put the key extraction objects here, for convenience. Each specialization derives from one or more of the template parameters to benefit from Ebo. This is important as this type is inherited in some cases by the `_Local_iterator_base` type used to implement `local_iterator` and `const_local_iterator`. As with any iterator type we prefer to make it as small as possible.

Primary template is unused except as a hook for specializations.

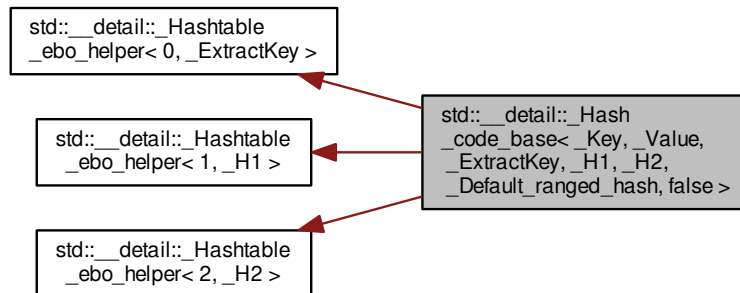

Definition at line 907 of file hashtable\_policy.h.

The documentation for this struct was generated from the following file:

- [hashtable\\_policy.h](#)

#### 4.429 `std::__detail::_Hash_code_base<_Key,_Value,_ExtractKey,_H1,_H2,_Default_ranged_hash,false>` Struct Template Reference

Inheritance diagram for `std::__detail::_Hash_code_base<_Key,_Value,_ExtractKey,_H1,_H2,_Default_ranged_hash,false>`:

#### Public Types

- typedef `_H1 hasher`

#### Public Member Functions

- hasher **hash\_function** () const

#### Protected Types

- typedef `std::size_t __hash_code`
- typedef `_Hash_node<_Value,false> __node_type`

#### Protected Member Functions

- **\_Hash\_code\_base** (const `_ExtractKey` &\_\_ex, const `_H1` &\_\_h1, const `_H2` &\_\_h2, const `_Default_ranged_hash` &\_\_)
- `std::size_t _M_bucket_index` (const `_Key` &\_\_, \_\_hash\_code \_\_c, `std::size_t` \_\_n) const

### 4.431.1 Detailed Description

```
template<typename _Key, typename _Value, typename _ExtractKey, typename _H1, typename _H2, typename _Hash> struct std::__detail::__Hash_code_base< _Key, _Value, _ExtractKey, _H1, _H2, _Hash, false >
```

Specialization: ranged hash function, no caching hash codes. H1 and H2 are provided but ignored. We define a dummy hash code type.

Definition at line 913 of file hashtable\_policy.h.

The documentation for this struct was generated from the following file:

- [hashtable\\_policy.h](#)

## 4.432 std::\_\_detail::\_\_Hash\_node< \_Value, \_Cache\_hash\_code > Struct Template Reference

### 4.432.1 Detailed Description

```
template<typename _Value, bool _Cache_hash_code> struct std::__detail::__Hash_node< _Value, _Cache_hash_code >
```

Primary template struct `_Hash_node`.

Definition at line 162 of file hashtable\_policy.h.

The documentation for this struct was generated from the following file:

- [hashtable\\_policy.h](#)

## 4.433 std::\_\_detail::\_Hash\_node&lt; \_Value, false &gt; Struct Template Reference

##### 4.434.1 Detailed Description

`template<typename _Value> struct std::__detail::_Hash_node<_Value, true>`

Specialization for nodes with caches, struct `_Hash_node`.

Base class is `__detail::_Hash_node_base`.

Definition at line 170 of file `hashtable_policy.h`.

The documentation for this struct was generated from the following file:

- [hashtable\\_policy.h](#)

## 4.435 std::\_\_detail::\_Hash\_node\_base Struct Reference

Inheritance diagram for std::\_\_detail::\_Hash\_node\_base:

## Public Member Functions

- `_Hash_node_base` ([\\_Hash\\_node\\_base](#) \* \_\_next)

## Public Attributes

- [\\_Hash\\_node\\_base](#) \* `_M_nxt`

## 4.435.1 Detailed Description

struct `_Hash_node_base`

Nodes, used to wrap elements stored in the hash table. A policy template parameter of class template `_Hashtable` controls whether nodes also store a hash code. In some cases (e.g. strings) this may be a performance win.

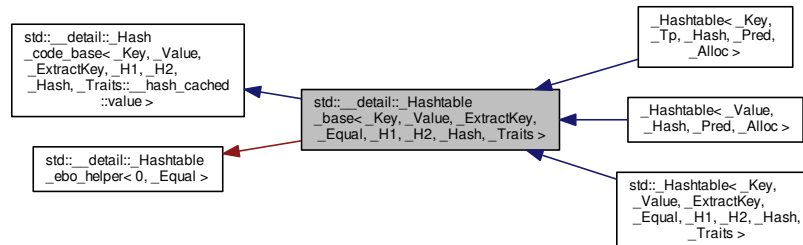

Definition at line 149 of file `hashtable_policy.h`.

The documentation for this struct was generated from the following file:

- [hashtable\\_policy.h](#)

#### 4.436 `std::__detail::_Hashtable_base< _Key, _Value, _ExtractKey, _Equal, _H1, _H2, _Hash, _Traits >` Struct Template Reference

- `using __constant_iterators = __bool_constant< _Constant_iterators >`
- `using __hash_cached = __bool_constant< _Cache_hash_code >`
- `using __unique_keys = __bool_constant< _Unique_keys >`

### 4.440.1 Detailed Description

```
template<bool _Cache_hash_code, bool _Constant_iterators, bool _Unique_keys>struct std::__detail::_Hashtable_traits<_Cache↵
_hash_code, _Constant_iterators, _Unique_keys >
```

struct \_Hashtable\_traits

Important traits for hash tables.

#### Template Parameters

<code>_Cache_hash_code</code>	Boolean value. True if the value of the hash function is stored along with the value. This is a time-space tradeoff. Storing it may improve lookup speed by reducing the number of times we need to call the <code>_Equal</code> function.
<code>_Constant_iterators</code>	Boolean value. True if iterator and const_iterator are both constant iterator types. This is true for <code>unordered_set</code> and <code>unordered_multiset</code> , false for <code>unordered_map</code> and <code>unordered_multimap</code> .
<code>_Unique_keys</code>	Boolean value. True if the return value of <code>_Hashtable::count(k)</code> is always at most one, false if it may be an arbitrary number. This is true for <code>unordered_set</code> and <code>unordered↵_map</code> , false for <code>unordered_multiset</code> and <code>unordered_multimap</code> .

Definition at line 131 of file hashtable\_policy.h.

```
template<typename _Key, typename _Value, typename _ExtractKey, typename _H1, typename _H2, typename _Hash, bool __cache_↵
hash_code>struct std::__detail::_Local_iterator_base< _Key, _Value, _ExtractKey, _H1, _H2, _Hash, __cache_hash_code >
```

Primary class template `_Local_iterator_base`.

Base class for local iterators, used to iterate within a bucket but not between buckets.

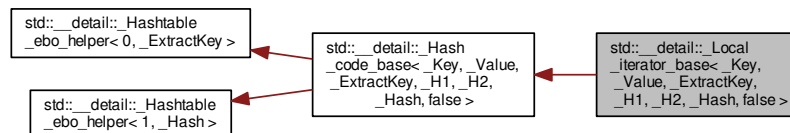

Definition at line 882 of file hashtable\_policy.h.

The documentation for this struct was generated from the following file:

4.452 `std::__detail::Map_base<_Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, _Unique_keys >` Struct Template Reference

Inheritance diagram for `std::__detail::Map_base<_Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, _Unique_keys >`:

#### 4.452.1 Detailed Description

```
template<typename _Key, typename _Value, typename _Alloc, typename _ExtractKey, typename _Equal, typename _H1, typename
_H2, typename _Hash, typename _RehashPolicy, typename _Traits, bool _Unique_keys = _Traits::__unique_keys::value> struct std::__
__detail::Map_base<_Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits, _Unique_keys >
```

Primary class template `_Map_base`.

If the hashtable has a value type of the form `pair<T1, T2>` and a key extraction policy (`_ExtractKey`) that returns the first part of the pair, the hashtable gets a `mapped_type` typedef. If it satisfies those criteria and also has unique keys, then it also gets an `operator[]`.

#### 4.456.1 Detailed Description

struct \_Nfa

A collection of all states making up an NFA.

An NFA is a 4-tuple  $M = (K, S, s, F)$ , where  $K$  is a finite set of states,  $S$  is the alphabet of the NFA,  $s$  is the initial state,  $F$  is a set of final (accepting) states.

This NFA class is templated on  $S$ , a type that will hold values of the underlying alphabet (without regard to semantics of that alphabet). The other elements of the tuple are generated during construction of the NFA and are available through accessor member functions.

Definition at line 269 of file regex\_nfa.h.

#### 4.456.2 Member Function Documentation

**4.456.2.1** pointer `std::vector<_State, std::allocator<_State>>::M_allocate_and_copy ( size_type __n, ForwardIterator __first, ForwardIterator __last )` [inline], [protected], [inherited]

Memory expansion handler. Uses the member allocation function to obtain  $n$  bytes of memory, and then copies [first,last) into it.

Definition at line 1135 of file stl\_vector.h.

**4.456.2.2** void `std::vector<_State, std::allocator<_State>>::M_range_check ( size_type __n ) const` [inline], [protected], [inherited]

Safety check used only from at().

Definition at line 791 of file stl\_vector.h.

References `std::vector<_Tp, _Alloc>::size()`.

**4.456.2.3** void `std::vector<_State, std::allocator<_State>>::assign ( size_type __n, const value_type & __val )` [inline], [inherited]

Assigns a given value to a vector.

Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a vector with `__n` copies of the given value. Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 479 of file stl\_vector.h.

**4.456.2.4** void `std::vector<_State, std::allocator<_State>>::assign ( InputIterator __first, InputIterator __last )` [inline], [inherited]

Assigns a range to a vector.

Parameters

<code>__first</code>	An input iterator.
----------------------	--------------------

<code>__last</code>	An input iterator.
---------------------	--------------------

This function fills a vector with copies of the elements in the range [`__first`,`__last`).

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 498 of file `stl_vector.h`.

**4.456.2.5** `void std::vector<_State, std::allocator<_State>>::assign ( initializer_list<value_type> & __l )`  
`[inline], [inherited]`

Assigns an initializer list to a vector.

#### Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 524 of file `stl_vector.h`.

References `std::vector<_Tp, _Alloc>::assign()`.

**4.456.2.6** `reference std::vector<_State, std::allocator<_State>>::at ( size_type __n )` `[inline]`,  
`[inherited]`

Provides access to the data contained in the vector.

#### Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

#### Returns

Read/write reference to data.

#### Exceptions

<code>std::out_of_range</code>	If <code>__n</code> is an invalid index.
--------------------------------	--

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

Definition at line 810 of file `stl_vector.h`.

References `std::vector<_Tp, _Alloc>::_M_range_check()`.

**4.456.2.7** `const_reference std::vector<_State, std::allocator<_State>>::at ( size_type __n ) const` `[inline]`,  
`[inherited]`

Provides access to the data contained in the vector.

#### Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

#### Returns

Read-only (constant) reference to data.

## Exceptions

<i>std::out_of_range</i>	If <i>__n</i> is an invalid index.
--------------------------	------------------------------------

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws *out\_of\_range* if the check fails.

Definition at line 828 of file *stl\_vector.h*.

References *std::vector<\_Tp, \_Alloc>::M\_range\_check()*.

#### 4.456.2.8 reference *std::vector<\_State, std::allocator<\_State>>::back ( )* [inline], [inherited]

Returns a read/write reference to the data at the last element of the vector.

Definition at line 855 of file *stl\_vector.h*.

References *std::vector<\_Tp, \_Alloc>::end()*.

#### 4.456.2.9 const\_reference *std::vector<\_State, std::allocator<\_State>>::back ( ) const* [inline], [inherited]

Returns a read-only (constant) reference to the data at the last element of the vector.

Definition at line 863 of file *stl\_vector.h*.

References *std::vector<\_Tp, \_Alloc>::end()*.

#### 4.456.2.10 iterator *std::vector<\_State, std::allocator<\_State>>::begin ( )* [inline], [noexcept], [inherited]

Returns a read/write iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 538 of file *stl\_vector.h*.

#### 4.456.2.11 const\_iterator *std::vector<\_State, std::allocator<\_State>>::begin ( ) const* [inline], [noexcept], [inherited]

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 547 of file *stl\_vector.h*.

#### 4.456.2.12 size\_type *std::vector<\_State, std::allocator<\_State>>::capacity ( ) const* [inline], [noexcept], [inherited]

Returns the total number of elements that the vector can hold before needing to allocate more memory.

Definition at line 725 of file *stl\_vector.h*.

#### 4.456.2.13 const\_iterator *std::vector<\_State, std::allocator<\_State>>::cbegin ( ) const* [inline], [noexcept], [inherited]

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 611 of file *stl\_vector.h*.

**4.456.2.14** `const_iterator std::vector<_State, std::allocator<_State>>::cend( ) const` `[inline]`,  
`[noexcept]`, `[inherited]`

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 620 of file `stl_vector.h`.

**4.456.2.15** `void std::vector<_State, std::allocator<_State>>::clear( )` `[inline]`, `[noexcept]`,  
`[inherited]`

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1125 of file `stl_vector.h`.

**4.456.2.16** `const_reverse_iterator std::vector<_State, std::allocator<_State>>::crbegin( ) const` `[inline]`,  
`[noexcept]`, `[inherited]`

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 629 of file `stl_vector.h`.

References `std::vector<_Tp, _Alloc>::end()`.

**4.456.2.17** `const_reverse_iterator std::vector<_State, std::allocator<_State>>::crend( ) const` `[inline]`,  
`[noexcept]`, `[inherited]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 638 of file `stl_vector.h`.

References `std::vector<_Tp, _Alloc>::begin()`.

**4.456.2.18** `_State* std::vector<_State, std::allocator<_State>>::data( )` `[inline]`, `[noexcept]`,  
`[inherited]`

Returns a pointer such that `[data(), data() + size())` is a valid range. For a non-empty vector, `data() == &front()`.

Definition at line 878 of file `stl_vector.h`.

References `std::__addressof()`, and `std::vector<_Tp, _Alloc>::front()`.

**4.456.2.19** `iterator std::vector<_State, std::allocator<_State>>::emplace( iterator __position, _Args&&... __args )`  
`[inherited]`

Inserts an object in vector before specified iterator.

#### Parameters

<code>__position</code>	An iterator into the vector.
<code>__args</code>	Arguments.

#### Returns

An iterator that points to the inserted data.

This function will insert an object of type `T` constructed with `T(std::forward<Args>(args)...) before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using`

std::list.

**4.456.2.20** `bool std::vector<_State, std::allocator<_State>>::empty( ) const` `[inline], [noexcept], [inherited]`

Returns true if the vector is empty. (Thus begin() would equal end().)

Definition at line 734 of file stl\_vector.h.

References std::vector<\_Tp, \_Alloc>::begin(), and std::vector<\_Tp, \_Alloc>::end().

**4.456.2.21** `iterator std::vector<_State, std::allocator<_State>>::end( )` `[inline], [noexcept], [inherited]`

Returns a read/write iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 556 of file stl\_vector.h.

**4.456.2.22** `const_iterator std::vector<_State, std::allocator<_State>>::end( ) const` `[inline], [noexcept], [inherited]`

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 565 of file stl\_vector.h.

**4.456.2.23** `iterator std::vector<_State, std::allocator<_State>>::erase( iterator __position )` `[inherited]`

Remove element at given position.

Parameters

<code>__position</code>	Iterator pointing to element to be erased.
-------------------------	--

Returns

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the vector by one.

Note This operation could be expensive and if it is frequently used the user should consider using std::list. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**4.456.2.24** `iterator std::vector<_State, std::allocator<_State>>::erase( iterator __first, iterator __last )` `[inherited]`

Remove a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by `__last` prior to erasing (or end()).

This function will erase the elements in the range [`__first`, `__last`) and shorten the vector accordingly.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**4.456.2.25** reference `std::vector<_State, std::allocator<_State>>::front ( )` `[inline]`, `[inherited]`

Returns a read/write reference to the data at the first element of the vector.

Definition at line 839 of file `stl_vector.h`.

References `std::vector<_Tp, _Alloc>::begin()`.

**4.456.2.26** const\_reference `std::vector<_State, std::allocator<_State>>::front ( ) const` `[inline]`, `[inherited]`

Returns a read-only (constant) reference to the data at the first element of the vector.

Definition at line 847 of file `stl_vector.h`.

References `std::vector<_Tp, _Alloc>::begin()`.

**4.456.2.27** iterator `std::vector<_State, std::allocator<_State>>::insert ( iterator __position, const value_type & __x )` `[inherited]`

Inserts given value into vector before specified iterator.

Parameters

<code>__position</code>	An iterator into the vector.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

**4.456.2.28** iterator `std::vector<_State, std::allocator<_State>>::insert ( iterator __position, value_type && __x )` `[inline]`, `[inherited]`

Inserts given rvalue into vector before specified iterator.

Parameters

<code>__position</code>	An iterator into the vector.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 988 of file `stl_vector.h`.

References `std::vector<_Tp, _Alloc>::emplace()`, and `std::move()`.

4.456.2.29 `void std::vector<_State, std::allocator<_State>>::insert ( iterator __position, initializer_list< value_type > __l ) [inline],[inherited]`

Inserts an initializer\_list into the vector.

## Parameters

<code>__position</code>	An iterator into the vector.
<code>__l</code>	An initializer_list.

This function will insert copies of the data in the initializer\_list *l* into the vector before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1005 of file `stl_vector.h`.

References `std::vector<_Tp, _Alloc>::insert()`.

**4.456.2.30** `void std::vector<_State, std::allocator<_State>>::insert ( iterator __position, size_type __n, const value_type & __x ) [inline], [inherited]`

Inserts a number of copies of given data into the vector.

## Parameters

<code>__position</code>	An iterator into the vector.
<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

This function will insert a specified number of copies of the given data before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1023 of file `stl_vector.h`.

**4.456.2.31** `void std::vector<_State, std::allocator<_State>>::insert ( iterator __position, _InputIterator __first, _InputIterator __last ) [inline], [inherited]`

Inserts a range into the vector.

## Parameters

<code>__position</code>	An iterator into the vector.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function will insert copies of the data in the range [`__first`,`__last`) into the vector before the location specified by *pos*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1044 of file `stl_vector.h`.

**4.456.2.32** `size_type std::vector<_State, std::allocator<_State>>::max_size ( ) const [inline], [noexcept], [inherited]`

Returns the `size()` of the largest possible vector.

Definition at line 650 of file `stl_vector.h`.

References `std::allocator_traits<_Tp_alloc_type>::max_size()`.

**4.456.2.33** `reference std::vector<_State, std::allocator<_State>>::operator[] ( size_type __n ) [inline], [inherited]`

Subscript access to the data contained in the vector.

**Parameters**

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

**Returns**

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 770 of file `stl_vector.h`.

**4.456.2.34** `const_reference std::vector<_State, std::allocator<_State>>::operator[] ( size_type __n ) const`  
`[inline], [inherited]`

Subscript access to the data contained in the vector.

**Parameters**

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

**Returns**

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 785 of file `stl_vector.h`.

**4.456.2.35** `void std::vector<_State, std::allocator<_State>>::pop_back ( ) [inline], [inherited]`

Removes last element.

This is a typical stack operation. It shrinks the vector by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

Definition at line 937 of file `stl_vector.h`.

**4.456.2.36** `void std::vector<_State, std::allocator<_State>>::push_back ( const value_type & __x ) [inline], [inherited]`

Add data to the end of the vector.

**Parameters**

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the end of the vector and assigns the given data to it. Due to the nature of a vector this operation can be done in constant time if the vector has preallocated space available.

Definition at line 901 of file `stl_vector.h`.

References `std::vector<_Tp, _Alloc>::end()`.

**4.456.2.37** `reverse_iterator std::vector<_State, std::allocator<_State>>::rbegin ( ) [inline], [noexcept], [inherited]`

Returns a read/write reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 574 of file stl\_vector.h.

References `std::vector<_Tp, _Alloc>::end()`.

**4.456.2.38** `const_reverse_iterator std::vector<_State, std::allocator<_State>>::rbegin( ) const` `[inline]`, `[noexcept]`, `[inherited]`

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 583 of file stl\_vector.h.

References `std::vector<_Tp, _Alloc>::end()`.

**4.456.2.39** `reverse_iterator std::vector<_State, std::allocator<_State>>::rend( )` `[inline]`, `[noexcept]`, `[inherited]`

Returns a read/write reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 592 of file stl\_vector.h.

References `std::vector<_Tp, _Alloc>::begin()`.

**4.456.2.40** `const_reverse_iterator std::vector<_State, std::allocator<_State>>::rend( ) const` `[inline]`, `[noexcept]`, `[inherited]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 601 of file stl\_vector.h.

References `std::vector<_Tp, _Alloc>::begin()`.

**4.456.2.41** `void std::vector<_State, std::allocator<_State>>::reserve( size_type __n )` `[inherited]`

Attempt to preallocate enough memory for specified number of elements.

#### Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

#### Exceptions

<code>std::length_error</code>	If <code>n</code> exceeds <code>max_size()</code> .
--------------------------------	---

This function attempts to reserve enough memory for the vector to hold the specified number of elements. If the number requested is more than `max_size()`, `length_error` is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the number of elements that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of vector data.

**4.456.2.42** `void std::vector<_State, std::allocator<_State>>::resize( size_type __new_size )` `[inline]`, `[inherited]`

Resizes the vector to the specified number of elements.

## Parameters

<code>__new_size</code>	Number of elements the vector should contain.
-------------------------	---

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise default constructed elements are appended.

Definition at line 664 of file `stl_vector.h`.

References `std::vector<_Tp, _Alloc>::size()`.

**4.456.2.43** `void std::vector<_State, std::allocator<_State>>::resize ( size_type __new_size, const value_type & __x )`  
`[inline], [inherited]`

Resizes the vector to the specified number of elements.

## Parameters

<code>__new_size</code>	Number of elements the vector should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise the vector is extended and new elements are populated with given data.

Definition at line 684 of file `stl_vector.h`.

References `std::vector<_Tp, _Alloc>::end()`, `std::vector<_Tp, _Alloc>::insert()`, and `std::vector<_Tp, _Alloc>::size()`.

**4.456.2.44** `void std::vector<_State, std::allocator<_State>>::shrink_to_fit ( )` `[inline], [inherited]`

A non-binding request to reduce `capacity()` to `size()`.

Definition at line 716 of file `stl_vector.h`.

**4.456.2.45** `size_type std::vector<_State, std::allocator<_State>>::size ( ) const` `[inline], [noexcept], [inherited]`

Returns the number of elements in the vector.

Definition at line 645 of file `stl_vector.h`.

**4.456.2.46** `void std::vector<_State, std::allocator<_State>>::swap ( vector<_State> & __x )` `[inline], [noexcept], [inherited]`

Swaps data with another vector.

## Parameters

<code>__x</code>	A vector of the same element and allocator types.
------------------	---

This exchanges the elements between two vectors in constant time. (Three pointers, so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(v1,v2)` will feed to this function.

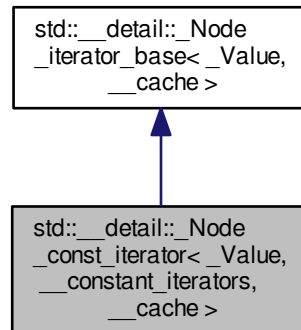

Definition at line 1108 of file `stl_vector.h`.

## 4.466.1 Detailed Description

```
template<typename _InputIterator> class std::__detail::_Scanner< _InputIterator >
```

struct \_Scanner. Scans an input range for regex tokens.

The \_Scanner class interprets the regular expression pattern in the input range passed to its constructor as a sequence of parse tokens passed to the regular expression compiler. The sequence of tokens provided depends on the flag settings passed to the constructor: different regular expression grammars will interpret the same input pattern in syntactically different ways.

Definition at line 65 of file regex\_compiler.h.

The documentation for this class was generated from the following file:

- [regex\\_compiler.h](#)

#### 4.471.1 Detailed Description

struct `_State`

An individual state in an NFA

In this case a "state" is an entry in the NFA definition coupled with its outgoing transition(s). All states have a single outgoing transition, except for accepting states (which have no outgoing transitions) and alt states, which have two outgoing transitions.

Definition at line 211 of file `regex_nfa.h`.

The documentation for this struct was generated from the following file:

- [regex\\_nfa.h](#)

#### 4.474 `std::__has_iterator_category_helper<_Tp>` Class Template Reference

Inherits `__sfinae_types`.

##### Static Public Attributes

- static constexpr bool **value**

##### 4.474.1 Detailed Description

```
template<typename _Tp>class std::__has_iterator_category_helper<_Tp>
```

Traits class for iterators.

This class does nothing but define nested typedefs. The general version simply *forwards* the nested typedefs from the Iterator argument. Specialized versions for pointers and pointers-to-const provide tighter, more correct semantics.

Definition at line 142 of file `stl_iterator_base_types.h`.

The documentation for this class was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

#### 4.475 `std::__parallel::CRandNumber<_MustBeInt>` Struct Template Reference

##### Public Member Functions

- int **operator()** (int \_\_limit)

##### 4.475.1 Detailed Description

```
template<typename _MustBeInt = int>struct std::__parallel::CRandNumber<_MustBeInt>
```

Functor wrapper for `std::rand()`.

Definition at line 1656 of file `algo.h`.

The documentation for this struct was generated from the following file:

- [algo.h](#)

## 4.480.1 Detailed Description

```
template<typename _Tp, typename _Alloc>class std::_Deque_base< _Tp, _Alloc >
```

Deque base class. This class provides the unified face for deque's allocation. This class's constructor and destructor allocate and deallocate (but do not initialize) storage. This makes exception safety easier.

Nothing in this class ever constructs or destroys an actual `Tp` element. (Deque handles that itself.) Only/All memory management is performed here.

Definition at line 439 of file `stl_deque.h`.

## 4.480.2 Member Function Documentation

4.480.2.1 `template<typename _Tp, typename _Alloc> void std::_Deque_base<_Tp, _Alloc>::_M_initialize_map ( size_t __num_elements )` [protected]

Layout storage.

## Parameters

<code>__num_elements</code>	The count of T's for which to allocate space at first.
-----------------------------	--

## Returns

Nothing.

The initial underlying memory layout is a bit complicated...

Definition at line 582 of file `stl_deque.h`.

References `std::max()`.

The documentation for this class was generated from the following file:

- [stl\\_deque.h](#)

## 4.481.1 Detailed Description

`template<typename _Tp, typename _Ref, typename _Ptr> struct std::_Deque_iterator<_Tp, _Ref, _Ptr>`

A `deque::iterator`.

Quite a bit of intelligence here. Much of the functionality of `deque` is actually passed off to this class. A `deque` holds two of these internally, marking its valid range. Access to elements is done as offsets of either of those two, relying on operator overloading in this class.

All the functions are op overloads except for `_M_set_node`.

Definition at line 106 of file `stl_deque.h`.

## 4.481.2 Member Function Documentation

4.481.2.1 `template<typename _Tp, typename _Ref, typename _Ptr> void std::_Deque_iterator<_Tp, _Ref, _Ptr>::_M_set_node( _Map_pointer __new_node ) [inline]`

Prepares to traverse `new_node`. Sets everything except `_M_cur`, which should therefore be set by the caller immediately afterwards, based on `_M_first` and `_M_last`.

Definition at line 234 of file `stl_deque.h`.

#### 4.487.1 Detailed Description

`template<typename _Key, typename _Value, typename _Alloc, typename _ExtractKey, typename _Equal, typename _H1, typename _H2, typename _Hash, typename _RehashPolicy, typename _Traits> class std::_Hashtable<_Key, _Value, _Alloc, _ExtractKey, _Equal, _H1, _H2, _Hash, _RehashPolicy, _Traits >`

Primary class template `_Hashtable`.

##### Template Parameters

<code>_Value</code>	CopyConstructible type.
<code>_Key</code>	CopyConstructible type.
<code>_Alloc</code>	An allocator type ([lib.allocator.requirements]) whose <code>_Alloc::value_type</code> is <code>_Value</code> . As a conforming extension, we allow for <code>_Alloc::value_type != _Value</code> .
<code>_ExtractKey</code>	Function object that takes an object of type <code>_Value</code> and returns a value of type <code>_Key</code> .
<code>_Equal</code>	Function object that takes two objects of type <code>k</code> and returns a bool-like value that is true if the two objects are considered equal.
<code>_H1</code>	The hash function. A unary function object with argument type <code>_Key</code> and result type <code>size_t</code> . Return values should be distributed over the entire range <code>[0, numeric_limits&lt;size_t&gt;:max())</code> .
<code>_H2</code>	The range-hashing function (in the terminology of Tavori and Dreizin). A binary function object whose argument types and result type are all <code>size_t</code> . Given arguments <code>r</code> and <code>N</code> , the return value is in the range <code>[0, N)</code> .
<code>_Hash</code>	The ranged hash function (Tavori and Dreizin). A binary function whose argument types are <code>_Key</code> and <code>size_t</code> and whose result type is <code>size_t</code> . Given arguments <code>k</code> and <code>N</code> , the return value is in the range <code>[0, N)</code> . Default: <code>hash(k, N) = h2(h1(k), N)</code> . If <code>_Hash</code> is anything other than the default, <code>_H1</code> and <code>_H2</code> are ignored.
<code>_RehashPolicy</code>	Policy class with three members, all of which govern the bucket count. <code>_M_next_bkt(n)</code> returns a bucket count no smaller than <code>n</code> . <code>_M_bkt_for_elements(n)</code> returns a bucket count appropriate for an element count of <code>n</code> . <code>_M_need_rehash(n_bkt, n_elt, n_ins)</code> determines whether, if the current bucket count is <code>n_bkt</code> and the current element count is <code>n_elt</code> , we need to increase the bucket count. If so, returns <code>make_pair(true, n)</code> , where <code>n</code> is the new bucket count. If not, returns <code>make_pair(false, &lt;anything&gt;)</code> .
<code>_Traits</code>	Compile-time class with three boolean <code>std::integral_constant</code> members: <code>__cache_hash_code</code> , <code>__constant_iterators</code> , <code>__unique_keys</code> .

Each `_Hashtable` data structure has:

- `_Bucket[] _M_buckets`
- `_Hash_node_base _M_bbegin`
- `size_type _M_bucket_count`
- `size_type _M_element_count`

with `_Bucket` being `_Hash_node*` and `_Hash_node` containing:

- `_Hash_node* _M_next`
- `Tp _M_value`
- `size_t _M_hash_code` if `cache_hash_code` is true

In terms of Standard containers the hashtable is like the aggregation of:

- `std::forward_list<_Node>` containing the elements
- `std::vector<std::forward_list<_Node>::iterator>` representing the buckets

The non-empty buckets contain the node before the first node in the bucket. This design makes it possible to implement something like `std::forward_list::insert_after` on container insertion and `std::forward_list::erase_after` on container erase calls. `_M_before_begin` is equivalent to `std::forward_list::before_begin`. Empty buckets contain `nullptr`. Note that one of the non-empty buckets contains `&_M_before_begin` which is not a dereferenceable node so the node pointer in a bucket shall never be dereferenced, only its next node can be.

Walking through a bucket's nodes requires a check on the hash code to see if each node is still in the bucket. Such a design assumes a quite efficient hash functor and is one of the reasons it is highly advisable to set `__cache_hash_code` to `true`.

The container iterators are simply built from nodes. This way incrementing the iterator is perfectly efficient independent of how many empty buckets there are in the container.

On insert we compute the element's hash code and use it to find the bucket index. If the element must be inserted in an empty bucket we add it at the beginning of the singly linked list and make the bucket point to `_M_before_begin`. The bucket that used to point to `_M_before_begin`, if any, is updated to point to its new before begin node.

On erase, the simple iterator design requires using the hash functor to get the index of the bucket to update. For this reason, when `__cache_hash_code` is set to `false` the hash functor must not throw and this is enforced by a static assertion.

Functionality is implemented by decomposition into base classes, where the derived `_Hashtable` class is used in `_Map_base`, `_Insert`, `_Rehash_base`, and `_Equality` base classes to access the "this" pointer. `_Hashtable_base` is used in the base classes as a non-recursive, fully-completed-type so that detailed nested type information, such as iterator type and node type, can be used. This is similar to the "Curiously Recurring Template Pattern" (CRTP) technique, but uses a reconstructed, not explicitly passed, template pattern.

Base class templates are:

- `__detail::_Hashtable_base`
- `__detail::_Map_base`
- `__detail::_Insert`
- `__detail::_Rehash_base`
- `__detail::_Equality`

Definition at line 174 of file `bits/hashtable.h`.

## 4.492 `std::_Temporary_buffer<_ForwardIterator, _Tp>` Class Template Reference

### Public Types

- typedef pointer **iterator**
- typedef value\_type \* **pointer**
- typedef ptrdiff\_t **size\_type**
- typedef \_Tp **value\_type**

### Public Member Functions

- [\\_Temporary\\_buffer](#) (`_ForwardIterator __first, _ForwardIterator __last`)
- iterator [begin](#) ()
- iterator [end](#) ()
- size\_type [requested\\_size](#) () const
- size\_type [size](#) () const

### Protected Attributes

- pointer **\_M\_buffer**
- size\_type **\_M\_len**
- size\_type **\_M\_original\_len**

#### 4.492.1 Detailed Description

```
template<typename _ForwardIterator, typename _Tp> class std::_Temporary_buffer<_ForwardIterator, _Tp>
```

This class is used in two places: `stl_algo.h` and `ext/memory`, where it is wrapped as the `temporary_buffer` class. See `temporary_buffer` docs for more notes.

Definition at line 122 of file `stl_tempbuf.h`.

#### 4.492.2 Constructor & Destructor Documentation

```
4.492.2.1 template<typename _ForwardIterator, typename _Tp> std::_Temporary_buffer<_ForwardIterator, _Tp>
::_Temporary_buffer ( _ForwardIterator __first, _ForwardIterator __last )
```

Constructs a temporary buffer of a size somewhere between zero and the size of the given range.

Definition at line 244 of file `stl_tempbuf.h`.

References `std::pair<_T1, _T2>::first`, `std::get_temporary_buffer()`, `std::return_temporary_buffer()`, and `std::pair<_T1, _T2>::second`.

#### 4.492.3 Member Function Documentation

4.492.3.1 `template<typename _ForwardIterator, typename _Tp> iterator std::_Temporary_buffer< _ForwardIterator, _Tp >::begin ( ) [inline]`

As per Table mumble.

Definition at line 151 of file `stl_tempbuf.h`.

Referenced by `std::inplace_merge()`, `std::stable_partition()`, and `std::stable_sort()`.

4.492.3.2 `template<typename _ForwardIterator, typename _Tp> iterator std::_Temporary_buffer< _ForwardIterator, _Tp >::end ( ) [inline]`

As per Table mumble.

Definition at line 156 of file `stl_tempbuf.h`.

4.492.3.3 `template<typename _ForwardIterator, typename _Tp> size_type std::_Temporary_buffer< _ForwardIterator, _Tp >::requested_size ( ) const [inline]`

Returns the size requested by the constructor; may be `>size()`.

Definition at line 146 of file `stl_tempbuf.h`.

Referenced by `std::stable_partition()`.

4.492.3.4 `template<typename _ForwardIterator, typename _Tp> size_type std::_Temporary_buffer< _ForwardIterator, _Tp >::size ( ) const [inline]`

As per Table mumble.

Definition at line 141 of file `stl_tempbuf.h`.

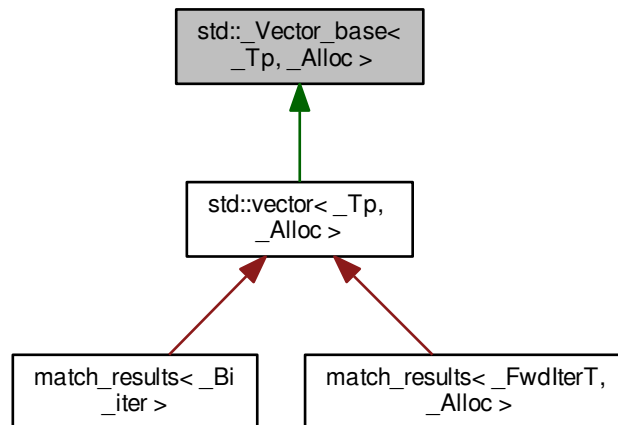

Referenced by `std::inplace_merge()`, `std::stable_partition()`, and `std::stable_sort()`.

The documentation for this class was generated from the following file:

- [stl\\_tempbuf.h](#)

## 4.493 std::\_Vector\_base&lt; \_Tp, \_Alloc &gt; Struct Template Reference

Inheritance diagram for std::\_Vector\_base< \_Tp, \_Alloc >:

## Public Types

#### 4.497.1 Detailed Description

```
template<typename _Alloc> struct std::allocator_traits<_Alloc>
```

Uniform interface to all allocator types.

Definition at line 85 of file bits/alloc\_traits.h.

#### 4.497.2 Member Typedef Documentation

**4.497.2.1** `template<typename _Alloc> typedef _Alloc std::allocator_traits<_Alloc>::allocator_type`

The allocator type.

Definition at line 88 of file bits/alloc\_traits.h.

**4.497.2.2** `template<typename _Alloc> typedef __const_pointer std::allocator_traits<_Alloc>::const_pointer`

The allocator's const pointer type.

`Alloc::const_pointer` if that type exists, otherwise `pointer_traits<pointer>::rebind<const value_type>`

Definition at line 118 of file bits/alloc\_traits.h.

**4.497.2.3** `template<typename _Alloc> typedef __const_void_pointer std::allocator_traits<_Alloc>::const_void_pointer`

The allocator's const void pointer type.

`Alloc::const_void_pointer` if that type exists, otherwise `pointer_traits<pointer>::rebind<const void>`

Definition at line 140 of file bits/alloc\_traits.h.

**4.497.2.4** `template<typename _Alloc> typedef __difference_type std::allocator_traits<_Alloc>::difference_type`

The allocator's difference type.

`Alloc::difference_type` if that type exists, otherwise `pointer_traits<pointer>::difference_type`

Definition at line 151 of file bits/alloc\_traits.h.

**4.497.2.5** `template<typename _Alloc> typedef __pointer std::allocator_traits<_Alloc>::pointer`

The allocator's pointer type.

`Alloc::pointer` if that type exists, otherwise `value_type*`

Definition at line 107 of file bits/alloc\_traits.h.

**4.497.2.6** `template<typename _Alloc> typedef __propagate_on_container_copy_assignment std::allocator_traits<_Alloc>::propagate_on_container_copy_assignment`

How the allocator is propagated on copy assignment.

`Alloc::propagate_on_container_copy_assignment` if that type exists, otherwise `false_type`

Definition at line 174 of file bits/alloc\_traits.h.

**4.497.2.7** `template<typename _Alloc> typedef __propagate_on_container_move_assignment std::allocator_traits< _Alloc >::propagate_on_container_move_assignment`

How the allocator is propagated on move assignment.

`Alloc::propagate_on_container_move_assignment` if that type exists, otherwise `false_type`

Definition at line 186 of file `bits/alloc_traits.h`.

**4.497.2.8** `template<typename _Alloc> typedef __propagate_on_container_swap std::allocator_traits< _Alloc >::propagate_on_container_swap`

How the allocator is propagated on swap.

`Alloc::propagate_on_container_swap` if that type exists, otherwise `false_type`

Definition at line 197 of file `bits/alloc_traits.h`.

**4.497.2.9** `template<typename _Alloc> typedef __size_type std::allocator_traits< _Alloc >::size_type`

The allocator's size type.

`Alloc::size_type` if that type exists, otherwise `make_unsigned<difference_type>::type`

Definition at line 162 of file `bits/alloc_traits.h`.

**4.497.2.10** `template<typename _Alloc> typedef _Alloc::value_type std::allocator_traits< _Alloc >::value_type`

The allocated type.

Definition at line 90 of file `bits/alloc_traits.h`.

**4.497.2.11** `template<typename _Alloc> typedef __void_pointer std::allocator_traits< _Alloc >::void_pointer`

The allocator's void pointer type.

`Alloc::void_pointer` if that type exists, otherwise `pointer_traits<pointer>::rebind<void>`

Definition at line 129 of file `bits/alloc_traits.h`.

#### 4.497.3 Member Function Documentation

**4.497.3.1** `template<typename _Alloc> static pointer std::allocator_traits< _Alloc >::allocate ( _Alloc & __a, size_type __n ) [inline],[static]`

Allocate memory.

Parameters

<code>__a</code>	An allocator.
<code>__n</code>	The number of objects to allocate space for.

Calls `a.allocate(n)`

Definition at line 350 of file `bits/alloc_traits.h`.

**4.497.3.2** `template<typename _Alloc> static pointer std::allocator_traits< _Alloc >::allocate ( _Alloc & __a, size_type __n, const_void_pointer __hint ) [inline],[static]`

Allocate memory.

## Parameters

<code>__a</code>	An allocator.
<code>__n</code>	The number of objects to allocate space for.
<code>__hint</code>	Aid to locality.

## Returns

Memory of suitable size and alignment for  $n$  objects of type `value_type`

Returns `a.allocate(n, hint)` if that expression is well-formed, otherwise returns `a.allocate(n)`

Definition at line 365 of file `bits/alloc_traits.h`.

```
4.497.3.3 template<typename _Alloc> template<typename _Tp, typename... _Args> static auto std::allocator_traits<
_Alloc>::construct ( _Alloc & __a, _Tp * __p, _Args &&... __args ) -> decltype(_S_construct(__a, __p,
std::forward<_Args>(__args)...)) [inline], [static]
```

Construct an object of type `_Tp`.

## Parameters

<code>__a</code>	An allocator.
<code>__p</code>	Pointer to memory of suitable size and alignment for <code>Tp</code>
<code>__args</code>	Constructor arguments.

Calls `__a.construct(__p, std::forward<Args>(__args)...)`  if that expression is well-formed, otherwise uses placement-new to construct an object of type `_Tp` at location `__p` from the arguments `__args...`

Definition at line 391 of file `bits/alloc_traits.h`.

```
4.497.3.4 template<typename _Alloc> static void std::allocator_traits<_Alloc>::deallocate ( _Alloc & __a, pointer __p,
size_type __n ) [inline], [static]
```

Deallocate memory.

## Parameters

<code>__a</code>	An allocator.
<code>__p</code>	Pointer to the memory to deallocate.
<code>__n</code>	The number of objects space was allocated for.

Calls `a.deallocate(p, n)`

Definition at line 376 of file `bits/alloc_traits.h`.

```
4.497.3.5 template<typename _Alloc> template<class _Tp> static void std::allocator_traits<_Alloc>::destroy ( _Alloc &
__a, _Tp * __p ) [inline], [static]
```

Destroy an object of type `_Tp`.

## Parameters

<code>__a</code>	An allocator.
<code>__p</code>	Pointer to the object to destroy

Calls `__a.destroy(__p)` if that expression is well-formed, otherwise calls `__p->~_Tp()`

Definition at line 404 of file `bits/alloc_traits.h`.

4.497.3.6 `template<typename _Alloc> static size_type std::allocator_traits<_Alloc>::max_size ( const _Alloc & __a )`  
`[inline], [static]`

The maximum supported allocation size.

## Parameters

<code>__a</code>	An allocator.
------------------	---------------

## Returns

`__a.max_size()` or `numeric_limits<size_type>::max()`

Returns `__a.max_size()` if that expression is well-formed, otherwise returns `numeric_limits<size_type>::max()`

Definition at line 415 of file `bits/alloc_traits.h`.

Referenced by `std::forward_list<_Tp, _Alloc>::max_size()`.

4.497.3.7 `template<typename _Alloc> static _Alloc std::allocator_traits<_Alloc>::select_on_container_copy_construction (const _Alloc &__rhs) [inline], [static]`

Obtain an allocator to use when copying a container.

## Parameters

<code>__rhs</code>	An allocator.
--------------------	---------------

## Returns

`__rhs.select_on_container_copy_construction()` or `__rhs`

Returns `__rhs.select_on_container_copy_construction()` if that expression is well-formed, otherwise returns `__rhs`

Definition at line 427 of file `bits/alloc_traits.h`.

The documentation for this struct was generated from the following file:

- [bits/alloc\\_traits.h](#)

## 4.499.1 Detailed Description

```
template<typename _Tp>class std::auto_ptr<_Tp>
```

A simple smart pointer providing strict ownership semantics.

The Standard says:

An `auto_ptr` owns the object it holds a pointer to. Copying an `auto_ptr` copies the pointer and transfers ownership to the destination. If more than one `auto_ptr` owns the same object at the same time the behavior of the program is undefined.

The uses of `auto_ptr` include providing temporary exception-safety for dynamically allocated memory, passing ownership of dynamically allocated memory to a function, and returning dynamically allocated memory from a function. `auto_ptr` does not meet the CopyConstructible requirements for Standard Library `container` elements and thus instantiating a Standard Library container with an `auto_ptr` results in undefined behavior.

Quoted from [20.4.5]/3.

Good examples of what can and cannot be done with `auto_ptr` can be found in the libstdc++ testsuite.

\_GLIBCXX\_RESOLVE\_LIB\_DEFECTS 127. `auto_ptr<>` conversion issues These resolutions have all been incorporated.

Definition at line 87 of file `auto_ptr.h`.

## 4.499.2 Member Typedef Documentation

4.499.2.1 `template<typename _Tp> typedef _Tp std::auto_ptr<_Tp>::element_type`

The pointed-to type.

Definition at line 94 of file `auto_ptr.h`.

## 4.499.3 Constructor &amp; Destructor Documentation

4.499.3.1 `template<typename _Tp> std::auto_ptr<_Tp>::auto_ptr ( element_type * __p = 0 ) throw () [inline], [explicit]`

An `auto_ptr` is usually constructed from a raw pointer.

Parameters

<code>__p</code>	A pointer (defaults to NULL).
------------------	-------------------------------

This object now *owns* the object pointed to by `__p`.

Definition at line 103 of file `auto_ptr.h`.

4.499.3.2 `template<typename _Tp> std::auto_ptr<_Tp>::auto_ptr ( auto_ptr<_Tp> & __a ) throw () [inline]`

An `auto_ptr` can be constructed from another `auto_ptr`.

**Parameters**

<code>__a</code>	Another <code>auto_ptr</code> of the same type.
------------------	---

This object now *owns* the object previously owned by `__a`, which has given up ownership.

Definition at line 112 of file `auto_ptr.h`.

**4.499.3.3** `template<typename _Tp> template<typename _Tp1 > std::auto_ptr<_Tp>::auto_ptr ( auto_ptr<_Tp1 > & __a ) throw ) [inline]`

An `auto_ptr` can be constructed from another `auto_ptr`.

**Parameters**

<code>__a</code>	Another <code>auto_ptr</code> of a different but related type.
------------------	--

A pointer-to-`Tp1` must be convertible to a pointer-to-`Tp/element_type`.

This object now *owns* the object previously owned by `__a`, which has given up ownership.

Definition at line 125 of file `auto_ptr.h`.

**4.499.3.4** `template<typename _Tp> std::auto_ptr<_Tp>::~~auto_ptr ( ) [inline]`

When the `auto_ptr` goes out of scope, the object it owns is deleted. If it no longer owns anything (i.e., `get ()` is `NULL`), then this has no effect.

The C++ standard says there is supposed to be an empty throw specification here, but omitting it is standard conforming. Its presence can be detected only if `_Tp::~~_Tp()` throws, but this is prohibited. [17.4.3.6]/2

Definition at line 170 of file `auto_ptr.h`.

**4.499.3.5** `template<typename _Tp> std::auto_ptr<_Tp>::auto_ptr ( auto_ptr_ref< element_type > __ref ) throw ) [inline]`

**Automatic conversions.**

These operations convert an `auto_ptr` into and from an `auto_ptr_ref` automatically as needed. This allows constructs such as

```
auto_ptr<Derived> func_returning_auto_ptr(...);
...
auto_ptr<Base> ptr = func_returning_auto_ptr(...);
```

Definition at line 260 of file `auto_ptr.h`.

**4.499.4 Member Function Documentation**

**4.499.4.1** `template<typename _Tp> element_type* std::auto_ptr<_Tp>::get ( ) const throw ) [inline]`

Bypassing the smart pointer.

**Returns**

The raw pointer being managed.

You can get a copy of the pointer that this object owns, for situations such as passing to a function which only accepts a raw pointer.

## Note

This auto\_ptr still owns the memory.

Definition at line 211 of file auto\_ptr.h.

4.499.4.2 `template<typename _Tp> element_type& std::auto_ptr<_Tp>::operator*( ) const throw )` `[inline]`

Smart pointer dereferencing.

If this auto\_ptr no longer owns anything, then this operation will crash. (For a smart pointer, *no longer owns anything* is the same as being a null pointer, and you know what happens when you dereference one of those...)

Definition at line 181 of file auto\_ptr.h.

4.499.4.3 `template<typename _Tp> element_type* std::auto_ptr<_Tp>::operator->( ) const throw )` `[inline]`

Smart pointer dereferencing.

This returns the pointer itself, which the language then will automatically cause to be dereferenced.

Definition at line 194 of file auto\_ptr.h.

4.499.4.4 `template<typename _Tp> auto_ptr& std::auto_ptr<_Tp>::operator=( auto_ptr<_Tp> &__a ) throw )`  
`[inline]`

auto\_ptr assignment operator.

## Parameters

<code>__a</code>	Another auto_ptr of the same type.
------------------	------------------------------------

This object now *owns* the object previously owned by `__a`, which has given up ownership. The object that this one *used* to own and track has been deleted.

Definition at line 136 of file auto\_ptr.h.

References `std::auto_ptr<_Tp>::reset()`.

4.499.4.5 `template<typename _Tp> template<typename _Tp1> auto_ptr& std::auto_ptr<_Tp>::operator=( auto_ptr<_Tp1> &__a ) throw )` `[inline]`

auto\_ptr assignment operator.

## Parameters

<code>__a</code>	Another auto_ptr of a different but related type.
------------------	---

A pointer-to-Tp1 must be convertible to a pointer-to-Tp/element\_type.

This object now *owns* the object previously owned by `__a`, which has given up ownership. The object that this one *used* to own and track has been deleted.

Definition at line 154 of file auto\_ptr.h.

References `std::auto_ptr<_Tp>::reset()`.

4.499.4.6 `template<typename _Tp> element_type* std::auto_ptr<_Tp>::release( ) throw )` `[inline]`

Bypassing the smart pointer.

**Returns**

The raw pointer being managed.

You can get a copy of the pointer that this object owns, for situations such as passing to a function which only accepts a raw pointer.

**Note**

This `auto_ptr` no longer owns the memory. When this object goes out of scope, nothing will happen.

Definition at line 225 of file `auto_ptr.h`.

4.499.4.7 `template<typename _Tp> void std::auto_ptr<_Tp>::reset ( element_type * __p = 0 ) throw ) [inline]`

Forcibly deletes the managed object.

**Parameters**

<code>__p</code>	A pointer (defaults to NULL).
------------------	-------------------------------

This object now *owns* the object pointed to by `__p`. The previous object has been deleted.

Definition at line 240 of file `auto_ptr.h`.

Referenced by `std::auto_ptr<_Tp>::operator=()`.

The documentation for this class was generated from the following file:

**4.500 std::auto\_ptr\_ref<\_Tp1> Struct Template Reference****Public Member Functions**

- `auto_ptr_ref (_Tp1 * __p)`

**Public Attributes**

- `_Tp1 * _M_ptr`

**4.500.1 Detailed Description**

`template<typename _Tp1> struct std::auto_ptr_ref<_Tp1>`

A wrapper class to provide `auto_ptr` with reference semantics. For example, an `auto_ptr` can be assigned (or constructed from) the result of a function which returns an `auto_ptr` by value.

All the `auto_ptr_ref` stuff should happen behind the scenes.

Definition at line 48 of file `auto_ptr.h`.

The documentation for this struct was generated from the following file:

- [auto\\_ptr.h](#)

## 4.501 std::back\_insert\_iterator&lt; \_Container &gt; Class Template Reference

Inheritance diagram for std::back\_insert\_iterator< \_Container >:

## Public Types

- typedef `_Container` `container_type`
- typedef void `difference_type`
- typedef `output_iterator_tag` `iterator_category`
- typedef void `pointer`
- typedef void `reference`
- typedef void `value_type`

## Public Member Functions

- `back_insert_iterator` (`_Container &__x`)
- `back_insert_iterator` & `operator*` ()
- `back_insert_iterator` & `operator++` ()
- `back_insert_iterator` `operator++` (int)
- `back_insert_iterator` & `operator=` (const typename `_Container::value_type` &\_\_value)
- `back_insert_iterator` & `operator=` (typename `_Container::value_type` &&\_\_value)

## Protected Attributes

- `_Container *` **`container`**

## 4.501.1 Detailed Description

```
template<typename _Container>class std::back_insert_iterator< _Container >
```

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator appends it to the container using `push_back`.

Tip: Using the `back_inserter` function to create these iterators can save typing.

Definition at line 402 of file `stl_iterator.h`.

#### 4.501.2 Member Typedef Documentation

4.501.2.1 `template<typename _Container> typedef _Container std::back_insert_iterator<_Container>::container_type`

A nested typedef for the type of whatever container you used.

Definition at line 410 of file `stl_iterator.h`.

4.501.2.2 `typedef void std::iterator< output_iterator_tag, void, void, void, void>::difference_type` `[inherited]`

Distance between iterators is represented as this type.

Definition at line 125 of file `stl_iterator_base_types.h`.

4.501.2.3 `typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void>::iterator_category`  
`[inherited]`

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

4.501.2.4 `typedef void std::iterator< output_iterator_tag, void, void, void, void>::pointer` `[inherited]`

This type represents a pointer-to-value\_type.

Definition at line 127 of file `stl_iterator_base_types.h`.

4.501.2.5 `typedef void std::iterator< output_iterator_tag, void, void, void, void>::reference` `[inherited]`

This type represents a reference-to-value\_type.

Definition at line 129 of file `stl_iterator_base_types.h`.

4.501.2.6 `typedef void std::iterator< output_iterator_tag, void, void, void, void>::value_type` `[inherited]`

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

#### 4.501.3 Constructor & Destructor Documentation

4.501.3.1 `template<typename _Container> std::back_insert_iterator<_Container>::back_insert_iterator( _Container &__x )` `[inline], [explicit]`

The only way to create this iterator is with a container.

Definition at line 414 of file `stl_iterator.h`.

#### 4.501.4 Member Function Documentation

4.501.4.1 `template<typename _Container> back_insert_iterator& std::back_insert_iterator<_Container>::operator*( )` `[inline]`

Simply returns `*this`.

Definition at line 452 of file stl\_iterator.h.

```
4.501.4.2 template<typename _Container > back_insert_iterator& std::back_insert_iterator< _Container >::operator++ (
    ) [inline]
```

Simply returns \*this. (This iterator does not *move*.)

Definition at line 457 of file stl\_iterator.h.

```
4.501.4.3 template<typename _Container > back_insert_iterator std::back_insert_iterator< _Container >::operator++ (
    int ) [inline]
```

Simply returns \*this. (This iterator does not *move*.)

Definition at line 462 of file stl\_iterator.h.

```
4.501.4.4 template<typename _Container > back_insert_iterator& std::back_insert_iterator< _Container >::operator= (
    const typename _Container::value_type & __value ) [inline]
```

#### Parameters

<code>__value</code>	An instance of whatever type <code>container_type::const_reference</code> is; presumably a reference-to-const T for <code>container&lt;T&gt;</code> .
----------------------	---

#### Returns

This iterator, for chained operations.

This kind of iterator doesn't really have a *position* in the container (you can think of the position as being permanently at the end, if you like). Assigning a value to the iterator will always append the value to the end of the container.

Definition at line 436 of file stl\_iterator.h.

The documentation for this class was generated from the following file:

- [stl\\_iterator.h](#)

## 4.502 std::bad\_weak\_ptr Class Reference

Inherits exception.

#### Public Member Functions

- virtual char const \* **what** () const noexcept

#### 4.502.1 Detailed Description

Exception possibly thrown by `shared_ptr`.

Definition at line 64 of file `shared_ptr_base.h`.

#### 4.503.1 Detailed Description

```
template<typename _CharT, typename _Traits>class std::basic_ios< _CharT, _Traits >
```

Template class basic\_ios, virtual base class for all stream classes.

##### Template Parameters

<code>_CharT</code>	Type of character stream.
<code>_Traits</code>	Traits for character type, defaults to <code>char_traits&lt;_CharT&gt;</code> .

Most of the member functions called dispatched on stream objects (e.g., `std::cout.foo(bar)`;) are consolidated in this class.

Definition at line 66 of file `basic_ios.h`.

#### 4.503.2 Member Typedef Documentation

4.503.2.1 `template<typename _CharT, typename _Traits > typedef ctype<_CharT> std::basic_ios< _CharT, _Traits >::__ctype_type`

These are non-standard types.

Definition at line 86 of file `basic_ios.h`.

4.503.2.2 `template<typename _CharT, typename _Traits > typedef num_get<_CharT, istreambuf_iterator<_CharT, _Traits> > std::basic_ios< _CharT, _Traits >::__num_get_type`

These are non-standard types.

Definition at line 90 of file `basic_ios.h`.

4.503.2.3 `template<typename _CharT, typename _Traits > typedef num_put<_CharT, ostreambuf_iterator<_CharT, _Traits> > std::basic_ios< _CharT, _Traits >::__num_put_type`

These are non-standard types.

Definition at line 88 of file `basic_ios.h`.

4.503.2.4 `template<typename _CharT, typename _Traits > typedef _CharT std::basic_ios< _CharT, _Traits >::__char_type`

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

Definition at line 75 of file `basic_ios.h`.

4.503.2.5 `typedef void(* std::ios_base::event_callback)(event __e, ios_base &__b, int __i) [inherited]`

The type of an event callback function.

## Parameters

<code>__e</code>	One of the members of the event enum.
<code>__b</code>	Reference to the <code>ios_base</code> object.
<code>__i</code>	The integer provided when the callback was registered.

Event callbacks are user defined functions that get called during several `ios_base` and `basic_ios` functions, specifically `imbue()`, `copyfmt()`, and `~ios()`.

Definition at line 436 of file `ios_base.h`.

#### 4.503.2.6 `typedef _Ios_Fmtflags std::ios_base::fmtflags` `[inherited]`

This is a bitmask type.

`_Ios_Fmtflags` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type `fmtflags` are:

- `boolalpha`
- `dec`
- `fixed`
- `hex`
- `internal`
- `left`
- `oct`
- `right`
- `scientific`
- `showbase`
- `showpoint`
- `showpos`
- `skipws`
- `unitbuf`
- `uppercase`
- `adjustfield`
- `basefield`
- `floatfield`

Definition at line 255 of file `ios_base.h`.

#### 4.503.2.7 `template<typename _CharT, typename _Traits> typedef _Traits::int_type std::basic_ios<_CharT, _Traits>::int_type`

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

Definition at line 76 of file `basic_ios.h`.

#### 4.503.2.8 typedef \_Ios\_Iostate std::ios\_base::iostate [inherited]

This is a bitmask type.

*\_Ios\_Iostate* is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type iostate are:

- badbit
- eofbit
- failbit
- goodbit

Definition at line 330 of file ios\_base.h.

#### 4.503.2.9 template<typename \_CharT, typename \_Traits> typedef \_Traits::off\_type std::basic\_ios<\_CharT, \_Traits>::off\_type

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

Definition at line 78 of file basic\_ios.h.

#### 4.503.2.10 typedef \_Ios\_Openmode std::ios\_base::openmode [inherited]

This is a bitmask type.

*\_Ios\_Openmode* is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type openmode are:

- app
- ate
- binary
- in
- out
- trunc

Definition at line 361 of file ios\_base.h.

#### 4.503.2.11 template<typename \_CharT, typename \_Traits> typedef \_Traits::pos\_type std::basic\_ios<\_CharT, \_Traits>::pos\_type

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

Definition at line 77 of file basic\_ios.h.

#### 4.503.2.12 typedef \_Ios\_Seekdir std::ios\_base::seekdir [inherited]

This is an enumerated type.

*\_Ios\_Seekdir* is implementation-defined. Defined values of type seekdir are:

- beg

- cur, equivalent to `SEEK_CUR` in the C standard library.
- end, equivalent to `SEEK_END` in the C standard library.

Definition at line 393 of file `ios_base.h`.

#### 4.503.2.13 `template<typename _CharT, typename _Traits> typedef _Traits std::basic_ios<_CharT, _Traits>::traits_type`

These are standard types. They permit a standardized way of referring to names of (or names dependent on) the template parameters, which are specific to the implementation.

Definition at line 79 of file `basic_ios.h`.

### 4.503.3 Member Enumeration Documentation

#### 4.503.3.1 `enum std::ios_base::event` [inherited]

The set of events that may be passed to an event callback.

`erase_event` is used during `~ios()` and `copyfmt()`. `imbue_event` is used during `imbue()`. `copyfmt_event` is used during `copyfmt()`.

Definition at line 419 of file `ios_base.h`.

### 4.503.4 Constructor & Destructor Documentation

#### 4.503.4.1 `template<typename _CharT, typename _Traits> std::basic_ios<_CharT, _Traits>::basic_ios ( basic_streambuf<_CharT, _Traits> * __sb )` [inline], [explicit]

Constructor performs initialization.

The parameter is passed by derived streams.

Definition at line 264 of file `basic_ios.h`.

References `std::basic_ios<_CharT, _Traits>::init()`.

#### 4.503.4.2 `template<typename _CharT, typename _Traits> virtual std::basic_ios<_CharT, _Traits>::~basic_ios ( )` [inline], [virtual]

Empty.

The destructor does nothing. More specifically, it does not destroy the streambuf held by `rdbuf()`.

Definition at line 276 of file `basic_ios.h`.

#### 4.503.4.3 `template<typename _CharT, typename _Traits> std::basic_ios<_CharT, _Traits>::basic_ios ( )` [inline], [protected]

Empty.

The default constructor does nothing and is not normally accessible to users.

Definition at line 454 of file `basic_ios.h`.

### 4.503.5 Member Function Documentation

4.503.5.1 `const locale& std::ios_base::_M_getloc ( ) const` `[inline],[inherited]`

Locale access.

Returns

A reference to the current locale.

Like getloc above, but returns a reference instead of generating a copy.

Definition at line 706 of file ios\_base.h.

4.503.5.2 `template<typename _CharT, typename _Traits > bool std::basic_ios< _CharT, _Traits >::bad ( ) const`  
`[inline]`

Fast error checking.

Returns

True if the badbit is set.

Note that other iostate flags may also be set.

Definition at line 205 of file basic\_ios.h.

References std::ios\_base::badbit, and std::basic\_ios< \_CharT, \_Traits >::rdstate().

4.503.5.3 `template<typename _CharT, typename _Traits > void std::basic_ios< _CharT, _Traits >::clear ( iostate __state = goodbit )`

[Re]sets the error state.

Parameters

<code>__state</code>	The new state flag(s) to set.
----------------------	-------------------------------

See std::ios\_base::iostate for the possible bit values. Most users will not need to pass an argument.

Referenced by std::basic\_ios< \_CharT, \_Traits >::exceptions(), and std::basic\_ios< \_CharT, \_Traits >::setstate().

4.503.5.4 `template<typename _CharT, typename _Traits > basic_ios& std::basic_ios< _CharT, _Traits >::copyfmt ( const basic_ios< _CharT, _Traits > & __rhs )`

Copies fields of \_\_rhs into this.

Parameters

<code>__rhs</code>	The source values for the copies.
--------------------	-----------------------------------

Returns

Reference to this object.

All fields of \_\_rhs are copied into this object except that rdbuf() and rdstate() remain unchanged. All values in the pword and iword arrays are copied. Before copying, each callback is invoked with erase\_event. After copying, each (new) callback is invoked with copyfmt\_event. The final step is to copy exceptions().

4.503.5.5 `template<typename _CharT, typename _Traits > bool std::basic_ios< _CharT, _Traits >::eof ( ) const`  
`[inline]`

Fast error checking.

**Returns**

True if the eofbit is set.

Note that other iostate flags may also be set.

Definition at line 184 of file basic\_ios.h.

References `std::ios_base::eofbit`, and `std::basic_ios<_CharT, _Traits>::rdstate()`.

**4.503.5.6** `template<typename _CharT, typename _Traits> iostate std::basic_ios<_CharT, _Traits>::exceptions ( ) const`  
`[inline]`

Throwing exceptions on errors.

**Returns**

The current exceptions mask.

This changes nothing in the stream. See the one-argument version of `exceptions(iostate)` for the meaning of the return value.

Definition at line 216 of file basic\_ios.h.

**4.503.5.7** `template<typename _CharT, typename _Traits> void std::basic_ios<_CharT, _Traits>::exceptions ( iostate`  
`__except ) [inline]`

Throwing exceptions on errors.

**Parameters**

<code>__except</code>	The new exceptions mask.
-----------------------	--------------------------

By default, error flags are set silently. You can set an exceptions mask for each stream; if a bit in the mask becomes set in the error flags, then an exception of type `std::ios_base::failure` is thrown.

If the error flag is already set when the exceptions mask is added, the exception is immediately thrown. Try running the following under GCC 3.1 or later:

```
#include <iostream>
#include <fstream>
#include <exception>

int main()
{
    std::set_terminate (__gnu_cxx::__verbose_terminate_handler);

    std::ifstream f ("/etc/motd");

    std::cerr << "Setting badbit\n";
    f.setstate (std::ios_base::badbit);

    std::cerr << "Setting exception mask\n";
    f.exceptions (std::ios_base::badbit);
}
```

Definition at line 251 of file basic\_ios.h.

References `std::basic_ios<_CharT, _Traits>::clear()`.

**4.503.5.8** `template<typename _CharT, typename _Traits> bool std::basic_ios<_CharT, _Traits>::fail ( ) const`  
`[inline]`

Fast error checking.

**Returns**

True if either the badbit or the failbit is set.

Checking the badbit in fail() is historical practice. Note that other iostate flags may also be set.

Definition at line 195 of file basic\_ios.h.

References std::ios\_base::badbit, std::ios\_base::failbit, and std::basic\_ios< \_CharT, \_Traits >::rdstate().

Referenced by std::basic\_ios< \_CharT, \_Traits >::operator void \*(), and std::basic\_ios< \_CharT, \_Traits >::operator!().

**4.503.5.9** `template<typename _CharT, typename _Traits> char_type std::basic_ios< _CharT, _Traits >::fill ( ) const`  
`[inline]`

Retrieves the *empty* character.

**Returns**

The current fill character.

It defaults to a space ( ' ' ) in the current locale.

Definition at line 364 of file basic\_ios.h.

References std::basic\_ios< \_CharT, \_Traits >::widen().

Referenced by std::basic\_ios< \_CharT, \_Traits >::fill().

**4.503.5.10** `template<typename _CharT, typename _Traits> char_type std::basic_ios< _CharT, _Traits >::fill ( char_type`  
`__ch ) [inline]`

Sets a new *empty* character.

**Parameters**

<code>__ch</code>	The new character.
-------------------	--------------------

**Returns**

The previous fill character.

The fill character is used to fill out space when P+ characters have been requested (e.g., via setw), Q characters are actually used, and Q<P. It defaults to a space ( ' ' ) in the current locale.

Definition at line 384 of file basic\_ios.h.

References std::basic\_ios< \_CharT, \_Traits >::fill().

**4.503.5.11** `fmtflags std::ios_base::flags ( ) const [inline],[inherited]`

Access to format flags.

**Returns**

The format control flags for both input and output.

Definition at line 551 of file ios\_base.h.

**4.503.5.12** `fmtflags std::ios_base::flags ( fmtflags __fmtfl ) [inline],[inherited]`

Setting new format flags all at once.

**Parameters**

<code>__fmtfl</code>	The new flags to set.
----------------------	-----------------------

**Returns**

The previous format control flags.

This function overwrites all the format flags with `__fmtfl`.

Definition at line 562 of file `ios_base.h`.

**4.503.5.13** `locale std::ios_base::getloc ( ) const` `[inline]`, `[inherited]`

Locale access.

**Returns**

A copy of the current locale.

If `imbue(loc)` has previously been called, then this function returns `loc`. Otherwise, it returns a copy of `std::locale()`, the global C++ locale.

Definition at line 695 of file `ios_base.h`.

**4.503.5.14** `template<typename _CharT, typename _Traits> bool std::basic_ios<_CharT, _Traits>::good ( ) const` `[inline]`

Fast error checking.

**Returns**

True if no error flags are set.

A wrapper around `rdstate`.

Definition at line 174 of file `basic_ios.h`.

References `std::basic_ios<_CharT, _Traits>::rdstate()`.

**4.503.5.15** `template<typename _CharT, typename _Traits> locale std::basic_ios<_CharT, _Traits>::imbue ( const locale & __loc )`

Moves to a new locale.

**Parameters**

<code>__loc</code>	The new locale.
--------------------	-----------------

**Returns**

The previous locale.

Calls `ios_base::imbue(loc)`, and if a stream buffer is associated with this stream, calls that buffer's `pubimbue(loc)`.

Additional I10n notes are at <http://gcc.gnu.org/onlinedocs/libstdc++/manual/localization.html>.

4.503.5.16 `template<typename _CharT, typename _Traits> void std::basic_ios< _CharT, _Traits >::init ( basic_streambuf< _CharT, _Traits > * __sb ) [protected]`

All setup is performed here.

This is called from the public constructor. It is not virtual and cannot be redefined.

Referenced by `std::basic_ios< _CharT, _Traits >::basic_ios()`.

4.503.5.17 `long& std::ios_base::iword ( int __ix ) [inline], [inherited]`

Access to integer array.

#### Parameters

<code>__ix</code>	Index into the array.
-------------------	-----------------------

#### Returns

A reference to an integer associated with the index.

The `iword` function provides access to an array of integers that can be used for any purpose. The array grows as required to hold the supplied index. All integers in the array are initialized to 0.

The implementation reserves several indices. You should use `xalloc` to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

Definition at line 741 of file `ios_base.h`.

4.503.5.18 `template<typename _CharT, typename _Traits> char std::basic_ios< _CharT, _Traits >::narrow ( char_type __c, char __dfault ) const [inline]`

Squeezes characters.

#### Parameters

<code>__c</code>	The character to narrow.
<code>__dfault</code>	The character to narrow.

#### Returns

The narrowed character.

Maps a character of `char_type` to a character of `char`, if possible.

Returns the result of

```
std::use_facet<ctype<char_type>> >(getloc()).narrow(c, dfault)
```

Additional I10n notes are at <http://gcc.gnu.org/onlinedocs/libstdc++/manual/localization.html>

Definition at line 424 of file `basic_ios.h`.

4.503.5.19 `template<typename _CharT, typename _Traits> std::basic_ios< _CharT, _Traits >::operator void * ( ) const [inline]`

The quick-and-easy status check.

This allows you to write constructs such as `if (!a_stream) ...` and `while (a_stream) ...`

Definition at line 115 of file `basic_ios.h`.

References `std::basic_ios<_CharT, _Traits>::fail()`.

**4.503.5.20** `template<typename _CharT, typename _Traits> bool std::basic_ios<_CharT, _Traits>::operator! ( ) const`  
`[inline]`

The quick-and-easy status check.

This allows you to write constructs such as `if (!a_stream) ...` and `while (a_stream) ...`.

Definition at line 119 of file `basic_ios.h`.

References `std::basic_ios<_CharT, _Traits>::fail()`.

**4.503.5.21** `streamsize std::ios_base::precision ( ) const` `[inline], [inherited]`

Flags access.

#### Returns

The precision to generate on certain output operations.

Be careful if you try to give a definition of *precision* here; see DR 189.

Definition at line 621 of file `ios_base.h`.

**4.503.5.22** `streamsize std::ios_base::precision ( streamsize __prec )` `[inline], [inherited]`

Changing flags.

#### Parameters

<code>__prec</code>	The new precision value.
---------------------	--------------------------

#### Returns

The previous value of `precision()`.

Definition at line 630 of file `ios_base.h`.

**4.503.5.23** `void*& std::ios_base::pword ( int __ix )` `[inline], [inherited]`

Access to void pointer array.

#### Parameters

<code>__ix</code>	Index into the array.
-------------------	-----------------------

#### Returns

A reference to a `void*` associated with the index.

The `pword` function provides access to an array of pointers that can be used for any purpose. The array grows as required to hold the supplied index. All pointers in the array are initialized to 0.

The implementation reserves several indices. You should use `xalloc` to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

Definition at line 762 of file `ios_base.h`.

4.503.5.24 `template<typename _CharT, typename _Traits> basic_streambuf<_CharT, _Traits>* std::basic_ios<_CharT, _Traits>::rdbuf ( ) const [inline]`

Accessing the underlying buffer.

#### Returns

The current stream buffer.

This does not change the state of the stream.

Definition at line 315 of file `basic_ios.h`.

4.503.5.25 `template<typename _CharT, typename _Traits> basic_streambuf<_CharT, _Traits>* std::basic_ios<_CharT, _Traits>::rdbuf ( basic_streambuf<_CharT, _Traits> * __sb )`

Changing the underlying buffer.

#### Parameters

<code>__sb</code>	The new stream buffer.
-------------------	------------------------

#### Returns

The previous stream buffer.

Associates a new buffer with the current stream, and clears the error state.

Due to historical accidents which the LWG refuses to correct, the I/O library suffers from a design error: this function is hidden in derived classes by overrides of the zero-argument `rdbuf()`, which is non-virtual for hysterical raisins. As a result, you must use explicit qualifications to access this function via any derived class. For example:

```
std::fstream    foo;           // or some other derived type
std::streambuf* p = .....;

foo.ios::rdbuf(p);           // ios == basic_ios<char>
```

4.503.5.26 `template<typename _CharT, typename _Traits> iostate std::basic_ios<_CharT, _Traits>::rdstate ( ) const [inline]`

Returns the error state of the stream buffer.

#### Returns

A bit pattern (well, isn't everything?)

See `std::ios_base::iostate` for the possible bit values. Most users will call one of the interpreting wrappers, e.g., `good()`.

Definition at line 131 of file `basic_ios.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::bad()`, `std::basic_ios<_CharT, _Traits>::eof()`, `std::basic_ios<_CharT, _Traits>::fail()`, `std::basic_ios<_CharT, _Traits>::good()`, and `std::basic_ios<_CharT, _Traits>::setstate()`.

4.503.5.27 `void std::ios_base::register_callback ( event_callback __fn, int __index ) [inherited]`

Add the callback `__fn` with parameter `__index`.

## Parameters

<code>__fn</code>	The function to add.
<code>__index</code>	The integer to pass to the function when invoked.

Registers a function as an event callback with an integer parameter to be passed to the function when invoked. Multiple copies of the function are allowed. If there are multiple callbacks, they are invoked in the order they were registered.

**4.503.5.28** `fmtflags std::ios_base::setf ( fmtflags __fmtfl ) [inline],[inherited]`

Setting new format flags.

## Parameters

<code>__fmtfl</code>	Additional flags to set.
----------------------	--------------------------

## Returns

The previous format control flags.

This function sets additional flags in format control. Flags that were previously set remain set.

Definition at line 578 of file `ios_base.h`.

Referenced by `std::boolalpha()`, `std::dec()`, `std::fixed()`, `std::hex()`, `std::left()`, `std::oct()`, `std::right()`, `std::scientific()`, `std::showbase()`, `std::showpoint()`, `std::showpos()`, `std::skipws()`, `std::unitbuf()`, and `std::uppercase()`.

**4.503.5.29** `fmtflags std::ios_base::setf ( fmtflags __fmtfl, fmtflags __mask ) [inline],[inherited]`

Setting new format flags.

## Parameters

<code>__fmtfl</code>	Additional flags to set.
<code>__mask</code>	The flags mask for <code>__fmtfl</code> .

## Returns

The previous format control flags.

This function clears `mask` in the format flags, then sets `__fmtfl & mask`. An example mask is `ios_base::adjustfield`.

Definition at line 595 of file `ios_base.h`.

**4.503.5.30** `template<typename _CharT, typename _Traits> void std::basic_ios<_CharT, _Traits>::setstate ( iostate __state ) [inline]`

Sets additional flags in the error state.

## Parameters

<code>__state</code>	The additional state flag(s) to set.
----------------------	--------------------------------------

See `std::ios_base::iostate` for the possible bit values.

Definition at line 151 of file `basic_ios.h`.

References `std::basic_ios<_CharT, _Traits>::clear()`, and `std::basic_ios<_CharT, _Traits>::rdstate()`.

**4.503.5.31** `static bool std::ios_base::sync_with_stdio ( bool __sync = true ) [static],[inherited]`

Interaction with the standard C I/O objects.

## Parameters

<code>__sync</code>	Whether to synchronize or not.
---------------------	--------------------------------

## Returns

True if the standard streams were previously synchronized.

The synchronization referred to is *only* that between the standard C facilities (e.g., `stdout`) and the standard C++ objects (e.g., `cout`). User-declared streams are unaffected. See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt1.html>

**4.503.5.32** `template<typename _CharT, typename _Traits> basic_ostream<_CharT, _Traits>* std::basic_ios<_CharT, _Traits>::tie ( ) const [inline]`

Fetches the current *tied* stream.

## Returns

A pointer to the tied stream, or NULL if the stream is not tied.

A stream may be *tied* (or synchronized) to a second output stream. When this stream performs any I/O, the tied stream is first flushed. For example, `std::cin` is tied to `std::cout`.

Definition at line 289 of file `basic_ios.h`.

**4.503.5.33** `template<typename _CharT, typename _Traits> basic_ostream<_CharT, _Traits>* std::basic_ios<_CharT, _Traits>::tie ( basic_ostream<_CharT, _Traits> * __tiestr ) [inline]`

Ties this stream to an output stream.

## Parameters

<code>__tiestr</code>	The output stream.
-----------------------	--------------------

## Returns

The previously tied output stream, or NULL if the stream was not tied.

This sets up a new tie; see `tie()` for more.

Definition at line 301 of file `basic_ios.h`.

**4.503.5.34** `void std::ios_base::unsetf ( fmtflags __mask ) [inline], [inherited]`

Clearing format flags.

## Parameters

<code>__mask</code>	The flags to unset.
---------------------	---------------------

This function clears `__mask` in the format flags.

Definition at line 610 of file `ios_base.h`.

Referenced by `std::noboolalpha()`, `std::noshowbase()`, `std::noshowpoint()`, `std::noshowpos()`, `std::noskipws()`, `std::nounitbuf()`, and `std::nouppercase()`.

**4.503.5.35** `template<typename _CharT, typename _Traits> char_type std::basic_ios<_CharT, _Traits>::widen ( char __c ) const [inline]`

Widens characters.

**Parameters**

<code>__c</code>	The character to widen.
------------------	-------------------------

**Returns**

The widened character.

Maps a character of `char` to a character of `char_type`.

Returns the result of

```
std::use_facet<ctype<char_type> >(getloc()).widen(c)
```

Additional l10n notes are at <http://gcc.gnu.org/onlinedocs/libstdc++/manual/localization.html>

Definition at line 443 of file `basic_ios.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::fill()`.

**4.503.5.36** `streamsize std::ios_base::width( ) const` `[inline], [inherited]`

Flags access.

**Returns**

The minimum field width to generate on output operations.

*Minimum field width* refers to the number of characters.

Definition at line 644 of file `ios_base.h`.

**4.503.5.37** `streamsize std::ios_base::width( streamsize __wide )` `[inline], [inherited]`

Changing flags.

**Parameters**

<code>__wide</code>	The new width value.
---------------------	----------------------

**Returns**

The previous value of `width()`.

Definition at line 653 of file `ios_base.h`.

**4.503.5.38** `static int std::ios_base::xalloc( ) throw` `[static], [inherited]`

Access to unique indices.

**Returns**

An integer different from all previous calls.

This function returns a unique integer every time it is called. It can be used for any purpose, but is primarily intended to be a unique index for the `iword` and `pword` functions. The expectation is that an application calls `xalloc` in order to obtain an index in the `iword` and `pword` arrays that can be used without fear of conflict.

The implementation maintains a static variable that is incremented and returned on each invocation. `xalloc` is guaranteed to return an index that is safe to use in the `iword` and `pword` arrays.

## 4.503.6 Member Data Documentation

## 4.503.6.1 const fmtflags std::ios\_base::adjustfield [static],[inherited]

A mask of left|right|internal. Useful for the 2-arg form of `setf`.

Definition at line 310 of file `ios_base.h`.

Referenced by `std::internal()`, `std::left()`, and `std::right()`.

## 4.503.6.2 const openmode std::ios\_base::app [static],[inherited]

Seek to end before each write.

Definition at line 364 of file `ios_base.h`.

## 4.503.6.3 const openmode std::ios\_base::ate [static],[inherited]

Open and seek to end immediately after opening.

Definition at line 367 of file `ios_base.h`.

## 4.503.6.4 const iostate std::ios\_base::badbit [static],[inherited]

Indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file).

Definition at line 334 of file `ios_base.h`.

Referenced by `std::basic_ios< _CharT, _Traits >::bad()`, and `std::basic_ios< _CharT, _Traits >::fail()`.

## 4.503.6.5 const fmtflags std::ios\_base::basefield [static],[inherited]

A mask of dec|oct|hex. Useful for the 2-arg form of `setf`.

Definition at line 313 of file `ios_base.h`.

Referenced by `std::dec()`, `std::hex()`, and `std::oct()`.

## 4.503.6.6 const seekdir std::ios\_base::beg [static],[inherited]

Request a seek relative to the beginning of the stream.

Definition at line 396 of file `ios_base.h`.

## 4.503.6.7 const openmode std::ios\_base::binary [static],[inherited]

Perform input and output in binary mode (as opposed to text mode). This is probably not what you think it is; see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt11ch27s02.html>.

Definition at line 372 of file `ios_base.h`.

## 4.503.6.8 const fmtflags std::ios\_base::boolalpha [static],[inherited]

Insert/extract `bool` in alphabetic rather than numeric format.

Definition at line 258 of file `ios_base.h`.

Referenced by `std::boolalpha()`, and `std::noboolalpha()`.

## 4.503.6.9 const seekdir std::ios\_base::cur [static],[inherited]

Request a seek relative to the current position within the sequence.

Definition at line 399 of file ios\_base.h.

**4.503.6.10** `const fmtflags std::ios_base::dec` `[static], [inherited]`

Converts integer input or generates integer output in decimal base.

Definition at line 261 of file ios\_base.h.

Referenced by `std::dec()`.

**4.503.6.11** `const seekdir std::ios_base::end` `[static], [inherited]`

Request a seek relative to the current end of the sequence.

Definition at line 402 of file ios\_base.h.

**4.503.6.12** `const iostate std::ios_base::eofbit` `[static], [inherited]`

Indicates that an input operation reached the end of an input sequence.

Definition at line 337 of file ios\_base.h.

Referenced by `std::basic_ios<_CharT, _Traits>::eof()`.

**4.503.6.13** `const iostate std::ios_base::failbit` `[static], [inherited]`

Indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

Definition at line 342 of file ios\_base.h.

Referenced by `std::basic_ios<_CharT, _Traits>::fail()`.

**4.503.6.14** `const fmtflags std::ios_base::fixed` `[static], [inherited]`

Generate floating-point output in fixed-point notation.

Definition at line 264 of file ios\_base.h.

Referenced by `std::fixed()`.

**4.503.6.15** `const fmtflags std::ios_base::floatfield` `[static], [inherited]`

A mask of scientific|fixed. Useful for the 2-arg form of `setf`.

Definition at line 316 of file ios\_base.h.

Referenced by `std::fixed()`, and `std::scientific()`.

**4.503.6.16** `const iostate std::ios_base::goodbit` `[static], [inherited]`

Indicates all is well.

Definition at line 345 of file ios\_base.h.

**4.503.6.17** `const fmtflags std::ios_base::hex` `[static], [inherited]`

Converts integer input or generates integer output in hexadecimal base.

Definition at line 267 of file ios\_base.h.

Referenced by `std::hex()`.

**4.503.6.18** `const openmode std::ios_base::in` `[static], [inherited]`

Open for input. Default for `ifstream` and `fstream`.

Definition at line 375 of file `ios_base.h`.

**4.503.6.19** `const fmtflags std::ios_base::internal` `[static], [inherited]`

Adds fill characters at a designated internal point in certain generated output, or identical to `right` if no such point is designated.

Definition at line 272 of file `ios_base.h`.

Referenced by `std::internal()`.

**4.503.6.20** `const fmtflags std::ios_base::left` `[static], [inherited]`

Adds fill characters on the right (final positions) of certain generated output. (I.e., the thing you print is flush left.)

Definition at line 276 of file `ios_base.h`.

Referenced by `std::left()`.

**4.503.6.21** `const fmtflags std::ios_base::oct` `[static], [inherited]`

Converts integer input or generates integer output in octal base.

Definition at line 279 of file `ios_base.h`.

Referenced by `std::oct()`.

**4.503.6.22** `const openmode std::ios_base::out` `[static], [inherited]`

Open for output. Default for `ofstream` and `fstream`.

Definition at line 378 of file `ios_base.h`.

**4.503.6.23** `const fmtflags std::ios_base::right` `[static], [inherited]`

Adds fill characters on the left (initial positions) of certain generated output. (I.e., the thing you print is flush right.)

Definition at line 283 of file `ios_base.h`.

Referenced by `std::right()`.

**4.503.6.24** `const fmtflags std::ios_base::scientific` `[static], [inherited]`

Generates floating-point output in scientific notation.

Definition at line 286 of file `ios_base.h`.

Referenced by `std::scientific()`.

**4.503.6.25** `const fmtflags std::ios_base::showbase` `[static], [inherited]`

Generates a prefix indicating the numeric base of generated integer output.

Definition at line 290 of file `ios_base.h`.

Referenced by `std::noshowbase()`, and `std::showbase()`.

**4.503.6.26** `const fmtflags std::ios_base::showpoint` `[static], [inherited]`

Generates a decimal-point character unconditionally in generated floating-point output.

Definition at line 294 of file `ios_base.h`.

Referenced by `std::noshowpoint()`, and `std::showpoint()`.

**4.503.6.27** `const fmtflags std::ios_base::showpos` `[static], [inherited]`

Generates a + sign in non-negative generated numeric output.

Definition at line 297 of file `ios_base.h`.

Referenced by `std::noshowpos()`, and `std::showpos()`.

**4.503.6.28** `const fmtflags std::ios_base::skipws` `[static], [inherited]`

Skips leading white space before certain input operations.

Definition at line 300 of file `ios_base.h`.

Referenced by `std::noskipws()`, and `std::skipws()`.

**4.503.6.29** `const openmode std::ios_base::trunc` `[static], [inherited]`

Open for input. Default for `ofstream`.

Definition at line 381 of file `ios_base.h`.

**4.503.6.30** `const fmtflags std::ios_base::unitbuf` `[static], [inherited]`

Flushes output after each output operation.

Definition at line 303 of file `ios_base.h`.

Referenced by `std::nounitbuf()`, and `std::unitbuf()`.

**4.503.6.31** `const fmtflags std::ios_base::uppercase` `[static], [inherited]`

Replaces certain lowercase letters with their uppercase equivalents in generated output.

Definition at line 307 of file `ios_base.h`.

Referenced by `std::nouppercase()`, and `std::uppercase()`.

## 4.504.1 Detailed Description

```
template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> class std::basic_regex<_Ch_type, _Rx_traits>
```

Objects of specializations of this class represent regular expressions constructed from sequences of character type `_Ch_type`.

Storage for the regular expression is allocated and deallocated as necessary by the member functions of this class.

Definition at line 335 of file `regex.h`.

## 4.504.2 Constructor &amp; Destructor Documentation

```
4.504.2.1 template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> std::basic_regex<_Ch_type,
    _Rx_traits>::basic_regex( ) [inline]
```

Constructs a basic regular expression that does not match any character sequence.

Definition at line 367 of file `regex.h`.

```
4.504.2.2 template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> std::basic_regex<_Ch_type,
    _Rx_traits>::basic_regex( const _Ch_type * __p, flag_type __f = ECMAScript ) [inline], [explicit]
```

Constructs a basic regular expression from the sequence `[__p, __p + char_traits<_Ch_type>::length(__p))` interpreted according to the flags in `__f`.

## Parameters

<code>__p</code>	A pointer to the start of a C-style null-terminated string containing a regular expression.
<code>__f</code>	Flags indicating the syntax rules and options.

## Exceptions

<code>regex_error</code>	if <code>__p</code> is not a valid regular expression.
--------------------------	--

Definition at line 385 of file `regex.h`.

```
4.504.2.3 template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> std::basic_regex<_Ch_type,
    _Rx_traits>::basic_regex( const _Ch_type * __p, std::size_t __len, flag_type __f ) [inline]
```

Constructs a basic regular expression from the sequence `[p, p + len)` interpreted according to the flags in `f`.

## Parameters

<code>__p</code>	A pointer to the start of a string containing a regular expression.
<code>__len</code>	The length of the string containing the regular expression.
<code>__f</code>	Flags indicating the syntax rules and options.

## Exceptions

<code>regex_error</code>	if <code>__p</code> is not a valid regular expression.
--------------------------	--

Definition at line 403 of file `regex.h`.

```
4.504.2.4 template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> std::basic_regex<_Ch_type,
    _Rx_traits>::basic_regex( const basic_regex<_Ch_type, _Rx_traits> & __rhs ) [inline]
```

Copy-constructs a basic regular expression.

## Parameters

<code>__rhs</code>	A regex object.
--------------------	-----------------

Definition at line 413 of file regex.h.

```
4.504.2.5 template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> std::basic_regex<_Ch_type,
_Rx_traits>::basic_regex ( const basic_regex<_Ch_type, _Rx_traits> && __rhs ) [inline],
[noexcept]
```

Move-constructs a basic regular expression.

## Parameters

<code>__rhs</code>	A regex object.
--------------------	-----------------

Definition at line 423 of file regex.h.

```
4.504.2.6 template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> template<typename _Ch_traits ,
typename _Ch_alloc > std::basic_regex<_Ch_type, _Rx_traits>::basic_regex ( const std::basic_string<
_Ch_type, _Ch_traits, _Ch_alloc> & __s, flag_type __f = ECMAScript ) [inline], [explicit]
```

Constructs a basic regular expression from the string `s` interpreted according to the flags in `f`.

## Parameters

<code>__s</code>	A string containing a regular expression.
<code>__f</code>	Flags indicating the syntax rules and options.

## Exceptions

<code>regex_error</code>	if <code>__s</code> is not a valid regular expression.
--------------------------	--

Definition at line 439 of file regex.h.

```
4.504.2.7 template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> template<typename _Inputiterator >
std::basic_regex<_Ch_type, _Rx_traits>::basic_regex ( _Inputiterator __first, _Inputiterator __last, flag_type __f
= ECMAScript ) [inline]
```

Constructs a basic regular expression from the range `[first, last)` interpreted according to the flags in `f`.

## Parameters

<code>__first</code>	The start of a range containing a valid regular expression.
<code>__last</code>	The end of a range containing a valid regular expression.
<code>__f</code>	The format flags of the regular expression.

## Exceptions

<code>regex_error</code>	if <code>[__first, __last)</code> is not a valid regular expression.
--------------------------	--

Definition at line 461 of file regex.h.

```
4.504.2.8 template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> std::basic_regex<_Ch_type,
_Rx_traits>::basic_regex ( initializer_list<_Ch_type> __l, flag_type __f = ECMAScript ) [inline]
```

Constructs a basic regular expression from an initializer list.

## Parameters

<code>__l</code>	The initializer list.
<code>__f</code>	The format flags of the regular expression.

## Exceptions

<code>regex_error</code>	if <code>__l</code> is not a valid regular expression.
--------------------------	--

Definition at line 475 of file `regex.h`.

4.504.2.9 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> std::basic_regex<_Ch_type, _Rx_traits>::~basic_regex ( ) [inline]`

Destroys a basic regular expression.

Definition at line 485 of file `regex.h`.

## 4.504.3 Member Function Documentation

4.504.3.1 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex& std::basic_regex<_Ch_type, _Rx_traits>::assign ( const basic_regex<_Ch_type, _Rx_traits> &__rhs ) [inline]`

the real assignment operator.

## Parameters

<code>__rhs</code>	Another regular expression object.
--------------------	------------------------------------

Definition at line 531 of file `regex.h`.

References `std::basic_regex<_Ch_type, _Rx_traits>::swap()`.

Referenced by `std::basic_regex<_Ch_type, _Rx_traits>::assign()`, and `std::basic_regex<_Ch_type, _Rx_traits>::operator=()`.

4.504.3.2 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex& std::basic_regex<_Ch_type, _Rx_traits>::assign ( basic_regex<_Ch_type, _Rx_traits> &&__rhs ) [inline], [noexcept]`

The move-assignment operator.

## Parameters

<code>__rhs</code>	Another regular expression object.
--------------------	------------------------------------

Definition at line 544 of file `regex.h`.

References `std::move()`, and `std::basic_regex<_Ch_type, _Rx_traits>::swap()`.

4.504.3.3 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex& std::basic_regex<_Ch_type, _Rx_traits>::assign ( const _Ch_type * __p, flag_type __flags = ECMAScript ) [inline]`

Assigns a new regular expression to a regex object from a C-style null-terminated string containing a regular expression pattern.

## Parameters

---

<code>__p</code>	A pointer to a C-style null-terminated string containing a regular expression pattern.
<code>__flags</code>	Syntax option flags.

**Exceptions**

<code>regex_error</code>	if <code>__p</code> does not contain a valid regular expression pattern interpreted according to <code>__flags</code> . If <code>regex_error</code> is thrown, <code>*this</code> remains unchanged.
--------------------------	--

Definition at line 565 of file `regex.h`.

References `std::basic_regex< _Ch_type, _Rx_traits >::assign()`.

**4.504.3.4** `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex& std::basic_regex<_Ch_type, _Rx_traits >::assign ( const _Ch_type * __p, std::size_t __len, flag_type __flags ) [inline]`

Assigns a new regular expression to a regex object from a C-style string containing a regular expression pattern.

**Parameters**

<code>__p</code>	A pointer to a C-style string containing a regular expression pattern.
<code>__len</code>	The length of the regular expression pattern string.
<code>__flags</code>	Syntax option flags.

**Exceptions**

<code>regex_error</code>	if <code>p</code> does not contain a valid regular expression pattern interpreted according to <code>__flags</code> . If <code>regex_error</code> is thrown, <code>*this</code> remains unchanged.
--------------------------	--

Definition at line 582 of file `regex.h`.

References `std::basic_regex< _Ch_type, _Rx_traits >::assign()`.

**4.504.3.5** `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> template<typename _Ch_type_traits, typename _Alloc > basic_regex& std::basic_regex<_Ch_type, _Rx_traits >::assign ( const basic_string<_Ch_type, _Ch_type_traits, _Alloc > & __s, flag_type __flags = ECMAScript ) [inline]`

Assigns a new regular expression to a regex object from a string containing a regular expression pattern.

**Parameters**

<code>__s</code>	A string containing a regular expression pattern.
<code>__flags</code>	Syntax option flags.

**Exceptions**

<code>regex_error</code>	if <code>__s</code> does not contain a valid regular expression pattern interpreted according to <code>__flags</code> . If <code>regex_error</code> is thrown, <code>*this</code> remains unchanged.
--------------------------	--

Definition at line 598 of file `regex.h`.

References `std::basic_regex< _Ch_type, _Rx_traits >::swap()`.

**4.504.3.6** `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> template<typename _InputIterator > basic_regex& std::basic_regex<_Ch_type, _Rx_traits >::assign ( _InputIterator __first, _InputIterator __last, flag_type __flags = ECMAScript ) [inline]`

Assigns a new regular expression to a regex object.

**Parameters**

<code>__first</code>	The start of a range containing a valid regular expression.
<code>__last</code>	The end of a range containing a valid regular expression.
<code>__flags</code>	Syntax option flags.

**Exceptions**

<code>regex_error</code>	if <code>p</code> does not contain a valid regular expression pattern interpreted according to <code>__flags</code> . If <code>regex_error</code> is thrown, the object remains unchanged.
--------------------------	--

Definition at line 621 of file `regex.h`.

References `std::basic_regex<_Ch_type, _Rx_traits>::assign()`.

4.504.3.7 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex& std::basic_regex<_Ch_type, _Rx_traits>::assign ( initializer_list<_Ch_type> __l, flag_type __flags = ECMAScript ) [inline]`

Assigns a new regular expression to a regex object.

**Parameters**

<code>__l</code>	An initializer list representing a regular expression.
<code>__flags</code>	Syntax option flags.

**Exceptions**

<code>regex_error</code>	if <code>__l</code> does not contain a valid regular expression pattern interpreted according to <code>__flags</code> . If <code>regex_error</code> is thrown, the object remains unchanged.
--------------------------	--

Definition at line 637 of file `regex.h`.

References `std::basic_regex<_Ch_type, _Rx_traits>::assign()`.

4.504.3.8 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> flag_type std::basic_regex<_Ch_type, _Rx_traits>::flags ( ) const [inline]`

Gets the flags used to construct the regular expression or in the last call to `assign()`.

Definition at line 654 of file `regex.h`.

Referenced by `std::basic_regex<_Ch_type, _Rx_traits>::operator=()`.

4.504.3.9 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> locale_type std::basic_regex<_Ch_type, _Rx_traits>::getloc ( ) const [inline]`

Gets the locale currently imbued in the regular expression object.

Definition at line 672 of file `regex.h`.

4.504.3.10 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> locale_type std::basic_regex<_Ch_type, _Rx_traits>::imbue ( locale_type __loc ) [inline]`

Imbues the regular expression object with the given locale.

**Parameters**

<code>__loc</code>	A locale.
--------------------	-----------

Definition at line 664 of file regex.h.

4.504.3.11 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> unsigned int std::basic_regex<_Ch_type, _Rx_traits>::mark_count ( ) const [inline]`

Gets the number of marked subexpressions within the regular expression.

Definition at line 646 of file regex.h.

4.504.3.12 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex& std::basic_regex<_Ch_type, _Rx_traits>::operator= ( const basic_regex<_Ch_type, _Rx_traits> & __rhs ) [inline]`

Assigns one regular expression to another.

Definition at line 492 of file regex.h.

References `std::basic_regex<_Ch_type, _Rx_traits>::assign()`.

4.504.3.13 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex& std::basic_regex<_Ch_type, _Rx_traits>::operator= ( basic_regex<_Ch_type, _Rx_traits> && __rhs ) [inline], [noexcept]`

Move-assigns one regular expression to another.

Definition at line 499 of file regex.h.

References `std::basic_regex<_Ch_type, _Rx_traits>::assign()`, and `std::move()`.

4.504.3.14 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> basic_regex& std::basic_regex<_Ch_type, _Rx_traits>::operator= ( const _Ch_type * __p ) [inline]`

Replaces a regular expression with a new one constructed from a C-style null-terminated string.

Parameters

<code>__p</code>	A pointer to the start of a null-terminated C-style string containing a regular expression.
------------------	---

Definition at line 510 of file regex.h.

References `std::basic_regex<_Ch_type, _Rx_traits>::assign()`, and `std::basic_regex<_Ch_type, _Rx_traits>::flags()`.

4.504.3.15 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> template<typename _Ch_type_traits, typename _Alloc> basic_regex& std::basic_regex<_Ch_type, _Rx_traits>::operator= ( const basic_string<_Ch_type, _Ch_type_traits, _Alloc> & __s ) [inline]`

Replaces a regular expression with a new one constructed from a string.

Parameters

<code>__s</code>	A pointer to a string containing a regular expression.
------------------	--

Definition at line 521 of file regex.h.

References `std::basic_regex<_Ch_type, _Rx_traits>::assign()`, and `std::basic_regex<_Ch_type, _Rx_traits>::flags()`.

4.504.3.16 `template<typename _Ch_type, typename _Rx_traits = regex_traits<_Ch_type>> void std::basic_regex<_Ch_type, _Rx_traits>::swap( basic_regex<_Ch_type, _Rx_traits> &__rhs ) [inline]`

Swaps the contents of two regular expression objects.

## Parameters

<code>__rhs</code>	Another regular expression object.
--------------------	------------------------------------

Definition at line 682 of file regex.h.

References `std::swap()`.

Referenced by `std::basic_regex< _Ch_type, _Rx_traits >::assign()`, and `std::swap()`.

#### 4.505.1 Detailed Description

```
template<typename _CharT, typename _Traits, typename _Alloc> class std::basic_string<_CharT, _Traits, _Alloc>
```

Managing sequences of characters and character-like objects.

#### Template Parameters

<code>_CharT</code>	Type of character
<code>_Traits</code>	Traits for character type, defaults to <code>char_traits&lt;_CharT&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_CharT&gt;</code> .

Meets the requirements of a `container`, a `reversible container`, and a `sequence`. Of the `optional sequence requirements`, only `push_back`, `at`, and `array access` are supported.

**Todo** Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation_style.html)

Documentation? What's that? Nathan Myers [ncm@cantrip.org](mailto:ncm@cantrip.org).

A string looks like this:

```

[basic_string<char_type>]
_M_dataplus
_M_p ----->
                                     [_Rep]
                                     _M_length
                                     _M_capacity
                                     _M_refcount
                                     unnamed array of char_type
```

Where the `_M_p` points to the first character in the string, and you cast it to a pointer-to-`_Rep` and subtract 1 to get a pointer to the header.

This approach has the enormous advantage that a string object requires only one allocation. All the ugliness is confined within a single pair of inline functions, which each compile to a single `add` instruction: `_Rep::_M_data()`, and `string↔::_M_rep()`; and the allocation function which gets a block of raw bytes and with room enough and constructs a `_Rep` object at the front.

The reason you want `_M_data` pointing to the character array and not the `_Rep` is so that the debugger can see the string contents. (Probably we should add a non-inline member to get the `_Rep` for the debugger to use, so users can check the actual string length.)

Note that the `_Rep` object is a POD so that you can have a static *empty string* `_Rep` object already *constructed* before static constructors have run. The reference-count encoding is chosen so that a 0 indicates one reference, so you never try to destroy the empty-string `_Rep` object.

All but the last paragraph is considered pretty conventional for a C++ string implementation.

Definition at line 112 of file `basic_string.h`.

#### 4.505.2 Constructor & Destructor Documentation

4.505.2.1 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string< _CharT, _Traits, _Alloc >::basic_string( ) [inline]`

Default constructor creates an empty string.

Definition at line 437 of file `basic_string.h`.

Referenced by `std::basic_string< _CharT >::substr()`.

4.505.2.2 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string< _CharT, _Traits, _Alloc >::basic_string( const _Alloc & __a ) [explicit]`

Construct an empty string using allocator *a*.

4.505.2.3 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string< _CharT, _Traits, _Alloc >::basic_string( const basic_string< _CharT, _Traits, _Alloc > & __str )`

Construct string with copy of value of *str*.

Parameters

<code>__str</code>	Source string.
--------------------	----------------

4.505.2.4 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string< _CharT, _Traits, _Alloc >::basic_string( const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos, size_type __n = npos )`

Construct string as copy of a substring.

Parameters

<code>__str</code>	Source string.
<code>__pos</code>	Index of first character to copy from.
<code>__n</code>	Number of characters to copy (default remainder).

4.505.2.5 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string< _CharT, _Traits, _Alloc >::basic_string( const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos, size_type __n, const _Alloc & __a )`

Construct string as copy of a substring.

Parameters

<code>__str</code>	Source string.
<code>__pos</code>	Index of first character to copy from.

<code>__n</code>	Number of characters to copy.
<code>__a</code>	Allocator to use.

4.505.2.6 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string< _CharT, _Traits, _Alloc  
>::basic_string ( const _CharT * __s, size_type __n, const _Alloc & __a = _Alloc() )`

Construct string initialized by a character array.

Parameters

<code>__s</code>	Source character array.
<code>__n</code>	Number of characters to copy.
<code>__a</code>	Allocator to use (default is default allocator).

NB: `__s` must have at least `__n` characters, `'\0'` has no special meaning.

4.505.2.7 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string< _CharT, _Traits, _Alloc  
>::basic_string ( const _CharT * __s, const _Alloc & __a = _Alloc() )`

Construct string as copy of a C string.

Parameters

<code>__s</code>	Source C string.
<code>__a</code>	Allocator to use (default is default allocator).

4.505.2.8 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string< _CharT, _Traits, _Alloc  
>::basic_string ( size_type __n, _CharT __c, const _Alloc & __a = _Alloc() )`

Construct string as multiple characters.

Parameters

<code>__n</code>	Number of characters.
<code>__c</code>	Character to use.
<code>__a</code>	Allocator to use (default is default allocator).

4.505.2.9 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string< _CharT, _Traits, _Alloc  
>::basic_string ( basic_string< _CharT, _Traits, _Alloc > && __str ) [inline], [noexcept]`

Move construct string.

Parameters

<code>__str</code>	Source string.
--------------------	----------------

The newly-created string contains the exact contents of `__str`. `__str` is a valid, but unspecified string.

Definition at line 507 of file `basic_string.h`.

4.505.2.10 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string< _CharT, _Traits, _Alloc  
>::basic_string ( initializer_list< _CharT > __l, const _Alloc & __a = _Alloc() )`

Construct string from an initializer list.

## Parameters

<code>__l</code>	std::initializer_list of characters.
<code>__a</code>	Allocator to use (default is default allocator).

4.505.2.11 `template<typename _CharT, typename _Traits, typename _Alloc> template<class _InputIterator >  
std::basic_string< _CharT, _Traits, _Alloc >::basic_string ( _InputIterator __beg, _InputIterator __end, const  
_Alloc & __a = _Alloc() )`

Construct string as copy of a range.

## Parameters

<code>__beg</code>	Start of range.
<code>__end</code>	End of range.
<code>__a</code>	Allocator to use (default is default allocator).

4.505.2.12 `template<typename _CharT, typename _Traits, typename _Alloc> std::basic_string< _CharT, _Traits, _Alloc  
>::~basic_string( ) [inline], [noexcept]`

Destroy the string instance.

Definition at line 538 of file basic\_string.h.

## 4.505.3 Member Function Documentation

4.505.3.1 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT,  
_Traits, _Alloc >::append ( const basic_string< _CharT, _Traits, _Alloc > & __str )`

Append a string to this string.

## Parameters

<code>__str</code>	The string to append.
--------------------	-----------------------

## Returns

Reference to this string.

Referenced by `std::basic_string< _CharT >::append()`, `std::operator+()`, and `std::basic_string< _CharT >::operator+=()`.

4.505.3.2 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT,  
_Traits, _Alloc >::append ( const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos, size_type __n )`

Append a substring.

## Parameters

<code>__str</code>	The string to append.
<code>__pos</code>	Index of the first character of str to append.
<code>__n</code>	The number of characters to append.

## Returns

Reference to this string.

**Exceptions**

<i>std::out_of_range</i>	if <i>__pos</i> is not a valid index.
--------------------------	---------------------------------------

This function appends *\_\_n* characters from *\_\_str* starting at *\_\_pos* to this string. If *\_\_n* is larger than the number of available characters in *\_\_str*, the remainder of *\_\_str* is appended.

4.505.3.3 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::append ( const _CharT * __s, size_type __n )`

Append a C substring.

**Parameters**

<i>__s</i>	The C string to append.
<i>__n</i>	The number of characters to append.

**Returns**

Reference to this string.

4.505.3.4 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::append ( const _CharT * __s ) [inline]`

Append a C string.

**Parameters**

<i>__s</i>	The C string to append.
------------	-------------------------

**Returns**

Reference to this string.

Definition at line 1006 of file `basic_string.h`.

4.505.3.5 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::append ( size_type __n, _CharT __c )`

Append multiple characters.

**Parameters**

<i>__n</i>	The number of characters to append.
<i>__c</i>	The character to use.

**Returns**

Reference to this string.

Appends *\_\_n* copies of *\_\_c* to this string.

4.505.3.6 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::append ( initializer_list< _CharT > __l ) [inline]`

Append an `initializer_list` of characters.

## Parameters

<code>__l</code>	The initializer_list of characters to append.
------------------	---

## Returns

Reference to this string.

Definition at line 1030 of file basic\_string.h.

4.505.3.7 `template<typename _CharT, typename _Traits, typename _Alloc> template<class _InputIterator > basic_string& std::basic_string< _CharT, _Traits, _Alloc >::append ( _InputIterator __first, _InputIterator __last ) [inline]`

Append a range of characters.

## Parameters

<code>__first</code>	Iterator referencing the first character to append.
<code>__last</code>	Iterator marking the end of the range.

## Returns

Reference to this string.

Appends characters in the range [`__first`,`__last`) to this string.

Definition at line 1044 of file basic\_string.h.

4.505.3.8 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::assign ( const basic_string< _CharT, _Traits, _Alloc > & __str )`

Set value to contents of another string.

## Parameters

<code>__str</code>	Source string to use.
--------------------	-----------------------

## Returns

Reference to this string.

Referenced by `std::basic_string< _CharT >::assign()`, and `std::basic_string< _CharT >::operator=()`.

4.505.3.9 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::assign ( basic_string< _CharT, _Traits, _Alloc > && __str ) [inline]`

Set value to contents of another string.

## Parameters

<code>__str</code>	Source string to use.
--------------------	-----------------------

## Returns

Reference to this string.

This function sets this string to the exact contents of `__str`. `__str` is a valid, but unspecified string.

Definition at line 1079 of file basic\_string.h.

4.505.3.10 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::assign ( const basic_string<_CharT, _Traits, _Alloc> & __str, size_type __pos, size_type __n )`  
`[inline]`

Set value to a substring of a string.

## Parameters

<code>__str</code>	The string to use.
<code>__pos</code>	Index of the first character of str.
<code>__n</code>	Number of characters to use.

## Returns

Reference to this string.

## Exceptions

<code>std::out_of_range</code>	if <code>pos</code> is not a valid index.
--------------------------------	---

This function sets this string to the substring of `__str` consisting of `__n` characters at `__pos`. If `__n` is larger than the number of available characters in `__str`, the remainder of `__str` is used.

Definition at line 1100 of file `basic_string.h`.

4.505.3.11 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::assign ( const _CharT * __s, size_type __n )`

Set value to a C substring.

## Parameters

<code>__s</code>	The C string to use.
<code>__n</code>	Number of characters to use.

## Returns

Reference to this string.

This function sets the value of this string to the first `__n` characters of `__s`. If `__n` is larger than the number of available characters in `__s`, the remainder of `__s` is used.

4.505.3.12 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::assign ( const _CharT * __s ) [inline]`

Set value to contents of a C string.

## Parameters

<code>__s</code>	The C string to use.
------------------	----------------------

## Returns

Reference to this string.

This function sets the value of this string to the value of `__s`. The data is copied, so there is no dependence on `__s` once the function returns.

Definition at line 1128 of file `basic_string.h`.

4.505.3.13 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::assign ( size_type __n, _CharT __c ) [inline]`

Set value to multiple characters.

**Parameters**

<code>__n</code>	Length of the resulting string.
<code>__c</code>	The character to use.

**Returns**

Reference to this string.

This function sets the value of this string to `__n` copies of character `__c`.

Definition at line 1144 of file `basic_string.h`.

4.505.3.14 `template<typename _CharT, typename _Traits, typename _Alloc> template<class _InputIterator > basic_string& std::basic_string< _CharT, _Traits, _Alloc >::assign ( _InputIterator __first, _InputIterator __last ) [inline]`

Set value to a range of characters.

**Parameters**

<code>__first</code>	Iterator referencing the first character to append.
<code>__last</code>	Iterator marking the end of the range.

**Returns**

Reference to this string.

Sets value of string to characters in the range `[__first,__last)`.

Definition at line 1157 of file `basic_string.h`.

4.505.3.15 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::assign ( initializer_list< _CharT > __l ) [inline]`

Set value to an `initializer_list` of characters.

**Parameters**

<code>__l</code>	The <code>initializer_list</code> of characters to assign.
------------------	--

**Returns**

Reference to this string.

Definition at line 1167 of file `basic_string.h`.

4.505.3.16 `template<typename _CharT, typename _Traits, typename _Alloc> const_reference std::basic_string< _CharT, _Traits, _Alloc >::at ( size_type __n ) const [inline]`

Provides access to the data contained in the string.

**Parameters**

<code>__n</code>	The index of the character to access.
------------------	---------------------------------------

**Returns**

Read-only (const) reference to the character.

**Exceptions**

<i>std::out_of_range</i>	If <i>n</i> is an invalid index.
--------------------------	----------------------------------

This function provides for safer data access. The parameter is first checked that it is in the range of the string. The function throws `out_of_range` if the check fails.

Definition at line 864 of file `basic_string.h`.

**4.505.3.17** `template<typename _CharT, typename _Traits, typename _Alloc> reference std::basic_string< _CharT, _Traits, _Alloc >::at( size_type __n ) [inline]`

Provides access to the data contained in the string.

**Parameters**

<code>__n</code>	The index of the character to access.
------------------	---------------------------------------

**Returns**

Read/write reference to the character.

**Exceptions**

<i>std::out_of_range</i>	If <i>n</i> is an invalid index.
--------------------------	----------------------------------

This function provides for safer data access. The parameter is first checked that it is in the range of the string. The function throws `out_of_range` if the check fails. Success results in unsharing the string.

Definition at line 883 of file `basic_string.h`.

**4.505.3.18** `template<typename _CharT, typename _Traits, typename _Alloc> reference std::basic_string< _CharT, _Traits, _Alloc >::back ( ) [inline]`

Returns a read/write reference to the data at the last element of the string.

Definition at line 913 of file `basic_string.h`.

**4.505.3.19** `template<typename _CharT, typename _Traits, typename _Alloc> const_reference std::basic_string< _CharT, _Traits, _Alloc >::back ( ) const [inline]`

Returns a read-only (constant) reference to the data at the last element of the string.

Definition at line 921 of file `basic_string.h`.

**4.505.3.20** `template<typename _CharT, typename _Traits, typename _Alloc> iterator std::basic_string< _CharT, _Traits, _Alloc >::begin ( ) [inline], [noexcept]`

Returns a read/write iterator that points to the first character in the string. Unshares the string.

Definition at line 605 of file `basic_string.h`.

Referenced by `std::basic_string< _CharT >::crend()`, `std::regex_match()`, `std::regex_replace()`, `std::regex_search()`, and `std::basic_string< _CharT >::rend()`.

**4.505.3.21** `template<typename _CharT, typename _Traits, typename _Alloc> const_iterator std::basic_string< _CharT, _Traits, _Alloc >::begin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first character in the string.

Definition at line 616 of file `basic_string.h`.

**4.505.3.22** `template<typename _CharT, typename _Traits, typename _Alloc> const _CharT* std::basic_string< _CharT, _Traits, _Alloc >::c_str ( ) const [inline], [noexcept]`

Return const pointer to null-terminated contents.

This is a handle to internal data. Do not modify or dire things may happen.

Definition at line 1800 of file basic\_string.h.

Referenced by std::operator==( ).

**4.505.3.23** `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::capacity ( ) const [inline], [noexcept]`

Returns the total number of characters that the string can hold before needing to allocate more memory.

Definition at line 776 of file basic\_string.h.

Referenced by std::basic\_string< \_CharT >::push\_back(), and std::basic\_string< \_CharT >::shrink\_to\_fit().

**4.505.3.24** `template<typename _CharT, typename _Traits, typename _Alloc> const_iterator std::basic_string< _CharT, _Traits, _Alloc >::cbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first character in the string.

Definition at line 680 of file basic\_string.h.

**4.505.3.25** `template<typename _CharT, typename _Traits, typename _Alloc> const_iterator std::basic_string< _CharT, _Traits, _Alloc >::cend ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last character in the string.

Definition at line 688 of file basic\_string.h.

**4.505.3.26** `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string< _CharT, _Traits, _Alloc >::clear ( ) [inline], [noexcept]`

Erases the string, making it empty.

Definition at line 803 of file basic\_string.h.

**4.505.3.27** `template<typename _CharT, typename _Traits, typename _Alloc> int std::basic_string< _CharT, _Traits, _Alloc >::compare ( const basic_string< _CharT, _Traits, _Alloc > & __str ) const [inline]`

Compare to a string.

#### Parameters

<code>__str</code>	String to compare against.
--------------------	----------------------------

#### Returns

Integer < 0, 0, or > 0.

Returns an integer < 0 if this string is ordered before `__str`, 0 if their values are equivalent, or > 0 if this string is ordered after `__str`. Determines the effective length `rlen` of the strings to compare as the smallest of `size()` and `str.size()`. The function then compares the two strings by calling `traits::compare(data(), str.data(), rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

Definition at line 2225 of file basic\_string.h.

Referenced by std::sub\_match< \_Bi\_iter >::compare(), std::operator<(), std::operator<=(), std::operator==((), std::operator>(), and std::operator>=().

**4.505.3.28** template<typename \_CharT, typename \_Traits, typename \_Alloc> int std::basic\_string< \_CharT, \_Traits, \_Alloc >::compare ( size\_type \_\_pos, size\_type \_\_n, const basic\_string< \_CharT, \_Traits, \_Alloc > & \_\_str ) const

Compare substring to a string.

Parameters

<code>__pos</code>	Index of first character of substring.
<code>__n</code>	Number of characters in substring.
<code>__str</code>	String to compare against.

Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the `__n` characters starting at `__pos`. Returns an integer < 0 if the substring is ordered before `__str`, 0 if their values are equivalent, or > 0 if the substring is ordered after `__str`. Determines the effective length `rlen` of the strings to compare as the smallest of the length of the substring and `__str.size()`. The function then compares the two strings by calling `traits::compare(substring.data(),str.data(),rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

**4.505.3.29** template<typename \_CharT, typename \_Traits, typename \_Alloc> int std::basic\_string< \_CharT, \_Traits, \_Alloc >::compare ( size\_type \_\_pos1, size\_type \_\_n1, const basic\_string< \_CharT, \_Traits, \_Alloc > & \_\_str, size\_type \_\_pos2, size\_type \_\_n2 ) const

Compare substring to a substring.

Parameters

<code>__pos1</code>	Index of first character of substring.
<code>__n1</code>	Number of characters in substring.
<code>__str</code>	String to compare against.
<code>__pos2</code>	Index of first character of substring of str.
<code>__n2</code>	Number of characters in substring of str.

Returns

Integer < 0, 0, or > 0.

Form the substring of this string from the `__n1` characters starting at `__pos1`. Form the substring of `__str` from the `__n2` characters starting at `__pos2`. Returns an integer < 0 if this substring is ordered before the substring of `__str`, 0 if their values are equivalent, or > 0 if this substring is ordered after the substring of `__str`. Determines the effective length `rlen` of the strings to compare as the smallest of the lengths of the substrings. The function then compares the two strings by calling `traits::compare(substring.data(),str.substr(pos2,n2).data(),rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

**4.505.3.30** template<typename \_CharT, typename \_Traits, typename \_Alloc> int std::basic\_string< \_CharT, \_Traits, \_Alloc >::compare ( const \_CharT \* \_\_s ) const

Compare to a C string.

**Parameters**

<code>__s</code>	C string to compare against.
------------------	------------------------------

**Returns**

Integer < 0, 0, or > 0.

Returns an integer < 0 if this string is ordered before `__s`, 0 if their values are equivalent, or > 0 if this string is ordered after `__s`. Determines the effective length `rlen` of the strings to compare as the smallest of `size()` and the length of a string constructed from `__s`. The function then compares the two strings by calling `traits::compare(data(),s,rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

**4.505.3.31** `template<typename _CharT, typename _Traits, typename _Alloc> int std::basic_string<_CharT, _Traits, _Alloc>::compare ( size_type __pos, size_type __n1, const _CharT * __s ) const`

Compare substring to a C string.

**Parameters**

<code>__pos</code>	Index of first character of substring.
<code>__n1</code>	Number of characters in substring.
<code>__s</code>	C string to compare against.

**Returns**

Integer < 0, 0, or > 0.

Form the substring of this string from the `__n1` characters starting at `pos`. Returns an integer < 0 if the substring is ordered before `__s`, 0 if their values are equivalent, or > 0 if the substring is ordered after `__s`. Determines the effective length `rlen` of the strings to compare as the smallest of the length of the substring and the length of a string constructed from `__s`. The function then compares the two string by calling `traits::compare(substring.data(),__s,rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

**4.505.3.32** `template<typename _CharT, typename _Traits, typename _Alloc> int std::basic_string<_CharT, _Traits, _Alloc>::compare ( size_type __pos, size_type __n1, const _CharT * __s, size_type __n2 ) const`

Compare substring against a character array.

**Parameters**

<code>__pos</code>	Index of first character of substring.
<code>__n1</code>	Number of characters in substring.
<code>__s</code>	character array to compare against.
<code>__n2</code>	Number of characters of <code>s</code> .

**Returns**

Integer < 0, 0, or > 0.

Form the substring of this string from the `__n1` characters starting at `__pos`. Form a string from the first `__n2` characters of `__s`. Returns an integer < 0 if this substring is ordered before the string from `__s`, 0 if their values are equivalent, or > 0 if this substring is ordered after the string from `__s`. Determines the effective length `rlen` of the strings to compare as the smallest of the length of the substring and `__n2`. The function then compares the two strings by calling `traits::compare(substring.data(),s,rlen)`. If the result of the comparison is nonzero returns it, otherwise the shorter one is ordered first.

NB: `s` must have at least `n2` characters, `'\0'` has no special meaning.

4.505.3.33 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string<_CharT, _Traits, _Alloc>::copy ( _CharT * __s, size_type __n, size_type __pos = 0 ) const`

Copy substring into C string.

## Parameters

<code>__s</code>	C string to copy value into.
<code>__n</code>	Number of characters to copy.
<code>__pos</code>	Index of first character to copy.

## Returns

Number of characters actually copied

## Exceptions

<code>std::out_of_range</code>	If <code>__pos &gt; size()</code> .
--------------------------------	-------------------------------------

Copies up to `__n` characters starting at `__pos` into the C string `__s`. If `__pos` is greater than `size()`, `out_of_range` is thrown.

**4.505.3.34** `template<typename _CharT, typename _Traits, typename _Alloc> const_reverse_iterator std::basic_string<_CharT, _Traits, _Alloc>::crbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last character in the string. Iteration is done in reverse element order.

Definition at line 697 of file `basic_string.h`.

**4.505.3.35** `template<typename _CharT, typename _Traits, typename _Alloc> const_reverse_iterator std::basic_string<_CharT, _Traits, _Alloc>::crend ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first character in the string. Iteration is done in reverse element order.

Definition at line 706 of file `basic_string.h`.

**4.505.3.36** `template<typename _CharT, typename _Traits, typename _Alloc> const _CharT* std::basic_string<_CharT, _Traits, _Alloc>::data ( ) const [inline], [noexcept]`

Return const pointer to contents.

This is a handle to internal data. Do not modify or dire things may happen.

Definition at line 1810 of file `basic_string.h`.

Referenced by `std::basic_string<_CharT>::compare()`, `std::basic_string<_CharT>::find()`, `std::basic_string<_CharT>::find_first_not_of()`, `std::basic_string<_CharT>::find_last_of()`, `std::match_results<_FwdIterT, _Alloc>::format()`, and `std::regex_traits<_Ch_type>::transform()`.

**4.505.3.37** `template<typename _CharT, typename _Traits, typename _Alloc> bool std::basic_string<_CharT, _Traits, _Alloc>::empty ( ) const [inline], [noexcept]`

Returns true if the string is empty. Equivalent to `*this == ""`.

Definition at line 811 of file `basic_string.h`.

**4.505.3.38** `template<typename _CharT, typename _Traits, typename _Alloc> iterator std::basic_string<_CharT, _Traits, _Alloc>::end ( ) [inline], [noexcept]`

Returns a read/write iterator that points one past the last character in the string. Unshares the string.

Definition at line 624 of file `basic_string.h`.

Referenced by `std::basic_string<_CharT>::crbegin()`, `std::basic_string<_CharT>::rbegin()`, `std::regex_match()`, `std::regex_replace()`, and `std::regex_search()`.

4.505.3.39 `template<typename _CharT, typename _Traits, typename _Alloc> const_iterator std::basic_string<_CharT, _Traits, _Alloc>::end( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last character in the string.

Definition at line 635 of file basic\_string.h.

4.505.3.40 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::erase( size_type __pos = 0, size_type __n = npos ) [inline]`

Remove characters.

Parameters

<code>__pos</code>	Index of first character to remove (default 0).
<code>__n</code>	Number of characters to remove (default remainder).

Returns

Reference to this string.

Exceptions

<code>std::out_of_range</code>	If <code>pos</code> is beyond the end of this string.
--------------------------------	---

Removes `__n` characters from this string starting at `__pos`. The length of the string is reduced by `__n`. If there are `< __n` characters to remove, the remainder of the string is truncated. If `__p` is beyond end of string, `out_of_range` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1362 of file basic\_string.h.

Referenced by `std::basic_string<_CharT>::pop_back()`.

4.505.3.41 `template<typename _CharT, typename _Traits, typename _Alloc> iterator std::basic_string<_CharT, _Traits, _Alloc>::erase( iterator __position ) [inline]`

Remove one character.

Parameters

<code>__position</code>	Iterator referencing the character to remove.
-------------------------	---

Returns

iterator referencing same location after removal.

Removes the character at `__position` from this string. The value of the string doesn't change if an error is thrown.

Definition at line 1378 of file basic\_string.h.

4.505.3.42 `template<typename _CharT, typename _Traits, typename _Alloc> iterator std::basic_string<_CharT, _Traits, _Alloc>::erase( iterator __first, iterator __last )`

Remove a range of characters.

Parameters

<code>__first</code>	Iterator referencing the first character to remove.
<code>__last</code>	Iterator referencing the end of the range.

**Returns**

Iterator referencing location of first after removal.

Removes the characters in the range [first,last) from this string. The value of the string doesn't change if an error is thrown.

4.505.3.43 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find ( const _CharT * __s, size_type __pos, size_type __n ) const`

Find position of a C substring.

**Parameters**

<code>__s</code>	C string to locate.
<code>__pos</code>	Index of character to search from.
<code>__n</code>	Number of characters from <code>s</code> to search for.

**Returns**

Index of start of first occurrence.

Starting from `__pos`, searches forward for the first `__n` characters in `__s` within this string. If found, returns the index where it begins. If not found, returns `npos`.

Referenced by `std::basic_string< _CharT >::find()`, and `std::basic_string< _CharT >::find_first_of()`.

4.505.3.44 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find ( const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos = 0 ) const [inline], [noexcept]`

Find position of a string.

**Parameters**

<code>__str</code>	String to locate.
<code>__pos</code>	Index of character to search from (default 0).

**Returns**

Index of start of first occurrence.

Starting from `__pos`, searches forward for value of `__str` within this string. If found, returns the index where it begins. If not found, returns `npos`.

Definition at line 1846 of file `basic_string.h`.

4.505.3.45 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find ( const _CharT * __s, size_type __pos = 0 ) const [inline]`

Find position of a C string.

## Parameters

<code>__s</code>	C string to locate.
<code>__pos</code>	Index of character to search from (default 0).

## Returns

Index of start of first occurrence.

Starting from `__pos`, searches forward for the value of `__s` within this string. If found, returns the index where it begins. If not found, returns `npos`.

Definition at line 1861 of file `basic_string.h`.

4.505.3.46 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find ( _CharT __c, size_type __pos = 0 ) const [noexcept]`

Find position of a character.

## Parameters

<code>__c</code>	Character to locate.
<code>__pos</code>	Index of character to search from (default 0).

## Returns

Index of first occurrence.

Starting from `__pos`, searches forward for `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

4.505.3.47 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_first_not_of ( const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos = 0 ) const [inline], [noexcept]`

Find position of a character not in string.

## Parameters

<code>__str</code>	String containing characters to avoid.
<code>__pos</code>	Index of character to search from (default 0).

## Returns

Index of first occurrence.

Starting from `__pos`, searches forward for a character not contained in `__str` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 2079 of file `basic_string.h`.

Referenced by `std::basic_string< _CharT >::find_first_not_of()`.

4.505.3.48 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_first_not_of ( const _CharT * __s, size_type __pos, size_type __n ) const`

Find position of a character not in C substring.

**Parameters**

<code>__s</code>	C string containing characters to avoid.
<code>__pos</code>	Index of character to search from.
<code>__n</code>	Number of characters from <code>__s</code> to consider.

**Returns**

Index of first occurrence.

Starting from `__pos`, searches forward for a character not contained in the first `__n` characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

4.505.3.49 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_first_not_of( const _CharT* __s, size_type __pos = 0 ) const [inline]`

Find position of a character not in C string.

**Parameters**

<code>__s</code>	C string containing characters to avoid.
<code>__pos</code>	Index of character to search from (default 0).

**Returns**

Index of first occurrence.

Starting from `__pos`, searches forward for a character not contained in `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 2110 of file `basic_string.h`.

4.505.3.50 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_first_not_of( _CharT __c, size_type __pos = 0 ) const [noexcept]`

Find position of a different character.

**Parameters**

<code>__c</code>	Character to avoid.
<code>__pos</code>	Index of character to search from (default 0).

**Returns**

Index of first occurrence.

Starting from `__pos`, searches forward for a character other than `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

4.505.3.51 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_first_of( const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos = 0 ) const [inline], [noexcept]`

Find position of a character of string.

## Parameters

<code>__str</code>	String containing characters to locate.
<code>__pos</code>	Index of character to search from (default 0).

## Returns

Index of first occurrence.

Starting from `__pos`, searches forward for one of the characters of `__str` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 1952 of file `basic_string.h`.

Referenced by `std::basic_string< _CharT >::find_first_of()`.

4.505.3.52 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_first_of( const _CharT * __s, size_type __pos, size_type __n ) const`

Find position of a character of C substring.

## Parameters

<code>__s</code>	String containing characters to locate.
<code>__pos</code>	Index of character to search from.
<code>__n</code>	Number of characters from <code>s</code> to search for.

## Returns

Index of first occurrence.

Starting from `__pos`, searches forward for one of the first `__n` characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

4.505.3.53 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_first_of( const _CharT * __s, size_type __pos = 0 ) const [inline]`

Find position of a character of C string.

## Parameters

<code>__s</code>	String containing characters to locate.
<code>__pos</code>	Index of character to search from (default 0).

## Returns

Index of first occurrence.

Starting from `__pos`, searches forward for one of the characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 1982 of file `basic_string.h`.

4.505.3.54 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_first_of( _CharT __c, size_type __pos = 0 ) const [inline], [noexcept]`

Find position of a character.

## Parameters

<code>__c</code>	Character to locate.
<code>__pos</code>	Index of character to search from (default 0).

## Returns

Index of first occurrence.

Starting from `__pos`, searches forward for the character `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Note: equivalent to `find(__c, __pos)`.

Definition at line 2001 of file `basic_string.h`.

```
4.505.3.55  template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits,
            _Alloc >::find_last_not_of ( const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos = npos ) const
            [inline], [noexcept]
```

Find last position of a character not in string.

## Parameters

<code>__str</code>	String containing characters to avoid.
<code>__pos</code>	Index of character to search back from (default end).

## Returns

Index of last occurrence.

Starting from `__pos`, searches backward for a character not contained in `__str` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 2142 of file `basic_string.h`.

Referenced by `std::basic_string< _CharT >::find_last_not_of()`.

```
4.505.3.56  template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits,
            _Alloc >::find_last_not_of ( const _CharT * __s, size_type __pos, size_type __n ) const
```

Find last position of a character not in C substring.

## Parameters

<code>__s</code>	C string containing characters to avoid.
<code>__pos</code>	Index of character to search back from.
<code>__n</code>	Number of characters from <code>s</code> to consider.

## Returns

Index of last occurrence.

Starting from `__pos`, searches backward for a character not contained in the first `__n` characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

```
4.505.3.57  template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits,
            _Alloc >::find_last_not_of ( const _CharT * __s, size_type __pos = npos ) const [inline]
```

Find last position of a character not in C string.

## Parameters

<code>__s</code>	C string containing characters to avoid.
<code>__pos</code>	Index of character to search back from (default end).

## Returns

Index of last occurrence.

Starting from `__pos`, searches backward for a character not contained in `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 2173 of file `basic_string.h`.

4.505.3.58 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_last_not_of ( _CharT __c, size_type __pos = npos ) const [noexcept]`

Find last position of a different character.

## Parameters

<code>__c</code>	Character to avoid.
<code>__pos</code>	Index of character to search back from (default end).

## Returns

Index of last occurrence.

Starting from `__pos`, searches backward for a character other than `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

4.505.3.59 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_last_of ( const basic_string< _CharT, _Traits, _Alloc > & __str, size_type __pos = npos ) const [inline], [noexcept]`

Find last position of a character of string.

## Parameters

<code>__str</code>	String containing characters to locate.
<code>__pos</code>	Index of character to search back from (default end).

## Returns

Index of last occurrence.

Starting from `__pos`, searches backward for one of the characters of `__str` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 2016 of file `basic_string.h`.

Referenced by `std::basic_string< _CharT >::find_last_of()`.

4.505.3.60 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_last_of ( const _CharT* __s, size_type __pos, size_type __n ) const`

Find last position of a character of C substring.

**Parameters**

<code>__s</code>	C string containing characters to locate.
<code>__pos</code>	Index of character to search back from.
<code>__n</code>	Number of characters from <code>s</code> to search for.

**Returns**

Index of last occurrence.

Starting from `__pos`, searches backward for one of the first `__n` characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

4.505.3.61 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_last_of( const _CharT * __s, size_type __pos = npos ) const [inline]`

Find last position of a character of C string.

**Parameters**

<code>__s</code>	C string containing characters to locate.
<code>__pos</code>	Index of character to search back from (default end).

**Returns**

Index of last occurrence.

Starting from `__pos`, searches backward for one of the characters of `__s` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Definition at line 2046 of file `basic_string.h`.

4.505.3.62 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string< _CharT, _Traits, _Alloc >::find_last_of( _CharT __c, size_type __pos = npos ) const [inline], [noexcept]`

Find last position of a character.

**Parameters**

<code>__c</code>	Character to locate.
<code>__pos</code>	Index of character to search back from (default end).

**Returns**

Index of last occurrence.

Starting from `__pos`, searches backward for `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

Note: equivalent to `rfind(__c, __pos)`.

Definition at line 2065 of file `basic_string.h`.

4.505.3.63 `template<typename _CharT, typename _Traits, typename _Alloc> reference std::basic_string< _CharT, _Traits, _Alloc >::front( ) [inline]`

Returns a read/write reference to the data at the first element of the string.

Definition at line 897 of file `basic_string.h`.

4.505.3.64 `template<typename _CharT, typename _Traits, typename _Alloc> const_reference std::basic_string<_CharT, _Traits, _Alloc>::front ( ) const [inline]`

Returns a read-only (constant) reference to the data at the first element of the string.

Definition at line 905 of file basic\_string.h.

4.505.3.65 `template<typename _CharT, typename _Traits, typename _Alloc> allocator_type std::basic_string<_CharT, _Traits, _Alloc>::get_allocator ( ) const [inline], [noexcept]`

Return copy of allocator used to construct this string.

Definition at line 1817 of file basic\_string.h.

Referenced by std::basic\_string<\_CharT>::basic\_string(), and std::basic\_string<\_CharT>::~~basic\_string().

4.505.3.66 `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string<_CharT, _Traits, _Alloc>::insert ( iterator __p, size_type __n, _CharT __c ) [inline]`

Insert multiple characters.

#### Parameters

<code>__p</code>	Iterator referencing location in string to insert at.
<code>__n</code>	Number of characters to insert
<code>__c</code>	The character to insert.

#### Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Inserts `__n` copies of character `__c` starting at the position referenced by iterator `__p`. If adding characters causes the length to exceed `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1185 of file basic\_string.h.

Referenced by std::basic\_string<\_CharT>::insert().

4.505.3.67 `template<typename _CharT, typename _Traits, typename _Alloc> template<class _InputIterator > void std::basic_string<_CharT, _Traits, _Alloc>::insert ( iterator __p, _InputIterator __beg, _InputIterator __end ) [inline]`

Insert a range of characters.

#### Parameters

<code>__p</code>	Iterator referencing location in string to insert at.
<code>__beg</code>	Start of range.
<code>__end</code>	End of range.

#### Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Inserts characters in range `[__beg, __end)`. If adding characters causes the length to exceed `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1202 of file basic\_string.h.

4.505.3.68 `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string<_CharT, _Traits, _Alloc>::insert ( iterator __p, initializer_list<_CharT> __l ) [inline]`

Insert an initializer\_list of characters.

## Parameters

<code>__p</code>	Iterator referencing location in string to insert at.
<code>__l</code>	The initializer_list of characters to insert.

## Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Definition at line 1213 of file `basic_string.h`.

4.505.3.69 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::insert( size_type __pos1, const basic_string<_CharT, _Traits, _Alloc> &__str ) [inline]`

Insert value of a string.

## Parameters

<code>__pos1</code>	Iterator referencing location in string to insert at.
<code>__str</code>	The string to insert.

## Returns

Reference to this string.

## Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Inserts value of `__str` starting at `__pos1`. If adding characters causes the length to exceed `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1233 of file `basic_string.h`.

4.505.3.70 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::insert( size_type __pos1, const basic_string<_CharT, _Traits, _Alloc> &__str, size_type __pos2, size_type __n ) [inline]`

Insert a substring.

## Parameters

<code>__pos1</code>	Iterator referencing location in string to insert at.
<code>__str</code>	The string to insert.
<code>__pos2</code>	Start of characters in <code>str</code> to insert.
<code>__n</code>	Number of characters to insert.

## Returns

Reference to this string.

## Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

<i>std::out_of_range</i>	If <i>pos1</i> > size() or <i>__pos2</i> > <i>str.size()</i> .
--------------------------	--

Starting at *pos1*, insert *\_\_n* character of *\_\_str* beginning with *\_\_pos2*. If adding characters causes the length to exceed *max\_size()*, *length\_error* is thrown. If *\_\_pos1* is beyond the end of this string or *\_\_pos2* is beyond the end of *\_\_str*, *out\_of\_range* is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1255 of file *basic\_string.h*.

4.505.3.71 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::insert ( size_type __pos, const _CharT * __s, size_type __n )`

Insert a C substring.

#### Parameters

<i>__pos</i>	Iterator referencing location in string to insert at.
<i>__s</i>	The C string to insert.
<i>__n</i>	The number of characters to insert.

#### Returns

Reference to this string.

#### Exceptions

<i>std::length_error</i>	If new length exceeds <i>max_size()</i> .
<i>std::out_of_range</i>	If <i>__pos</i> is beyond the end of this string.

Inserts the first *\_\_n* characters of *\_\_s* starting at *\_\_pos*. If adding characters causes the length to exceed *max\_size()*, *length\_error* is thrown. If *\_\_pos* is beyond *end()*, *out\_of\_range* is thrown. The value of the string doesn't change if an error is thrown.

4.505.3.72 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::insert ( size_type __pos, const _CharT * __s ) [inline]`

Insert a C string.

#### Parameters

<i>__pos</i>	Iterator referencing location in string to insert at.
<i>__s</i>	The C string to insert.

#### Returns

Reference to this string.

#### Exceptions

<i>std::length_error</i>	If new length exceeds <i>max_size()</i> .
<i>std::out_of_range</i>	If <i>pos</i> is beyond the end of this string.

Inserts the first *n* characters of *\_\_s* starting at *\_\_pos*. If adding characters causes the length to exceed *max\_size()*, *length\_error* is thrown. If *\_\_pos* is beyond *end()*, *out\_of\_range* is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1296 of file *basic\_string.h*.

4.505.3.73 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::insert ( size_type __pos, size_type __n, _CharT __c ) [inline]`

Insert multiple characters.

## Parameters

<code>__pos</code>	Index in string to insert at.
<code>__n</code>	Number of characters to insert
<code>__c</code>	The character to insert.

## Returns

Reference to this string.

## Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
<code>std::out_of_range</code>	If <code>__pos</code> is beyond the end of this string.

Inserts `__n` copies of character `__c` starting at index `__pos`. If adding characters causes the length to exceed `max_size()`, `length_error` is thrown. If `__pos > length()`, `out_of_range` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1319 of file `basic_string.h`.

4.505.3.74 `template<typename _CharT, typename _Traits, typename _Alloc> iterator std::basic_string<_CharT, _Traits, _Alloc>::insert( iterator __p, _CharT __c ) [inline]`

Insert one character.

## Parameters

<code>__p</code>	Iterator referencing position in string to insert at.
<code>__c</code>	The character to insert.

## Returns

Iterator referencing newly inserted char.

## Exceptions

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Inserts character `__c` at position referenced by `__p`. If adding character causes the length to exceed `max_size()`, `length_error` is thrown. If `__p` is beyond end of string, `out_of_range` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1337 of file `basic_string.h`.

4.505.3.75 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string<_CharT, _Traits, _Alloc>::length( ) const [inline], [noexcept]`

Returns the number of characters in the string, not including any null-termination.

Definition at line 721 of file `basic_string.h`.

4.505.3.76 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string<_CharT, _Traits, _Alloc>::max_size( ) const [inline], [noexcept]`

Returns the `size()` of the largest possible string.

Definition at line 726 of file `basic_string.h`.

4.505.3.77 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::operator+=( const basic_string<_CharT, _Traits, _Alloc> &__str ) [inline]`

Append a string to this string.

## Parameters

<code>__str</code>	The string to append.
--------------------	-----------------------

## Returns

Reference to this string.

Definition at line 932 of file basic\_string.h.

4.505.3.78 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::operator+=( const _CharT * __s ) [inline]`

Append a C string.

## Parameters

<code>__s</code>	The C string to append.
------------------	-------------------------

## Returns

Reference to this string.

Definition at line 941 of file basic\_string.h.

4.505.3.79 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::operator+=( _CharT __c ) [inline]`

Append a character.

## Parameters

<code>__c</code>	The character to append.
------------------	--------------------------

## Returns

Reference to this string.

Definition at line 950 of file basic\_string.h.

4.505.3.80 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::operator+=( initializer_list< _CharT > __l ) [inline]`

Append an initializer\_list of characters.

## Parameters

<code>__l</code>	The initializer_list of characters to be appended.
------------------	--

## Returns

Reference to this string.

Definition at line 963 of file basic\_string.h.

4.505.3.81 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::operator=( const basic_string< _CharT, _Traits, _Alloc > & __str ) [inline]`

Assign the value of *str* to this string.

## Parameters

<code>__str</code>	Source string.
--------------------	----------------

Definition at line 546 of file `basic_string.h`.

4.505.3.82 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::operator= ( const _CharT * __s ) [inline]`

Copy contents of `s` into this string.

## Parameters

<code>__s</code>	Source null-terminated string.
------------------	--------------------------------

Definition at line 554 of file `basic_string.h`.

4.505.3.83 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::operator= ( _CharT __c ) [inline]`

Set value to string of length 1.

## Parameters

<code>__c</code>	Source character.
------------------	-------------------

Assigning to a character makes this string length 1 and `(*this)[0] == c`.

Definition at line 565 of file `basic_string.h`.

4.505.3.84 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::operator= ( basic_string< _CharT, _Traits, _Alloc > && __str ) [inline]`

Move assign the value of `str` to this string.

## Parameters

<code>__str</code>	Source string.
--------------------	----------------

The contents of `str` are moved into this string (without copying). `str` is a valid, but unspecified string.

Definition at line 580 of file `basic_string.h`.

4.505.3.85 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::operator= ( initializer_list< _CharT > __l ) [inline]`

Set value to string constructed from initializer list.

## Parameters

<code>__l</code>	<code>std::initializer_list</code> .
------------------	--------------------------------------

Definition at line 592 of file `basic_string.h`.

4.505.3.86 `template<typename _CharT, typename _Traits, typename _Alloc> const_reference std::basic_string< _CharT, _Traits, _Alloc >::operator[] ( size_type __pos ) const [inline]`

Subscript access to the data contained in the string.

## Parameters

<code>__pos</code>	The index of the character to access.
--------------------	---------------------------------------

## Returns

Read-only (constant) reference to the character.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 826 of file `basic_string.h`.

Referenced by `std::basic_string< _CharT >::back()`, and `std::basic_string< _CharT >::front()`.

**4.505.3.87** `template<typename _CharT, typename _Traits, typename _Alloc> reference std::basic_string< _CharT, _Traits, _Alloc >::operator[]( size_type __pos ) [inline]`

Subscript access to the data contained in the string.

## Parameters

<code>__pos</code>	The index of the character to access.
--------------------	---------------------------------------

## Returns

Read/write reference to the character.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.) Unshares the string.

Definition at line 843 of file `basic_string.h`.

**4.505.3.88** `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string< _CharT, _Traits, _Alloc >::pop_back( ) [inline]`

Remove the last character.

The string must be non-empty.

Definition at line 1407 of file `basic_string.h`.

**4.505.3.89** `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string< _CharT, _Traits, _Alloc >::push_back( _CharT __c ) [inline]`

Append a single character.

## Parameters

<code>__c</code>	Character to append.
------------------	----------------------

Definition at line 1052 of file `basic_string.h`.

Referenced by `std::basic_string< _CharT >::operator+=( )`.

**4.505.3.90** `template<typename _CharT, typename _Traits, typename _Alloc> reverse_iterator std::basic_string< _CharT, _Traits, _Alloc >::rbegin( ) [inline], [noexcept]`

Returns a read/write reverse iterator that points to the last character in the string. Iteration is done in reverse element order. Unshares the string.

Definition at line 644 of file `basic_string.h`.

**4.505.3.91** `template<typename _CharT, typename _Traits, typename _Alloc> const_reverse_iterator std::basic_string<_CharT, _Traits, _Alloc>::rbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last character in the string. Iteration is done in reverse element order.

Definition at line 653 of file `basic_string.h`.

**4.505.3.92** `template<typename _CharT, typename _Traits, typename _Alloc> reverse_iterator std::basic_string<_CharT, _Traits, _Alloc>::rend ( ) [inline], [noexcept]`

Returns a read/write reverse iterator that points to one before the first character in the string. Iteration is done in reverse element order. Unshares the string.

Definition at line 662 of file `basic_string.h`.

**4.505.3.93** `template<typename _CharT, typename _Traits, typename _Alloc> const_reverse_iterator std::basic_string<_CharT, _Traits, _Alloc>::rend ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first character in the string. Iteration is done in reverse element order.

Definition at line 671 of file `basic_string.h`.

**4.505.3.94** `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::replace ( size_type __pos, size_type __n, const basic_string<_CharT, _Traits, _Alloc> & __str ) [inline]`

Replace characters with value from another string.

#### Parameters

<code>__pos</code>	Index of first character to replace.
<code>__n</code>	Number of characters to be replaced.
<code>__str</code>	String to insert.

#### Returns

Reference to this string.

#### Exceptions

<code>std::out_of_range</code>	If <code>pos</code> is beyond the end of this string.
<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .

Removes the characters in the range `[__pos, __pos+__n)` from this string. In place, the value of `__str` is inserted. If `__pos` is beyond end of string, `out_of_range` is thrown. If the length of the result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1429 of file `basic_string.h`.

Referenced by `std::basic_string<_CharT>::append()`, `std::basic_string<_CharT>::assign()`, `std::basic_string<_CharT>::insert()`, and `std::basic_string<_CharT>::replace()`.

**4.505.3.95** `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::replace ( size_type __pos1, size_type __n1, const basic_string<_CharT, _Traits, _Alloc> & __str, size_type __pos2, size_type __n2 ) [inline]`

Replace characters with value from another string.

## Parameters

<code>__pos1</code>	Index of first character to replace.
<code>__n1</code>	Number of characters to be replaced.
<code>__str</code>	String to insert.
<code>__pos2</code>	Index of first character of str to use.
<code>__n2</code>	Number of characters from str to use.

## Returns

Reference to this string.

## Exceptions

<code>std::out_of_range</code>	If <code>__pos1 &gt; size()</code> or <code>__pos2 &gt; __str.size()</code> .
<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .

Removes the characters in the range `[__pos1, __pos1 + n)` from this string. In place, the value of `__str` is inserted. If `__pos` is beyond end of string, `out_of_range` is thrown. If the length of the result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1451 of file `basic_string.h`.

4.505.3.96 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::replace ( size_type __pos, size_type __n1, const _CharT * __s, size_type __n2 )`

Replace characters with value of a C substring.

## Parameters

<code>__pos</code>	Index of first character to replace.
<code>__n1</code>	Number of characters to be replaced.
<code>__s</code>	C string to insert.
<code>__n2</code>	Number of characters from s to use.

## Returns

Reference to this string.

## Exceptions

<code>std::out_of_range</code>	If <code>pos1 &gt; size()</code> .
<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .

Removes the characters in the range `[__pos, __pos + __n1)` from this string. In place, the first `__n2` characters of `__s` are inserted, or all of `__s` if `__n2` is too large. If `__pos` is beyond end of string, `out_of_range` is thrown. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

4.505.3.97 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT, _Traits, _Alloc >::replace ( size_type __pos, size_type __n1, const _CharT * __s ) [inline]`

Replace characters with value of a C string.

## Parameters

<code>__pos</code>	Index of first character to replace.
<code>__n1</code>	Number of characters to be replaced.
<code>__s</code>	C string to insert.

**Returns**

Reference to this string.

**Exceptions**

<code>std::out_of_range</code>	If <code>pos &gt; size()</code> .
<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .

Removes the characters in the range `[__pos, __pos + __n1)` from this string. In place, the characters of `__s` are inserted. If `__pos` is beyond end of string, `out_of_range` is thrown. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1496 of file `basic_string.h`.

```
4.505.3.98 template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT,
    _Traits, _Alloc >::replace ( size_type __pos, size_type __n1, size_type __n2, _CharT __c ) [inline]
```

Replace characters with multiple characters.

**Parameters**

<code>__pos</code>	Index of first character to replace.
<code>__n1</code>	Number of characters to be replaced.
<code>__n2</code>	Number of characters to insert.
<code>__c</code>	Character to insert.

**Returns**

Reference to this string.

**Exceptions**

<code>std::out_of_range</code>	If <code>__pos &gt; size()</code> .
<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .

Removes the characters in the range `[pos, pos + n1)` from this string. In place, `__n2` copies of `__c` are inserted. If `__pos` is beyond end of string, `out_of_range` is thrown. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1520 of file `basic_string.h`.

```
4.505.3.99 template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string< _CharT,
    _Traits, _Alloc >::replace ( iterator __i1, iterator __i2, const basic_string< _CharT, _Traits, _Alloc > & __str )
    [inline]
```

Replace range of characters with string.

**Parameters**

<code>__i1</code>	Iterator referencing start of range to replace.
-------------------	---

<code>__i2</code>	Iterator referencing end of range to replace.
<code>__str</code>	String value to insert.

**Returns**

Reference to this string.

**Exceptions**

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Removes the characters in the range `[__i1, __i2)`. In place, the value of `__str` is inserted. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1538 of file `basic_string.h`.

4.505.3.100 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::replace ( iterator __i1, iterator __i2, const _CharT* __s, size_type __n ) [inline]`

Replace range of characters with C substring.

**Parameters**

<code>__i1</code>	Iterator referencing start of range to replace.
<code>__i2</code>	Iterator referencing end of range to replace.
<code>__s</code>	C string value to insert.
<code>__n</code>	Number of characters from <code>s</code> to insert.

**Returns**

Reference to this string.

**Exceptions**

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Removes the characters in the range `[__i1, __i2)`. In place, the first `__n` characters of `__s` are inserted. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1557 of file `basic_string.h`.

4.505.3.101 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::replace ( iterator __i1, iterator __i2, const _CharT* __s ) [inline]`

Replace range of characters with C string.

**Parameters**

<code>__i1</code>	Iterator referencing start of range to replace.
<code>__i2</code>	Iterator referencing end of range to replace.
<code>__s</code>	C string value to insert.

**Returns**

Reference to this string.

**Exceptions**

<i>std::length_error</i>	If new length exceeds <code>max_size()</code> .
--------------------------	---

Removes the characters in the range `[__i1,__i2)`. In place, the characters of `__s` are inserted. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1578 of file `basic_string.h`.

4.505.3.102 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string& std::basic_string<_CharT, _Traits, _Alloc>::replace ( iterator __i1, iterator __i2, size_type __n, _CharT __c ) [inline]`

Replace range of characters with multiple characters.

**Parameters**

<code>__i1</code>	Iterator referencing start of range to replace.
<code>__i2</code>	Iterator referencing end of range to replace.
<code>__n</code>	Number of characters to insert.
<code>__c</code>	Character to insert.

**Returns**

Reference to this string.

**Exceptions**

<i>std::length_error</i>	If new length exceeds <code>max_size()</code> .
--------------------------	---

Removes the characters in the range `[__i1,__i2)`. In place, `__n` copies of `__c` are inserted. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1599 of file `basic_string.h`.

4.505.3.103 `template<typename _CharT, typename _Traits, typename _Alloc> template<class _InputIterator > basic_string& std::basic_string<_CharT, _Traits, _Alloc>::replace ( iterator __i1, iterator __i2, _InputIterator __k1, _InputIterator __k2 ) [inline]`

Replace range of characters with range.

**Parameters**

<code>__i1</code>	Iterator referencing start of range to replace.
<code>__i2</code>	Iterator referencing end of range to replace.
<code>__k1</code>	Iterator referencing start of range to insert.
<code>__k2</code>	Iterator referencing end of range to insert.

**Returns**

Reference to this string.

**Exceptions**

<i>std::length_error</i>	If new length exceeds <code>max_size()</code> .
--------------------------	---

Removes the characters in the range `[__i1,__i2)`. In place, characters in the range `[__k1,__k2)` are inserted. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1623 of file `basic_string.h`.

4.505.3.104 template<typename \_CharT, typename \_Traits, typename \_Alloc> basic\_string& std::basic\_string<\_CharT, \_Traits, \_Alloc>::replace ( iterator \_\_i1, iterator \_\_i2, initializer\_list<\_CharT> \_\_l ) [inline]

Replace range of characters with initializer\_list.

**Parameters**

<code>__i1</code>	Iterator referencing start of range to replace.
<code>__i2</code>	Iterator referencing end of range to replace.
<code>__l</code>	The initializer_list of characters to insert.

**Returns**

Reference to this string.

**Exceptions**

<code>std::length_error</code>	If new length exceeds <code>max_size()</code> .
--------------------------------	---

Removes the characters in the range `[__i1,__i2)`. In place, characters in the range `[__k1,__k2)` are inserted. If the length of result exceeds `max_size()`, `length_error` is thrown. The value of the string doesn't change if an error is thrown.

Definition at line 1692 of file `basic_string.h`.

4.505.3.105 `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string< _CharT, _Traits, _Alloc >::reserve ( size_type __res_arg = 0 )`

Attempt to preallocate enough memory for specified number of characters.

**Parameters**

<code>__res_arg</code>	Number of characters required.
------------------------	--------------------------------

**Exceptions**

<code>std::length_error</code>	If <code>__res_arg</code> exceeds <code>max_size()</code> .
--------------------------------	---

This function attempts to reserve enough memory for the string to hold the specified number of characters. If the number requested is more than `max_size()`, `length_error` is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the string length that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of string data.

Referenced by `std::basic_string< _CharT >::push_back()`, and `std::basic_string< _CharT >::shrink_to_fit()`.

4.505.3.106 `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string< _CharT, _Traits, _Alloc >::resize ( size_type __n, _CharT __c )`

Resizes the string to the specified number of characters.

**Parameters**

<code>__n</code>	Number of characters the string should contain.
<code>__c</code>	Character to fill any new elements.

This function will resize the string to the specified number of characters. If the number is smaller than the string's current size the string is truncated, otherwise the string is extended and new elements are set to `__c`.

Referenced by `std::basic_string< _CharT >::resize()`.

4.505.3.107 `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string< _CharT, _Traits, _Alloc >::resize ( size_type __n ) [inline]`

Resizes the string to the specified number of characters.

## Parameters

<code>__n</code>	Number of characters the string should contain.
------------------	---

This function will resize the string to the specified length. If the new size is smaller than the string's current size the string is truncated, otherwise the string is extended and new characters are default-constructed. For basic types such as char, this means setting them to 0.

Definition at line 753 of file basic\_string.h.

4.505.3.108 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string<_CharT, _Traits, _Alloc>::rfind ( const basic_string<_CharT, _Traits, _Alloc> & __str, size_type __pos = npos ) const [inline], [noexcept]`

Find last position of a string.

## Parameters

<code>__str</code>	String to locate.
<code>__pos</code>	Index of character to search back from (default end).

## Returns

Index of start of last occurrence.

Starting from `__pos`, searches backward for value of `__str` within this string. If found, returns the index where it begins. If not found, returns `npos`.

Definition at line 1891 of file basic\_string.h.

Referenced by `std::basic_string<_CharT>::find_last_of()`, and `std::basic_string<_CharT>::rfind()`.

4.505.3.109 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string<_CharT, _Traits, _Alloc>::rfind ( const _CharT * __s, size_type __pos, size_type __n ) const`

Find last position of a C substring.

## Parameters

<code>__s</code>	C string to locate.
<code>__pos</code>	Index of character to search back from.
<code>__n</code>	Number of characters from s to search for.

## Returns

Index of start of last occurrence.

Starting from `__pos`, searches backward for the first `__n` characters in `__s` within this string. If found, returns the index where it begins. If not found, returns `npos`.

4.505.3.110 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string<_CharT, _Traits, _Alloc>::rfind ( const _CharT * __s, size_type __pos = npos ) const [inline]`

Find last position of a C string.

## Parameters

<code>__s</code>	C string to locate.
<code>__pos</code>	Index of character to start search at (default end).

## Returns

Index of start of last occurrence.

Starting from `__pos`, searches backward for the value of `__s` within this string. If found, returns the index where it begins. If not found, returns `npos`.

Definition at line 1921 of file `basic_string.h`.

4.505.3.111 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string<_CharT, _Traits, _Alloc>::rfind ( _CharT __c, size_type __pos = npos ) const [noexcept]`

Find last position of a character.

## Parameters

<code>__c</code>	Character to locate.
<code>__pos</code>	Index of character to search back from (default end).

## Returns

Index of last occurrence.

Starting from `__pos`, searches backward for `__c` within this string. If found, returns the index where it was found. If not found, returns `npos`.

4.505.3.112 `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string<_CharT, _Traits, _Alloc>::shrink_to_fit ( ) [inline]`

A non-binding request to `reduce_capacity()` to `size()`.

Definition at line 759 of file `basic_string.h`.

4.505.3.113 `template<typename _CharT, typename _Traits, typename _Alloc> size_type std::basic_string<_CharT, _Traits, _Alloc>::size ( ) const [inline], [noexcept]`

Returns the number of characters in the string, not including any null-termination.

Definition at line 715 of file `basic_string.h`.

Referenced by `std::basic_string<_CharT>::assign()`, `std::basic_string<_CharT>::at()`, `std::basic_string<_CharT>::back()`, `std::basic_string<_CharT>::cend()`, `std::basic_string<_CharT>::clear()`, `std::basic_string<_CharT>::compare()`, `std::basic_string<_CharT>::empty()`, `std::basic_string<_CharT>::end()`, `std::basic_string<_CharT>::find()`, `std::basic_string<_CharT>::find_first_not_of()`, `std::basic_string<_CharT>::find_last_of()`, `std::match_results<_FwdIterT, _Alloc>::format()`, `std::basic_string<_CharT>::insert()`, `std::basic_string<_CharT>::operator[]()`, `std::basic_string<_CharT>::pop_back()`, `std::basic_string<_CharT>::push_back()`, `std::basic_string<_CharT>::replace()`, `std::basic_string<_CharT>::shrink_to_fit()`, and `std::regex_traits<_Ch_type>::transform()`.

4.505.3.114 `template<typename _CharT, typename _Traits, typename _Alloc> basic_string std::basic_string<_CharT, _Traits, _Alloc>::substr ( size_type __pos = 0, size_type __n = npos ) const [inline]`

Get a substring.

## Parameters

<code>__pos</code>	Index of first character (default 0).
<code>__n</code>	Number of characters in substring (default remainder).

## Returns

The new string.

## Exceptions

<code>std::out_of_range</code>	If <code>__pos &gt; size()</code> .
--------------------------------	-------------------------------------

Construct and return a new string using the `__n` characters starting at `__pos`. If the string is too short, use the remainder of the characters. If `__pos` is beyond the end of the string, `out_of_range` is thrown.

Definition at line 2206 of file `basic_string.h`.

4.505.3.115 `template<typename _CharT, typename _Traits, typename _Alloc> void std::basic_string< _CharT, _Traits, _Alloc >::swap ( basic_string< _CharT, _Traits, _Alloc > & __s )`

Swap contents with another string.

## Parameters

<code>__s</code>	String to swap with.
------------------	----------------------

Exchanges the contents of this string with that of `__s` in constant time.

Referenced by `std::basic_string< _CharT >::assign()`, `std::basic_string< _CharT >::operator=()`, and `std::swap()`.

## 4.505.4 Member Data Documentation

4.505.4.1 `template<typename _CharT, typename _Traits, typename _Alloc> const size_type std::basic_string< _CharT, _Traits, _Alloc >::npos [static]`

Value returned by various member functions when they fail.

Definition at line 285 of file `basic_string.h`.

#### 4.506.1 Detailed Description

A Bernoulli random number distribution.

Generates a sequence of true and false values with likelihood  $p$  that true will come up and  $(1 - p)$  that false will appear.

Definition at line 3572 of file random.h.

#### 4.506.2 Member Typedef Documentation

##### 4.506.2.1 typedef bool std::bernoulli\_distribution::result\_type

The type of the range of the distribution.

Definition at line 3576 of file random.h.

#### 4.506.3 Constructor & Destructor Documentation

##### 4.506.3.1 std::bernoulli\_distribution::bernoulli\_distribution ( double \_\_p = 0.5 ) [inline], [explicit]

Constructs a Bernoulli distribution with likelihood  $p$ .

#### Parameters

<a href="#">__p</a>	[IN] The likelihood of a true result being returned. Must be in the interval $[0, 1]$ .
---------------------	---

Definition at line 3609 of file random.h.

## 4.506.4 Member Function Documentation

4.506.4.1 **result\_type** std::bernoulli\_distribution::max ( ) const [inline]

Returns the least upper bound value of the distribution.

Definition at line 3659 of file random.h.

References std::max().

4.506.4.2 **result\_type** std::bernoulli\_distribution::min ( ) const [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 3652 of file random.h.

References std::min().

4.506.4.3 **template**<typename \_UniformRandomNumberGenerator > **result\_type** std::bernoulli\_distribution::operator() ( \_UniformRandomNumberGenerator & \_\_urng ) [inline]

Generating functions.

Definition at line 3667 of file random.h.

4.506.4.4 **double** std::bernoulli\_distribution::p ( ) const [inline]

Returns the *p* parameter of the distribution.

Definition at line 3630 of file random.h.

4.506.4.5 **param\_type** std::bernoulli\_distribution::param ( ) const [inline]

Returns the parameter set of the distribution.

Definition at line 3637 of file random.h.

Referenced by std::operator>>().

4.506.4.6 **void** std::bernoulli\_distribution::param ( const param\_type & \_\_param ) [inline]

Sets the parameter set of the distribution.

Parameters

<b>__param</b>	The new parameter set of the distribution.
----------------	--

Definition at line 3645 of file random.h.

4.506.4.7 **void** std::bernoulli\_distribution::reset ( ) [inline]

Resets the distribution state.

Does nothing for a Bernoulli distribution.

Definition at line 3624 of file random.h.

## 4.506.5 Friends And Related Function Documentation

4.506.5.1 **bool** operator== ( const bernoulli\_distribution & \_\_d1, const bernoulli\_distribution & \_\_d2 ) [friend]

Return true if two Bernoulli distributions have the same parameters.

Definition at line 3709 of file random.h.

The documentation for this class was generated from the following file:

- [random.h](#)

#### 4.507 std::bernoulli\_distribution::param\_type Struct Reference

## 4.513.1 Detailed Description

```
template<typename _IntType = int> class std::binomial_distribution< _IntType >
```

A discrete binomial random number distribution.

The formula for the binomial probability density function is  $p(i|t, p) = \binom{t}{i} p^i (1-p)^{t-i}$  where  $t$  and  $p$  are the parameters of the distribution.

Definition at line 3777 of file random.h.

## 4.513.2 Member Typedef Documentation

```
4.513.2.1 template<typename _IntType = int> typedef _IntType std::binomial_distribution< _IntType >::result_type
```

The type of the range of the distribution.

Definition at line 3780 of file random.h.

## 4.513.3 Member Function Documentation

```
4.513.3.1 template<typename _IntType = int> result_type std::binomial_distribution< _IntType >::max ( ) const
[inline]
```

Returns the least upper bound value of the distribution.

Definition at line 3887 of file random.h.

```
4.513.3.2 template<typename _IntType = int> result_type std::binomial_distribution< _IntType >::min ( ) const
[inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 3880 of file random.h.

```
4.513.3.3 template<typename _IntType = int> template<typename _UniformRandomNumberGenerator> result_type
std::binomial_distribution< _IntType >::operator() ( _UniformRandomNumberGenerator & __urng ) [inline]
```

Generating functions.

Definition at line 3895 of file random.h.

```
4.513.3.4 template<typename _IntType = int> double std::binomial_distribution< _IntType >::p ( ) const [inline]
```

Returns the distribution  $p$  parameter.

Definition at line 3858 of file random.h.

```
4.513.3.5 template<typename _IntType = int> param_type std::binomial_distribution< _IntType >::param ( ) const
[inline]
```

Returns the parameter set of the distribution.

Definition at line 3865 of file random.h.

```
4.513.3.6  template<typename _IntType = int> void std::binomial_distribution<_IntType>::param ( const param_type &  
          __param ) [inline]
```

Sets the parameter set of the distribution.

## Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 3873 of file random.h.

4.513.3.7 `template<typename _IntType = int> void std::binomial_distribution< _IntType >::reset ( ) [inline]`

Resets the distribution state.

Definition at line 3844 of file random.h.

References `std::normal_distribution< _RealType >::reset()`.

4.513.3.8 `template<typename _IntType = int> _IntType std::binomial_distribution< _IntType >::t ( ) const [inline]`

Returns the distribution `t` parameter.

Definition at line 3851 of file random.h.

## 4.513.4 Friends And Related Function Documentation

4.513.4.1 `template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits > std::basic_ostream< _CharT, _Traits>& operator<< ( std::basic_ostream< _CharT, _Traits > & __os, const std::binomial_distribution< _IntType1 > & __x ) [friend]`

Inserts a `binomial_distribution` random number distribution `__x` into the output stream `__os`.

## Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>binomial_distribution</code> random number distribution.

## Returns

The output stream with the state of `__x` inserted or in an error state.

4.513.4.2 `template<typename _IntType = int> bool operator== ( const binomial_distribution< _IntType > & __d1, const binomial_distribution< _IntType > & __d2 ) [friend]`

Return true if two `binomial` distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 3931 of file random.h.

4.513.4.3 `template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits > std::basic_istream< _CharT, _Traits>& operator>> ( std::basic_istream< _CharT, _Traits > & __is, std::binomial_distribution< _IntType1 > & __x ) [friend]`

Extracts a `binomial_distribution` random number distribution `__x` from the input stream `__is`.

## Parameters

<code>__is</code>	An input stream.
-------------------	------------------

<code>__x</code>	A <code>binomial_distribution</code> random number generator engine.
------------------	--

## Returns

The input stream with `__x` extracted or in an error state.

## 4.515.1 Detailed Description

```
template<typename _RealType = double>class std::cauchy_distribution< _RealType >
```

A `cauchy_distribution` random number distribution.

The formula for the normal probability mass function is  $p(x|a,b) = (\pi b(1 + (\frac{x-a}{b})^2))^{-1}$

Definition at line 2929 of file `random.h`.

## 4.515.2 Member Typedef Documentation

4.515.2.1 `template<typename _RealType = double> typedef _RealType std::cauchy_distribution< _RealType >::result_type`

The type of the range of the distribution.

Definition at line 2932 of file `random.h`.

## 4.515.3 Member Function Documentation

4.515.3.1 `template<typename _RealType = double> result_type std::cauchy_distribution< _RealType >::max ( ) const`  
`[inline]`

Returns the least upper bound value of the distribution.

Definition at line 3020 of file `random.h`.

References `std::max()`.

4.515.3.2 `template<typename _RealType = double> result_type std::cauchy_distribution<_RealType>::min ( ) const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 3013 of file random.h.

4.515.3.3 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator> result_type std::cauchy_distribution<_RealType>::operator() ( _UniformRandomNumberGenerator &__urng ) [inline]`

Generating functions.

Definition at line 3028 of file random.h.

4.515.3.4 `template<typename _RealType = double> param_type std::cauchy_distribution<_RealType>::param ( ) const [inline]`

Returns the parameter set of the distribution.

Definition at line 2998 of file random.h.

4.515.3.5 `template<typename _RealType = double> void std::cauchy_distribution<_RealType>::param ( const param_type &__param ) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 3006 of file random.h.

4.515.3.6 `template<typename _RealType = double> void std::cauchy_distribution<_RealType>::reset ( ) [inline]`

Resets the distribution state.

Definition at line 2980 of file random.h.

#### 4.515.4 Friends And Related Function Documentation

4.515.4.1 `template<typename _RealType = double> bool operator== ( const cauchy_distribution<_RealType> &__d1, const cauchy_distribution<_RealType> &__d2 ) [friend]`

Return true if two Cauchy distributions have the same parameters.

Definition at line 3063 of file random.h.

#### 4.517.1 Detailed Description

`template<class _CharT>struct std::char_traits< _CharT >`

Basis for explicit traits specializations.

#### Note

For any given actual character type, this definition is probably wrong. Since this is just a thin wrapper around `__gnu_cxx::char_traits`, it is possible to achieve a more appropriate definition by specializing `__gnu_cxx::char_traits`.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt05ch13s03.html> for advice on how to make use of this class for *unusual* character types. Also, check out `include/ext/pod_char_traits.h`.

Definition at line 227 of file `char_traits.h`.

## 4.521.1 Detailed Description

```
template<typename _RealType = double>class std::chi_squared_distribution< _RealType >
```

A chi\_squared\_distribution random number distribution.

The formula for the normal probability mass function is  $p(x|n) = \frac{x^{(n/2)-1}e^{-x/2}}{\Gamma(n/2)2^{n/2}}$

Definition at line 2719 of file random.h.

## 4.521.2 Member Typedef Documentation

```
4.521.2.1 template<typename _RealType = double> typedef _RealType std::chi_squared_distribution< _RealType
>::result_type
```

The type of the range of the distribution.

Definition at line 2722 of file random.h.

## 4.521.3 Member Function Documentation

```
4.521.3.1 template<typename _RealType = double> result_type std::chi_squared_distribution< _RealType >::max ( )
const [inline]
```

Returns the least upper bound value of the distribution.

Definition at line 2799 of file random.h.

References std::max().

```
4.521.3.2 template<typename _RealType = double> result_type std::chi_squared_distribution< _RealType >::min ( )
const [inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 2792 of file random.h.

```
4.521.3.3 template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type
std::chi_squared_distribution< _RealType >::operator() ( _UniformRandomNumberGenerator & __urng )
[inline]
```

Generating functions.

Definition at line 2807 of file random.h.

```
4.521.3.4 template<typename _RealType = double> param_type std::chi_squared_distribution< _RealType >::param ( )
const [inline]
```

Returns the parameter set of the distribution.

Definition at line 2777 of file random.h.

```
4.521.3.5 template<typename _RealType = double> void std::chi_squared_distribution< _RealType >::param ( const
param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

## Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 2785 of file random.h.

4.521.3.6 `template<typename _RealType = double> void std::chi_squared_distribution< _RealType >::reset ( )`  
`[inline]`

Resets the distribution state.

Definition at line 2763 of file random.h.

References `std::gamma_distribution< _RealType >::reset()`.

## 4.521.4 Friends And Related Function Documentation

4.521.4.1 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > std::basic_ostream< _CharT, _Traits>& operator<< ( std::basic_ostream< _CharT, _Traits > & __os, const std::chi_squared_distribution< _RealType1 > & __x )` `[friend]`

Inserts a `chi_squared_distribution` random number distribution `__x` into the output stream `__os`.

## Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>chi_squared_distribution</code> random number distribution.

## Returns

The output stream with the state of `__x` inserted or in an error state.

4.521.4.2 `template<typename _RealType = double> bool operator==( const chi_squared_distribution< _RealType > & __d1, const chi_squared_distribution< _RealType > & __d2 )` `[friend]`

Return true if two Chi-squared distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 2858 of file random.h.

4.521.4.3 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > std::basic_istream< _CharT, _Traits>& operator>> ( std::basic_istream< _CharT, _Traits > & __is, std::chi_squared_distribution< _RealType1 > & __x )` `[friend]`

Extracts a `chi_squared_distribution` random number distribution `__x` from the input stream `__is`.

## Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>chi_squared_distribution</code> random number generator engine.

## Returns

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following file:

## 4.523.1 Detailed Description

template<typename \_InternT, typename \_ExternT, typename \_StateT>class std::codecvt<\_InternT, \_ExternT, \_StateT >

Primary class template codecvt.

NB: Generic, mostly useless implementation.

Definition at line 276 of file codecvt.h.

## 4.523.2 Member Function Documentation

4.523.2.1 template<typename \_InternT, typename \_ExternT, typename \_StateT> virtual result std::codecvt<\_InternT, \_ExternT, \_StateT>::do\_out ( state\_type &\_\_state, const intern\_type \*\_\_from, const intern\_type \*\_\_from\_end, const intern\_type \*\_\_from\_next, extern\_type \*\_\_to, extern\_type \*\_\_to\_end, extern\_type \*\_\_to\_next ) const [protected], [virtual]

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This function is a hook for derived classes to change the value returned.

See also

out for more information.

Implements [std::\\_\\_codecvt\\_abstract\\_base<\\_InternT, \\_ExternT, \\_StateT >](#).

```
4.523.2.2 template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<
    _InternT, _ExternT, _StateT >::in ( state_type & __state, const extern_type * __from, const extern_type * __from_end,
    const extern_type * & __from_next, intern_type * __to, intern_type * __to_end, intern_type * & __to_next ) const
    [inline], [inherited]
```

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

#### Returns

`codecvt_base::result`.

Definition at line 196 of file `codecvt.h`.

```
4.523.2.3 template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base<
    _InternT, _ExternT, _StateT >::out ( state_type & __state, const intern_type * __from, const intern_type * __from_end,
    const intern_type * & __from_next, extern_type * __to, extern_type * __to_end, extern_type * & __to_next ) const
    [inline], [inherited]
```

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

#### Returns

`codecvt_base::result`.

Definition at line 116 of file `codecvt.h`.

```
4.523.2.4 template<typename _InternT, typename _ExternT, typename _StateT> result std:: __codecvt_abstract_base<
    _InternT, _ExternT, _StateT>::unshift ( state_type & __state, extern_type * __to, extern_type * __to_end, extern_type
    *& __to_next ) const    [inline],[inherited]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

#### Returns

`codecvt_base::result`.

Definition at line 155 of file `codecvt.h`.

## 4.524.1 Detailed Description

template<typename \_InternT, typename \_ExternT>class std::codecvt<\_InternT, \_ExternT, encoding\_state >

codecvt<InternT, \_ExternT, encoding\_state> specialization.

Definition at line 230 of file codecvt\_specializations.h.

## 4.524.2 Member Function Documentation

4.524.2.1 template<typename \_InternT, typename \_ExternT > codecvt\_base::result std::codecvt<\_InternT, \_ExternT, encoding\_state >::do\_out ( state\_type &\_\_state, const intern\_type \*\_\_from, const intern\_type \*\_\_from\_end, const intern\_type \*&\_\_from\_next, extern\_type \*\_\_to, extern\_type \*\_\_to\_end, extern\_type \*&\_\_to\_next ) const [protected], [virtual]

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This function is a hook for derived classes to change the value returned.

See also

out for more information.

Implements std::\_\_codecvt\_abstract\_base<\_InternT, \_ExternT, encoding\_state >.

Definition at line 306 of file codecvt\_specializations.h.

4.524.2.2 **result** **std::\_\_codecvt\_abstract\_base**< **\_InternT**, **\_ExternT**, **encoding\_state** >::**in** ( **state\_type** & **\_\_state**, **const extern\_type** \* **\_\_from**, **const extern\_type** \* **\_\_from\_end**, **const extern\_type** \* & **\_\_from\_next**, **intern\_type** \* **\_\_to**, **intern\_type** \* **\_\_to\_end**, **intern\_type** \* & **\_\_to\_next** ) **const** [inline],[inherited]

Convert from external to internal character set.

Converts input string of **extern\_type** to output string of **intern\_type**. This is analogous to **mbsrtowcs**. It does this by calling **codecvt::do\_in**.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [**from**,**from\_end**) are converted and written to [**to**,**to\_end**). **from\_next** and **to\_next** are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, **from\_next** and **to\_next** are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of **codecvt\_base::result**. If all the input is converted, returns **codecvt\_base::ok**. If no conversion is necessary, returns **codecvt\_base::noconv**. If the input ends early or there is insufficient space in the output, returns **codecvt\_base::partial**. Otherwise the conversion failed and **codecvt\_base::error** is returned.

#### Parameters

<b>__state</b>	Persistent conversion state data.
<b>__from</b>	Start of input.
<b>__from_end</b>	End of input.
<b>__from_next</b>	Returns start of unconverted data.
<b>__to</b>	Start of output buffer.
<b>__to_end</b>	End of output buffer.
<b>__to_next</b>	Returns start of unused output area.

#### Returns

**codecvt\_base::result**.

Definition at line 196 of file **codecvt.h**.

4.524.2.3 **result** **std::\_\_codecvt\_abstract\_base**< **\_InternT**, **\_ExternT**, **encoding\_state** >::**out** ( **state\_type** & **\_\_state**, **const intern\_type** \* **\_\_from**, **const intern\_type** \* **\_\_from\_end**, **const intern\_type** \* & **\_\_from\_next**, **extern\_type** \* **\_\_to**, **extern\_type** \* **\_\_to\_end**, **extern\_type** \* & **\_\_to\_next** ) **const** [inline],[inherited]

Convert from internal to external character set.

Converts input string of **intern\_type** to output string of **extern\_type**. This is analogous to **wcsrtombs**. It does this by calling **codecvt::do\_out**.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [**from**,**from\_end**) are converted and written to [**to**,**to\_end**). **from\_next** and **to\_next** are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, **from\_next** and **to\_next** are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of **codecvt\_base::result**. If all the input is converted, returns **codecvt\_base::ok**. If no conversion is necessary, returns **codecvt\_base::noconv**. If the input ends early or there is insufficient space in the output, returns **codecvt\_base::partial**. Otherwise the conversion failed and **codecvt\_base::error** is returned.

## Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

## Returns

codecvt\_base::result.

Definition at line 116 of file codecvt.h.

References `std::__codecvt_abstract_base<_InternT, _ExternT, _StateT >::do_out()`.

**4.524.2.4** `result std::__codecvt_abstract_base<_InternT, _ExternT, encoding_state >::unshift ( state_type & __state, extern_type * __to, extern_type * __to_end, extern_type *& __to_next ) const` [inline],[inherited]

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

## Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

## Returns

codecvt\_base::result.

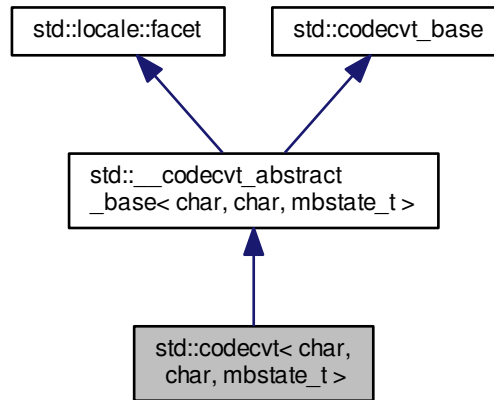

Definition at line 155 of file codecvt.h.

## 4.525.1 Detailed Description

template<>class std::codecvt< char, char, mbstate\_t >

class codecvt<char, char, mbstate\_t> specialization.

Definition at line 340 of file codecvt.h.

## 4.525.2 Member Function Documentation

4.525.2.1 virtual result std::codecvt< char, char, mbstate\_t >::do\_out ( state\_type &\_\_state, const intern\_type \*\_\_from, const intern\_type \*\_\_from\_end, const intern\_type \*\_\_&\_\_from\_next, extern\_type \*\_\_to, extern\_type \*\_\_to\_end, extern\_type \*\_\_&\_\_to\_next ) const [protected], [virtual]

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This function is a hook for derived classes to change the value returned.

## See also

out for more information.

Implements [std::\\_\\_codecvt\\_abstract\\_base< char, char, mbstate\\_t >](#).

4.525.2.2 **result** **std::\_\_codecvt\_abstract\_base**< char , char , mbstate\_t >::in ( state\_type & \_\_state, const extern\_type \* \_\_from, const extern\_type \* \_\_from\_end, const extern\_type \* & \_\_from\_next, intern\_type \* \_\_to, intern\_type \* \_\_to\_end, intern\_type \* & \_\_to\_next ) const [inline], [inherited]

Convert from external to internal character set.

Converts input string of extern\_type to output string of intern\_type. This is analogous to mbsrtowcs. It does this by calling codecvt::do\_in.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from\_end) are converted and written to [to,to\_end). from\_next and to\_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from\_next and to\_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt\_base::result. If all the input is converted, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt\_base::partial. Otherwise the conversion failed and codecvt\_base::error is returned.

#### Parameters

__state	Persistent conversion state data.
__from	Start of input.
__from_end	End of input.
__from_next	Returns start of unconverted data.
__to	Start of output buffer.
__to_end	End of output buffer.
__to_next	Returns start of unused output area.

#### Returns

codecvt\_base::result.

Definition at line 196 of file codecvt.h.

4.525.2.3 **result** **std::\_\_codecvt\_abstract\_base**< char , char , mbstate\_t >::out ( state\_type & \_\_state, const intern\_type \* \_\_from, const intern\_type \* \_\_from\_end, const intern\_type \* & \_\_from\_next, extern\_type \* \_\_to, extern\_type \* \_\_to\_end, extern\_type \* & \_\_to\_next ) const [inline], [inherited]

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This is analogous to wcsrtombs. It does this by calling codecvt::do\_out.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in [from,from\_end) are converted and written to [to,to\_end). from\_next and to\_next are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, from\_next and to\_next are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of codecvt\_base::result. If all the input is converted, returns codecvt\_base::ok. If no conversion is necessary, returns codecvt\_base::noconv. If the input ends early or there is insufficient space in the output, returns codecvt\_base::partial. Otherwise the conversion failed and codecvt\_base::error is returned.

## Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

## Returns

`codecvt_base::result`.

Definition at line 116 of file `codecvt.h`.

**4.525.2.4** `result std::__codecvt_abstract_base< char , char , mbstate_t >::unshift ( state_type & __state, extern_type * __to, extern_type * __to_end, extern_type *& __to_next ) const` `[inline],[inherited]`

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

## Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

### 4.528.1 Detailed Description

```
template<typename _InternT, typename _ExternT, typename _StateT> class std::codecvt_byname< _InternT, _ExternT, _StateT >
```

class codecvt\_byname [22.2.1.6].

Definition at line 458 of file codecvt.h.

### 4.528.2 Member Function Documentation

4.528.2.1 `template<typename _InternT, typename _ExternT, typename _StateT> virtual result std::codecvt< _InternT, _ExternT, _StateT >::do_out ( state_type &__state, const intern_type *__from, const intern_type *__from_end, const intern_type *&__from_next, extern_type *__to, extern_type *__to_end, extern_type *&__to_next ) const` [protected], [virtual], [inherited]

Convert from internal to external character set.

Converts input string of intern\_type to output string of extern\_type. This function is a hook for derived classes to change the value returned.

See also

out for more information.

Implements [std::\\_\\_codecvt\\_abstract\\_base< \\_InternT, \\_ExternT, \\_StateT >](#).

4.528.2.2 `template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::in ( state_type & __state, const extern_type * __from, const extern_type * __from_end, const extern_type * & __from_next, intern_type * __to, intern_type * __to_end, intern_type * & __to_next ) const [inline], [inherited]`

Convert from external to internal character set.

Converts input string of `extern_type` to output string of `intern_type`. This is analogous to `mbsrtowcs`. It does this by calling `codecvt::do_in`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The `state` argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how `state` is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

#### Returns

`codecvt_base::result`.

Definition at line 196 of file `codecvt.h`.

4.528.2.3 `template<typename _InternT, typename _ExternT, typename _StateT> result std::__codecvt_abstract_base< _InternT, _ExternT, _StateT >::out ( state_type & __state, const intern_type * __from, const intern_type * __from_end, const intern_type * & __from_next, extern_type * __to, extern_type * __to_end, extern_type * & __to_next ) const [inline], [inherited]`

Convert from internal to external character set.

Converts input string of `intern_type` to output string of `extern_type`. This is analogous to `wcsrtombs`. It does this by calling `codecvt::do_out`.

The source and destination character sets are determined by the facet's locale, internal and external types.

The characters in `[from,from_end)` are converted and written to `[to,to_end)`. `from_next` and `to_next` are set to point to the character following the last successfully converted character, respectively. If the result needed no conversion, `from_next` and `to_next` are not affected.

The *state* argument should be initialized if the input is at the beginning and carried from a previous call if continuing conversion. There are no guarantees about how *state* is used.

The result returned is a member of `codecvt_base::result`. If all the input is converted, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the input ends early or there is insufficient space in the output, returns `codecvt_base::partial`. Otherwise the conversion failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__from</code>	Start of input.
<code>__from_end</code>	End of input.
<code>__from_next</code>	Returns start of unconverted data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

#### Returns

`codecvt_base::result`.

Definition at line 116 of file `codecvt.h`.

```
4.528.2.4 template<typename _InternT, typename _ExternT, typename _StateT> result std:: __codecvt_abstract_base<
    _InternT, _ExternT, _StateT>::unshift ( state_type & __state, extern_type * __to, extern_type * __to_end, extern_type
    *& __to_next ) const    [inline],[inherited]
```

Reset conversion state.

Writes characters to output that would restore *state* to initial conditions. The idea is that if a partial conversion occurs, then the converting the characters written by this function would leave the state in initial conditions, rather than partial conversion state. It does this by calling `codecvt::do_unshift()`.

For example, if 4 external characters always converted to 1 internal character, and input to `in()` had 6 external characters with state saved, this function would write two characters to the output and set the state to initialized conditions.

The source and destination character sets are determined by the facet's locale, internal and external types.

The result returned is a member of `codecvt_base::result`. If the state could be reset and data written, returns `codecvt_base::ok`. If no conversion is necessary, returns `codecvt_base::noconv`. If the output has insufficient space, returns `codecvt_base::partial`. Otherwise the reset failed and `codecvt_base::error` is returned.

#### Parameters

<code>__state</code>	Persistent conversion state data.
<code>__to</code>	Start of output buffer.
<code>__to_end</code>	End of output buffer.
<code>__to_next</code>	Returns start of unused output area.

#### Returns

`codecvt_base::result`.

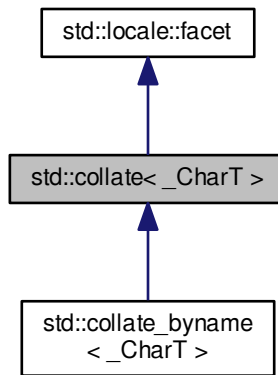

Definition at line 155 of file `codecvt.h`.

#### 4.529.1 Detailed Description

`template<typename _CharT> class std::collate<_CharT>`

Facet for localized string comparison.

This facet encapsulates the code to compare strings in a localized manner.

The collate template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the collate facet.

Definition at line 584 of file `locale_classes.h`.

#### 4.529.2 Member Typedef Documentation

4.529.2.1 `template<typename _CharT> typedef _CharT std::collate<_CharT>::char_type`

Public typedefs.

Definition at line 590 of file `locale_classes.h`.

4.529.2.2 `template<typename _CharT> typedef basic_string<_CharT> std::collate<_CharT>::string_type`

Public typedefs.

Definition at line 591 of file `locale_classes.h`.

#### 4.529.3 Constructor & Destructor Documentation

4.529.3.1 `template<typename _CharT> std::collate<_CharT>::collate(size_t __refs = 0) [inline], [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

## Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 611 of file `locale_classes.h`.

**4.529.3.2** `template<typename _CharT> std::collate<_CharT>::collate ( __c_locale __cloc, size_t __refs = 0 )`  
`[inline], [explicit]`

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

## Parameters

<code>__cloc</code>	The C locale.
<code>__refs</code>	Passed to the base facet class.

Definition at line 625 of file `locale_classes.h`.

**4.529.3.3** `template<typename _CharT> virtual std::collate<_CharT>::~~collate ( )` `[inline], [protected], [virtual]`

Destructor.

Definition at line 688 of file `locale_classes.h`.

**4.529.4 Member Function Documentation**

**4.529.4.1** `template<typename _CharT> int std::collate<_CharT>::compare ( const _CharT * __lo1, const _CharT * __hi1, const _CharT * __lo2, const _CharT * __hi2 ) const` `[inline]`

Compare two strings.

This function compares two strings and returns the result by calling `collate::do_compare()`.

## Parameters

<code>__lo1</code>	Start of string 1.
<code>__hi1</code>	End of string 1.
<code>__lo2</code>	Start of string 2.
<code>__hi2</code>	End of string 2.

## Returns

1 if `string1 > string2`, -1 if `string1 < string2`, else 0.

Definition at line 642 of file `locale_classes.h`.

**4.529.4.2** `template<typename _CharT> virtual int std::collate<_CharT>::do_compare ( const _CharT * __lo1, const _CharT * __hi1, const _CharT * __lo2, const _CharT * __hi2 ) const` `[protected], [virtual]`

Compare two strings.

This function is a hook for derived classes to change the value returned.

## See also

`compare()`.

## Parameters

<code>__lo1</code>	Start of string 1.
<code>__hi1</code>	End of string 1.
<code>__lo2</code>	Start of string 2.
<code>__hi2</code>	End of string 2.

## Returns

1 if string1 > string2, -1 if string1 < string2, else 0.

4.529.4.3 `template<typename _CharT> virtual long std::collate<_CharT>::do_hash ( const _CharT * __lo, const _CharT * __hi ) const` [protected], [virtual]

Return hash of a string.

This function computes and returns a hash on the input string. This function is a hook for derived classes to change the value returned.

## Parameters

<code>__lo</code>	Start of string.
<code>__hi</code>	End of string.

## Returns

Hash value.

4.529.4.4 `template<typename _CharT> virtual string_type std::collate<_CharT>::do_transform ( const _CharT * __lo, const _CharT * __hi ) const` [protected], [virtual]

Transform string to comparable form.

This function is a hook for derived classes to change the value returned.

## Parameters

<code>__lo</code>	Start.
<code>__hi</code>	End.

## Returns

transformed string.

4.529.4.5 `template<typename _CharT> long std::collate<_CharT>::hash ( const _CharT * __lo, const _CharT * __hi ) const` [inline]

Return hash of a string.

This function computes and returns a hash on the input string. It does so by returning `collate::do_hash()`.

## Parameters

<code>__lo</code>	Start of string.
<code>__hi</code>	End of string.

**Returns**

Hash value.

Definition at line 675 of file `locale_classes.h`.

**4.529.4.6** `template<typename _CharT> string_type std::collate<_CharT>::transform ( const _CharT * __lo, const _CharT * __hi ) const [inline]`

Transform string to comparable form.

This function is a wrapper for `strxfrm` functionality. It takes the input string and returns a modified string that can be directly compared to other transformed strings. In the C locale, this function just returns a copy of the input string. In some other locales, it may replace two chars with one, change a char for another, etc. It does so by returning `collate::do_transform()`.

**Parameters**

<code>__lo</code>	Start of string.
<code>__hi</code>	End of string.

**Returns**

Transformed `string_type`.

Definition at line 661 of file `locale_classes.h`.

**4.529.5 Member Data Documentation**

**4.529.5.1** `template<typename _CharT> locale::id std::collate<_CharT>::id [static]`

Numpunct facet id.

Definition at line 601 of file `locale_classes.h`.

## 4.535.1 Detailed Description

```
template<typename _CharT>class std::ctype< _CharT >
```

Primary class template ctype facet.

This template class defines classification and conversion functions for character sets. It wraps ctype functionality. Ctype gets used by streams for many I/O operations.

This template provides the protected virtual functions the developer will have to replace in a derived class or specialization to make a working facet. The public functions that access them are defined in `__ctype_abstract_base`, to allow for

implementation flexibility. See `ctype<wchar_t>` for an example. The functions are documented in `__ctype_abstract_base`.

Note: implementations are provided for all the protected virtual functions, but will likely not be useful.

Definition at line 605 of file `locale_facets.h`.

#### 4.535.2 Member Function Documentation

**4.535.2.1** `template<typename _CharT> virtual bool std::ctype<_CharT>::do_is ( mask __m, char_type __c ) const`  
`[protected], [virtual]`

Test `char_type` classification.

This function finds a mask `M` for `c` and compares it to mask `m`.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

##### Parameters

<code>__c</code>	The <code>char_type</code> to find the mask of.
<code>__m</code>	The mask to compare against.

##### Returns

`(M & __m) != 0`.

Implements `std::__ctype_abstract_base<_CharT>`.

**4.535.2.2** `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_is ( const char_type * __lo, const char_type * __hi, mask * __vec ) const`  
`[protected], [virtual]`

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the input.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

##### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

##### Returns

`__hi`.

Implements `std::__ctype_abstract_base<_CharT>`.

**4.535.2.3** `template<typename _CharT> virtual char std::ctype<_CharT>::do_narrow ( char_type __c, char __dfault ) const`  
`[protected], [virtual]`

Narrow `char_type` to `char`.

This virtual function converts the argument to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

<code>__c</code>	The char_type to convert.
<code>__dfault</code>	Char to return if conversion fails.

#### Returns

The converted char.

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

Referenced by `std::ctype< char >::narrow()`.

**4.535.2.4** `template<typename _CharT> virtual const char_type* std::ctype< _CharT >::do_narrow ( const char_type *  
__lo, const char_type * __hi, char __dfault, char * __to ) const` [protected],[virtual]

Narrow char\_type array to char.

This virtual function converts each char\_type in the range [`__lo`,`__hi`) to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__dfault` is used instead.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

**4.535.2.5** `template<typename _CharT> virtual const char_type* std::ctype< _CharT >::do_scan_is ( mask __m, const  
char_type * __lo, const char_type * __hi ) const` [protected],[virtual]

Find char\_type matching mask.

This function searches for and returns the first char\_type c in [`__lo`,`__hi`) for which is(`__m`,c) is true.

do\_scan\_is() is a hook for a derived facet to change the behavior of match searching. do\_is() must always return the same result for the same input.

#### Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

**Returns**

Pointer to a matching `char_type` if found, else `__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**4.535.2.6** `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_scan_not ( mask __m, const char_type * __lo, const char_type * __hi ) const` `[protected]`, `[virtual]`

Find `char_type` not matching mask.

This function searches for and returns a pointer to the first `char_type` `c` of `[lo,hi)` for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

**Parameters**

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

**Returns**

Pointer to a non-matching `char_type` if found, else `__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**4.535.2.7** `template<typename _CharT> virtual char_type std::ctype<_CharT>::do_tolower ( char_type __c ) const` `[protected]`, `[virtual]`

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

**Parameters**

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

**Returns**

The lowercase `char_type` if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by `std::ctype<char>::tolower()`.

**4.535.2.8** `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_tolower ( char_type * __lo, const char_type * __hi ) const` `[protected]`, `[virtual]`

Convert array to lowercase.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

#### Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

**4.535.2.9** `template<typename _CharT > virtual char_type std::ctype< _CharT >::do_toupper ( char_type __c ) const`  
`[protected], [virtual]`

Convert to uppercase.

This virtual function converts the `char_type` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

#### Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

#### Returns

The uppercase `char_type` if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

Referenced by `std::ctype< char >::toupper()`.

**4.535.2.10** `template<typename _CharT > virtual const char_type* std::ctype< _CharT >::do_toupper ( char_type * __lo, const char_type * __hi ) const`  
`[protected], [virtual]`

Convert array to uppercase.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

#### Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#).

**4.535.2.11** `template<typename _CharT> virtual char_type std::ctype<_CharT>::do_widen ( char __c ) const`  
`[protected], [virtual]`

Widen char.

This virtual function converts the char to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

#### Returns

The converted char\_type

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by `std::ctype<char>::widen()`.

**4.535.2.12** `template<typename _CharT> virtual const char* std::ctype<_CharT>::do_widen ( const char * __lo, const char * __hi, char_type * __to ) const`  
`[protected], [virtual]`

Widen char array.

This function converts each char in the input to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

<code>__lo</code>	Pointer to start range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**4.535.2.13** `template<typename _CharT> bool std::__ctype_abstract_base<_CharT>::is ( mask __m, char_type __c )`  
`const [inline], [inherited]`

Test char\_type classification.

This function finds a mask M for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_type>::do_is()`.

## Parameters

<code>__c</code>	The <code>char_type</code> to compare the mask of.
<code>__m</code>	The mask to compare against.

## Returns

`(M & __m) != 0.`

Definition at line 162 of file `locale_facets.h`.

**4.535.2.14** `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::is ( const char_type * __lo, const char_type * __hi, mask * __vec ) const` `[inline]`, `[inherited]`

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

## Returns

`__hi.`

Definition at line 179 of file `locale_facets.h`.

**4.535.2.15** `template<typename _CharT> char std::__ctype_abstract_base<_CharT>::narrow ( char_type __c, char __dfault ) const` `[inline]`, `[inherited]`

Narrow `char_type` to `char`.

This function converts the `char_type` to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead. It does so by returning `ctype<char_type>::do_narrow(__c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__c</code>	The <code>char_type</code> to convert.
<code>__dfault</code>	Char to return if conversion fails.

## Returns

The converted `char`.

Definition at line 324 of file `locale_facets.h`.

**4.535.2.16** `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::narrow ( const char_type * __lo, const char_type * __hi, char __dfault, char * __to ) const` `[inline]`, `[inherited]`

Narrow array to `char` array.

This function converts each `char_type` in the input to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `char_type` in the input that cannot be converted, `dfault` is used instead. It does so by returning `ctype<char_type>::do_narrow(__lo, __hi, __dfault, __to)`.

Note: this is not what you want for codepage conversions. See `codecv` for that.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

## Returns

`__hi`.

Definition at line 346 of file locale\_facets.h.

**4.535.2.17** `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::scan_is ( mask __m, const char_type * __lo, const char_type * __hi ) const` `[inline]`, `[inherited]`

Find char\_type matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char\_type>::do\_scan\_is().

## Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

Pointer to matching char\_type if found, else `__hi`.

Definition at line 195 of file locale\_facets.h.

**4.535.2.18** `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::scan_not ( mask __m, const char_type * __lo, const char_type * __hi ) const` `[inline]`, `[inherited]`

Find char\_type not matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char\_type>::do\_scan\_not().

## Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

## Returns

Pointer to non-matching char if found, else `__hi`.

Definition at line 211 of file locale\_facets.h.

**4.535.2.19** `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::tolower ( char_type __c ) const` `[inline]`, `[inherited]`

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char\_type>::do\_tolower(c).

**Parameters**

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

**Returns**

The lowercase `char_type` if convertible, else `__c`.

Definition at line 254 of file `locale_facets.h`.

**4.535.2.20** `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::tolower ( char_type * __lo, const char_type * __hi ) const [inline],[inherited]`

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

**Returns**

`__hi`.

Definition at line 269 of file `locale_facets.h`.

**4.535.2.21** `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::toupper ( char_type __c ) const [inline],[inherited]`

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

**Parameters**

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

**Returns**

The uppercase `char_type` if convertible, else `__c`.

Definition at line 225 of file `locale_facets.h`.

**4.535.2.22** `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::toupper ( char_type * __lo, const char_type * __hi ) const [inline],[inherited]`

Convert array to uppercase.

This function converts each `char_type` in the range `[lo,hi)` to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

Definition at line 240 of file locale\_facets.h.

**4.535.2.23** `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::widen ( char __c ) const`  
`[inline], [inherited]`

Widen char to char\_type.

This function converts the char argument to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

## Returns

The converted char\_type.

Definition at line 286 of file locale\_facets.h.

**4.535.2.24** `template<typename _CharT> const char* std::__ctype_abstract_base<_CharT>::widen ( const char * __lo,`  
`const char * __hi, char_type * __to ) const` `[inline], [inherited]`

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

## Returns

`__hi`.

Definition at line 305 of file locale\_facets.h.

**4.535.3 Member Data Documentation**

**4.535.3.1** `template<typename _CharT> locale::id std::ctype<_CharT>::id` `[static]`

The facet id for `ctype<char_type>`

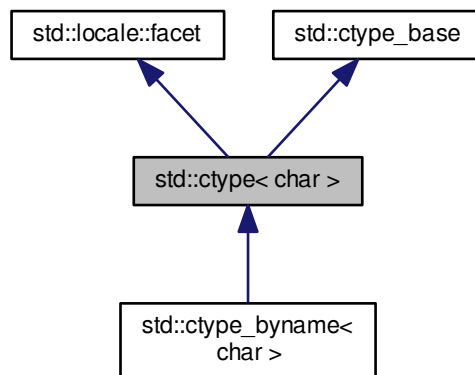

Definition at line 613 of file locale\_facets.h.

#### 4.536.1 Detailed Description

`template<>class std::ctype< char >`

The `ctype<char>` specialization.

This class defines classification and conversion functions for the `char` type. It gets used by `char` streams for many I/O operations. The `char` specialization provides a number of optimizations as well.

Definition at line 674 of file `locale_facets.h`.

#### 4.536.2 Member Typedef Documentation

##### 4.536.2.1 typedef `char std::ctype< char >::char_type`

Typedef for the template parameter `char`.

Definition at line 679 of file `locale_facets.h`.

#### 4.536.3 Constructor & Destructor Documentation

##### 4.536.3.1 `std::ctype< char >::ctype ( const mask * __table = 0, bool __del = false, size_t __refs = 0 )` [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__table</code>	If non-zero, table is used as the per-char mask. Else <code>classic_table()</code> is used.
<code>__del</code>	If true, passes ownership of table to this facet.
<code>__refs</code>	Passed to the base facet class.

##### 4.536.3.2 `std::ctype< char >::ctype ( __c_locale __cloc, const mask * __table = 0, bool __del = false, size_t __refs = 0 )` [explicit]

Constructor performs static initialization.

This constructor is used to construct the initial C locale facet.

Parameters

<code>__cloc</code>	Handle to C locale data.
<code>__table</code>	If non-zero, table is used as the per-char mask.
<code>__del</code>	If true, passes ownership of table to this facet.
<code>__refs</code>	Passed to the base facet class.

##### 4.536.3.3 `virtual std::ctype< char >::~~ctype ( )` [protected],[virtual]

Destructor.

This function deletes `table()` if `del` was true in the constructor.

## 4.536.4 Member Function Documentation

## 4.536.4.1 static const mask\* std::ctype&lt; char &gt;::classic\_table ( ) throw [static]

Returns a pointer to the C locale mask table.

## 4.536.4.2 virtual char std::ctype&lt; char &gt;::do\_narrow ( char\_type \_\_c, char \_\_dfault ) const [inline], [protected], [virtual]

Narrow char.

This virtual function converts the char to char using the simplest reasonable transformation. If the conversion fails, *dfault* is returned instead. For an underived ctype<char> facet, *c* will be returned unchanged.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

<code>__c</code>	The char to convert.
<code>__dfault</code>	Char to return if conversion fails.

## Returns

The converted char.

Definition at line 1124 of file locale\_facets.h.

## 4.536.4.3 virtual const char\_type\* std::ctype&lt; char &gt;::do\_narrow ( const char\_type \* \_\_lo, const char\_type \* \_\_hi, char \_\_dfault, char \* \_\_to ) const [inline], [protected], [virtual]

Narrow char array to char array.

This virtual function converts each char in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived ctype<char> facet, the argument will be copied unchanged.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

## Returns

`__hi`.

Definition at line 1150 of file locale\_facets.h.

## 4.536.4.4 virtual char\_type std::ctype&lt; char &gt;::do\_tolower ( char\_type \_\_c ) const [protected], [virtual]

Convert to lowercase.

This virtual function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

#### Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

#### Returns

The lowercase char if convertible, else `__c`.

**4.536.4.5** `virtual const char_type* std::ctype< char >::do_tolower ( char_type * __lo, const char_type * __hi ) const`  
[protected], [virtual]

Convert array to lowercase.

This virtual function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

#### Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

#### Returns

`__hi`.

**4.536.4.6** `virtual char_type std::ctype< char >::do_toupper ( char_type __c ) const` [protected], [virtual]

Convert to uppercase.

This virtual function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

#### Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

#### Returns

The uppercase char if convertible, else `__c`.

**4.536.4.7** `virtual const char_type* std::ctype< char >::do_toupper ( char_type * __lo, const char_type * __hi ) const`  
[protected], [virtual]

Convert array to uppercase.

This virtual function converts each char in the range [lo,hi) to uppercase if possible. Other chars remain untouched.

do\_toupper() is a hook for a derived facet to change the behavior of uppercasing. do\_toupper() must always return the same result for the same input.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

**4.536.4.8** `virtual char_type std::ctype< char >::do_widen ( char __c ) const` `[inline]`, `[protected]`, `[virtual]`

Widen char.

This virtual function converts the char to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be returned unchanged.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

## Returns

The converted character.

Definition at line 1075 of file locale\_facets.h.

**4.536.4.9** `virtual const char* std::ctype< char >::do_widen ( const char * __lo, const char * __hi, char_type * __to ) const` `[inline]`, `[protected]`, `[virtual]`

Widen char array.

This function converts each char in the range [lo,hi) to char using the simplest reasonable transformation. For an underived ctype<char> facet, the argument will be copied unchanged.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

## Returns

`__hi`.

Definition at line 1098 of file locale\_facets.h.

**4.536.4.10** `bool std::ctype< char >::is ( mask __m, char __c ) const` `[inline]`

Test char classification.

This function compares the mask table[c] to `__m`.

## Parameters

<code>__c</code>	The char to compare the mask of.
<code>__m</code>	The mask to compare against.

## Returns

True if `__m & table[__c]` is true, false otherwise.

Definition at line 43 of file `ctype_inline.h`.

**4.536.4.11** `const char * std::ctype< char >::is ( const char * __lo, const char * __hi, mask * __vec ) const` `[inline]`

Return a mask array.

This function finds the mask for each char in the range `[lo, hi)` and successively writes it to `vec`. `vec` must have as many elements as the char array.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

## Returns

`__hi`.

Definition at line 48 of file `ctype_inline.h`.

**4.536.4.12** `char std::ctype< char >::narrow ( char_type __c, char __dfault ) const` `[inline]`

Narrow char.

This function converts the `char` to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead. For an undervied `ctype<char>` facet, `c` will be returned unchanged.

This function works as if it returns `ctype<char>::do_narrow(c)`. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__c</code>	The char to convert.
<code>__dfault</code>	Char to return if conversion fails.

## Returns

The converted character.

Definition at line 923 of file `locale_facets.h`.

References `std::ctype< _CharT >::do_narrow()`.

**4.536.4.13** `const char_type* std::ctype< char >::narrow ( const char_type * __lo, const char_type * __hi, char __dfault, char * __to ) const` `[inline]`

Narrow char array.

This function converts each char in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do\_narrow(lo, hi, dfault, to). do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

Definition at line 956 of file locale\_facets.h.

References std::ctype<\_CharT>::do\_narrow().

4.536.4.14 `const char * std::ctype< char >::scan_is ( mask __m, const char * __lo, const char * __hi ) const` [inline]

Find char matching a mask.

This function searches for and returns the first char in [lo,hi) for which is(m,char) is true.

#### Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

#### Returns

Pointer to a matching char if found, else `__hi`.

Definition at line 57 of file ctype\_inline.h.

4.536.4.15 `const char * std::ctype< char >::scan_not ( mask __m, const char * __lo, const char * __hi ) const` [inline]

Find char not matching a mask.

This function searches for and returns a pointer to the first char in [\_\_lo,\_\_hi) for which is(m,char) is false.

#### Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

#### Returns

Pointer to a non-matching char if found, else `__hi`.

Definition at line 67 of file ctype\_inline.h.

**4.536.4.16** `const mask* std::ctype< char >::table ( ) const throw ( )` `[inline]`

Returns a pointer to the mask table provided to the constructor, or the default from `classic_table()` if none was provided.

Definition at line 974 of file `locale_facets.h`.

**4.536.4.17** `char_type std::ctype< char >::tolower ( char_type __c ) const` `[inline]`

Convert to lowercase.

This function converts the `char` argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`tolower()` acts as if it returns `ctype<char>::do_tolower(__c)`. `do_tolower()` must always return the same result for the same input.

#### Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

#### Returns

The lowercase char if convertible, else `__c`.

Definition at line 828 of file `locale_facets.h`.

References `std::ctype< _CharT >::do_tolower()`.

**4.536.4.18** `const char_type* std::ctype< char >::tolower ( char_type * __lo, const char_type * __hi ) const` `[inline]`

Convert array to lowercase.

This function converts each `char` in the range `[lo,hi)` to lowercase if possible. Other chars remain untouched.

`tolower()` acts as if it returns `ctype<char>::do_tolower(__lo, __hi)`. `do_tolower()` must always return the same result for the same input.

#### Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

#### Returns

`__hi`.

Definition at line 845 of file `locale_facets.h`.

References `std::ctype< _CharT >::do_tolower()`.

**4.536.4.19** `char_type std::ctype< char >::toupper ( char_type __c ) const` `[inline]`

Convert to uppercase.

This function converts the `char` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`toupper()` acts as if it returns `ctype<char>::do_toupper(c)`. `do_toupper()` must always return the same result for the same input.

**Parameters**

<code>__c</code>	The char to convert.
------------------	----------------------

**Returns**

The uppercase char if convertible, else `__c`.

Definition at line 795 of file `locale_facets.h`.

References `std::ctype<_CharT>::do_toupper()`.

**4.536.4.20** `const char_type* std::ctype<char>::toupper ( char_type * __lo, const char_type * __hi ) const`  
`[inline]`

Convert array to uppercase.

This function converts each char in the range `[__lo,__hi)` to uppercase if possible. Other chars remain untouched.

`toupper()` acts as if it returns `ctype<char>::do_toupper(__lo, __hi)`. `do_toupper()` must always return the same result for the same input.

**Parameters**

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

**Returns**

`__hi`.

Definition at line 812 of file `locale_facets.h`.

References `std::ctype<_CharT>::do_toupper()`.

**4.536.4.21** `char_type std::ctype<char>::widen ( char __c ) const` `[inline]`

Widen char.

This function converts the char to `char_type` using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be returned unchanged.

This function works as if it returns `ctype<char>::do_widen(c)`. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

<code>__c</code>	The char to convert.
------------------	----------------------

**Returns**

The converted character.

Definition at line 865 of file `locale_facets.h`.

References `std::ctype<_CharT>::do_widen()`.

**4.536.4.22** `const char* std::ctype<char>::widen ( const char * __lo, const char * __hi, char_type * __to ) const`  
`[inline]`

Widen char array.

This function converts each char in the input to char using the simplest reasonable transformation. For an undervived ctype<char> facet, the argument will be copied unchanged.

This function works as if it returns ctype<char>::do\_widen(c). do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

Definition at line 892 of file locale\_facets.h.

References std::ctype< \_CharT >::do\_widen().

### 4.536.5 Member Data Documentation

#### 4.536.5.1 locale::id std::ctype< char >::id [static]

The facet id for ctype<char>

Definition at line 696 of file locale\_facets.h.

#### 4.536.5.2 const size\_t std::ctype< char >::table\_size [static]

The size of the mask table. It is SCHAR\_MAX + 1.

Definition at line 698 of file locale\_facets.h.

The documentation for this class was generated from the following files:

- [locale\\_facets.h](#)
- [ctype\\_inline.h](#)

#### 4.537 `std::ctype< wchar_t >` Class Template Reference

Inheritance diagram for `std::ctype< wchar_t >`:

##### Public Types

#### 4.537.1 Detailed Description

`template<>class std::ctype< wchar_t >`

The `ctype<wchar_t>` specialization.

This class defines classification and conversion functions for the `wchar_t` type. It gets used by `wchar_t` streams for many I/O operations. The `wchar_t` specialization provides a number of optimizations as well.

`ctype<wchar_t>` inherits its public methods from `__ctype_abstract_base<wchar_t>`.

Definition at line 1175 of file `locale_facets.h`.

#### 4.537.2 Member Typedef Documentation

4.537.2.1 `typedef wchar_t std::ctype< wchar_t >::char_type`

Typedef for the template parameter `wchar_t`.

Definition at line 1180 of file `locale_facets.h`.

#### 4.537.3 Constructor & Destructor Documentation

4.537.3.1 `std::ctype< wchar_t >::ctype ( size_t __refs = 0 ) [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

4.537.3.2 `std::ctype< wchar_t >::ctype ( __c_locale __cloc, size_t __refs = 0 ) [explicit]`

Constructor performs static initialization.

This constructor is used to construct the initial C locale facet.

Parameters

<code>__cloc</code>	Handle to C locale data.
<code>__refs</code>	Passed to the base facet class.

4.537.3.3 `virtual std::ctype< wchar_t >::~~ctype ( ) [protected],[virtual]`

Destructor.

#### 4.537.4 Member Function Documentation

4.537.4.1 `virtual bool std::ctype< wchar_t >::do_is ( mask __m, char_type __c ) const [protected],[virtual]`

Test `wchar_t` classification.

This function finds a mask `M` for `c` and compares it to mask `m`.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

## Parameters

<code>__c</code>	The <code>wchar_t</code> to find the mask of.
<code>__m</code>	The mask to compare against.

## Returns

`(M & __m) != 0.`

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.537.4.2** `virtual const char_type* std::ctype< wchar_t >::do_is ( const char_type * __lo, const char_type * __hi, mask * __vec ) const` [protected],[virtual]

Return a mask array.

This function finds the mask for each `wchar_t` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the input.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

## Returns

`__hi.`

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.537.4.3** `virtual char std::ctype< wchar_t >::do_narrow ( char_type __c, char __dfault ) const` [protected],[virtual]

Narrow `wchar_t` to `char`.

This virtual function converts the argument to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead. For an underived `ctype<wchar_t>` facet, `c` will be cast to `char` and returned.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__c</code>	The <code>wchar_t</code> to convert.
<code>__dfault</code>	Char to return if conversion fails.

## Returns

The converted `char`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

4.537.4.4 **virtual const char\_type\* std::ctype< wchar\_t >::do\_narrow ( const char\_type \* \_\_lo, const char\_type \* \_\_hi, char \_\_default, char \* \_\_to ) const** [protected], [virtual]

Narrow wchar\_t array to char array.

This virtual function converts each wchar\_t in the range [lo,hi) to char using the simplest reasonable transformation and writes the results to the destination array. For any wchar\_t in the input that cannot be converted, *default* is used instead. For an underived ctype<wchar\_t> facet, the argument will be copied, casting each element to char.

do\_narrow() is a hook for a derived facet to change the behavior of narrowing. do\_narrow() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

4.537.4.5 **virtual const char\_type\* std::ctype< wchar\_t >::do\_scan\_is ( mask \_\_m, const char\_type \* \_\_lo, const char\_type \* \_\_hi ) const** [protected], [virtual]

Find wchar\_t matching mask.

This function searches for and returns the first wchar\_t c in [\_\_lo,\_\_hi) for which is(\_\_m,c) is true.

do\_scan\_is() is a hook for a derived facet to change the behavior of match searching. do\_is() must always return the same result for the same input.

#### Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

#### Returns

Pointer to a matching wchar\_t if found, else `__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

4.537.4.6 **virtual const char\_type\* std::ctype< wchar\_t >::do\_scan\_not ( mask \_\_m, const char\_type \* \_\_lo, const char\_type \* \_\_hi ) const** [protected], [virtual]

Find wchar\_t not matching mask.

This function searches for and returns a pointer to the first wchar\_t c of [\_\_lo,\_\_hi) for which is(\_\_m,c) is false.

do\_scan\_is() is a hook for a derived facet to change the behavior of match searching. do\_is() must always return the same result for the same input.

## Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

Pointer to a non-matching `wchar_t` if found, else `__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.537.4.7** `virtual char_type std::ctype< wchar_t >::do_tolower ( char_type __c ) const` `[protected]`, `[virtual]`

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

## Parameters

<code>__c</code>	The <code>wchar_t</code> to convert.
------------------	--------------------------------------

## Returns

The lowercase `wchar_t` if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.537.4.8** `virtual const char_type* std::ctype< wchar_t >::do_tolower ( char_type * __lo, const char_type * __hi ) const` `[protected]`, `[virtual]`

Convert array to lowercase.

This virtual function converts each `wchar_t` in the range `[lo,hi)` to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.537.4.9** `virtual char_type std::ctype< wchar_t >::do_toupper ( char_type __c ) const` `[protected]`, `[virtual]`

Convert to uppercase.

This virtual function converts the `wchar_t` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

<code>__c</code>	The <code>wchar_t</code> to convert.
------------------	--------------------------------------

## Returns

The uppercase `wchar_t` if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.537.4.10** `virtual const char_type* std::ctype< wchar_t >::do_toupper ( char_type * __lo, const char_type * __hi ) const` `[protected]`, `[virtual]`

Convert array to uppercase.

This virtual function converts each `wchar_t` in the range `[lo,hi)` to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.537.4.11** `virtual char_type std::ctype< wchar_t >::do_widen ( char __c ) const` `[protected]`, `[virtual]`

Widen char to `wchar_t`.

This virtual function converts the char to `wchar_t` using the simplest reasonable transformation. For an underived `ctype<wchar_t>` facet, the argument will be cast to `wchar_t`.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

## Returns

The converted `wchar_t`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.537.4.12** `virtual const char* std::ctype< wchar_t >::do_widen ( const char * __lo, const char * __hi, char_type * __to ) const` `[protected]`, `[virtual]`

Widen char array to `wchar_t` array.

This function converts each char in the input to `wchar_t` using the simplest reasonable transformation. For an underived `ctype<wchar_t>` facet, the argument will be copied, casting each element to `wchar_t`.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

<code>__lo</code>	Pointer to start range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base< wchar\\_t >](#).

**4.537.4.13** `bool std::__ctype_abstract_base< wchar_t >::is ( mask __m, char_type __c ) const` `[inline]`,  
`[inherited]`

Test char\_type classification.

This function finds a mask M for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_type>::do_is()`.

#### Parameters

<code>__c</code>	The char_type to compare the mask of.
<code>__m</code>	The mask to compare against.

#### Returns

`(M & __m) != 0`.

Definition at line 162 of file locale\_facets.h.

References `std::__ctype_abstract_base< _CharT >::do_is()`.

**4.537.4.14** `const char_type* std::__ctype_abstract_base< wchar_t >::is ( const char_type * __lo, const char_type * __hi, mask * __vec ) const` `[inline]`,`[inherited]`

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of `ctype<char_type>::do_is()`.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

#### Returns

`__hi`.

Definition at line 179 of file locale\_facets.h.

References `std::__ctype_abstract_base< _CharT >::do_is()`.

**4.537.4.15** `char std::__ctype_abstract_base<wchar_t>::narrow ( char_type __c, char __default ) const` `[inline], [inherited]`

Narrow char\_type to char.

This function converts the char\_type to char using the simplest reasonable transformation. If the conversion fails, default is returned instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_c).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

<code>__c</code>	The char_type to convert.
<code>__default</code>	Char to return if conversion fails.

#### Returns

The converted char.

Definition at line 324 of file locale\_facets.h.

References std::\_\_ctype\_abstract\_base<\_CharT>::do\_narrow().

**4.537.4.16** `const char_type* std::__ctype_abstract_base<wchar_t>::narrow ( const char_type * __lo, const char_type * __hi, char __default, char * __to ) const` `[inline], [inherited]`

Narrow array to char array.

This function converts each char\_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char\_type in the input that cannot be converted, default is used instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_lo, \_\_hi, \_\_default, \_\_to).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

Definition at line 346 of file locale\_facets.h.

References std::\_\_ctype\_abstract\_base<\_CharT>::do\_narrow().

**4.537.4.17** `const char_type* std::__ctype_abstract_base<wchar_t>::scan_is ( mask __m, const char_type * __lo, const char_type * __hi ) const` `[inline], [inherited]`

Find char\_type matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char\_type>::do\_scan\_is().

## Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

Pointer to matching char\_type if found, else `__hi`.

Definition at line 195 of file locale\_facets.h.

References std::ctype\_abstract\_base< \_CharT >::do\_scan\_is().

**4.537.4.18** `const char_type* std::ctype_abstract_base< wchar_t >::scan_not ( mask __m, const char_type * __lo, const char_type * __hi ) const` [inline],[inherited]

Find char\_type not matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char\_type>::do\_scan\_not().

## Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

## Returns

Pointer to non-matching char if found, else `__hi`.

Definition at line 211 of file locale\_facets.h.

References std::ctype\_abstract\_base< \_CharT >::do\_scan\_not().

**4.537.4.19** `char_type std::ctype_abstract_base< wchar_t >::tolower ( char_type __c ) const` [inline],[inherited]

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char\_type>::do\_tolower(c).

## Parameters

<code>__c</code>	The char_type to convert.
------------------	---------------------------

## Returns

The lowercase char\_type if convertible, else `__c`.

Definition at line 254 of file locale\_facets.h.

References std::ctype\_abstract\_base< \_CharT >::do\_tolower().

**4.537.4.20** `const char_type* std::ctype_abstract_base< wchar_t >::tolower ( char_type * __lo, const char_type * __hi ) const` [inline],[inherited]

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo, __hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

Definition at line 269 of file locale\_facets.h.

References `std::__ctype_abstract_base< _CharT >::do_tolower()`.

**4.537.4.21** `char_type std::__ctype_abstract_base< wchar_t >::toupper ( char_type __c ) const` `[inline]`, `[inherited]`

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

## Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

## Returns

The uppercase `char_type` if convertible, else `__c`.

Definition at line 225 of file locale\_facets.h.

References `std::__ctype_abstract_base< _CharT >::do_toupper()`.

**4.537.4.22** `const char_type* std::__ctype_abstract_base< wchar_t >::toupper ( char_type * __lo, const char_type * __hi ) const` `[inline]`, `[inherited]`

Convert array to uppercase.

This function converts each `char_type` in the range `[lo,hi)` to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

Definition at line 240 of file locale\_facets.h.

References `std::__ctype_abstract_base< _CharT >::do_toupper()`.

**4.537.4.23** `char_type std::__ctype_abstract_base< wchar_t >::widen ( char __c ) const` `[inline]`, `[inherited]`

Widen char to `char_type`.

This function converts the `char` argument to `char_type` using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

<code>__c</code>	The char to convert.
------------------	----------------------

**Returns**

The converted `char_type`.

Definition at line 286 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_widen()`.

**4.537.4.24** `const char* std::__ctype_abstract_base<wchar_t>::widen ( const char * __lo, const char * __hi, char_type * __to ) const` `[inline],[inherited]`

Widen array to `char_type`.

This function converts each char in the input to `char_type` using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

**Returns**

`__hi`.

Definition at line 305 of file `locale_facets.h`.

References `std::__ctype_abstract_base<_CharT>::do_widen()`.

**4.537.5 Member Data Documentation**

**4.537.5.1** `locale::id std::ctype<wchar_t>::id` `[static]`

The facet id for `ctype<wchar_t>`

Definition at line 1198 of file `locale_facets.h`.

## 4.539.1 Detailed Description

```
template<typename _CharT>class std::ctype_byname<_CharT>
```

class [ctype\\_byname](#) [22.2.1.2].

Definition at line 1467 of file [locale\\_facets.h](#).

#### 4.539.2 Member Function Documentation

4.539.2.1 `template<typename _CharT> virtual bool std::ctype<_CharT>::do_is ( mask __m, char_type __c ) const`  
`[protected], [virtual], [inherited]`

Test `char_type` classification.

This function finds a mask `M` for `c` and compares it to mask `m`.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

##### Parameters

<code>__c</code>	The <code>char_type</code> to find the mask of.
<code>__m</code>	The mask to compare against.

##### Returns

`(M & __m) != 0.`

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

4.539.2.2 `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_is ( const char_type * __lo, const char_type * __hi, mask * __vec ) const`  
`[protected], [virtual], [inherited]`

Return a mask array.

This function finds the mask for each `char_type` in the range `[lo,hi)` and successively writes it to `vec`. `vec` must have as many elements as the input.

`do_is()` is a hook for a derived facet to change the behavior of classifying. `do_is()` must always return the same result for the same input.

##### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

##### Returns

`__hi.`

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

4.539.2.3 `template<typename _CharT> virtual char std::ctype<_CharT>::do_narrow ( char_type __c, char __dfault ) const`  
`[protected], [virtual], [inherited]`

Narrow `char_type` to `char`.

This virtual function converts the argument to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__c</code>	The char_type to convert.
<code>__default</code>	Char to return if conversion fails.

## Returns

The converted char.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by `std::ctype<char>::narrow()`.

**4.539.2.4** `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_narrow ( const char_type * __lo, const char_type * __hi, char __default, char * __to ) const` [protected], [virtual], [inherited]

Narrow char\_type array to char.

This virtual function converts each char\_type in the range [`__lo`,`__hi`) to char using the simplest reasonable transformation and writes the results to the destination array. For any element in the input that cannot be converted, `__default` is used instead.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__default</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

## Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**4.539.2.5** `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_scan_is ( mask __m, const char_type * __lo, const char_type * __hi ) const` [protected], [virtual], [inherited]

Find char\_type matching mask.

This function searches for and returns the first char\_type `c` in [`__lo`,`__hi`) for which `is(__m,c)` is true.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

## Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.

<code>__hi</code>	Pointer to end of range.
-------------------	--------------------------

**Returns**

Pointer to a matching `char_type` if found, else `__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**4.539.2.6** `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_scan_not ( mask __m, const char_type * __lo, const char_type * __hi ) const` `[protected]`, `[virtual]`, `[inherited]`

Find `char_type` not matching mask.

This function searches for and returns a pointer to the first `char_type` `c` of `[lo,hi)` for which `is(m,c)` is false.

`do_scan_is()` is a hook for a derived facet to change the behavior of match searching. `do_is()` must always return the same result for the same input.

**Parameters**

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

**Returns**

Pointer to a non-matching `char_type` if found, else `__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**4.539.2.7** `template<typename _CharT> virtual char_type std::ctype<_CharT>::do_tolower ( char_type __c ) const` `[protected]`, `[virtual]`, `[inherited]`

Convert to lowercase.

This virtual function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

**Parameters**

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

**Returns**

The lowercase `char_type` if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by `std::ctype<char>::tolower()`.

**4.539.2.8** `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_tolower ( char_type * __lo, const char_type * __hi ) const` `[protected]`, `[virtual]`, `[inherited]`

Convert array to lowercase.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched.

`do_tolower()` is a hook for a derived facet to change the behavior of lowercasing. `do_tolower()` must always return the same result for the same input.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**4.539.2.9** `template<typename _CharT> virtual char_type std::ctype<_CharT>::do_toupper ( char_type __c ) const`  
`[protected], [virtual], [inherited]`

Convert to uppercase.

This virtual function converts the `char_type` argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

## Returns

The uppercase `char_type` if convertible, else `__c`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by `std::ctype<char>::toupper()`.

**4.539.2.10** `template<typename _CharT> virtual const char_type* std::ctype<_CharT>::do_toupper ( char_type * __lo,`  
`const char_type * __hi ) const` `[protected], [virtual], [inherited]`

Convert array to uppercase.

This virtual function converts each `char_type` in the range `[__lo,__hi)` to uppercase if possible. Other elements remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**4.539.2.11** `template<typename _CharT> virtual char_type std::ctype<_CharT>::do_widen ( char __c ) const`  
`[protected], [virtual], [inherited]`

Widen char.

This virtual function converts the char to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

#### Returns

The converted char\_type

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

Referenced by `std::ctype<char>::widen()`.

**4.539.2.12** `template<typename _CharT> virtual const char* std::ctype<_CharT>::do_widen ( const char * __lo, const char * __hi, char_type * __to ) const` `[protected]`, `[virtual]`, `[inherited]`

Widen char array.

This function converts each char in the input to char\_type using the simplest reasonable transformation.

do\_widen() is a hook for a derived facet to change the behavior of widening. do\_widen() must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

<code>__lo</code>	Pointer to start range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

Implements [std::\\_\\_ctype\\_abstract\\_base<\\_CharT>](#).

**4.539.2.13** `template<typename _CharT> bool std::__ctype_abstract_base<_CharT>::is ( mask __m, char_type __c ) const` `[inline]`, `[inherited]`

Test char\_type classification.

This function finds a mask M for `__c` and compares it to mask `__m`. It does so by returning the value of `ctype<char_type>::do_is()`.

#### Parameters

<code>__c</code>	The char_type to compare the mask of.
<code>__m</code>	The mask to compare against.

#### Returns

`(M & __m) != 0`.

Definition at line 162 of file locale\_facets.h.

4.539.2.14 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::is ( const char_type  
* __lo, const char_type * __hi, mask * __vec ) const [inline],[inherited]`

Return a mask array.

This function finds the mask for each char\_type in the range [lo,hi) and successively writes it to vec. vec must have as many elements as the char array. It does so by returning the value of ctype<char\_type>::do\_is().

#### Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

#### Returns

`__hi`.

Definition at line 179 of file locale\_facets.h.

4.539.2.15 `template<typename _CharT> char std::__ctype_abstract_base<_CharT>::narrow ( char_type __c, char  
__default ) const [inline],[inherited]`

Narrow char\_type to char.

This function converts the char\_type to char using the simplest reasonable transformation. If the conversion fails, default is returned instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_c).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

<code>__c</code>	The char_type to convert.
<code>__default</code>	Char to return if conversion fails.

#### Returns

The converted char.

Definition at line 324 of file locale\_facets.h.

4.539.2.16 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::narrow ( const  
char_type * __lo, const char_type * __hi, char __default, char * __to ) const [inline],[inherited]`

Narrow array to char array.

This function converts each char\_type in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char\_type in the input that cannot be converted, default is used instead. It does so by returning ctype<char\_type>::do\_narrow(\_\_lo, \_\_hi, \_\_default, \_\_to).

Note: this is not what you want for codepage conversions. See codecvt for that.

#### Parameters

<code>__lo</code>	Pointer to start of range.
-------------------	----------------------------

<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

**Returns**`__hi`.

Definition at line 346 of file locale\_facets.h.

4.539.2.17 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::scan_is ( mask __m, const char_type * __lo, const char_type * __hi ) const` `[inline]`,`[inherited]`

Find char\_type matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is true. It does so by returning ctype<char\_type>::do\_scan\_is().

**Parameters**

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

**Returns**Pointer to matching char\_type if found, else `__hi`.

Definition at line 195 of file locale\_facets.h.

4.539.2.18 `template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::scan_not ( mask __m, const char_type * __lo, const char_type * __hi ) const` `[inline]`,`[inherited]`

Find char\_type not matching a mask.

This function searches for and returns the first char\_type c in [lo,hi) for which is(m,c) is false. It does so by returning ctype<char\_type>::do\_scan\_not().

**Parameters**

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

**Returns**Pointer to non-matching char if found, else `__hi`.

Definition at line 211 of file locale\_facets.h.

4.539.2.19 `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::tolower ( char_type __c ) const` `[inline]`,`[inherited]`

Convert to lowercase.

This function converts the argument to lowercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning ctype<char\_type>::do\_tolower(c).

**Parameters**

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

**Returns**

The lowercase `char_type` if convertible, else `__c`.

Definition at line 254 of file `locale_facets.h`.

```
4.539.2.20  template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::tolower ( char_type
            * __lo, const char_type * __hi ) const    [inline],[inherited]
```

Convert array to lowercase.

This function converts each `char_type` in the range `[__lo,__hi)` to lowercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_tolower(__lo, __hi)`.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

**Returns**

`__hi`.

Definition at line 269 of file `locale_facets.h`.

```
4.539.2.21  template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::toupper ( char_type __c )
            const    [inline],[inherited]
```

Convert to uppercase.

This function converts the argument to uppercase if possible. If not possible (for example, '2'), returns the argument. It does so by returning `ctype<char_type>::do_toupper()`.

**Parameters**

<code>__c</code>	The <code>char_type</code> to convert.
------------------	--

**Returns**

The uppercase `char_type` if convertible, else `__c`.

Definition at line 225 of file `locale_facets.h`.

```
4.539.2.22  template<typename _CharT> const char_type* std::__ctype_abstract_base<_CharT>::toupper ( char_type
            * __lo, const char_type * __hi ) const    [inline],[inherited]
```

Convert array to uppercase.

This function converts each `char_type` in the range `[lo,hi)` to uppercase if possible. Other elements remain untouched. It does so by returning `ctype<char_type>::do_toupper(lo, hi)`.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

Definition at line 240 of file locale\_facets.h.

**4.539.2.23** `template<typename _CharT> char_type std::__ctype_abstract_base<_CharT>::widen ( char __c ) const`  
`[inline], [inherited]`

Widen char to char\_type.

This function converts the char argument to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

## Returns

The converted char\_type.

Definition at line 286 of file locale\_facets.h.

**4.539.2.24** `template<typename _CharT> const char* std::__ctype_abstract_base<_CharT>::widen ( const char * __lo,`  
`const char * __hi, char_type * __to ) const` `[inline], [inherited]`

Widen array to char\_type.

This function converts each char in the input to char\_type using the simplest reasonable transformation. It does so by returning `ctype<char_type>::do_widen(c)`.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

## Returns

`__hi`.

Definition at line 305 of file locale\_facets.h.

## 4.539.3 Member Data Documentation

**4.539.3.1** `template<typename _CharT> locale::id std::ctype<_CharT>::id` `[static], [inherited]`

The facet id for `ctype<char_type>`

Definition at line 613 of file locale\_facets.h.

The documentation for this class was generated from the following file:

#### 4.540.1 Detailed Description

`template<>class std::ctype_byname< char >`

22.2.1.4 Class `ctype_byname` specializations.

Definition at line 1482 of file `locale_facets.h`.

#### 4.540.2 Member Typedef Documentation

4.540.2.1 `typedef char std::ctype< char >::char_type` `[inherited]`

Typedef for the template parameter `char`.

Definition at line 679 of file `locale_facets.h`.

#### 4.540.3 Member Function Documentation

4.540.3.1 `static const mask* std::ctype< char >::classic_table ( ) throw` `[static],[inherited]`

Returns a pointer to the C locale mask table.

4.540.3.2 `virtual char std::ctype< char >::do_narrow ( char_type __c, char __dfault ) const` `[inline],[protected],[virtual],[inherited]`

Narrow `char`.

This virtual function converts the `char` to `char` using the simplest reasonable transformation. If the conversion fails, `dfault` is returned instead. For an underived `ctype<char>` facet, `c` will be returned unchanged.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

##### Parameters

<code>__c</code>	The <code>char</code> to convert.
<code>__dfault</code>	Char to return if conversion fails.

##### Returns

The converted `char`.

Definition at line 1124 of file `locale_facets.h`.

4.540.3.3 `virtual const char_type* std::ctype< char >::do_narrow ( const char_type * __lo, const char_type * __hi, char __dfault, char * __to ) const` `[inline],[protected],[virtual],[inherited]`

Narrow `char` array to `char` array.

This virtual function converts each `char` in the range `[lo,hi)` to `char` using the simplest reasonable transformation and writes the results to the destination array. For any `char` in the input that cannot be converted, `dfault` is used instead. For an underived `ctype<char>` facet, the argument will be copied unchanged.

`do_narrow()` is a hook for a derived facet to change the behavior of narrowing. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

## Returns

`__hi`.

Definition at line 1150 of file locale\_facets.h.

4.540.3.4 **virtual char\_type std::ctype< char >::do\_tolower ( char\_type \_\_c ) const** [protected],[virtual],[inherited]

Convert to lowercase.

This virtual function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

## Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

## Returns

The lowercase char if convertible, else `__c`.

4.540.3.5 **virtual const char\_type\* std::ctype< char >::do\_tolower ( char\_type \* \_\_lo, const char\_type \* \_\_hi ) const** [protected],[virtual],[inherited]

Convert array to lowercase.

This virtual function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

do\_tolower() is a hook for a derived facet to change the behavior of lowercasing. do\_tolower() must always return the same result for the same input.

## Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

4.540.3.6 **virtual char\_type std::ctype< char >::do\_toupper ( char\_type \_\_c ) const** [protected],[virtual],[inherited]

Convert to uppercase.

This virtual function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

## Returns

The uppercase char if convertible, else `__c`.

**4.540.3.7** `virtual const char_type* std::ctype< char >::do_toupper ( char_type * __lo, const char_type * __hi ) const` `[protected]`, `[virtual]`, `[inherited]`

Convert array to uppercase.

This virtual function converts each char in the range [lo,hi) to uppercase if possible. Other chars remain untouched.

`do_toupper()` is a hook for a derived facet to change the behavior of uppercasing. `do_toupper()` must always return the same result for the same input.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

**4.540.3.8** `virtual char_type std::ctype< char >::do_widen ( char __c ) const` `[inline]`, `[protected]`, `[virtual]`, `[inherited]`

Widen char.

This virtual function converts the char to char using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be returned unchanged.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

## Returns

The converted character.

Definition at line 1075 of file `locale_facets.h`.

**4.540.3.9** `virtual const char* std::ctype< char >::do_widen ( const char * __lo, const char * __hi, char_type * __to ) const` `[inline]`, `[protected]`, `[virtual]`, `[inherited]`

Widen char array.

This function converts each char in the range [lo,hi) to char using the simplest reasonable transformation. For an underived `ctype<char>` facet, the argument will be copied unchanged.

`do_widen()` is a hook for a derived facet to change the behavior of widening. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

**Returns**

`__hi`.

Definition at line 1098 of file `locale_facets.h`.

**4.540.3.10** `bool std::ctype< char >::is ( mask __m, char __c ) const` `[inline],[inherited]`

Test char classification.

This function compares the mask table[c] to `__m`.

**Parameters**

<code>__c</code>	The char to compare the mask of.
<code>__m</code>	The mask to compare against.

**Returns**

True if `__m & table[__c]` is true, false otherwise.

Definition at line 43 of file `ctype_inline.h`.

**4.540.3.11** `const char * std::ctype< char >::is ( const char * __lo, const char * __hi, mask * __vec ) const` `[inline],[inherited]`

Return a mask array.

This function finds the mask for each char in the range [lo, hi) and successively writes it to vec. vec must have as many elements as the char array.

**Parameters**

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__vec</code>	Pointer to an array of mask storage.

**Returns**

`__hi`.

Definition at line 48 of file `ctype_inline.h`.

**4.540.3.12** `char std::ctype< char >::narrow ( char_type __c, char __dfault ) const` `[inline],[inherited]`

Narrow char.

This function converts the char to char using the simplest reasonable transformation. If the conversion fails, dfault is returned instead. For an underived ctype<char> facet, c will be returned unchanged.

This function works as if it returns `ctype<char>::do_narrow(c)`. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__c</code>	The char to convert.
<code>__dfault</code>	Char to return if conversion fails.

## Returns

The converted character.

Definition at line 923 of file locale\_facets.h.

References `std::ctype< _CharT >::do_narrow()`.

**4.540.3.13** `const char_type* std::ctype< char >::narrow ( const char_type * __lo, const char_type * __hi, char __dfault, char * __to ) const` `[inline]`, `[inherited]`

Narrow char array.

This function converts each char in the input to char using the simplest reasonable transformation and writes the results to the destination array. For any char in the input that cannot be converted, *dfault* is used instead. For an underived `ctype<char>` facet, the argument will be copied unchanged.

This function works as if it returns `ctype<char>::do_narrow(lo, hi, dfault, to)`. `do_narrow()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

## Parameters

<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.
<code>__dfault</code>	Char to use if conversion fails.
<code>__to</code>	Pointer to the destination array.

## Returns

`__hi`.

Definition at line 956 of file locale\_facets.h.

References `std::ctype< _CharT >::do_narrow()`.

**4.540.3.14** `const char * std::ctype< char >::scan_is ( mask __m, const char * __lo, const char * __hi ) const` `[inline]`, `[inherited]`

Find char matching a mask.

This function searches for and returns the first char in `[lo,hi)` for which `is(m,char)` is true.

## Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

## Returns

Pointer to a matching char if found, else `__hi`.

Definition at line 57 of file ctype\_inline.h.

**4.540.3.15** `const char * std::ctype< char >::scan_not ( mask __m, const char * __lo, const char * __hi ) const` [inline], [inherited]

Find char not matching a mask.

This function searches for and returns a pointer to the first char in [\_\_lo,\_\_hi) for which is(m,char) is false.

#### Parameters

<code>__m</code>	The mask to compare against.
<code>__lo</code>	Pointer to start of range.
<code>__hi</code>	Pointer to end of range.

#### Returns

Pointer to a non-matching char if found, else `__hi`.

Definition at line 67 of file `ctype_inline.h`.

**4.540.3.16** `const mask* std::ctype< char >::table ( ) const throw` [inline], [inherited]

Returns a pointer to the mask table provided to the constructor, or the default from `classic_table()` if none was provided.

Definition at line 974 of file `locale_facets.h`.

**4.540.3.17** `char_type std::ctype< char >::tolower ( char_type __c ) const` [inline], [inherited]

Convert to lowercase.

This function converts the char argument to lowercase if possible. If not possible (for example, '2'), returns the argument.

`tolower()` acts as if it returns `ctype<char>::do_tolower(__c)`. `do_tolower()` must always return the same result for the same input.

#### Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

#### Returns

The lowercase char if convertible, else `__c`.

Definition at line 828 of file `locale_facets.h`.

References `std::ctype< _CharT >::do_tolower()`.

**4.540.3.18** `const char_type* std::ctype< char >::tolower ( char_type * __lo, const char_type * __hi ) const` [inline], [inherited]

Convert array to lowercase.

This function converts each char in the range [lo,hi) to lowercase if possible. Other chars remain untouched.

`tolower()` acts as if it returns `ctype<char>::do_tolower(__lo, __hi)`. `do_tolower()` must always return the same result for the same input.

## Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

Definition at line 845 of file locale\_facets.h.

References std::ctype&lt; \_CharT &gt;::do\_tolower().

**4.540.3.19 char\_type std::ctype< char >::toupper ( char\_type \_\_c ) const** [inline],[inherited]

Convert to uppercase.

This function converts the char argument to uppercase if possible. If not possible (for example, '2'), returns the argument.

toupper() acts as if it returns ctype&lt;char&gt;::do\_toupper(c). do\_toupper() must always return the same result for the same input.

## Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

## Returns

The uppercase char if convertible, else `__c`.

Definition at line 795 of file locale\_facets.h.

References std::ctype&lt; \_CharT &gt;::do\_toupper().

**4.540.3.20 const char\_type\* std::ctype< char >::toupper ( char\_type \* \_\_lo, const char\_type \* \_\_hi ) const** [inline],[inherited]

Convert array to uppercase.

This function converts each char in the range [ \_\_lo, \_\_hi) to uppercase if possible. Other chars remain untouched.

toupper() acts as if it returns ctype&lt;char&gt;::do\_toupper(\_\_lo, \_\_hi). do\_toupper() must always return the same result for the same input.

## Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.

## Returns

`__hi`.

Definition at line 812 of file locale\_facets.h.

References std::ctype&lt; \_CharT &gt;::do\_toupper().

**4.540.3.21 char\_type std::ctype< char >::widen ( char \_\_c ) const** [inline],[inherited]

Widen char.

This function converts the `char` to `char_type` using the simplest reasonable transformation. For an undervied `ctype<char>` facet, the argument will be returned unchanged.

This function works as if it returns `ctype<char>::do_widen(c)`. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

<code>__c</code>	The char to convert.
------------------	----------------------

#### Returns

The converted character.

Definition at line 865 of file `locale_facets.h`.

References `std::ctype<_CharT>::do_widen()`.

**4.540.3.22** `const char* std::ctype< char >::widen ( const char * __lo, const char * __hi, char_type * __to ) const`  
`[inline], [inherited]`

Widen char array.

This function converts each `char` in the input to `char` using the simplest reasonable transformation. For an undervied `ctype<char>` facet, the argument will be copied unchanged.

This function works as if it returns `ctype<char>::do_widen(c)`. `do_widen()` must always return the same result for the same input.

Note: this is not what you want for codepage conversions. See `codecvt` for that.

#### Parameters

<code>__lo</code>	Pointer to first char in range.
<code>__hi</code>	Pointer to end of range.
<code>__to</code>	Pointer to the destination array.

#### Returns

`__hi`.

Definition at line 892 of file `locale_facets.h`.

References `std::ctype<_CharT>::do_widen()`.

### 4.540.4 Member Data Documentation

**4.540.4.1** `locale::id std::ctype< char >::id` `[static], [inherited]`

The facet id for `ctype<char>`

Definition at line 696 of file `locale_facets.h`.

**4.540.4.2** `const size_t std::ctype< char >::table_size` `[static], [inherited]`

The size of the mask table. It is `SCHAR_MAX + 1`.

Definition at line 698 of file `locale_facets.h`.

The documentation for this class was generated from the following file:

#### 4.543.1 Detailed Description

`template<typename _Tp, typename _Alloc = std::allocator<_Tp>> class std::deque<_Tp, _Alloc>`

A standard container using fixed-size memory allocation and constant-time manipulation of elements at either end.

#### Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#).

In previous HP/SGI versions of deque, there was an extra template parameter so users could control the node size. This extension turned out to violate the C++ standard (it can be detected using template template parameters), and it was removed.

Here's how a `deque<Tp>` manages memory. Each deque has 4 members:

- `Tp** _M_map`
- `size_t _M_map_size`
- `iterator _M_start, _M_finish`

map\_size is at least 8. map is an array of map\_size pointers-to-nodes. (The name map has nothing to do with the std::map class, and **nodes** should not be confused with std::list's usage of *node*.)

A *node* has no specific type name as such, but it is referred to as *node* in this file. It is a simple array-of-Tp. If Tp is very large, there will be one Tp element per node (i.e., an *array* of one). For non-huge Tp's, node size is inversely related to Tp size: the larger the Tp, the fewer Tp's will fit in a node. The goal here is to keep the total size of a node relatively small and constant over different Tp's, to improve allocator efficiency.

Not every pointer in the map array will point to a node. If the initial number of elements in the deque is small, the /middle/ map pointers will be valid, and the ones at the edges will be unused. This same situation will arise as the map grows: available map pointers, if any, will be on the ends. As new nodes are created, only a subset of the map's pointers need to be copied *outward*.

Class invariants:

- For any nonsingular iterator i:
  - i.node points to a member of the map array. (Yes, you read that correctly: i.node does not actually point to a node.) The member of the map array is what actually points to the node.
  - i.first == \*(i.node) (This points to the node (first Tp element).)
  - i.last == i.first + node\_size
  - i.cur is a pointer in the range [i.first, i.last). NOTE: the implication of this is that i.cur is always a dereferenceable pointer, even if i is a past-the-end iterator.
- Start and Finish are always nonsingular iterators. NOTE: this means that an empty deque must have one node, a deque with <N elements (where N is the node buffer size) must have one node, a deque with N through (2N-1) elements must have two nodes, etc.
- For every node other than start.node and finish.node, every element in the node is an initialized object. If start.↔ node == finish.node, then [start.cur, finish.cur) are initialized objects, and the elements outside that range are uninitialized storage. Otherwise, [start.cur, start.last) and [finish.first, finish.cur) are initialized objects, and [start.↔ first, start.cur) and [finish.cur, finish.last) are uninitialized storage.
- [map, map + map\_size) is a valid, non-empty range.
- [start.node, finish.node] is a valid range contained within [map, map + map\_size).
- A pointer in the range [map, map + map\_size) points to an allocated node if and only if the pointer is in the range [start.node, finish.node].

Here's the magic: nothing in deque is **aware** of the discontinuous storage!

The memory setup and layout occurs in the parent, \_Base, and the iterator class is entirely responsible for *leaping* from one node to the next. All the implementation routines for deque itself work only through the start and finish iterators. This keeps the routines simple and sane, and we can use other standard algorithms as well.

Definition at line 730 of file stl\_deque.h.

#### 4.543.2 Constructor & Destructor Documentation

4.543.2.1 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::deque ( )`  
`[inline]`

Default constructor creates no elements.

Definition at line 782 of file stl\_deque.h.

4.543.2.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::deque ( const allocator_type &__a ) [inline], [explicit]`

Creates a deque with no elements.

## Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 790 of file `stl_deque.h`.

4.543.2.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::deque ( size_type __n ) [inline], [explicit]`

Creates a deque with default constructed elements.

## Parameters

<code>__n</code>	The number of elements to initially create.
------------------	---

This constructor fills the deque with *n* default constructed elements.

Definition at line 802 of file `stl_deque.h`.

4.543.2.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::deque ( size_type __n, const value_type & __value, const allocator_type & __a = allocator_type() ) [inline]`

Creates a deque with copies of an exemplar element.

## Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__a</code>	An allocator.

This constructor fills the deque with `__n` copies of `__value`.

Definition at line 814 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::_M_fill_initialize()`.

4.543.2.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::deque ( const deque<_Tp, _Alloc> & __x ) [inline]`

Deque copy constructor.

## Parameters

<code>__x</code>	A deque of identical element and allocator types.
------------------	---

The newly-created deque uses a copy of the allocation object used by `__x`.

Definition at line 841 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::begin()`, and `std::deque<_Tp, _Alloc>::end()`.

4.543.2.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::deque ( deque<_Tp, _Alloc> && __x ) [inline]`

Deque move constructor.

## Parameters

<code>__x</code>	A deque of identical element and allocator types.
------------------	---

The newly-created deque contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified deque.

Definition at line 855 of file `stl_deque.h`.

4.543.2.7 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::deque (`  
`initializer_list<value_type> __l, const allocator_type & __a = allocator_type() ) [inline]`

Builds a deque from an initializer list.

**Parameters**

<code>__l</code>	An initializer_list.
<code>__a</code>	An allocator object.

Create a deque consisting of copies of the elements in the initializer\_list `__l`.

This will call the element type's copy constructor N times (where N is `__l.size()`) and do no memory reallocation.

Definition at line 869 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::_M_range_initialize()`.

**4.543.2.8** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::RequireInputIter<_InputIterator>> std::deque<_Tp, _Alloc>::deque ( _InputIterator __first, _InputIterator __last, const allocator_type & __a = allocator_type() ) [inline]`

Builds a deque from a range.

**Parameters**

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__a</code>	An allocator object.

Create a deque consisting of copies of the elements from `[__first, __last)`.

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor N times (where N is `distance(__first, __last)`) and do no memory reallocation. But if only input iterators are used, then this will do at most 2N calls to the copy constructor, and logN memory reallocations.

Definition at line 896 of file `stl_deque.h`.

**4.543.2.9** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::deque<_Tp, _Alloc>::~~deque ( ) [inline], [noexcept]`

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 917 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::begin()`, and `std::deque<_Tp, _Alloc>::end()`.

**4.543.3 Member Function Documentation**

**4.543.3.1** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::_M_fill_initialize ( const value_type & __value ) [protected]`

Fills the deque with copies of `value`.

**Parameters**

<code>__value</code>	Initial value.
----------------------	----------------

**Returns**

Nothing.

**Precondition**

\_M\_start and \_M\_finish have already been initialized, but none of the deque's elements have yet been constructed.

This function is called only when the user provides an explicit size (with or without an explicit exemplar value).

Referenced by std::deque< \_Tp, \_Alloc >::deque().

4.543.3.2 `template<typename _Tp, typename _Alloc> void std::_Deque_base< _Tp, _Alloc >::_M_initialize_map( size_t __num_elements )` [protected], [inherited]

Layout storage.

**Parameters**

<code>__num_elements</code>	The count of T's for which to allocate space at first.
-----------------------------	--

**Returns**

Nothing.

The initial underlying memory layout is a bit complicated...

Definition at line 582 of file stl\_deque.h.

References std::max().

4.543.3.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::_M_new_elements_at_back( size_type __new_elements )` [protected]

Memory-handling helpers for the previous internal insert functions.

Referenced by std::deque< \_Tp, \_Alloc >::\_M\_reserve\_elements\_at\_back().

4.543.3.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::_M_new_elements_at_front( size_type __new_elements )` [protected]

Memory-handling helpers for the previous internal insert functions.

Referenced by std::deque< \_Tp, \_Alloc >::\_M\_reserve\_elements\_at\_front().

4.543.3.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::_M_pop_back_aux( )` [protected]

Helper functions for push\_\* and pop\_\*.

Referenced by std::deque< \_Tp, \_Alloc >::pop\_back().

4.543.3.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::_M_pop_front_aux( )` [protected]

Helper functions for push\_\* and pop\_\*.

Referenced by std::deque< \_Tp, \_Alloc >::pop\_front().

4.543.3.7 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> void std::deque< _Tp, _Alloc >::_M_push_back_aux( _Args &&... __args )` [protected]

Helper functions for push\_\* and pop\_\*.

Referenced by std::deque< \_Tp, \_Alloc >::push\_back().

4.543.3.8 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> void std::deque<_Tp, _Alloc>::_M_push_front_aux ( _Args &&... __args ) [protected]`

Helper functions for push\_\* and pop\_\*.

Referenced by `std::deque<_Tp, _Alloc>::push_front()`.

4.543.3.9 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::_M_range_check ( size_type __n ) const [inline], [protected]`

Safety check used only from `at()`.

Definition at line 1265 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::size()`.

Referenced by `std::deque<_Tp, _Alloc>::at()`.

4.543.3.10 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator > void std::deque<_Tp, _Alloc>::_M_range_initialize ( _InputIterator __first, _InputIterator __last, std::input_iterator_tag ) [protected]`

Fills the deque with whatever is in `[first,last)`.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

Nothing.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using `push_back` on each value from the iterator.

Referenced by `std::deque<_Tp, _Alloc>::deque()`.

4.543.3.11 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _ForwardIterator > void std::deque<_Tp, _Alloc>::_M_range_initialize ( _ForwardIterator __first, _ForwardIterator __last, std::forward_iterator_tag ) [protected]`

Fills the deque with whatever is in `[first,last)`.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Returns

Nothing.

If the iterators are actually forward iterators (or better), then the memory layout can be done all at once. Else we move forward using `push_back` on each value from the iterator.

4.543.3.12 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::_M_reallocate_map ( size_type __nodes_to_add, bool __add_at_front ) [protected]`

Memory-handling helpers for the major map.

Makes sure the `_M_map` has space for new nodes. Does not actually add the nodes. Can invalidate `_M_map` pointers. (And consequently, deque iterators.)

Referenced by `std::deque< _Tp, _Alloc >::_M_reserve_map_at_back()`, and `std::deque< _Tp, _Alloc >::_M_reserve_map_at_front()`.

**4.543.3.14** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque< _Tp, _Alloc >::_M_reserve_elements_at_front( size_type __n ) [inline], [protected]`

Memory-handling helpers for the previous internal insert functions.

Definition at line 1888 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::_M_new_elements_at_front()`.

**4.543.3.15** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::_M_reserve_map_at_back( size_type __nodes_to_add = 1 ) [inline], [protected]`

Memory-handling helpers for the major map.

Makes sure the `_M_map` has space for new nodes. Does not actually add the nodes. Can invalidate `_M_map` pointers. (And consequently, deque iterators.)

Definition at line 1924 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::_M_reallocate_map()`.

**4.543.3.16** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::_M_reserve_map_at_front( size_type __nodes_to_add = 1 ) [inline], [protected]`

Memory-handling helpers for the major map.

Makes sure the `_M_map` has space for new nodes. Does not actually add the nodes. Can invalidate `_M_map` pointers. (And consequently, deque iterators.)

Definition at line 1932 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::_M_reallocate_map()`.

**4.543.3.17** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::assign ( size_type __n, const value_type & __val ) [inline]`

Assigns a given value to a deque.

Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a deque with `n` copies of the given value. Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 978 of file `stl_deque.h`.

Referenced by `std::deque< _Tp, _Alloc >::assign()`, and `std::deque< _Tp, _Alloc >::operator=()`.

4.543.3.18 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename  
= std::_RequireInputIter<_InputIterator>> void std::deque<_Tp, _Alloc>::assign ( _InputIterator __first,  
_InputIterator __last ) [inline]`

Assigns a range to a deque.

#### Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a deque with copies of the elements in the range `[__first, __last)`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 997 of file `stl_deque.h`.

4.543.3.19 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::assign (   
initializer_list< value_type > __l ) [inline]`

Assigns an initializer list to a deque.

#### Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills a deque with copies of the elements in the `initializer_list __l`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 1022 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::assign()`.

4.543.3.20 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque<_Tp, _Alloc>::at (   
size_type __n ) [inline]`

Provides access to the data contained in the deque.

#### Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

#### Returns

Read/write reference to data.

#### Exceptions

<code>std::out_of_range</code>	If <code>__n</code> is an invalid index.
--------------------------------	--

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws `out_of_range` if the check fails.

Definition at line 1284 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::_M_range_check()`.

4.543.3.21 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque<_Tp, _Alloc>::at (   
size_type __n ) const [inline]`

Provides access to the data contained in the deque.

## Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

## Returns

Read-only (constant) reference to data.

## Exceptions

<code>std::out_of_range</code>	If <code>__n</code> is an invalid index.
--------------------------------	--

This function provides for safer data access. The parameter is first checked that it is in the range of the deque. The function throws `out_of_range` if the check fails.

Definition at line 1302 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::_M_range_check()`.

**4.543.3.22** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque< _Tp, _Alloc >::back ( )`  
`[inline]`

Returns a read/write reference to the data at the last element of the deque.

Definition at line 1329 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::end()`.

**4.543.3.23** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque< _Tp, _Alloc >::back ( ) const` `[inline]`

Returns a read-only (constant) reference to the data at the last element of the deque.

Definition at line 1341 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::end()`.

**4.543.3.24** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque< _Tp, _Alloc >::begin ( )`  
`[inline], [noexcept]`

Returns a read/write iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Definition at line 1037 of file `stl_deque.h`.

Referenced by `std::deque< _Tp, _Alloc >::clear()`, `std::deque< _Tp, _Alloc >::deque()`, `std::deque< _Tp, _Alloc >::front()`, `std::operator==( )`, and `std::deque< _Tp, _Alloc >::~~deque()`.

**4.543.3.25** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque< _Tp, _Alloc >::begin ( ) const` `[inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Definition at line 1045 of file `stl_deque.h`.

**4.543.3.26** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque< _Tp, _Alloc >::cbegin ( ) const` `[inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the deque. Iteration is done in ordinary element order.

Definition at line 1108 of file `stl_deque.h`.

**4.543.3.27** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque<_Tp, _Alloc>::cend ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Definition at line 1117 of file `stl_deque.h`.

**4.543.3.28** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::clear ( ) [inline], [noexcept]`

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1616 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::begin()`.

Referenced by `std::deque<_Tp, _Alloc>::operator=()`.

**4.543.3.29** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque<_Tp, _Alloc>::crbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

Definition at line 1126 of file `stl_deque.h`.

**4.543.3.30** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque<_Tp, _Alloc>::crend ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

Definition at line 1135 of file `stl_deque.h`.

**4.543.3.31** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> iterator std::deque<_Tp, _Alloc>::emplace ( iterator __position, _Args &&... __args )`

Inserts an object in deque before specified iterator.

#### Parameters

<code>__position</code>	An iterator into the deque.
<code>__args</code>	Arguments.

#### Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with `T(std::forward<Args>(args)...) before the specified location.`

Referenced by `std::deque<_Tp, _Alloc>::insert()`.

**4.543.3.32** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> bool std::deque<_Tp, _Alloc>::empty ( ) const [inline], [noexcept]`

Returns true if the deque is empty. (Thus `begin()` would equal `end()`.)

Definition at line 1228 of file `stl_deque.h`.

4.543.3.33 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::end ( )`  
`[inline], [noexcept]`

Returns a read/write iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Definition at line 1054 of file `stl_deque.h`.

Referenced by `std::deque<_Tp, _Alloc>::back()`, `std::deque<_Tp, _Alloc>::deque()`, `std::operator==(, and std::deque<_Tp, _Alloc>::~~deque().`

4.543.3.34 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::deque<_Tp, _Alloc>::end ( ) const` `[inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the deque. Iteration is done in ordinary element order.

Definition at line 1063 of file `stl_deque.h`.

4.543.3.35 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::erase (`  
`iterator __position )`

Remove element at given position.

Parameters

<code>__position</code>	Iterator pointing to element to be erased.
-------------------------	--

Returns

An iterator pointing to the next element (or `end()`).

This function will erase the element at the given position and thus shorten the deque by one.

The user is cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

4.543.3.36 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::erase (`  
`iterator __first, iterator __last )`

Remove a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by `last` prior to erasing (or `end()`).

This function will erase the elements in the range `[__first, __last)` and shorten the deque accordingly.

The user is cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

4.543.3.37 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque<_Tp, _Alloc>::front ( )`  
`[inline]`

Returns a read/write reference to the data at the first element of the deque.

Definition at line 1313 of file `std_deque.h`.

References `std::deque<_Tp, _Alloc>::begin()`.

**4.543.3.38** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque<_Tp, _Alloc>::front ( ) const [inline]`

Returns a read-only (constant) reference to the data at the first element of the deque.

Definition at line 1321 of file `std_deque.h`.

References `std::deque<_Tp, _Alloc>::begin()`.

**4.543.3.39** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> allocator_type std::deque<_Tp, _Alloc>::get_allocator ( ) const [inline], [noexcept]`

Get a copy of the memory allocation object.

Definition at line 1028 of file `std_deque.h`.

**4.543.3.40** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::insert ( iterator __position, const value_type & __x )`

Inserts given value into deque before specified iterator.

Parameters

<code>__position</code>	An iterator into the deque.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location.

Referenced by `std::deque<_Tp, _Alloc>::insert()`, and `std::deque<_Tp, _Alloc>::resize()`.

**4.543.3.41** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::deque<_Tp, _Alloc>::insert ( iterator __position, value_type && __x ) [inline]`

Inserts given rvalue into deque before specified iterator.

Parameters

<code>__position</code>	An iterator into the deque.
<code>__x</code>	Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location.

Definition at line 1492 of file `std_deque.h`.

References `std::deque<_Tp, _Alloc>::emplace()`, and `std::move()`.

**4.543.3.42** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::insert ( iterator __p, initializer_list< value_type > __l ) [inline]`

Inserts an initializer list into the deque.

## Parameters

<code>__p</code>	An iterator into the deque.
<code>__l</code>	An initializer_list.

This function will insert copies of the data in the initializer\_list `__l` into the deque before the location specified by `__p`. This is known as *list insert*.

Definition at line 1505 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::insert()`.

4.543.3.43 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::insert ( iterator __position, size_type __n, const value_type & __x ) [inline]`

Inserts a number of copies of given data into the deque.

## Parameters

<code>__position</code>	An iterator into the deque.
<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

This function will insert a specified number of copies of the given data before the location specified by `__position`.

Definition at line 1519 of file `stl_deque.h`.

4.543.3.44 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>> void std::deque< _Tp, _Alloc >::insert ( iterator __position, _InputIterator __first, _InputIterator __last ) [inline]`

Inserts a range into the deque.

## Parameters

<code>__position</code>	An iterator into the deque.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function will insert copies of the data in the range `[__first,__last)` into the deque before the location specified by `__position`. This is known as *range insert*.

Definition at line 1536 of file `stl_deque.h`.

4.543.3.45 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::deque< _Tp, _Alloc >::max_size ( ) const [inline],[noexcept]`

Returns the `size()` of the largest possible deque.

Definition at line 1147 of file `stl_deque.h`.

4.543.3.46 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> deque& std::deque< _Tp, _Alloc >::operator= ( const deque< _Tp, _Alloc > & __x )`

Deque assignment operator.

## Parameters

<code>__x</code>	A deque of identical element and allocator types.
------------------	---

All the elements of `x` are copied, but unlike the copy constructor, the allocator object is not copied.

4.543.3.47 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> deque& std::deque<_Tp, _Alloc>::operator= ( deque<_Tp, _Alloc> && __x ) [inline]`

Deque move assignment operator.

## Parameters

<code>__x</code>	A deque of identical element and allocator types.
------------------	---

The contents of `__x` are moved into this deque (without copying). `__x` is a valid, but unspecified deque.

Definition at line 939 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::clear()`, and `std::deque< _Tp, _Alloc >::swap()`.

**4.543.3.48** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> deque& std::deque< _Tp, _Alloc >::operator= (initializer_list< value_type > __l) [inline]`

Assigns an initializer list to a deque.

## Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills a deque with copies of the elements in the `initializer_list __l`.

Note that the assignment completely changes the deque and that the resulting deque's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 960 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::assign()`.

**4.543.3.49** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::deque< _Tp, _Alloc >::operator[] (size_type __n) [inline]`

Subscript access to the data contained in the deque.

## Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

## Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 1244 of file `stl_deque.h`.

**4.543.3.50** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::deque< _Tp, _Alloc >::operator[] (size_type __n) const [inline]`

Subscript access to the data contained in the deque.

## Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

## Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 1259 of file `stl_deque.h`.

**4.543.3.51** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::pop_back ( )`  
`[inline]`

Removes last element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

Definition at line 1442 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::_M_pop_back_aux()`.

**4.543.3.52** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::pop_front ( )`  
`[inline]`

Removes first element.

This is a typical stack operation. It shrinks the deque by one.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

Definition at line 1421 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::_M_pop_front_aux()`.

**4.543.3.53** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::push_back (`  
`const value_type &__x ) [inline]`

Add data to the end of the deque.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the end of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

Definition at line 1390 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::_M_push_back_aux()`.

**4.543.3.54** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::push_front (`  
`const value_type &__x ) [inline]`

Add data to the front of the deque.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the front of the deque and assigns the given data to it. Due to the nature of a deque this operation can be done in constant time.

Definition at line 1359 of file `stl_deque.h`.

References `std::deque<_Tp, _Alloc>::_M_push_front_aux()`.

**4.543.3.55** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::deque<_Tp, _Alloc>`  
`>::rbegin ( ) [inline], [noexcept]`

Returns a read/write reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

Definition at line 1072 of file `stl_deque.h`.

4.543.3.56 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque< _Tp, _Alloc >::rbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the deque. Iteration is done in reverse element order.

Definition at line 1081 of file `stl_deque.h`.

4.543.3.57 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::deque< _Tp, _Alloc >::rend ( ) [inline], [noexcept]`

Returns a read/write reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

Definition at line 1090 of file `stl_deque.h`.

4.543.3.58 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::deque< _Tp, _Alloc >::rend ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the deque. Iteration is done in reverse element order.

Definition at line 1099 of file `stl_deque.h`.

4.543.3.59 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::resize ( size_type __new_size ) [inline]`

Resizes the deque to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the deque should contain.
-------------------------	--

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise default constructed elements are appended.

Definition at line 1161 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::size()`.

4.543.3.60 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::resize ( size_type __new_size, const value_type & __x ) [inline]`

Resizes the deque to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the deque should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the deque to the specified number of elements. If the number is smaller than the deque's current size the deque is truncated, otherwise the deque is extended and new elements are populated with given data.

Definition at line 1183 of file `stl_deque.h`.

References `std::deque< _Tp, _Alloc >::insert()`, and `std::deque< _Tp, _Alloc >::size()`.

4.543.3.61 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque< _Tp, _Alloc >::shrink_to_fit ( ) [inline]`

A non-binding request to reduce memory use.

Definition at line 1219 of file `stl_deque.h`.

4.543.3.62 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::deque<_Tp, _Alloc>::size ( )`  
`const [inline], [noexcept]`

Returns the number of elements in the deque.

Definition at line 1142 of file `stl_deque.h`.

Referenced by `std::deque<_Tp, _Alloc>::_M_range_check()`, `std::operator==()`, and `std::deque<_Tp, _Alloc>::resize()`.

4.543.3.63 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::deque<_Tp, _Alloc>::swap (`  
`deque<_Tp, _Alloc> &__x ) [inline]`

Swaps data with another deque.

#### Parameters

<code>__x</code>	A deque of the same element and allocator types.
------------------	--

This exchanges the elements between two deques in constant time. (Four pointers, so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(d1,d2)` will feed to this function.

Definition at line 1596 of file `stl_deque.h`.

References `std::swap()`.

Referenced by `std::deque<_Tp, _Alloc>::operator=()`, and `std::swap()`.

The documentation for this class was generated from the following file:

- [stl\\_deque.h](#)

## 4.544.1 Detailed Description

```
template<typename _RandomNumberEngine, size_t __p, size_t __r> class std::discard_block_engine<_RandomNumberEngine, __p, __r>
```

Produces random numbers from some base engine by discarding blocks of data.

0 <= \_\_r <= \_\_p

Definition at line 854 of file random.h.

## 4.544.2 Member Typedef Documentation

4.544.2.1 `template<typename _RandomNumberEngine, size_t __p, size_t __r> typedef _RandomNumberEngine::result_type std::discard_block_engine<_RandomNumberEngine, __p, __r>::result_type`

The type of the generated random value.

Definition at line 857 of file random.h.

## 4.544.3 Constructor &amp; Destructor Documentation

4.544.3.1 `template<typename _RandomNumberEngine, size_t __p, size_t __r> std::discard_block_engine<_RandomNumberEngine, __p, __r>::discard_block_engine( ) [inline]`

Constructs a default discard\_block\_engine engine.

The underlying engine is default constructed as well.

Definition at line 872 of file random.h.

4.544.3.2 `template<typename _RandomNumberEngine, size_t __p, size_t __r> std::discard_block_engine<_RandomNumberEngine, __p, __r>::discard_block_engine( const _RandomNumberEngine &__rng ) [inline], [explicit]`

Copy constructs a discard\_block\_engine engine.

Copies an existing base class random number generator.

## Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 882 of file random.h.

```
4.544.3.3  template<typename _RandomNumberEngine, size_t __p, size_t __r> std::discard_block_engine<
            _RandomNumberEngine, __p, __r>::discard_block_engine ( _RandomNumberEngine && __rng ) [inline],
            [explicit]
```

Move constructs a discard\_block\_engine engine.

Copies an existing base class random number generator.

## Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 892 of file random.h.

```
4.544.3.4  template<typename _RandomNumberEngine, size_t __p, size_t __r> std::discard_block_engine<
            _RandomNumberEngine, __p, __r>::discard_block_engine ( result_type __s ) [inline], [explicit]
```

Seed constructs a discard\_block\_engine engine.

Constructs the underlying generator engine seeded with `__s`.

## Parameters

<code>__s</code>	A seed value for the base class engine.
------------------	---

Definition at line 902 of file random.h.

```
4.544.3.5  template<typename _RandomNumberEngine, size_t __p, size_t __r> template<typename _Sseq, typename
            = typename std::enable_if<!std::is_same<_Sseq, discard_block_engine>::value && !std::is_same<_Sseq,
            _RandomNumberEngine>::value> ::type> std::discard_block_engine< _RandomNumberEngine, __p, __r
            >::discard_block_engine ( _Sseq & __q ) [inline], [explicit]
```

Generator construct a discard\_block\_engine engine.

## Parameters

<code>__q</code>	A seed sequence.
------------------	------------------

Definition at line 915 of file random.h.

## 4.544.4 Member Function Documentation

```
4.544.4.1  template<typename _RandomNumberEngine, size_t __p, size_t __r> const _RandomNumberEngine&
            std::discard_block_engine< _RandomNumberEngine, __p, __r >::base ( ) const [inline], [noexcept]
```

Gets a const reference to the underlying generator engine object.

Definition at line 959 of file random.h.

```
4.544.4.2  template<typename _RandomNumberEngine, size_t __p, size_t __r> void std::discard_block_engine<
            _RandomNumberEngine, __p, __r>::discard ( unsigned long long __z ) [inline]
```

Discard a sequence of random numbers.

Definition at line 980 of file random.h.

4.544.4.3 `template<typename _RandomNumberEngine, size_t __p, size_t __r> static constexpr result_type  
std::discard_block_engine<_RandomNumberEngine, __p, __r>::max( ) [inline], [static]`

Gets the maximum value in the generated random number range.

Definition at line 973 of file random.h.

References std::max().

4.544.4.4 `template<typename _RandomNumberEngine, size_t __p, size_t __r> static constexpr result_type  
std::discard_block_engine<_RandomNumberEngine, __p, __r>::min( ) [inline], [static]`

Gets the minimum value in the generated random number range.

Definition at line 966 of file random.h.

References std::min().

4.544.4.5 `template<typename _RandomNumberEngine, size_t __p, size_t __r> result_type std::discard_block_engine<  
_RandomNumberEngine, __p, __r>::operator()( )`

Gets the next value in the generated random number sequence.

4.544.4.6 `template<typename _RandomNumberEngine, size_t __p, size_t __r> void std::discard_block_engine<  
_RandomNumberEngine, __p, __r>::seed( ) [inline]`

Reseeds the discard\_block\_engine object with the default seed for the underlying base class generator engine.

Definition at line 924 of file random.h.

4.544.4.7 `template<typename _RandomNumberEngine, size_t __p, size_t __r> void std::discard_block_engine<  
_RandomNumberEngine, __p, __r>::seed( result_type __s ) [inline]`

Reseeds the discard\_block\_engine object with the default seed for the underlying base class generator engine.

Definition at line 935 of file random.h.

4.544.4.8 `template<typename _RandomNumberEngine, size_t __p, size_t __r> template<typename _Sseq> void  
std::discard_block_engine<_RandomNumberEngine, __p, __r>::seed( _Sseq & __q ) [inline]`

Reseeds the discard\_block\_engine object with the given seed sequence.

Parameters

<code>__q</code>	A seed generator function.
------------------	----------------------------

Definition at line 948 of file random.h.

#### 4.544.5 Friends And Related Function Documentation

4.544.5.1 `template<typename _RandomNumberEngine, size_t __p, size_t __r> template<typename _RandomNumberEngine1,  
size_t __p1, size_t __r1, typename _CharT, typename _Traits> std::basic_ostream<_CharT, _Traits>& operator<<(  
std::basic_ostream<_CharT, _Traits> & __os, const std::discard_block_engine<_RandomNumberEngine1, __p1,  
__r1> & __x ) [friend]`

Inserts the current state of a discard\_block\_engine random number generator engine \_\_x into the output stream \_\_os.

## Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>discard_block_engine</code> random number generator engine.

## Returns

The output stream with the state of `__x` inserted or in an error state.

4.544.5.2 `template<typename _RandomNumberEngine, size_t __p, size_t __r> bool operator==( const discard_block_engine< _RandomNumberEngine, __p, __r > & __lhs, const discard_block_engine< _RandomNumberEngine, __p, __r > & __rhs ) [friend]`

Compares two `discard_block_engine` random number generator objects of the same type for equality.

## Parameters

<code>__lhs</code>	A <code>discard_block_engine</code> random number generator object.
<code>__rhs</code>	Another <code>discard_block_engine</code> random number generator object.

## Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1004 of file `random.h`.

4.544.5.3 `template<typename _RandomNumberEngine, size_t __p, size_t __r> template<typename _RandomNumberEngine1, size_t __p1, size_t __r1, typename _CharT, typename _Traits> std::basic_istream< _CharT, _Traits> & operator>> ( std::basic_istream< _CharT, _Traits> & __is, std::discard_block_engine< _RandomNumberEngine1, __p1, __r1 > & __x ) [friend]`

Extracts the current state of a `% subtract_with_carry_engine` random number generator engine `__x` from the input stream `__is`.

## Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>discard_block_engine</code> random number generator engine.

## Returns

The input stream with the state of `__x` extracted or in an error state.

The documentation for this class was generated from the following file:

**4.545.3.4** `template<typename _IntType = int> param_type std::discrete_distribution< _IntType >::param ( ) const`  
`[inline]`

Returns the parameter set of the distribution.

Definition at line 5349 of file random.h.

**4.545.3.5** `template<typename _IntType = int> void std::discrete_distribution< _IntType >::param ( const param_type &`  
`__param ) [inline]`

Sets the parameter set of the distribution.

##### Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 5357 of file random.h.

**4.545.3.6** `template<typename _IntType = int> std::vector<double> std::discrete_distribution< _IntType >::probabilities (`  
`) const [inline]`

Returns the probabilities of the distribution.

Definition at line 5339 of file random.h.

References `std::vector< _Tp, _Alloc >::empty()`.

**4.545.3.7** `template<typename _IntType = int> void std::discrete_distribution< _IntType >::reset ( ) [inline]`

Resets the distribution state.

Definition at line 5332 of file random.h.

#### 4.545.4 Friends And Related Function Documentation

4.545.4.1 `template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits >  
std::basic_ostream<_CharT, _Traits>& operator<< ( std::basic_ostream< _CharT, _Traits > &__os, const  
std::discrete_distribution<_IntType1 > &__x ) [friend]`

Inserts a discrete\_distribution random number distribution \_\_x into the output stream \_\_os.

## Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>discrete_distribution</code> random number distribution.

## Returns

The output stream with the state of `__x` inserted or in an error state.

4.545.4.2 `template<typename _IntType = int> bool operator== ( const discrete_distribution< _IntType > &__d1, const discrete_distribution< _IntType > &__d2 ) [friend]`

Return true if two discrete distributions have the same parameters.

Definition at line 5417 of file `random.h`.

4.545.4.3 `template<typename _IntType = int> template<typename _IntType1, typename _CharT, typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> ( std::basic_istream<_CharT, _Traits > &__is, std::discrete_distribution<_IntType1 > &__x ) [friend]`

Extracts a `discrete_distribution` random number distribution `__x` from the input stream `__is`.

## Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>discrete_distribution</code> random number generator engine.

## Returns

The input stream with `__x` extracted or in an error state.

### 4.550.1 Detailed Description

```
template<typename _RealType = double>class std::exponential_distribution<_RealType>
```

An exponential continuous distribution for random numbers.

Mean	$\frac{1}{\lambda}$
Median	$\frac{\ln 2}{\lambda}$
Mode	<i>zero</i>
Range	$[0, \infty]$
Standard Deviation	$\frac{1}{\lambda}$

Table 2: Distribution Statistics

The formula for the exponential probability density function is  $p(x|\lambda) = \lambda e^{-\lambda x}$ .

Definition at line 4646 of file random.h.

#### 4.550.2 Member Typedef Documentation

4.550.2.1 `template<typename _RealType = double> typedef _RealType std::exponential_distribution<_RealType>::result_type`

The type of the range of the distribution.

Definition at line 4649 of file random.h.

#### 4.550.3 Constructor & Destructor Documentation

4.550.3.1 `template<typename _RealType = double> std::exponential_distribution<_RealType>::exponential_distribution ( const result_type & __lambda = result_type(1) ) [inline], [explicit]`

Constructs an exponential distribution with inverse scale parameter  $\lambda$ .

Definition at line 4684 of file random.h.

#### 4.550.4 Member Function Documentation

4.550.4.1 `template<typename _RealType = double> _RealType std::exponential_distribution<_RealType>::lambda ( ) const [inline]`

Returns the inverse scale parameter of the distribution.

Definition at line 4705 of file random.h.

4.550.4.2 `template<typename _RealType = double> result_type std::exponential_distribution<_RealType>::max ( ) const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 4734 of file random.h.

References `std::max()`.

4.550.4.3 `template<typename _RealType = double> result_type std::exponential_distribution<_RealType>::min ( ) const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 4727 of file random.h.

4.550.4.4 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type  
std::exponential_distribution< _RealType >::operator() ( _UniformRandomNumberGenerator & __urng )  
[inline]`

Generating functions.

Definition at line 4742 of file random.h.

4.550.4.5 `template<typename _RealType = double> param_type std::exponential_distribution< _RealType >::param ( )  
const [inline]`

Returns the parameter set of the distribution.

Definition at line 4712 of file random.h.

4.550.4.6 `template<typename _RealType = double> void std::exponential_distribution< _RealType >::param ( const  
param_type & __param ) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 4720 of file random.h.

4.550.4.7 `template<typename _RealType = double> void std::exponential_distribution< _RealType >::reset ( )  
[inline]`

Resets the distribution state.

Has no effect on exponential distributions.

Definition at line 4699 of file random.h.

#### 4.550.5 Friends And Related Function Documentation

4.550.5.1 `template<typename _RealType = double> bool operator== ( const exponential_distribution< _RealType > & __d1,  
const exponential_distribution< _RealType > & __d2 ) [friend]`

Return true if two exponential distributions have the same parameters.

Definition at line 4782 of file random.h.

## 4.552.1 Detailed Description

```
template<typename _RealType = double>class std::extreme_value_distribution< _RealType >
```

A `extreme_value_distribution` random number distribution.

The formula for the normal probability mass function is

$$p(x|a, b) = \frac{1}{b} \exp\left(\frac{a-x}{b} - \exp\left(\frac{a-x}{b}\right)\right)$$

Definition at line 5051 of file `random.h`.

## 4.552.2 Member Typedef Documentation

4.552.2.1 `template<typename _RealType = double> typedef _RealType std::extreme_value_distribution< _RealType >::result_type`

The type of the range of the distribution.

Definition at line 5054 of file `random.h`.

## 4.552.3 Member Function Documentation

4.552.3.1 `template<typename _RealType = double> _RealType std::extreme_value_distribution< _RealType >::a ( ) const`  
[inline]

Return the  $a$  parameter of the distribution.

Definition at line 5109 of file `random.h`.

4.552.3.2 `template<typename _RealType = double> _RealType std::extreme_value_distribution< _RealType >::b ( ) const`  
[inline]

Return the  $b$  parameter of the distribution.

Definition at line 5116 of file `random.h`.

4.552.3.3 `template<typename _RealType = double> result_type std::extreme_value_distribution< _RealType >::max ( ) const` [inline]

Returns the least upper bound value of the distribution.

Definition at line 5145 of file `random.h`.

References `std::max()`.

4.552.3.4 `template<typename _RealType = double> result_type std::extreme_value_distribution< _RealType >::min ( ) const` [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 5138 of file `random.h`.

4.552.3.5 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type std::extreme_value_distribution< _RealType >::operator() ( _UniformRandomNumberGenerator & __urng )`

#### 4.554.1 Detailed Description

template<typename \_RealType = double> class std::fisher\_f\_distribution<\_RealType>

A fisher\_f\_distribution random number distribution.

The formula for the normal probability mass function is

$$p(x|m, n) = \frac{\Gamma((m+n)/2)}{\Gamma(m/2)\Gamma(n/2)} \left(\frac{m}{n}\right)^{m/2} x^{(m/2)-1} \left(1 + \frac{mx}{n}\right)^{-(m+n)/2}$$

Definition at line 3130 of file random.h.

#### 4.554.2 Member Typedef Documentation

4.554.2.1 template<typename \_RealType = double> typedef \_RealType std::fisher\_f\_distribution<\_RealType>::result\_type

The type of the range of the distribution.

Definition at line 3133 of file random.h.

#### 4.554.3 Member Function Documentation

4.554.3.1 template<typename \_RealType = double> result\_type std::fisher\_f\_distribution<\_RealType>::max ( ) const  
[inline]

Returns the least upper bound value of the distribution.

Definition at line 3224 of file random.h.

References std::max().

4.554.3.2 template<typename \_RealType = double> result\_type std::fisher\_f\_distribution<\_RealType>::min ( ) const  
[inline]

Returns the greatest lower bound value of the distribution.

Definition at line 3217 of file random.h.

4.554.3.3 template<typename \_RealType = double> template<typename \_UniformRandomNumberGenerator> result\_type  
std::fisher\_f\_distribution<\_RealType>::operator() ( \_UniformRandomNumberGenerator &\_\_urng ) [inline]

Generating functions.

Definition at line 3232 of file random.h.

4.554.3.4 template<typename \_RealType = double> param\_type std::fisher\_f\_distribution<\_RealType>::param ( ) const  
[inline]

Returns the parameter set of the distribution.

Definition at line 3202 of file random.h.

4.554.3.5 `template<typename _RealType = double> void std::fisher_f_distribution<_RealType >::param ( const  
param_type & __param ) [inline]`

Sets the parameter set of the distribution.

## Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 3210 of file random.h.

4.554.3.6 `template<typename _RealType = double> void std::fisher_f_distribution<_RealType>::reset ( ) [inline]`

Resets the distribution state.

Definition at line 3181 of file random.h.

References `std::gamma_distribution<_RealType>::reset()`.

## 4.554.4 Friends And Related Function Documentation

4.554.4.1 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< ( std::basic_ostream<_CharT, _Traits> & __os, const std::fisher_f_distribution<_RealType1> & __x ) [friend]`

Inserts a `fisher_f_distribution` random number distribution `__x` into the output stream `__os`.

## Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>fisher_f_distribution</code> random number distribution.

## Returns

The output stream with the state of `__x` inserted or in an error state.

4.554.4.2 `template<typename _RealType = double> bool operator==( const fisher_f_distribution<_RealType> & __d1, const fisher_f_distribution<_RealType> & __d2 ) [friend]`

Return true if two Fisher f distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 3280 of file random.h.

4.554.4.3 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> ( std::basic_istream<_CharT, _Traits> & __is, std::fisher_f_distribution<_RealType1> & __x ) [friend]`

Extracts a `fisher_f_distribution` random number distribution `__x` from the input stream `__is`.

## Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>fisher_f_distribution</code> random number generator engine.

## Returns

The input stream with `__x` extracted or in an error state.

### 4.557.1 Detailed Description

`template<typename \_Tp, typename \_Alloc = allocator<\_Tp>> class std::forward\_list<\_Tp, \_Alloc>`

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

#### Template Parameters

<code><a href="#">_Tp</a></code>	Type of element.
<code><a href="#">_Alloc</a></code>	Allocator type, defaults to <code><a href="#">allocator</a>&lt;<a href="#">_Tp</a>&gt;</code> .

Meets the requirements of a [container](#), a [sequence](#), including the [optional sequence requirements](#) with the exception of `at` and `operator[]`.

This is a *singly linked* list. Traversal up the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike `std::vector` and `std::deque`, random-access iterators are not provided, so subscripting ( `[]` ) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, `std::forward_list` provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

Definition at line 408 of file `forward_list.h`.

### 4.557.2 Constructor & Destructor Documentation

4.557.2.1 `template<typename \_Tp, typename \_Alloc = allocator<\_Tp>> std::forward\_list<\_Tp, \_Alloc>::forward_list ( const \_Alloc & __a/ = \_Alloc() ) [inline], [explicit]`

Creates a `forward_list` with no elements.

#### Parameters

<code>__a/</code>	An allocator object.
-------------------	----------------------

Definition at line 440 of file `forward_list.h`.

4.557.2.2 `template<typename \_Tp, typename \_Alloc = allocator<\_Tp>> std::forward\_list<\_Tp, \_Alloc>::forward_list ( const forward\_list<\_Tp, \_Alloc> & __list, const \_Alloc & __a/ ) [inline]`

Copy constructor with allocator argument.

## Parameters

<code>__list</code>	Input list to copy.
<code>__al</code>	An allocator object.

Definition at line 449 of file forward\_list.h.

References `std::forward_list< _Tp, _Alloc >::begin()`, and `std::forward_list< _Tp, _Alloc >::end()`.

4.557.2.3 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list< _Tp, _Alloc >::forward_list ( forward_list< _Tp, _Alloc > && __list, const _Alloc & __al ) [inline], [noexcept]`

Move constructor with allocator argument.

## Parameters

<code>__list</code>	Input list to move.
<code>__al</code>	An allocator object.

Definition at line 458 of file forward\_list.h.

4.557.2.4 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list< _Tp, _Alloc >::forward_list ( size_type __n, const _Alloc & __al = _Alloc() ) [inline], [explicit]`

Creates a forward\_list with default constructed elements.

## Parameters

<code>__n</code>	The number of elements to initially create.
------------------	---

This constructor creates the forward\_list with `__n` default constructed elements.

Definition at line 471 of file forward\_list.h.

4.557.2.5 `template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list< _Tp, _Alloc >::forward_list ( size_type __n, const _Tp & __value, const _Alloc & __al = _Alloc() ) [inline]`

Creates a forward\_list with copies of an exemplar element.

## Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__al</code>	An allocator object.

This constructor fills the forward\_list with `__n` copies of `__value`.

Definition at line 484 of file forward\_list.h.

4.557.2.6 `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>>> std::forward_list< _Tp, _Alloc >::forward_list ( _InputIterator __first, _InputIterator __last, const _Alloc & __al = _Alloc() ) [inline]`

Builds a forward\_list from a range.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

<code>__al</code>	An allocator object.
-------------------	----------------------

Create a `forward_list` consisting of copies of the elements from `[__first,__last)`. This is linear in `N` (where `N` is `distance(__first,__last)`).

Definition at line 501 of file `forward_list.h`.

```
4.557.2.7 template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::forward_list (
    const forward_list<_Tp, _Alloc> & __list ) [inline]
```

The `forward_list` copy constructor.

Parameters

<code>__list</code>	A <code>forward_list</code> of identical element and allocator types.
---------------------	---

Definition at line 511 of file `forward_list.h`.

References `std::forward_list<_Tp, _Alloc>::begin()`, and `std::forward_list<_Tp, _Alloc>::end()`.

```
4.557.2.8 template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::forward_list (
    forward_list<_Tp, _Alloc> && __list ) [inline], [noexcept]
```

The `forward_list` move constructor.

Parameters

<code>__list</code>	A <code>forward_list</code> of identical element and allocator types.
---------------------	---

The newly-created `forward_list` contains the exact contents of `__list`. The contents of `__list` are a valid, but unspecified `forward_list`.

Definition at line 525 of file `forward_list.h`.

```
4.557.2.9 template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::forward_list (
    std::initializer_list<_Tp> & __il, const _Alloc & __al = _Alloc() ) [inline]
```

Builds a `forward_list` from an `initializer_list`.

Parameters

<code>__il</code>	An <code>initializer_list</code> of <code>value_type</code> .
<code>__al</code>	An allocator object.

Create a `forward_list` consisting of copies of the elements in the `initializer_list` `__il`. This is linear in `__il.size()`.

Definition at line 536 of file `forward_list.h`.

```
4.557.2.10 template<typename _Tp, typename _Alloc = allocator<_Tp>> std::forward_list<_Tp, _Alloc>::~~forward_list (
    ) [inline], [noexcept]
```

The `forward_list` dtor.

Definition at line 544 of file `forward_list.h`.

#### 4.557.3 Member Function Documentation

```
4.557.3.1 template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _InputIterator, typename =
    std::RequireInputIter<_InputIterator>> void std::forward_list<_Tp, _Alloc>::assign ( _InputIterator __first,
    _InputIterator __last ) [inline]
```

Assigns a range to a `forward_list`.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a forward\_list with copies of the elements in the range [`__first`,`__last`).

Note that the assignment completely changes the forward\_list and that the number of elements of the resulting forward\_list is the same as the number of elements assigned. Old data is lost.

Definition at line 609 of file forward\_list.h.

Referenced by std::forward\_list< \_Tp, \_Alloc >::assign(), and std::forward\_list< \_Tp, \_Alloc >::operator=().

**4.557.3.2** `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::assign ( size_type __n, const _Tp & __val ) [inline]`

Assigns a given value to a forward\_list.

## Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a forward\_list with `__n` copies of the given value. Note that the assignment completely changes the forward\_list, and that the resulting forward\_list has `__n` elements. Old data is lost.

Definition at line 626 of file forward\_list.h.

**4.557.3.3** `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::assign ( std::initializer_list<_Tp> & __il ) [inline]`

Assigns an initializer\_list to a forward\_list.

## Parameters

<code>__il</code>	An initializer_list of value_type.
-------------------	------------------------------------

Replace the contents of the forward\_list with copies of the elements in the initializer\_list `__il`. This is linear in `il.size()`.

Definition at line 638 of file forward\_list.h.

References std::forward\_list< \_Tp, \_Alloc >::assign().

**4.557.3.4** `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list< _Tp, _Alloc >::before_begin ( ) [inline], [noexcept]`

Returns a read/write iterator that points before the first element in the forward\_list. Iteration is done in ordinary element order.

Definition at line 653 of file forward\_list.h.

**4.557.3.5** `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list< _Tp, _Alloc >::before_begin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points before the first element in the forward\_list. Iteration is done in ordinary element order.

Definition at line 662 of file forward\_list.h.

**4.557.3.6** `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc>::begin ( )`  
`[inline], [noexcept]`

Returns a read/write iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 670 of file `forward_list.h`.

Referenced by `std::forward_list<_Tp, _Alloc>::forward_list()`.

**4.557.3.7** `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list<_Tp, _Alloc>::begin ( ) const` `[inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 679 of file `forward_list.h`.

**4.557.3.8** `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list<_Tp, _Alloc>::cbefore_begin ( ) const` `[inline], [noexcept]`

Returns a read-only (constant) iterator that points before the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 715 of file `forward_list.h`.

Referenced by `std::forward_list<_Tp, _Alloc>::emplace_front()`, and `std::forward_list<_Tp, _Alloc>::push_front()`.

**4.557.3.9** `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list<_Tp, _Alloc>::cbegin ( ) const` `[inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 706 of file `forward_list.h`.

**4.557.3.10** `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list<_Tp, _Alloc>::cend ( ) const` `[inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the `forward_list`. Iteration is done in ordinary element order.

Definition at line 724 of file `forward_list.h`.

**4.557.3.11** `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::clear ( )`  
`[inline], [noexcept]`

Erases all the elements.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1027 of file `forward_list.h`.

**4.557.3.12** `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename... _Args> iterator`  
`std::forward_list<_Tp, _Alloc>::emplace_after ( const_iterator __pos, _Args &&... __args )` `[inline]`

Constructs object in `forward_list` after the specified iterator.

## Parameters

<code>__pos</code>	A const_iterator into the forward_list.
<code>__args</code>	Arguments.

## Returns

An iterator that points to the inserted data.

This function will insert an object of type T constructed with `T(std::forward<Args>(args)...)`  after the specified location. Due to the nature of a forward\_list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 837 of file forward\_list.h.

```
4.557.3.13  template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename... _Args> void
            std::forward_list< _Tp, _Alloc >::emplace_front ( _Args &&... __args ) [inline]
```

Constructs object in forward\_list at the front of the list.

## Parameters

<code>__args</code>	Arguments.
---------------------	------------

This function will insert an object of type Tp constructed with `Tp(std::forward<Args>(args)...)`  at the front of the list. Due to the nature of a forward\_list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 781 of file forward\_list.h.

References `std::forward_list< _Tp, _Alloc >::cbefore_begin()`.

```
4.557.3.14  template<typename _Tp, typename _Alloc = allocator<_Tp>> bool std::forward_list< _Tp, _Alloc >::empty ( )
            const [inline],[noexcept]
```

Returns true if the forward\_list is empty. (Thus `begin()` would equal `end()`.)

Definition at line 732 of file forward\_list.h.

```
4.557.3.15  template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list< _Tp, _Alloc >::end ( )
            [inline],[noexcept]
```

Returns a read/write iterator that points one past the last element in the forward\_list. Iteration is done in ordinary element order.

Definition at line 688 of file forward\_list.h.

Referenced by `std::forward_list< _Tp, _Alloc >::forward_list()`.

```
4.557.3.16  template<typename _Tp, typename _Alloc = allocator<_Tp>> const_iterator std::forward_list< _Tp, _Alloc
            >::end ( ) const [inline],[noexcept]
```

Returns a read-only iterator that points one past the last element in the forward\_list. Iteration is done in ordinary element order.

Definition at line 697 of file forward\_list.h.

```
4.557.3.17  template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list< _Tp, _Alloc
            >::erase_after ( const_iterator __pos ) [inline]
```

Removes the element pointed to by the iterator following `pos`.

**Parameters**

<code>__pos</code>	Iterator pointing before element to be erased.
--------------------	--

**Returns**

An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

This function will erase the element at the given position and thus shorten the `forward_list` by one.

Due to the nature of a `forward_list` this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 940 of file `forward_list.h`.

**4.557.3.18** `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc>::erase_after ( const_iterator __pos, const_iterator __last ) [inline]`

Remove a range of elements.

**Parameters**

<code>__pos</code>	Iterator pointing before the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

**Returns**

`@ __last`.

This function will erase the elements in the range `(__pos, __last)` and shorten the `forward_list` accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 963 of file `forward_list.h`.

**4.557.3.19** `template<typename _Tp, typename _Alloc = allocator<_Tp>> reference std::forward_list<_Tp, _Alloc>::front ( ) [inline]`

Returns a read/write reference to the data at the first element of the `forward_list`.

Definition at line 749 of file `forward_list.h`.

**4.557.3.20** `template<typename _Tp, typename _Alloc = allocator<_Tp>> const_reference std::forward_list<_Tp, _Alloc>::front ( ) const [inline]`

Returns a read-only (constant) reference to the data at the first element of the `forward_list`.

Definition at line 760 of file `forward_list.h`.

**4.557.3.21** `template<typename _Tp, typename _Alloc = allocator<_Tp>> allocator_type std::forward_list<_Tp, _Alloc>::get_allocator ( ) const [inline], [noexcept]`

Get a copy of the memory allocation object.

Definition at line 643 of file `forward_list.h`.

4.557.3.22 `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc>::insert_after( const_iterator __pos, const _Tp & __val ) [inline]`

Inserts given value into forward\_list after specified iterator.

**Parameters**

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__val</code>	Data to be inserted.

**Returns**

An iterator that points to the inserted data.

This function will insert a copy of the given value after the specified location. Due to the nature of a `forward_list` this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 854 of file `forward_list.h`.

Referenced by `std::forward_list<_Tp, _Alloc>::insert_after()`.

**4.557.3.23** `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc>::insert_after ( const_iterator __pos, size_type __n, const _Tp & __val )`

Inserts a number of copies of given data into the `forward_list`.

**Parameters**

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__n</code>	Number of elements to be inserted.
<code>__val</code>	Data to be inserted.

**Returns**

An iterator pointing to the last inserted copy of `val` or `pos` if `n == 0`.

This function will insert a specified number of copies of the given data after the location specified by `pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

**4.557.3.24** `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>> iterator std::forward_list<_Tp, _Alloc>::insert_after ( const_iterator __pos, _InputIterator __first, _InputIterator __last )`

Inserts a range into the `forward_list`.

**Parameters**

<code>__pos</code>	An iterator into the <code>forward_list</code> .
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

**Returns**

An iterator pointing to the last inserted element or `__pos` if `__first == __last`.

This function will insert copies of the data in the range `[__first, __last)` into the `forward_list` after the location specified by `__pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

**4.557.3.25** `template<typename _Tp, typename _Alloc = allocator<_Tp>> iterator std::forward_list<_Tp, _Alloc>::insert_after ( const_iterator __pos, std::initializer_list<_Tp> __il ) [inline]`

Inserts the contents of an `initializer_list` into `forward_list` after the specified iterator.

## Parameters

<code>__pos</code>	An iterator into the forward_list.
<code>__il</code>	An initializer_list of value_type.

## Returns

An iterator pointing to the last inserted element or `__pos` if `__il` is empty.

This function will insert copies of the data in the initializer\_list `__il` into the forward\_list before the location specified by `__pos`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 919 of file forward\_list.h.

References std::forward\_list< \_Tp, \_Alloc >::insert\_after().

**4.557.3.26** `template<typename _Tp, typename _Alloc = allocator<_Tp>> size_type std::forward_list< _Tp, _Alloc >::max_size ( ) const [inline], [noexcept]`

Returns the largest possible number of elements of forward\_list.

Definition at line 739 of file forward\_list.h.

References std::allocator\_traits< \_Alloc >::max\_size().

**4.557.3.27** `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::merge ( forward_list< _Tp, _Alloc > && __list ) [inline]`

Merge sorted lists.

## Parameters

<code>__list</code>	Sorted list to merge.
---------------------	-----------------------

Assumes that both `list` and this list are sorted according to operator<(). Merges elements of `__list` into this list in sorted order, leaving `__list` empty when complete. Elements in this list precede elements in `__list` that are equal.

Definition at line 1165 of file forward\_list.h.

References std::move().

**4.557.3.28** `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _Comp > void std::forward_list< _Tp, _Alloc >::merge ( forward_list< _Tp, _Alloc > && __list, _Comp __comp )`

Merge sorted lists according to comparison function.

## Parameters

<code>__list</code>	Sorted list to merge.
<code>__comp</code>	Comparison function defining sort order.

Assumes that both `__list` and this list are sorted according to comp. Merges elements of `__list` into this list in sorted order, leaving `__list` empty when complete. Elements in this list precede elements in `__list` that are equivalent according to comp().

**4.557.3.29** `template<typename _Tp, typename _Alloc = allocator<_Tp>> forward_list& std::forward_list< _Tp, _Alloc >::operator= ( const forward_list< _Tp, _Alloc > & __list )`

The forward\_list assignment operator.

## Parameters

<code>__list</code>	A <code>forward_list</code> of identical element and allocator types.
---------------------	---

All the elements of `__list` are copied, but unlike the copy constructor, the allocator object is not copied.

**4.557.3.30** `template<typename _Tp, typename _Alloc = allocator<_Tp>> forward_list& std::forward_list<_Tp, _Alloc>::operator= ( forward_list<_Tp, _Alloc> && __list ) [inline], [noexcept]`

The `forward_list` move assignment operator.

## Parameters

<code>__list</code>	A <code>forward_list</code> of identical element and allocator types.
---------------------	---

The contents of `__list` are moved into this `forward_list` (without copying, if the allocators permit it). `__list` is a valid, but unspecified `forward_list`

Definition at line 568 of file `forward_list.h`.

References `std::move()`.

**4.557.3.31** `template<typename _Tp, typename _Alloc = allocator<_Tp>> forward_list& std::forward_list<_Tp, _Alloc>::operator= ( std::initializer_list<_Tp> & __il ) [inline]`

The `forward_list` initializer list assignment operator.

## Parameters

<code>__il</code>	An <code>initializer_list</code> of <code>value_type</code> .
-------------------	---

Replace the contents of the `forward_list` with copies of the elements in the `initializer_list` `__il`. This is linear in `__il.size()`.

Definition at line 588 of file `forward_list.h`.

References `std::forward_list<_Tp, _Alloc>::assign()`.

**4.557.3.32** `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::pop_front ( ) [inline]`

Removes first element.

This is a typical stack operation. It shrinks the `forward_list` by one. Due to the nature of a `forward_list` this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

Definition at line 819 of file `forward_list.h`.

**4.557.3.33** `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::push_front ( const _Tp & __val ) [inline]`

Add data to the front of the `forward_list`.

## Parameters

<code>__val</code>	Data to be added.
--------------------	-------------------

This is a typical stack operation. The function creates an element at the front of the `forward_list` and assigns the given data to it. Due to the nature of a `forward_list` this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 796 of file `forward_list.h`.

References `std::forward_list<_Tp, _Alloc>::cbefore_begin()`.

```
4.557.3.34  template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc >::remove (
    const _Tp & __val )
```

Remove all elements equal to value.

## Parameters

<code>__val</code>	The value to remove.
--------------------	----------------------

Removes every element in the list equal to `__val`. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**4.557.3.35** `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _Pred > void std::forward_list<_Tp, _Alloc>::remove_if ( _Pred __pred )`

Remove all elements satisfying a predicate.

## Parameters

<code>__pred</code>	Unary predicate function or object.
---------------------	-------------------------------------

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**4.557.3.36** `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::resize ( size_type __sz )`

Resizes the `forward_list` to the specified number of elements.

## Parameters

<code>__sz</code>	Number of elements the <code>forward_list</code> should contain.
-------------------	--

This function will resize the `forward_list` to the specified number of elements. If the number is smaller than the `forward_list`'s current number of elements the `forward_list` is truncated, otherwise the `forward_list` is extended and the new elements are default constructed.

**4.557.3.37** `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::resize ( size_type __sz, const value_type & __val )`

Resizes the `forward_list` to the specified number of elements.

## Parameters

<code>__sz</code>	Number of elements the <code>forward_list</code> should contain.
<code>__val</code>	Data with which new elements should be populated.

This function will resize the `forward_list` to the specified number of elements. If the number is smaller than the `forward_list`'s current number of elements the `forward_list` is truncated, otherwise the `forward_list` is extended and new elements are populated with given data.

**4.557.3.38** `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::reverse ( )`  
`[inline], [noexcept]`

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

Definition at line 1218 of file `forward_list.h`.

**4.557.3.39** `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::sort ( )`  
`[inline]`

Sort the elements of the list.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 1199 of file forward\_list.h.

4.557.3.40 `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _Comp > void  
std::forward_list< _Tp, _Alloc >::sort ( _Comp __comp )`

Sort the forward\_list using a comparison function.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

4.557.3.41 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::splice_after (   
const_iterator __pos, forward_list< _Tp, _Alloc > && __list ) [inline]`

Insert contents of another forward\_list.

Parameters

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.

The elements of *list* are inserted in constant time after the element referenced by *pos*. *list* becomes an empty list.

Requires this != x.

Definition at line 1044 of file forward\_list.h.

4.557.3.42 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::splice_after (   
const_iterator __pos, forward_list< _Tp, _Alloc > && __list, const_iterator __i )`

Insert element from another forward\_list.

Parameters

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.
<code>__i</code>	Iterator referencing the element before the element to move.

Removes the element in list *list* referenced by *i* and inserts it into the current list after *pos*.

4.557.3.43 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::splice_after (   
const_iterator __pos, forward_list< _Tp, _Alloc > &&, const_iterator __before, const_iterator __last )  
[inline]`

Insert range from another forward\_list.

Parameters

<code>__pos</code>	Iterator referencing the element to insert after.
<code>__list</code>	Source list.
<code>__before</code>	Iterator referencing before the start of range in list.
<code>__last</code>	Iterator referencing the end of range in list.

Removes elements in the range ( \_\_before, \_\_last) and inserts them after \_\_pos in constant time.

Undefined if \_\_pos is in ( \_\_before, \_\_last).

Definition at line 1087 of file forward\_list.h.

4.557.3.44 `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list< _Tp, _Alloc >::swap (   
forward_list< _Tp, _Alloc > & __list ) [inline], [noexcept]`

Swaps data with another forward\_list.

## Parameters

<code>__list</code>	A forward_list of the same element and allocator types.
---------------------	---

This exchanges the elements between two lists in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(l1,l2)` will feed to this function.

Definition at line 980 of file `forward_list.h`.

References `std::swap()`.

Referenced by `std::swap()`.

**4.557.3.45** `template<typename _Tp, typename _Alloc = allocator<_Tp>> void std::forward_list<_Tp, _Alloc>::unique ( )`  
`[inline]`

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1136 of file `forward_list.h`.

**4.557.3.46** `template<typename _Tp, typename _Alloc = allocator<_Tp>> template<typename _BinPred > void`  
`std::forward_list<_Tp, _Alloc>::unique ( _BinPred __binary_pred )`

Remove consecutive elements satisfying a predicate.

## Parameters

<code>__binary_pred</code>	Binary predicate function or object.
----------------------------	--------------------------------------

For each consecutive set of elements `[first,last)` that satisfy `predicate(first,i)` where `i` is an iterator in `[first,last)`, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**4.558.1** Detailed Description

```
template<typename _StateT>class std::fpos<_StateT>
```

Class representing stream positions.

The standard places no requirements upon the template parameter StateT. In this implementation StateT must be DefaultConstructible, CopyConstructible and Assignable. The standard only requires that fpos should contain a member of type StateT. In this implementation it also contains an offset stored as a signed integer.

#### Parameters

<i>StateT</i>	Type passed to and returned from state().
---------------	---

Definition at line 112 of file postypes.h.

### 4.558.2 Constructor & Destructor Documentation

4.558.2.1 `template<typename _StateT> std::fpos<_StateT>::fpos ( streamoff __off ) [inline]`

Construct position from offset.

Definition at line 133 of file postypes.h.

### 4.558.3 Member Function Documentation

4.558.3.1 `template<typename _StateT> std::fpos<_StateT>::operator streamoff ( ) const [inline]`

Convert to streamoff.

Definition at line 137 of file postypes.h.

4.558.3.2 `template<typename _StateT> fpos std::fpos<_StateT>::operator+ ( streamoff __off ) const [inline]`

Add position and offset.

Definition at line 178 of file postypes.h.

4.558.3.3 `template<typename _StateT> fpos& std::fpos<_StateT>::operator+= ( streamoff __off ) [inline]`

Add offset to this position.

Definition at line 154 of file postypes.h.

4.558.3.4 `template<typename _StateT> fpos std::fpos<_StateT>::operator- ( streamoff __off ) const [inline]`

Subtract offset from position.

Definition at line 192 of file postypes.h.

4.558.3.5 `template<typename _StateT> streamoff std::fpos<_StateT>::operator- ( const fpos<_StateT> &__other ) const [inline]`

Subtract position to return offset.

Definition at line 205 of file postypes.h.

4.558.3.6 `template<typename _StateT> fpos& std::fpos<_StateT>::operator-= ( streamoff __off ) [inline]`

Subtract offset from this position.

Definition at line 165 of file postypes.h.

4.558.3.7 `template<typename _StateT> void std::fpos<_StateT>::state ( _StateT __st ) [inline]`

Remember the value of *st*.

Definition at line 141 of file postypes.h.

4.558.3.8 `template<typename _StateT> _StateT std::fpos<_StateT>::state ( ) const [inline]`

Return the last set value of *st*.

Definition at line 146 of file postypes.h.

## 4.559 `std::front_insert_iterator<_Container>` Class Template Reference

Inheritance diagram for `std::front_insert_iterator<_Container>`:

### Public Types

- typedef `_Container` [container\\_type](#)
- typedef void [difference\\_type](#)
- typedef [output\\_iterator\\_tag](#) [iterator\\_category](#)
- typedef void [pointer](#)
- typedef void [reference](#)
- typedef void [value\\_type](#)

### Public Member Functions

- [front\\_insert\\_iterator](#) (`_Container &__x`)
- [front\\_insert\\_iterator](#) & [operator\\*](#) ()
- [front\\_insert\\_iterator](#) & [operator++](#) ()
- [front\\_insert\\_iterator](#) [operator++](#) (int)
- [front\\_insert\\_iterator](#) & [operator=](#) (const typename `_Container::value_type` &\_\_value)
- [front\\_insert\\_iterator](#) & [operator=](#) (typename `_Container::value_type` &&\_\_value)

## Protected Attributes

- `_Container * container`

## 4.559.1 Detailed Description

```
template<typename _Container>class std::front_insert_iterator<_Container>
```

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator prepends it to the container using `push_front`.

Tip: Using the `front_inserter` function to create these iterators can save typing.

Definition at line 493 of file `stl_iterator.h`.

## 4.559.2 Member Typedef Documentation

4.559.2.1 `template<typename _Container> typedef _Container std::front_insert_iterator<_Container>::container_type`

A nested typedef for the type of whatever container you used.

Definition at line 501 of file `stl_iterator.h`.

4.559.2.2 `typedef void std::iterator< output_iterator_tag, void, void, void, void>::difference_type [inherited]`

Distance between iterators is represented as this type.

Definition at line 125 of file `stl_iterator_base_types.h`.

4.559.2.3 `typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void>::iterator_category [inherited]`

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

4.559.2.4 `typedef void std::iterator< output_iterator_tag, void, void, void, void>::pointer [inherited]`

This type represents a pointer-to-value\_type.

Definition at line 127 of file `stl_iterator_base_types.h`.

4.559.2.5 `typedef void std::iterator< output_iterator_tag, void, void, void, void>::reference [inherited]`

This type represents a reference-to-value\_type.

Definition at line 129 of file `stl_iterator_base_types.h`.

4.559.2.6 `typedef void std::iterator< output_iterator_tag, void, void, void, void>::value_type [inherited]`

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

## 4.559.3 Constructor &amp; Destructor Documentation

4.559.3.1 `template<typename _Container > std::front_insert_iterator< _Container >::front_insert_iterator ( _Container &__x ) [inline],[explicit]`

The only way to create this iterator is with a container.

Definition at line 504 of file `stl_iterator.h`.

#### 4.559.4 Member Function Documentation

4.559.4.1 `template<typename _Container > front_insert_iterator& std::front_insert_iterator< _Container >::operator* ( ) [inline]`

Simply returns `*this`.

Definition at line 542 of file `stl_iterator.h`.

4.559.4.2 `template<typename _Container > front_insert_iterator& std::front_insert_iterator< _Container >::operator++ ( ) [inline]`

Simply returns `*this`. (This iterator does not *move*.)

Definition at line 547 of file `stl_iterator.h`.

4.559.4.3 `template<typename _Container > front_insert_iterator std::front_insert_iterator< _Container >::operator++ ( int ) [inline]`

Simply returns `*this`. (This iterator does not *move*.)

Definition at line 552 of file `stl_iterator.h`.

4.559.4.4 `template<typename _Container > front_insert_iterator& std::front_insert_iterator< _Container >::operator= ( const typename _Container::value_type & __value ) [inline]`

#### Parameters

<code>__value</code>	An instance of whatever type <code>container_type::const_reference</code> is; presumably a reference-to- <code>const T</code> for <code>container&lt;T&gt;</code> .
----------------------	---

#### Returns

This iterator, for chained operations.

This kind of iterator doesn't really have a *position* in the container (you can think of the position as being permanently at the front, if you like). Assigning a value to the iterator will always prepend the value to the front of the container.

Definition at line 526 of file `stl_iterator.h`.

## 4.560.1 Detailed Description

```
template<typename _RealType = double> class std::gamma_distribution<_RealType>
```

A gamma continuous distribution for random numbers.

The formula for the gamma probability density function is:

$$p(x|\alpha, \beta) = \frac{1}{\beta\Gamma(\alpha)} (x/\beta)^{\alpha-1} e^{-x/\beta}$$

Definition at line 2502 of file random.h.

#### 4.560.2 Member Typedef Documentation

4.560.2.1 `template<typename _RealType = double> typedef _RealType std::gamma_distribution< _RealType >::result_type`

The type of the range of the distribution.

Definition at line 2505 of file random.h.

#### 4.560.3 Constructor & Destructor Documentation

4.560.3.1 `template<typename _RealType = double> std::gamma_distribution< _RealType >::gamma_distribution ( _RealType __alpha_val = _RealType(1), _RealType __beta_val = _RealType(1) ) [inline], [explicit]`

Constructs a gamma distribution with parameters  $\alpha$  and  $\beta$ .

Definition at line 2554 of file random.h.

#### 4.560.4 Member Function Documentation

4.560.4.1 `template<typename _RealType = double> _RealType std::gamma_distribution< _RealType >::alpha ( ) const [inline]`

Returns the  $\alpha$  of the distribution.

Definition at line 2575 of file random.h.

4.560.4.2 `template<typename _RealType = double> _RealType std::gamma_distribution< _RealType >::beta ( ) const [inline]`

Returns the  $\beta$  of the distribution.

Definition at line 2582 of file random.h.

4.560.4.3 `template<typename _RealType = double> result_type std::gamma_distribution< _RealType >::max ( ) const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 2611 of file random.h.

4.560.4.4 `template<typename _RealType = double> result_type std::gamma_distribution< _RealType >::min ( ) const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 2604 of file random.h.

4.560.4.5 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator> result_type std::gamma_distribution< _RealType >::operator() ( _UniformRandomNumberGenerator & __urng ) [inline]`

Generating functions.

Definition at line 2619 of file random.h.

Referenced by `std::gamma_distribution< result_type >::operator()()`.

4.560.4.6 `template<typename _RealType = double> param_type std::gamma_distribution<_RealType>::param ( ) const [inline]`

Returns the parameter set of the distribution.

Definition at line 2589 of file random.h.

4.560.4.7 `template<typename _RealType = double> void std::gamma_distribution<_RealType>::param ( const param_type & __param ) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 2597 of file random.h.

4.560.4.8 `template<typename _RealType = double> void std::gamma_distribution<_RealType>::reset ( ) [inline]`

Resets the distribution state.

Definition at line 2568 of file random.h.

Referenced by `std::chi_squared_distribution<_RealType>::reset()`, `std::fisher_f_distribution<_RealType>::reset()`, `std::student_t_distribution<_RealType>::reset()`, and `std::negative_binomial_distribution<_IntType>::reset()`.

#### 4.560.5 Friends And Related Function Documentation

4.560.5.1 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits> > std::basic_ostream<_CharT, _Traits>& operator<< ( std::basic_ostream<_CharT, _Traits> & __os, const std::gamma_distribution<_RealType1> & __x ) [friend]`

Inserts a gamma\_distribution random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A gamma_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.560.5.2 `template<typename _RealType = double> bool operator==( const gamma_distribution<_RealType> & __d1, const gamma_distribution<_RealType> & __d2 ) [friend]`

Return true if two gamma distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 2655 of file random.h.

4.560.5.3 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits> > std::basic_istream<_CharT, _Traits>& operator>> ( std::basic_istream<_CharT, _Traits> & __is, std::gamma_distribution<_RealType1> & __x ) [friend]`

Extracts a gamma\_distribution random number distribution `__x` from the input stream `__is`.

## Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>gamma_distribution</code> random number generator engine.

## Returns

The input stream with `__x` extracted or in an error state.

## Friends

- `template<typename _Tp> class valarray`

## 4.566.1 Detailed Description

Class defining multi-dimensional subset of an array.

The slice class represents a multi-dimensional subset of an array, specified by three parameter sets: start offset, size array, and stride array. The start offset is the index of the first element of the array that is part of the subset. The size and stride array describe each dimension of the slice. Size is the number of elements in that dimension, and stride is the distance in the array between successive elements in that dimension. Each dimension's size and stride is taken to begin at an array element described by the previous dimension. The size array and stride array must be the same size.

For example, if you have `offset==3`, `stride[0]==11`, `size[1]==3`, `stride[1]==3`, then `slice[0,0]==array[3]`, `slice[0,1]==array[6]`, `slice[0,2]==array[9]`, `slice[1,0]==array[14]`, `slice[1,1]==array[17]`, `slice[1,2]==array[20]`.

#### Friends

- class **valarray**< \_Tp >

#### 4.567.1 Detailed Description

template<typename \_Tp>class std::gslice\_array< \_Tp >

Reference to multi-dimensional subset of an array.

A gslice\_array is a reference to the actual elements of an array specified by a gslice. The way to get a gslice\_array is to call operator[](gslice) on a valarray. The returned gslice\_array then permits carrying operations out on the referenced subset of elements in the original valarray. For example, operator+=(valarray) will add values to the subset of elements in the underlying valarray this gslice\_array refers to.

#### Parameters

<i>Tp</i>	Element type.
-----------	---------------

Definition at line 60 of file gslice\_array.h.

The documentation for this class was generated from the following file:

- [gslice\\_array.h](#)

## 4.568 std::hash< \_Tp > Struct Template Reference

#### 4.568.1 Detailed Description

template<typename \_Tp>struct std::hash< \_Tp >

Primary class template hash.

Definition at line 58 of file functional\_hash.h.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

## 4.569 std::hash< \_\_gnu\_cxx::\_\_u16vstring > Struct Template Reference

Inherits std::\_\_hash\_base< \_Result, \_Arg >.

#### Public Types

- typedef \_Arg **argument\_type**
- typedef \_Result **result\_type**

## Public Member Functions

- `size_t operator()` (const [\\_\\_gnu\\_cxx::\\_\\_u16vstring](#) &\_\_s) const noexcept

### 4.569.1 Detailed Description

`template<> struct std::hash< \_\_gnu\_cxx::\_\_u16vstring >`

`std::hash` specialization for `__u16vstring`.

Definition at line 2826 of file `vstring.h`.

The documentation for this struct was generated from the following file:

- [vstring.h](#)

## 4.570 `std::hash< \_\_gnu\_cxx::\_\_u32vstring >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

- `typedef _Arg argument_type`
- `typedef _Result result_type`

## Public Member Functions

- `size_t operator()` (const [\\_\\_gnu\\_cxx::\\_\\_u32vstring](#) &\_\_s) const noexcept

### 4.570.1 Detailed Description

`template<> struct std::hash< \_\_gnu\_cxx::\_\_u32vstring >`

`std::hash` specialization for `__u32vstring`.

Definition at line 2837 of file `vstring.h`.

The documentation for this struct was generated from the following file:

- [vstring.h](#)

## 4.571 `std::hash< \_\_gnu\_cxx::\_\_vstring >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

- `typedef _Arg argument_type`
- `typedef _Result result_type`

## Public Member Functions

- `size_t operator()` (const [\\_\\_gnu\\_cxx::\\_\\_vstring](#) &\_\_s) const noexcept

## 4.571.1 Detailed Description

`template<> struct std::hash< __gnu_cxx::__vstring >`

`std::hash` specialization for `__vstring`.

Definition at line 2802 of file `vstring.h`.

The documentation for this struct was generated from the following file:

- [vstring.h](#)

4.572 `std::hash< __gnu_cxx::__wvstring >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

- `typedef _Arg argument_type`
- `typedef _Result result_type`

## Public Member Functions

- `size_t operator()` (const [\\_\\_gnu\\_cxx::\\_\\_wvstring](#) &\_\_s) const noexcept

## 4.572.1 Detailed Description

`template<> struct std::hash< __gnu_cxx::__wvstring >`

`std::hash` specialization for `__wvstring`.

Definition at line 2813 of file `vstring.h`.

The documentation for this struct was generated from the following file:

- [vstring.h](#)

#### 4.573 `std::hash< __gnu_cxx::throw_value_limit >` Struct Template Reference

Inheritance diagram for `std::hash< __gnu_cxx::throw_value_limit >`:

##### Public Types

- typedef `__gnu_cxx::throw_value_limit` `argument_type`
- typedef `size_t` `result_type`

##### Public Member Functions

- `size_t operator()` (`const __gnu_cxx::throw_value_limit &__val`) `const`

##### 4.573.1 Detailed Description

`template<> struct std::hash< __gnu_cxx::throw_value_limit >`

Explicit specialization of `std::hash` for `__gnu_cxx::throw_value_limit`.

Definition at line 788 of file `throw_allocator.h`.

##### 4.573.2 Member Typedef Documentation

**4.573.2.1** typedef `__gnu_cxx::throw_value_limit` `std::unary_function< __gnu_cxx::throw_value_limit, size_t >::argument_type` `[inherited]`

`argument_type` is the type of the argument

Definition at line 104 of file `stl_function.h`.

**4.573.2.2** typedef `size_t` `std::unary_function< __gnu_cxx::throw_value_limit, size_t >::result_type` `[inherited]`

`result_type` is the return type

Definition at line 107 of file `stl_function.h`.

The documentation for this struct was generated from the following file:

- [throw\\_allocator.h](#)

#### 4.574 `std::hash<__gnu_cxx::throw_value_random >` Struct Template Reference

Inheritance diagram for `std::hash<__gnu_cxx::throw_value_random >`:

##### Public Types

- typedef `__gnu_cxx::throw_value_random` `argument_type`
- typedef `size_t` `result_type`

##### Public Member Functions

- `size_t operator()` (const `__gnu_cxx::throw_value_random` &`__val`) const

##### 4.574.1 Detailed Description

```
template<> struct std::hash<__gnu_cxx::throw_value_random >
```

Explicit specialization of `std::hash` for `__gnu_cxx::throw_value_limit`.

Definition at line 802 of file `throw_allocator.h`.

##### 4.574.2 Member Typedef Documentation

4.574.2.1 typedef `__gnu_cxx::throw_value_random` `std::unary_function<__gnu_cxx::throw_value_random, size_t>::argument_type` `[inherited]`

`argument_type` is the type of the argument

Definition at line 104 of file `stl_function.h`.

#### 4.574.2.2 `typedef size_t std::unary_function< __gnu_cxx::throw_value_random, size_t>::result_type` [inherited]

`result_type` is the return type

Definition at line 107 of file `stl_function.h`.

The documentation for this struct was generated from the following file:

- [throw\\_allocator.h](#)

#### 4.575 `std::hash< __shared_ptr< _Tp, _Lp > >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

##### Public Types

- `typedef _Arg argument_type`
- `typedef _Result result_type`

##### Public Member Functions

- `size_t operator() (const __shared_ptr< _Tp, _Lp > &__s) const` noexcept

##### 4.575.1 Detailed Description

`template<typename _Tp, _Lock_policy _Lp>struct std::hash< __shared_ptr< _Tp, _Lp > >`

`std::hash` specialization for `__shared_ptr`.

Definition at line 1413 of file `shared_ptr_base.h`.

The documentation for this struct was generated from the following file:

- [shared\\_ptr\\_base.h](#)

#### 4.576 `std::hash< _Tp * >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

##### Public Types

- `typedef _Arg argument_type`
- `typedef _Result result_type`

##### Public Member Functions

- `size_t operator() (_Tp *__p) const` noexcept

## 4.576.1 Detailed Description

```
template<typename _Tp>struct std::hash< _Tp * >
```

Partial specializations for pointer types.

Definition at line 62 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

4.577 `std::hash< bool >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

## Public Member Functions

- `size_t operator()` (`bool __val`) `const noexcept`

## 4.577.1 Detailed Description

```
template<>struct std::hash< bool >
```

Explicit specialization for `bool`.

Definition at line 80 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

4.578 `std::hash< char >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

## Public Member Functions

- `size_t operator()` (`char __val`) `const noexcept`

#### 4.578.1 Detailed Description

`template<> struct std::hash< char >`

Explicit specialization for char.

Definition at line 83 of file functional\_hash.h.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

### 4.579 std::hash< char16\_t > Struct Template Reference

Inherits std::\_\_hash\_base< \_Result, \_Arg >.

#### Public Types

- typedef \_Arg **argument\_type**
- typedef \_Result **result\_type**

#### Public Member Functions

- `size_t operator() (char16_t __val) const` noexcept

#### 4.579.1 Detailed Description

`template<> struct std::hash< char16_t >`

Explicit specialization for char16\_t.

Definition at line 95 of file functional\_hash.h.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

### 4.580 std::hash< char32\_t > Struct Template Reference

Inherits std::\_\_hash\_base< \_Result, \_Arg >.

#### Public Types

- typedef \_Arg **argument\_type**
- typedef \_Result **result\_type**

#### Public Member Functions

- `size_t operator() (char32_t __val) const` noexcept

## 4.580.1 Detailed Description

`template<> struct std::hash< char32_t >`

Explicit specialization for `char32_t`.

Definition at line 98 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

4.581 `std::hash< double >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

## Public Member Functions

- `size_t` **operator()** (`double __val`) const noexcept

## 4.581.1 Detailed Description

`template<> struct std::hash< double >`

Specialization for `double`.

Definition at line 176 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

4.582 `std::hash< float >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

## Public Member Functions

- `size_t` **operator()** (`float __val`) const noexcept

#### 4.582.1 Detailed Description

`template<>struct std::hash< float >`

Specialization for float.

Definition at line 164 of file functional\_hash.h.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

### 4.583 std::hash< int > Struct Template Reference

Inherits std::\_\_hash\_base< \_Result, \_Arg >.

#### Public Types

- typedef \_Arg **argument\_type**
- typedef \_Result **result\_type**

#### Public Member Functions

- size\_t **operator()** (int \_\_val) const noexcept

#### 4.583.1 Detailed Description

`template<>struct std::hash< int >`

Explicit specialization for int.

Definition at line 104 of file functional\_hash.h.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

### 4.584 std::hash< long > Struct Template Reference

Inherits std::\_\_hash\_base< \_Result, \_Arg >.

#### Public Types

- typedef \_Arg **argument\_type**
- typedef \_Result **result\_type**

#### Public Member Functions

- size\_t **operator()** (long \_\_val) const noexcept

## 4.584.1 Detailed Description

`template<> struct std::hash< long >`

Explicit specialization for long.

Definition at line 107 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

4.585 `std::hash< long double >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

## Public Member Functions

- `size_t` **operator()** (`long double __val`) `const noexcept`

## 4.585.1 Detailed Description

`template<> struct std::hash< long double >`

Specialization for long double.

Definition at line 188 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

4.586 `std::hash< long long >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

## Public Member Functions

- `size_t` **operator()** (`long long __val`) `const noexcept`

#### 4.586.1 Detailed Description

`template<>struct std::hash< long long >`

Explicit specialization for long long.

Definition at line 110 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

#### 4.587 `std::hash< shared_ptr< _Tp > >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

##### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

##### Public Member Functions

- `size_t operator()` (const [shared\\_ptr](#)< `_Tp` > &\_\_s) const noexcept

#### 4.587.1 Detailed Description

`template<typename _Tp>struct std::hash< shared_ptr< _Tp > >`

`std::hash` specialization for `shared_ptr`.

Definition at line 619 of file `shared_ptr.h`.

The documentation for this struct was generated from the following file:

- [shared\\_ptr.h](#)

#### 4.588 `std::hash< short >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

##### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

##### Public Member Functions

- `size_t operator()` (short \_\_val) const noexcept

## 4.588.1 Detailed Description

`template<>struct std::hash< short >`

Explicit specialization for short.

Definition at line 101 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

4.589 `std::hash< signed char >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

## Public Member Functions

- `size_t operator()` (`signed char __val`) `const noexcept`

## 4.589.1 Detailed Description

`template<>struct std::hash< signed char >`

Explicit specialization for signed char.

Definition at line 86 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

4.590 `std::hash< string >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

## Public Member Functions

- `size_t operator()` (`const string &__s`) `const noexcept`

#### 4.590.1 Detailed Description

`template<>struct std::hash< string >`

`std::hash` specialization for `string`.

Definition at line 3044 of file `basic_string.h`.

The documentation for this struct was generated from the following file:

- [basic\\_string.h](#)

#### 4.591 `std::hash< u16string >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

##### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

##### Public Member Functions

- `size_t operator()` (const [u16string](#) &\_\_s) const noexcept

#### 4.591.1 Detailed Description

`template<>struct std::hash< u16string >`

`std::hash` specialization for `u16string`.

Definition at line 3077 of file `basic_string.h`.

The documentation for this struct was generated from the following file:

- [basic\\_string.h](#)

#### 4.592 `std::hash< u32string >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

##### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

##### Public Member Functions

- `size_t operator()` (const [u32string](#) &\_\_s) const noexcept

## 4.592.1 Detailed Description

`template<> struct std::hash< u32string >`

`std::hash` specialization for `u32string`.

Definition at line 3092 of file `basic_string.h`.

The documentation for this struct was generated from the following file:

- [basic\\_string.h](#)

4.593 `std::hash< unique_ptr< _Tp, _Dp > >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

- typedef `_Result` **result\_type**

## Public Member Functions

- `size_t operator()` (`unsigned long long __val`) `const noexcept`

## 4.597.1 Detailed Description

`template<> struct std::hash< unsigned long long >`

Explicit specialization for unsigned long long.

Definition at line 122 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

4.598 `std::hash< unsigned short >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

## Public Member Functions

- `size_t operator()` (`unsigned short __val`) `const noexcept`

#### 4.598.1 Detailed Description

`template<> struct std::hash< unsigned short >`

Explicit specialization for unsigned short.

Definition at line 113 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

### 4.599 `std::hash< wchar_t >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

#### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

#### Public Member Functions

- `size_t operator()` (`wchar_t __val`) `const noexcept`

#### 4.599.1 Detailed Description

`template<> struct std::hash< wchar_t >`

Explicit specialization for `wchar_t`.

Definition at line 92 of file `functional_hash.h`.

The documentation for this struct was generated from the following file:

- [functional\\_hash.h](#)

### 4.600 `std::hash< wstring >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

#### Public Types

- typedef `_Arg` **argument\_type**
- typedef `_Result` **result\_type**

#### Public Member Functions

- `size_t operator()` (`const wstring &__s`) `const noexcept`

## 4.600.1 Detailed Description

`template<> struct std::hash< wstring >`

`std::hash` specialization for `wstring`.

Definition at line 3059 of file `basic_string.h`.

The documentation for this struct was generated from the following file:

- [basic\\_string.h](#)

4.601 `std::hash<::vector< bool, _Alloc > >` Struct Template Reference

Inherits `std::__hash_base< _Result, _Arg >`.

## Public Types

#### Static Public Member Functions

- `static constexpr result_type max ()`
- `static constexpr result_type min ()`

#### Friends

- `bool operator== (const independent_bits_engine &__lhs, const independent_bits_engine &__rhs)`
- `template<typename _CharT, typename _Traits > std::basic_istream< _CharT, _Traits > & operator>> (std::basic_istream< _CharT, _Traits > &__is, std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType > &__x)`

#### 4.602.1 Detailed Description

`template<typename _RandomNumberEngine, size_t __w, typename _UIntType> class std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >`

Produces random numbers by combining random numbers from some base engine to produce random numbers with a specifies number of bits `__w`.

Definition at line 1074 of file random.h.

#### 4.602.2 Member Typedef Documentation

4.602.2.1 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType > typedef _UIntType std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::result_type`

The type of the generated random value.

Definition at line 1077 of file random.h.

#### 4.602.3 Constructor & Destructor Documentation

4.602.3.1 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType > std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType >::independent_bits_engine ( ) [inline]`

Constructs a default `independent_bits_engine` engine.

The underlying engine is default constructed as well.

Definition at line 1090 of file random.h.

```
4.602.3.2 template<typename _RandomNumberEngine, size_t __w, typename _UIntType > std::independent_bits_engine<
    _RandomNumberEngine, __w, _UIntType >::independent_bits_engine ( const _RandomNumberEngine & __rng )
    [inline], [explicit]
```

Copy constructs a independent\_bits\_engine engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 1100 of file random.h.

```
4.602.3.3 template<typename _RandomNumberEngine, size_t __w, typename _UIntType > std::independent_bits_engine<
    _RandomNumberEngine, __w, _UIntType >::independent_bits_engine ( _RandomNumberEngine && __rng )
    [inline], [explicit]
```

Move constructs a independent\_bits\_engine engine.

Copies an existing base class random number generator.

Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 1110 of file random.h.

```
4.602.3.4 template<typename _RandomNumberEngine, size_t __w, typename _UIntType > std::independent_bits_engine<
    _RandomNumberEngine, __w, _UIntType >::independent_bits_engine ( result_type __s ) [inline],
    [explicit]
```

Seed constructs a independent\_bits\_engine engine.

Constructs the underlying generator engine seeded with `__s`.

Parameters

<code>__s</code>	A seed value for the base class engine.
------------------	---

Definition at line 1120 of file random.h.

```
4.602.3.5 template<typename _RandomNumberEngine, size_t __w, typename _UIntType > template<typename _Sseq, typename
    = typename std::enable_if<!std::is_same<_Sseq, independent_bits_engine>::value && !std::is_same<_Sseq,
    _RandomNumberEngine>::value> ::type> std::independent_bits_engine< _RandomNumberEngine, __w,
    _UIntType >::independent_bits_engine ( _Sseq & __q ) [inline], [explicit]
```

Generator construct a independent\_bits\_engine engine.

Parameters

<code>__q</code>	A seed sequence.
------------------	------------------

Definition at line 1133 of file random.h.

#### 4.602.4 Member Function Documentation

4.602.4.1 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> const _RandomNumberEngine& std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::base( ) const [inline], [noexcept]`

Gets a const reference to the underlying generator engine object.

Definition at line 1168 of file random.h.

Referenced by `std::operator<<()`.

4.602.4.2 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> void std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::discard( unsigned long long __z ) [inline]`

Discard a sequence of random numbers.

Definition at line 1189 of file random.h.

4.602.4.3 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> static constexpr result_type std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::max( ) [inline], [static]`

Gets the maximum value in the generated random number range.

Definition at line 1182 of file random.h.

4.602.4.4 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> static constexpr result_type std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::min( ) [inline], [static]`

Gets the minimum value in the generated random number range.

Definition at line 1175 of file random.h.

4.602.4.5 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> result_type std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::operator()( )`

Gets the next value in the generated random number sequence.

4.602.4.6 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> void std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::seed( ) [inline]`

Reseeds the `independent_bits_engine` object with the default seed for the underlying base class generator engine.

Definition at line 1142 of file random.h.

4.602.4.7 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> void std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::seed( result_type __s ) [inline]`

Reseeds the `independent_bits_engine` object with the default seed for the underlying base class generator engine.

Definition at line 1150 of file random.h.

4.602.4.8 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> template<typename _Sseq> void std::independent_bits_engine<_RandomNumberEngine, __w, _UIntType>::seed( _Sseq & __q ) [inline]`

Reseeds the `independent_bits_engine` object with the given seed sequence.

## Parameters

<code>__q</code>	A seed generator function.
------------------	----------------------------

Definition at line 1160 of file random.h.

## 4.602.5 Friends And Related Function Documentation

4.602.5.1 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> bool operator==( const independent_bits_engine< _RandomNumberEngine, __w, _UIntType> & __lhs, const independent_bits_engine< _RandomNumberEngine, __w, _UIntType> & __rhs ) [friend]`

Compares two independent\_bits\_engine random number generator objects of the same type for equality.

## Parameters

<code>__lhs</code>	A independent_bits_engine random number generator object.
<code>__rhs</code>	Another independent_bits_engine random number generator object.

## Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1214 of file random.h.

4.602.5.2 `template<typename _RandomNumberEngine, size_t __w, typename _UIntType> template<typename _CharT, typename _Traits> std::basic_istream<_CharT, _Traits>& operator>>( std::basic_istream< _CharT, _Traits> & __is, std::independent_bits_engine< _RandomNumberEngine, __w, _UIntType> & __x ) [friend]`

Extracts the current state of a % subtract\_with\_carry\_engine random number generator engine `__x` from the input stream `__is`.

## Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A independent_bits_engine random number generator engine.

## Returns

The input stream with the state of `__x` extracted or in an error state.

Definition at line 1232 of file random.h.

## 4.603.1 Detailed Description

**template<class \_Tp>class std::indirect\_array<\_Tp>**

Reference to arbitrary subset of an array.

An `indirect_array` is a reference to the actual elements of an array specified by an ordered array of indices. The way to get an `indirect_array` is to call `operator[]`(`valarray<size_t>`) on a `valarray`. The returned `indirect_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`.

For example, if an `indirect_array` is obtained using the array (4,2,0) as an argument, and then assigned to an array containing (1,2,3), then the underlying array will have `array[0]==3`, `array[2]==2`, and `array[4]==1`.

## Parameters

<i>Tp</i>	Element type.
-----------	---------------

Definition at line 62 of file `indirect_array.h`.

The documentation for this class was generated from the following file:

- [indirect\\_array.h](#)

## 4.604 `std::input_iterator_tag` Struct Reference

Inheritance diagram for `std::input_iterator_tag`:

### 4.604.1 Detailed Description

Marking input iterators.

Definition at line 89 of file `stl_iterator_base_types.h`.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

#### 4.605 `std::insert_iterator<_Container>` Class Template Reference

Inheritance diagram for `std::insert_iterator<_Container>`:

##### Public Types

- typedef `_Container` `container_type`
- typedef void `difference_type`
- typedef `output_iterator_tag` `iterator_category`
- typedef void `pointer`
- typedef void `reference`
- typedef void `value_type`

##### Public Member Functions

- `insert_iterator` (`_Container &__x`, `typename _Container::iterator __i`)
- `insert_iterator & operator*` ()
- `insert_iterator & operator++` ()
- `insert_iterator & operator++` (int)
- `insert_iterator & operator=` (const `typename _Container::value_type &__value`)
- `insert_iterator & operator=` (`typename _Container::value_type &&__value`)

##### Protected Attributes

- `_Container * container`
- `_Container::iterator iter`

##### 4.605.1 Detailed Description

```
template<typename _Container>class std::insert_iterator<_Container>
```

Turns assignment into insertion.

These are output iterators, constructed from a container-of-T. Assigning a T to the iterator inserts it in the container at the iterator's position, rather than overwriting the value at that position.

(Sequences will actually insert a *copy* of the value before the iterator's position.)

Tip: Using the inserter function to create these iterators can save typing.

Definition at line 587 of file stl\_iterator.h.

#### 4.605.2 Member Typedef Documentation

##### 4.605.2.1 template<typename \_Container> typedef \_Container std::insert\_iterator< \_Container >::container\_type

A nested typedef for the type of whatever container you used.

Definition at line 596 of file stl\_iterator.h.

##### 4.605.2.2 typedef void std::iterator< output\_iterator\_tag , void , void , void , void >::difference\_type [inherited]

Distance between iterators is represented as this type.

Definition at line 125 of file stl\_iterator\_base\_types.h.

##### 4.605.2.3 typedef output\_iterator\_tag std::iterator< output\_iterator\_tag , void , void , void , void >::iterator\_category [inherited]

One of the [tag types](#).

Definition at line 121 of file stl\_iterator\_base\_types.h.

##### 4.605.2.4 typedef void std::iterator< output\_iterator\_tag , void , void , void , void >::pointer [inherited]

This type represents a pointer-to-value\_type.

Definition at line 127 of file stl\_iterator\_base\_types.h.

##### 4.605.2.5 typedef void std::iterator< output\_iterator\_tag , void , void , void , void >::reference [inherited]

This type represents a reference-to-value\_type.

Definition at line 129 of file stl\_iterator\_base\_types.h.

##### 4.605.2.6 typedef void std::iterator< output\_iterator\_tag , void , void , void , void >::value\_type [inherited]

The type "pointed to" by the iterator.

Definition at line 123 of file stl\_iterator\_base\_types.h.

#### 4.605.3 Constructor & Destructor Documentation

##### 4.605.3.1 template<typename \_Container> std::insert\_iterator< \_Container >::insert\_iterator ( \_Container & \_\_x, typename \_Container::iterator \_\_i ) [inline]

The only way to create this iterator is with a container and an initial position (a normal iterator into the container).

Definition at line 602 of file stl\_iterator.h.

#### 4.605.4 Member Function Documentation

4.605.4.1 `template<typename _Container> insert_iterator& std::insert_iterator<_Container>::operator* ( )`  
`[inline]`

Simply returns `*this`.

Definition at line 656 of file `stl_iterator.h`.

4.605.4.2 `template<typename _Container> insert_iterator& std::insert_iterator<_Container>::operator++ ( )`  
`[inline]`

Simply returns `*this`. (This iterator does not *move*.)

Definition at line 661 of file `stl_iterator.h`.

4.605.4.3 `template<typename _Container> insert_iterator& std::insert_iterator<_Container>::operator++ ( int )`  
`[inline]`

Simply returns `*this`. (This iterator does not *move*.)

Definition at line 666 of file `stl_iterator.h`.

4.605.4.4 `template<typename _Container> insert_iterator& std::insert_iterator<_Container>::operator= ( const`  
`typename _Container::value_type & __value ) [inline]`

#### Parameters

<code>__value</code>	An instance of whatever type <code>container_type::const_reference</code> is; presumably a reference-to- <code>const T</code> for <code>container&lt;T&gt;</code> .
----------------------	---

#### Returns

This iterator, for chained operations.

This kind of iterator maintains its own position in the container. Assigning a value to the iterator will insert the value into the container at the place before the iterator.

The position is maintained such that subsequent assignments will insert values immediately after one another. For example,

```
// vector v contains A and Z
insert_iterator i (v, ++v.begin());
i = 1;
i = 2;
i = 3;

// vector v contains A, 1, 2, 3, and Z
```

Definition at line 638 of file `stl_iterator.h`.

The documentation for this class was generated from the following file:

- [stl\\_iterator.h](#)

## 4.606.1 Detailed Description

The base of the I/O class hierarchy.

This class defines everything that can be defined about I/O that does not depend on the type of characters being input or output. Most people will only see `ios_base` when they need to specify the full name of the various I/O flags (e.g., the openmodes).

Definition at line 199 of file `ios_base.h`.

## 4.606.2 Member Typedef Documentation

## 4.606.2.1 typedef void(\* std::ios\_base::event\_callback) (event \_\_e, ios\_base &amp;\_\_b, int \_\_i)

The type of an event callback function.

## Parameters

<code>__e</code>	One of the members of the event enum.
<code>__b</code>	Reference to the <code>ios_base</code> object.
<code>__i</code>	The integer provided when the callback was registered.

Event callbacks are user defined functions that get called during several `ios_base` and `basic_ios` functions, specifically `imbue()`, `copyfmt()`, and `~ios()`.

Definition at line 436 of file `ios_base.h`.

## 4.606.2.2 typedef \_Ios\_Fmtflags std::ios\_base::fmtflags

This is a bitmask type.

`_Ios_Fmtflags` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type `fmtflags` are:

- boolalpha
- dec
- fixed
- hex
- internal
- left
- oct
- right
- scientific
- showbase
- showpoint
- showpos
- skipws
- unitbuf
- uppercase
- adjustfield
- basefield
- floatfield

Definition at line 255 of file ios\_base.h.

#### 4.606.2.3 `typedef _Ios_Iostate std::ios_base::iostate`

This is a bitmask type.

`_Ios_Iostate` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type `iostate` are:

- badbit
- eofbit
- failbit
- goodbit

Definition at line 330 of file ios\_base.h.

#### 4.606.2.4 typedef \_Ios\_Openmode std::ios\_base::openmode

This is a bitmask type.

`_Ios_Openmode` is implementation-defined, but it is valid to perform bitwise operations on these values and expect the Right Thing to happen. Defined objects of type `openmode` are:

- `app`
- `ate`
- `binary`
- `in`
- `out`
- `trunc`

Definition at line 361 of file `ios_base.h`.

#### 4.606.2.5 typedef \_Ios\_Seekdir std::ios\_base::seekdir

This is an enumerated type.

`_Ios_Seekdir` is implementation-defined. Defined values of type `seekdir` are:

- `beg`
- `cur`, equivalent to `SEEK_CUR` in the C standard library.
- `end`, equivalent to `SEEK_END` in the C standard library.

Definition at line 393 of file `ios_base.h`.

### 4.606.3 Member Enumeration Documentation

#### 4.606.3.1 enum std::ios\_base::event

The set of events that may be passed to an event callback.

`erase_event` is used during `~ios()` and `copyfmt()`. `imbue_event` is used during `imbue()`. `copyfmt_event` is used during `copyfmt()`.

Definition at line 419 of file `ios_base.h`.

### 4.606.4 Constructor & Destructor Documentation

#### 4.606.4.1 virtual std::ios\_base::~ios\_base ( ) [virtual]

Invokes each callback with `erase_event`. Destroys local storage.

Note that the `ios_base` object for the standard streams never gets destroyed. As a result, any callbacks registered with the standard streams will not get invoked with `erase_event` (unless `copyfmt` is used).

#### 4.606.5 Member Function Documentation

##### 4.606.5.1 `const locale& std::ios_base::_M_getloc ( ) const` `[inline]`

Locale access.

##### Returns

A reference to the current locale.

Like `getloc` above, but returns a reference instead of generating a copy.

Definition at line 706 of file `ios_base.h`.

##### 4.606.5.2 `fmtflags std::ios_base::flags ( ) const` `[inline]`

Access to format flags.

##### Returns

The format control flags for both input and output.

Definition at line 551 of file `ios_base.h`.

##### 4.606.5.3 `fmtflags std::ios_base::flags ( fmtflags __fmtfl )` `[inline]`

Setting new format flags all at once.

##### Parameters

<code>__fmtfl</code>	The new flags to set.
----------------------	-----------------------

##### Returns

The previous format control flags.

This function overwrites all the format flags with `__fmtfl`.

Definition at line 562 of file `ios_base.h`.

##### 4.606.5.4 `locale std::ios_base::getloc ( ) const` `[inline]`

Locale access.

##### Returns

A copy of the current locale.

If `imbue(loc)` has previously been called, then this function returns `loc`. Otherwise, it returns a copy of `std::ios_base::getloc()`, the global C++ locale.

Definition at line 695 of file `ios_base.h`.

##### 4.606.5.5 `locale std::ios_base::imbue ( const locale & __loc ) throw`

Setting a new locale.

## Parameters

<code>__loc</code>	The new locale.
--------------------	-----------------

## Returns

The previous locale.

Sets the new locale for this stream, and then invokes each callback with imbue\_event.

**4.606.5.6** `long& std::ios_base::iword ( int __ix ) [inline]`

Access to integer array.

## Parameters

<code>__ix</code>	Index into the array.
-------------------	-----------------------

## Returns

A reference to an integer associated with the index.

The iword function provides access to an array of integers that can be used for any purpose. The array grows as required to hold the supplied index. All integers in the array are initialized to 0.

The implementation reserves several indices. You should use xalloc to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

Definition at line 741 of file ios\_base.h.

**4.606.5.7** `streamsize std::ios_base::precision ( ) const [inline]`

Flags access.

## Returns

The precision to generate on certain output operations.

Be careful if you try to give a definition of *precision* here; see DR 189.

Definition at line 621 of file ios\_base.h.

**4.606.5.8** `streamsize std::ios_base::precision ( streamsize __prec ) [inline]`

Changing flags.

## Parameters

<code>__prec</code>	The new precision value.
---------------------	--------------------------

## Returns

The previous value of precision().

Definition at line 630 of file ios\_base.h.

**4.606.5.9** `void*& std::ios_base::pword ( int __ix ) [inline]`

Access to void pointer array.

**Parameters**

<code>__ix</code>	Index into the array.
-------------------	-----------------------

**Returns**

A reference to a `void*` associated with the index.

The `pwd` function provides access to an array of pointers that can be used for any purpose. The array grows as required to hold the supplied index. All pointers in the array are initialized to 0.

The implementation reserves several indices. You should use `xalloc` to obtain an index that is safe to use. Also note that since the array can grow dynamically, it is not safe to hold onto the reference.

Definition at line 762 of file `ios_base.h`.

**4.606.5.10** `void std::ios_base::register_callback ( event_callback __fn, int __index )`

Add the callback `__fn` with parameter `__index`.

**Parameters**

<code>__fn</code>	The function to add.
<code>__index</code>	The integer to pass to the function when invoked.

Registers a function as an event callback with an integer parameter to be passed to the function when invoked. Multiple copies of the function are allowed. If there are multiple callbacks, they are invoked in the order they were registered.

**4.606.5.11** `fmtflags std::ios_base::setf ( fmtflags __fmtfl ) [inline]`

Setting new format flags.

**Parameters**

<code>__fmtfl</code>	Additional flags to set.
----------------------	--------------------------

**Returns**

The previous format control flags.

This function sets additional flags in format control. Flags that were previously set remain set.

Definition at line 578 of file `ios_base.h`.

Referenced by `std::boolalpha()`, `std::dec()`, `std::fixed()`, `std::hex()`, `std::left()`, `std::oct()`, `std::right()`, `std::scientific()`, `std::showbase()`, `std::showpoint()`, `std::showpos()`, `std::skipws()`, `std::unitbuf()`, and `std::uppercase()`.

**4.606.5.12** `fmtflags std::ios_base::setf ( fmtflags __fmtfl, fmtflags __mask ) [inline]`

Setting new format flags.

**Parameters**

<code>__fmtfl</code>	Additional flags to set.
<code>__mask</code>	The flags mask for <code>__fmtfl</code> .

**Returns**

The previous format control flags.

This function clears *mask* in the format flags, then sets *fmtfl* & *mask*. An example mask is `ios_base::adjustfield`.

Definition at line 595 of file `ios_base.h`.

**4.606.5.13** `static bool std::ios_base::sync_with_stdio( bool __sync = true ) [static]`

Interaction with the standard C I/O objects.

**Parameters**

<code>__sync</code>	Whether to synchronize or not.
---------------------	--------------------------------

**Returns**

True if the standard streams were previously synchronized.

The synchronization referred to is *only* that between the standard C facilities (e.g., `stdout`) and the standard C++ objects (e.g., `cout`). User-declared streams are unaffected. See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt1.html>

**4.606.5.14** `void std::ios_base::unsetf( fmtflags __mask ) [inline]`

Clearing format flags.

**Parameters**

<code>__mask</code>	The flags to unset.
---------------------	---------------------

This function clears `__mask` in the format flags.

Definition at line 610 of file `ios_base.h`.

Referenced by `std::noboolalpha()`, `std::noshowbase()`, `std::noshowpoint()`, `std::noshowpos()`, `std::noskipws()`, `std::nounitbuf()`, and `std::nouppercase()`.

**4.606.5.15** `streamsize std::ios_base::width( ) const [inline]`

Flags access.

**Returns**

The minimum field width to generate on output operations.

*Minimum field width* refers to the number of characters.

Definition at line 644 of file `ios_base.h`.

**4.606.5.16** `streamsize std::ios_base::width( streamsize __wide ) [inline]`

Changing flags.

**Parameters**

<code>__wide</code>	The new width value.
---------------------	----------------------

**Returns**

The previous value of `width()`.

Definition at line 653 of file `ios_base.h`.

**4.606.5.17** `static int std::ios_base::xalloc ( ) throw` `[static]`

Access to unique indices.

**Returns**

An integer different from all previous calls.

This function returns a unique integer every time it is called. It can be used for any purpose, but is primarily intended to be a unique index for the `iword` and `pword` functions. The expectation is that an application calls `xalloc` in order to obtain an index in the `iword` and `pword` arrays that can be used without fear of conflict.

The implementation maintains a static variable that is incremented and returned on each invocation. `xalloc` is guaranteed to return an index that is safe to use in the `iword` and `pword` arrays.

**4.606.6 Member Data Documentation**

**4.606.6.1** `const fmtflags std::ios_base::adjustfield` `[static]`

A mask of `left|right|internal`. Useful for the 2-arg form of `setf`.

Definition at line 310 of file `ios_base.h`.

Referenced by `std::internal()`, `std::left()`, and `std::right()`.

**4.606.6.2** `const openmode std::ios_base::app` `[static]`

Seek to end before each write.

Definition at line 364 of file `ios_base.h`.

**4.606.6.3** `const openmode std::ios_base::ate` `[static]`

Open and seek to end immediately after opening.

Definition at line 367 of file `ios_base.h`.

**4.606.6.4** `const iostate std::ios_base::badbit` `[static]`

Indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file).

Definition at line 334 of file `ios_base.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::bad()`, and `std::basic_ios<_CharT, _Traits>::fail()`.

**4.606.6.5** `const fmtflags std::ios_base::basefield` `[static]`

A mask of `dec|oct|hex`. Useful for the 2-arg form of `setf`.

Definition at line 313 of file `ios_base.h`.

Referenced by `std::dec()`, `std::hex()`, and `std::oct()`.

#### 4.606.6.6 `const seekdir std::ios_base::beg` [static]

Request a seek relative to the beginning of the stream.

Definition at line 396 of file `ios_base.h`.

#### 4.606.6.7 `const openmode std::ios_base::binary` [static]

Perform input and output in binary mode (as opposed to text mode). This is probably not what you think it is; see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt11ch27s02.html>.

Definition at line 372 of file `ios_base.h`.

#### 4.606.6.8 `const fmtflags std::ios_base::boolalpha` [static]

Insert/extract `bool` in alphabetic rather than numeric format.

Definition at line 258 of file `ios_base.h`.

Referenced by `std::boolalpha()`, and `std::noboolalpha()`.

#### 4.606.6.9 `const seekdir std::ios_base::cur` [static]

Request a seek relative to the current position within the sequence.

Definition at line 399 of file `ios_base.h`.

#### 4.606.6.10 `const fmtflags std::ios_base::dec` [static]

Converts integer input or generates integer output in decimal base.

Definition at line 261 of file `ios_base.h`.

Referenced by `std::dec()`.

#### 4.606.6.11 `const seekdir std::ios_base::end` [static]

Request a seek relative to the current end of the sequence.

Definition at line 402 of file `ios_base.h`.

#### 4.606.6.12 `const iostate std::ios_base::eofbit` [static]

Indicates that an input operation reached the end of an input sequence.

Definition at line 337 of file `ios_base.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::eof()`.

#### 4.606.6.13 `const iostate std::ios_base::failbit` [static]

Indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

Definition at line 342 of file `ios_base.h`.

Referenced by `std::basic_ios<_CharT, _Traits>::fail()`.

#### 4.606.6.14 `const fmtflags std::ios_base::fixed` [static]

Generate floating-point output in fixed-point notation.

Definition at line 264 of file `ios_base.h`.

Referenced by `std::fixed()`.

**4.606.6.15** `const fmtflags std::ios_base::floatfield` `[static]`

A mask of `scientific|fixed`. Useful for the 2-arg form of `setf`.

Definition at line 316 of file `ios_base.h`.

Referenced by `std::fixed()`, and `std::scientific()`.

**4.606.6.16** `const iostate std::ios_base::goodbit` `[static]`

Indicates all is well.

Definition at line 345 of file `ios_base.h`.

**4.606.6.17** `const fmtflags std::ios_base::hex` `[static]`

Converts integer input or generates integer output in hexadecimal base.

Definition at line 267 of file `ios_base.h`.

Referenced by `std::hex()`.

**4.606.6.18** `const openmode std::ios_base::in` `[static]`

Open for input. Default for `ifstream` and `fstream`.

Definition at line 375 of file `ios_base.h`.

**4.606.6.19** `const fmtflags std::ios_base::internal` `[static]`

Adds fill characters at a designated internal point in certain generated output, or identical to `right` if no such point is designated.

Definition at line 272 of file `ios_base.h`.

Referenced by `std::internal()`.

**4.606.6.20** `const fmtflags std::ios_base::left` `[static]`

Adds fill characters on the right (final positions) of certain generated output. (I.e., the thing you print is flush left.)

Definition at line 276 of file `ios_base.h`.

Referenced by `std::left()`.

**4.606.6.21** `const fmtflags std::ios_base::oct` `[static]`

Converts integer input or generates integer output in octal base.

Definition at line 279 of file `ios_base.h`.

Referenced by `std::oct()`.

**4.606.6.22** `const openmode std::ios_base::out` `[static]`

Open for output. Default for `ofstream` and `fstream`.

Definition at line 378 of file `ios_base.h`.

**4.606.6.23** `const fmtflags std::ios_base::right` `[static]`

Adds fill characters on the left (initial positions) of certain generated output. (I.e., the thing you print is flush right.)

Definition at line 283 of file `ios_base.h`.

Referenced by `std::right()`.

**4.606.6.24** `const fmtflags std::ios_base::scientific` `[static]`

Generates floating-point output in scientific notation.

Definition at line 286 of file `ios_base.h`.

Referenced by `std::scientific()`.

**4.606.6.25** `const fmtflags std::ios_base::showbase` `[static]`

Generates a prefix indicating the numeric base of generated integer output.

Definition at line 290 of file `ios_base.h`.

Referenced by `std::noshowbase()`, and `std::showbase()`.

**4.606.6.26** `const fmtflags std::ios_base::showpoint` `[static]`

Generates a decimal-point character unconditionally in generated floating-point output.

Definition at line 294 of file `ios_base.h`.

Referenced by `std::noshowpoint()`, and `std::showpoint()`.

**4.606.6.27** `const fmtflags std::ios_base::showpos` `[static]`

Generates a + sign in non-negative generated numeric output.

Definition at line 297 of file `ios_base.h`.

Referenced by `std::noshowpos()`, and `std::showpos()`.

**4.606.6.28** `const fmtflags std::ios_base::skipws` `[static]`

Skips leading white space before certain input operations.

Definition at line 300 of file `ios_base.h`.

Referenced by `std::noskipws()`, and `std::skipws()`.

**4.606.6.29** `const openmode std::ios_base::trunc` `[static]`

Open for input. Default for `ofstream`.

Definition at line 381 of file `ios_base.h`.

**4.606.6.30** `const fmtflags std::ios_base::unitbuf` `[static]`

Flushes output after each output operation.

Definition at line 303 of file `ios_base.h`.

Referenced by `std::nounitbuf()`, and `std::unitbuf()`.

#### 4.606.6.31 `const fmtflags std::ios_base::uppercase` [static]

Replaces certain lowercase letters with their uppercase equivalents in generated output.

Definition at line 307 of file `ios_base.h`.

Referenced by `std::nouppercase()`, and `std::uppercase()`.

The documentation for this class was generated from the following file:

- [ios\\_base.h](#)

### 4.607 `std::ios_base::failure` Class Reference

Inherits exception.

#### Public Member Functions

- **failure** (const [string](#) &\_\_str) throw ()
- virtual const char \* **what** () const throw ()

#### 4.607.1 Detailed Description

These are thrown to indicate problems with io.

27.4.2.1.1 Class `ios_base::failure`.

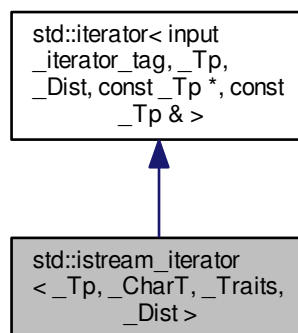

Definition at line 209 of file `ios_base.h`.

The documentation for this class was generated from the following file:

- [ios\\_base.h](#)

### 4.608 `std::istream_iterator< _Tp, _CharT, _Traits, _Dist >` Class Template Reference

Inheritance diagram for `std::istream_iterator< _Tp, _CharT, _Traits, _Dist >`:

## Public Types

- typedef `_CharT` **char\_type**
- typedef `_Dist` [difference\\_type](#)
- typedef `basic_istream< _CharT, _Traits >` **istream\_type**
- typedef [input\\_iterator\\_tag](#) **iterator\_category**
- typedef `const _Tp *` [pointer](#)
- typedef `const _Tp &` [reference](#)
- typedef `_Traits` **traits\_type**
- typedef `_Tp` [value\\_type](#)

## Public Member Functions

- constexpr [istream\\_iterator](#) ()
- [istream\\_iterator](#) ([istream\\_type](#) &\_\_s)
- **istream\_iterator** (const [istream\\_iterator](#) &\_\_obj)
- `bool` **\_M\_equal** (const [istream\\_iterator](#) &\_\_x) const
- `const _Tp &` **operator\*** () const
- [istream\\_iterator](#) & **operator++** ()
- [istream\\_iterator](#) **operator++** (int)
- `const _Tp *` **operator->** () const

## 4.608.1 Detailed Description

template<typename `_Tp`, typename `_CharT` = char, typename `_Traits` = `char_traits<_CharT>`, typename `_Dist` = `ptrdiff_t`> class std::istream\_iterator< `_Tp`, `_CharT`, `_Traits`, `_Dist` >

Provides input iterator semantics for streams.

Definition at line 49 of file `stream_iterator.h`.

## 4.608.2 Member Typedef Documentation

4.608.2.1 typedef `_Dist` std::iterator< [input\\_iterator\\_tag](#) , `_Tp`, `_Dist` , `const _Tp *` , `const _Tp &` >::[difference\\_type](#) [\[inherited\]](#)

Distance between iterators is represented as this type.

Definition at line 125 of file `stl_iterator_base_types.h`.

4.608.2.2 typedef [input\\_iterator\\_tag](#) std::iterator< [input\\_iterator\\_tag](#) , `_Tp`, `_Dist` , `const _Tp *` , `const _Tp &` >::[iterator\\_category](#) [\[inherited\]](#)

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

4.608.2.3 typedef `const _Tp *` std::iterator< [input\\_iterator\\_tag](#) , `_Tp`, `_Dist` , `const _Tp *` , `const _Tp &` >::[pointer](#) [\[inherited\]](#)

This type represents a pointer-to-value\_type.

Definition at line 127 of file `stl_iterator_base_types.h`.

**4.608.2.4** `typedef const _Tp & std::iterator< input_iterator_tag , _Tp, _Dist , const _Tp * , const _Tp & >::reference`  
[inherited]

This type represents a reference-to-value\_type.

Definition at line 129 of file `stl_iterator_base_types.h`.

**4.608.2.5** `typedef _Tp std::iterator< input_iterator_tag , _Tp, _Dist , const _Tp * , const _Tp & >::value_type`  
[inherited]

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

### 4.608.3 Constructor & Destructor Documentation

**4.608.3.1** `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename _Dist = ptrdiff_t>`  
`constexpr std::istream_iterator< _Tp, _CharT, _Traits, _Dist >::istream_iterator ( )` [inline]

Construct end of input stream iterator.

Definition at line 64 of file `stream_iterator.h`.

**4.608.3.2** `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>, typename _Dist = ptrdiff_t>`  
`std::istream_iterator< _Tp, _CharT, _Traits, _Dist >::istream_iterator ( istream_type & __s )` [inline]

Construct start of input stream iterator.

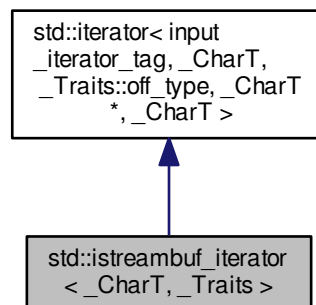

Definition at line 68 of file `stream_iterator.h`.

The documentation for this class was generated from the following file:

- [stream\\_iterator.h](#)

## 4.609 std::istreambuf\_iterator< \_CharT, \_Traits > Class Template Reference

Inheritance diagram for `std::istreambuf_iterator< _CharT, _Traits >`:

## Public Types

- typedef \_Traits::off\_type [difference\\_type](#)

## 4.609.1 Detailed Description

template<typename \_CharT, typename \_Traits> class std::istreambuf\_iterator<\_CharT, \_Traits>

Provides input iterator semantics for streambufs.

Definition at line 399 of file stl\_algobase.h.

## 4.609.2 Member Typedef Documentation

4.609.2.1 template<typename \_CharT, typename \_Traits> typedef \_CharT std::istreambuf\_iterator<\_CharT, \_Traits>::\_\_char\_type

Public typedefs.

Definition at line 64 of file streambuf\_iterator.h.

**4.609.2.2** `typedef _Traits::off_type std::iterator< input_iterator_tag , _CharT , _Traits::off_type , _CharT * , _CharT >::difference_type` [inherited]

Distance between iterators is represented as this type.

Definition at line 125 of file `stl_iterator_base_types.h`.

**4.609.2.3** `template<typename _CharT , typename _Traits > typedef _Traits::int_type std::istreambuf_iterator< _CharT, _Traits >::int_type`

Public typedefs.

Definition at line 66 of file `streambuf_iterator.h`.

**4.609.2.4** `template<typename _CharT , typename _Traits > typedef basic_istream< _CharT, _Traits > std::istreambuf_iterator< _CharT, _Traits >::istream_type`

Public typedefs.

Definition at line 68 of file `streambuf_iterator.h`.

**4.609.2.5** `typedef input_iterator_tag std::iterator< input_iterator_tag , _CharT , _Traits::off_type , _CharT * , _CharT >::iterator_category` [inherited]

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

**4.609.2.6** `typedef _CharT * std::iterator< input_iterator_tag , _CharT , _Traits::off_type , _CharT * , _CharT >::pointer` [inherited]

This type represents a pointer-to-value\_type.

Definition at line 127 of file `stl_iterator_base_types.h`.

**4.609.2.7** `typedef _CharT std::iterator< input_iterator_tag , _CharT , _Traits::off_type , _CharT * , _CharT >::reference` [inherited]

This type represents a reference-to-value\_type.

Definition at line 129 of file `stl_iterator_base_types.h`.

**4.609.2.8** `template<typename _CharT , typename _Traits > typedef basic_streambuf< _CharT, _Traits > std::istreambuf_iterator< _CharT, _Traits >::streambuf_type`

Public typedefs.

Definition at line 67 of file `streambuf_iterator.h`.

**4.609.2.9** `template<typename _CharT , typename _Traits > typedef _Traits std::istreambuf_iterator< _CharT, _Traits >::traits_type`

Public typedefs.

Definition at line 65 of file `streambuf_iterator.h`.

**4.609.2.10** `typedef _CharT std::iterator< input_iterator_tag , _CharT , _Traits::off_type , _CharT * , _CharT >::value_type` [inherited]

The type "pointed to" by the iterator.

Definition at line 123 of file stl\_iterator\_base\_types.h.

#### 4.609.3 Constructor & Destructor Documentation

4.609.3.1 `template<typename _CharT, typename _Traits> constexpr std::istreambuf_iterator< _CharT, _Traits>::istreambuf_iterator( ) [inline], [noexcept]`

Construct end of input stream iterator.

Definition at line 102 of file streambuf\_iterator.h.

4.609.3.2 `template<typename _CharT, typename _Traits> std::istreambuf_iterator< _CharT, _Traits>::istreambuf_iterator( istream_type &__s ) [inline], [noexcept]`

Construct start of input stream iterator.

Definition at line 112 of file streambuf\_iterator.h.

4.609.3.3 `template<typename _CharT, typename _Traits> std::istreambuf_iterator< _CharT, _Traits>::istreambuf_iterator( streambuf_type *__s ) [inline], [noexcept]`

Construct start of streambuf iterator.

Definition at line 116 of file streambuf\_iterator.h.

#### 4.609.4 Member Function Documentation

4.609.4.1 `template<typename _CharT, typename _Traits> bool std::istreambuf_iterator< _CharT, _Traits>::equal( const istreambuf_iterator< _CharT, _Traits> &__b ) const [inline]`

Return true both iterators are end or both are not end.

Definition at line 172 of file streambuf\_iterator.h.

4.609.4.2 `template<typename _CharT, typename _Traits> char_type std::istreambuf_iterator< _CharT, _Traits>::operator*( ) const [inline]`

Return the current character pointed to by iterator. This returns streambuf.sgetc(). It cannot be assigned. NB: The result of operator\*() on an end of stream is undefined.

Definition at line 123 of file streambuf\_iterator.h.

4.609.4.3 `template<typename _CharT, typename _Traits> istreambuf_iterator& std::istreambuf_iterator< _CharT, _Traits>::operator++( ) [inline]`

Advance the iterator. Calls streambuf.sbumpc().

Definition at line 137 of file streambuf\_iterator.h.

4.609.4.4 `template<typename _CharT, typename _Traits> istreambuf_iterator std::istreambuf_iterator< _CharT, _Traits>::operator++( int ) [inline]`

Advance the iterator. Calls streambuf.sbumpc().

Definition at line 152 of file streambuf\_iterator.h.

The documentation for this class was generated from the following files:

- [stl\\_algobase.h](#)

- [streambuf\\_iterator.h](#)

#### 4.610 `std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference>` Struct Template Reference

##### Public Types

- typedef `_Distance` [difference\\_type](#)
- typedef `_Category` [iterator\\_category](#)
- typedef `_Pointer` [pointer](#)
- typedef `_Reference` [reference](#)
- typedef `_Tp` [value\\_type](#)

##### 4.610.1 Detailed Description

```
template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference =
_Tp> struct std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >
```

Common iterator class.

This class does nothing but define nested typedefs. Iterator classes can inherit from this class to save some work. The typedefs are then used in specializations and overloading.

In particular, there are no default implementations of requirements such as `operator++` and the like. (How could there be?)

Definition at line 118 of file `stl_iterator_base_types.h`.

##### 4.610.2 Member Typedef Documentation

4.610.2.1 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,  
typename _Reference = _Tp&> typedef _Distance std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference  
>::difference_type`

Distance between iterators is represented as this type.

Definition at line 125 of file `stl_iterator_base_types.h`.

4.610.2.2 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*,  
typename _Reference = _Tp&> typedef _Category std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference  
>::iterator_category`

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

4.610.2.3 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename  
_Reference = _Tp&> typedef _Pointer std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::pointer`

This type represents a pointer-to-value\_type.

Definition at line 127 of file `stl_iterator_base_types.h`.

4.610.2.4 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename  
_Reference = _Tp&> typedef _Reference std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::reference`

This type represents a reference-to-value\_type.

Definition at line 129 of file `stl_iterator_base_types.h`.

4.610.2.5 `template<typename _Category, typename _Tp, typename _Distance = ptrdiff_t, typename _Pointer = _Tp*, typename _Reference = _Tp&> typedef _Tp std::iterator< _Category, _Tp, _Distance, _Pointer, _Reference >::value_type`

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

## 4.611 `std::iterator_traits< _Tp * >` Struct Template Reference

### Public Types

- typedef ptrdiff\_t **difference\_type**
- typedef [random\\_access\\_iterator\\_tag](#) **iterator\_category**
- typedef \_Tp \* **pointer**
- typedef \_Tp & **reference**
- typedef \_Tp **value\_type**

### 4.611.1 Detailed Description

`template<typename _Tp>struct std::iterator_traits< _Tp * >`

Partial specialization for pointer types.

Definition at line 175 of file `stl_iterator_base_types.h`.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

## 4.612 `std::iterator_traits< const _Tp * >` Struct Template Reference

### Public Types

- typedef ptrdiff\_t **difference\_type**
- typedef [random\\_access\\_iterator\\_tag](#) **iterator\_category**
- typedef const \_Tp \* **pointer**
- typedef const \_Tp & **reference**
- typedef \_Tp **value\_type**

### 4.612.1 Detailed Description

`template<typename _Tp>struct std::iterator_traits< const _Tp * >`

Partial specialization for const pointer types.

Definition at line 186 of file `stl_iterator_base_types.h`.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

#### 4.613 std::less< \_Tp > Struct Template Reference

Inheritance diagram for std::less< \_Tp >:

##### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef `bool` [result\\_type](#)
- typedef `_Tp` [second\\_argument\\_type](#)

##### Public Member Functions

- `bool` **operator()** (`const _Tp &__x`, `const _Tp &__y`) `const`

##### 4.613.1 Detailed Description

`template<typename _Tp>struct std::less< _Tp >`

One of the [comparison functors](#).

Definition at line 231 of file `stl_function.h`.

##### 4.613.2 Member Typedef Documentation

**4.613.2.1** typedef `_Tp` `std::binary_function< _Tp, _Tp, bool >::first_argument_type` `[inherited]`

`first_argument_type` is the type of the first argument

Definition at line 117 of file `stl_function.h`.

**4.613.2.2** typedef `bool` `std::binary_function< _Tp, _Tp, bool >::result_type` `[inherited]`

`result_type` is the return type

Definition at line 123 of file `stl_function.h`.

4.613.2.3 `typedef _Tp std::binary_function< _Tp, _Tp, bool >::second_argument_type` [inherited]

`second_argument_type` is the type of the second argument

Definition at line 120 of file `stl_function.h`.

The documentation for this struct was generated from the following file:

- [stl\\_function.h](#)

## 4.614 std::less\_equal< \_Tp > Struct Template Reference

Inheritance diagram for `std::less_equal< _Tp >`:

### Public Types

- `typedef _Tp` [first\\_argument\\_type](#)
- `typedef bool` [result\\_type](#)
- `typedef _Tp` [second\\_argument\\_type](#)

### Public Member Functions

- `bool` **operator()** (const `_Tp` &\_\_x, const `_Tp` &\_\_y) const

### 4.614.1 Detailed Description

`template<typename _Tp>struct std::less_equal< _Tp >`

One of the [comparison functors](#).

Definition at line 249 of file `stl_function.h`.

### 4.614.2 Member Typedef Documentation

4.614.2.1 `typedef _Tp std::binary_function< _Tp, _Tp, bool >::first_argument_type` [inherited]

`first_argument_type` is the type of the first argument

Definition at line 117 of file `stl_function.h`.

**4.614.2.2** `typedef bool std::binary_function<_Tp, _Tp, bool>::result_type` [inherited]

`result_type` is the return type

Definition at line 123 of file `stl_function.h`.

**4.614.2.3** `typedef _Tp std::binary_function<_Tp, _Tp, bool>::second_argument_type` [inherited]

`second_argument_type` is the type of the second argument

Definition at line 120 of file `stl_function.h`.

The documentation for this struct was generated from the following file:

- [stl\\_function.h](#)

## 4.615 `std::linear_congruential_engine<_UIntType, __a, __c, __m>` Class Template Reference

### Public Types

- `typedef _UIntType result_type`

### Public Member Functions

- `linear_congruential_engine` (`result_type __s=default_seed`)
- `template<typename _Sseq, typename = typename std::enable_if<!std::is_same<_Sseq, linear_congruential_engine>::value>::type> linear_congruential_engine` (`_Sseq &__q`)
- `void discard` (`unsigned long long __z`)
- `result_type operator()` ()
- `void seed` (`result_type __s=default_seed`)
- `template<typename _Sseq> std::enable_if< std::is_class<_Sseq>::value>::type seed` (`_Sseq &__q`)

### Static Public Member Functions

- `static constexpr result_type max` ()
- `static constexpr result_type min` ()

### Static Public Attributes

- `static constexpr result_type default_seed`
- `static constexpr result_type increment`
- `static constexpr result_type modulus`
- `static constexpr result_type multiplier`

### Friends

- `template<typename _UIntType1, _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT, typename _Traits> std::basic_ostream<_CharT, _Traits> & operator<<` (`std::basic_ostream<_CharT, _Traits> &__os, const std::linear_congruential_engine<_UIntType1, __a1, __c1, __m1> &__lcr`)
- `bool operator==` (`const linear_congruential_engine &__lhs, const linear_congruential_engine &__rhs`)

- `template<typename _UIntType1 , _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT , typename _Traits > std::basic_istream< _CharT, _Traits > & operator>> (std::basic_istream< _CharT, _Traits > & __is, std::linear_congruential_engine< _UIntType1, __a1, __c1, __m1 > & __lcr)`

#### 4.615.1 Detailed Description

`template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> class std::linear_congruential_engine< _UIntType, __a, __c, __m >`

A model of a linear congruential random number generator.

A random number generator that produces pseudorandom numbers via linear function:

$$x_{i+1} \leftarrow (ax_i + c) \bmod m$$

The template parameter `_UIntType` must be an unsigned integral type large enough to store values up to `(__m-1)`. If the template parameter `__m` is 0, the modulus `__m` used is `std::numeric_limits<_UIntType>::max()` plus 1. Otherwise, the template parameters `__a` and `__c` must be less than `__m`.

The size of the state is 1.

Definition at line 241 of file `random.h`.

#### 4.615.2 Member Typedef Documentation

4.615.2.1 `template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m> typedef _UIntType std::linear_congruential_engine< _UIntType, __a, __c, __m >::result_type`

The type of the generated random value.

Definition at line 244 of file `random.h`.

#### 4.615.3 Constructor & Destructor Documentation

4.615.3.1 `template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m> std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine( result_type __s = default_seed )`  
`[inline], [explicit]`

Constructs a `linear_congruential_engine` random number generator engine with seed `__s`. The default seed value is 1.

Parameters

<code>__s</code>	The initial seed value.
------------------	-------------------------

Definition at line 268 of file `random.h`.

References `std::linear_congruential_engine< _UIntType, __a, __c, __m >::seed()`.

4.615.3.2 `template<typename _UIntType , _UIntType __a, _UIntType __c, _UIntType __m> template<typename _Sseq , typename = typename std::enable_if<!std::is_same<_Sseq, linear_congruential_engine>::value>::type> std::linear_congruential_engine< _UIntType, __a, __c, __m >::linear_congruential_engine( _Sseq & __q )`  
`[inline], [explicit]`

Constructs a `linear_congruential_engine` random number generator engine seeded from the seed sequence `__q`.

## Parameters

<code>__q</code>	the seed sequence.
------------------	--------------------

Definition at line 281 of file random.h.

References `std::linear_congruential_engine<_UIntType, __a, __c, __m>::seed()`.

## 4.615.4 Member Function Documentation

4.615.4.1 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> void std::linear_congruential_engine<_UIntType, __a, __c, __m>::discard ( unsigned long long __z )`  
[inline]

Discard a sequence of random numbers.

Definition at line 325 of file random.h.

4.615.4.2 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> static constexpr result_type std::linear_congruential_engine<_UIntType, __a, __c, __m>::max ( )` [inline], [static]

Gets the largest possible value in the output range.

Definition at line 318 of file random.h.

4.615.4.3 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> static constexpr result_type std::linear_congruential_engine<_UIntType, __a, __c, __m>::min ( )` [inline], [static]

Gets the smallest possible value in the output range.

The minimum depends on the `__c` parameter: if it is zero, the minimum generated must be  $> 0$ , otherwise 0 is allowed.

Definition at line 311 of file random.h.

4.615.4.4 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> result_type std::linear_congruential_engine<_UIntType, __a, __c, __m>::operator() ( )` [inline]

Gets the next random number in the sequence.

Definition at line 335 of file random.h.

4.615.4.5 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> void std::linear_congruential_engine<_UIntType, __a, __c, __m>::seed ( result_type __s = default_seed )`

Reseeds the `linear_congruential_engine` random number generator engine sequence to the seed `__s`.

## Parameters

<code>__s</code>	The new seed.
------------------	---------------

Referenced by `std::linear_congruential_engine<_UIntType, __a, __c, __m>::linear_congruential_engine()`.

4.615.4.6 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> template<typename _Sseq> std::enable_if<std::is_class<_Sseq>::value>::type std::linear_congruential_engine<_UIntType, __a, __c, __m>::seed ( _Sseq & __q )`

Reseeds the `linear_congruential_engine` random number generator engine sequence using values from the seed sequence `__q`.

## Parameters

<code>__q</code>	the seed sequence.
------------------	--------------------

## 4.615.5 Friends And Related Function Documentation

4.615.5.1 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> template<typename _UIntType1, _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT, typename _Traits> std::basic_ostream<_CharT, _Traits>& operator<< ( std::basic_ostream<_CharT, _Traits> & __os, const std::linear_congruential_engine<_UIntType1, __a1, __c1, __m1> & __lcr ) [friend]`

Writes the textual representation of the state  $x(i)$  of  $x$  to `__os`.

## Parameters

<code>__os</code>	The output stream.
<code>__lcr</code>	A % linear_congruential_engine random number generator.

## Returns

`__os`.

4.615.5.2 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> bool operator== ( const linear_congruential_engine<_UIntType, __a, __c, __m> & __lhs, const linear_congruential_engine<_UIntType, __a, __c, __m> & __rhs ) [friend]`

Compares two linear congruential random number generator objects of the same type for equality.

## Parameters

<code>__lhs</code>	A linear congruential random number generator object.
<code>__rhs</code>	Another linear congruential random number generator object.

## Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 353 of file random.h.

4.615.5.3 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> template<typename _UIntType1, _UIntType1 __a1, _UIntType1 __c1, _UIntType1 __m1, typename _CharT, typename _Traits> std::basic_istream<_CharT, _Traits>& operator>> ( std::basic_istream<_CharT, _Traits> & __is, std::linear_congruential_engine<_UIntType1, __a1, __c1, __m1> & __lcr ) [friend]`

Sets the state of the engine by reading its textual representation from `__is`.

The textual representation must have been previously written using an output stream whose imbued locale and whose type's template specialization arguments `_CharT` and `_Traits` were the same as those of `__is`.

## Parameters

<code>__is</code>	The input stream.
-------------------	-------------------

<code>__lcr</code>	A % linear_congruential_engine random number generator.
--------------------	---

#### Returns

`__is`.

#### 4.615.6 Member Data Documentation

4.615.6.1 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> constexpr result_type std::linear_congruential_engine<_UIntType, __a, __c, __m>::increment [static]`

An increment.

Definition at line 255 of file random.h.

4.615.6.2 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> constexpr result_type std::linear_congruential_engine<_UIntType, __a, __c, __m>::modulus [static]`

The modulus.

Definition at line 257 of file random.h.

4.615.6.3 `template<typename _UIntType, _UIntType __a, _UIntType __c, _UIntType __m> constexpr result_type std::linear_congruential_engine<_UIntType, __a, __c, __m>::multiplier [static]`

The multiplier.

Definition at line 253 of file random.h.

The documentation for this class was generated from the following file:

- [random.h](#)

## 4.616.1 Detailed Description

`template<typename _Tp, typename _Alloc = std::allocator<_Tp>> class std::list<_Tp, _Alloc>`

A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

## Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `at` and `operator[]`.

This is a *doubly linked* list. Traversal up and down the list requires linear time, but adding and removing elements (or *nodes*) is done in constant time, regardless of where the change takes place. Unlike `std::vector` and `std::deque`, random-access iterators are not provided, so subscripting ( `[]` ) access is not allowed. For algorithms which only need sequential access, this lack makes no difference.

Also unlike the other standard containers, `std::list` provides specialized algorithms unique to linked lists, such as splicing, sorting, and in-place reversal.

A couple points on memory allocation for `list<Tp>`:

First, we never actually allocate a `Tp`, we allocate `List_node<Tp>`'s and trust [20.1.5]/4 to DTRT. This is to ensure that after elements from `list<X, Alloc1>` are spliced into `list<X, Alloc2>`, destroying the memory of the second list is a valid operation, i.e., `Alloc1` giveth and `Alloc2` taketh away.

Second, a list conceptually represented as

A <----> B <----> C <----> D

is actually circular; a link exists between A and D. The list class holds (as its only data member) a private `list::iterator` pointing to *D*, not to *A*! To get to the head of the list, we start at the tail and move forward by one. When this member iterator's next/previous pointers refer to itself, the list is empty.

Definition at line 438 of file `stl_list.h`.

#### 4.616.2 Constructor & Destructor Documentation

**4.616.2.1** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list ( ) [inline]`

Default constructor creates no elements.

Definition at line 523 of file `stl_list.h`.

**4.616.2.2** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list ( const allocator_type &__a ) [inline], [explicit]`

Creates a list with no elements.

Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 531 of file `stl_list.h`.

**4.616.2.3** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list ( size_type __n ) [inline], [explicit]`

Creates a list with default constructed elements.

Parameters

<code>__n</code>	The number of elements to initially create.
------------------	---

This constructor fills the list with `__n` default constructed elements.

Definition at line 543 of file `stl_list.h`.

**4.616.2.4** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list ( size_type __n, const value_type &__value, const allocator_type &__a = allocator_type() ) [inline]`

Creates a list with copies of an exemplar element.

Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__a</code>	An allocator object.

This constructor fills the list with `__n` copies of `__value`.

Definition at line 555 of file `stl_list.h`.

**4.616.2.5** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list ( const list<_Tp, _Alloc> &__x ) [inline]`

List copy constructor.

## Parameters

<code>__x</code>	A list of identical element and allocator types.
------------------	--

The newly-created list uses a copy of the allocation object used by `__x`.

Definition at line 582 of file `stl_list.h`.

**4.616.2.6** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list ( list<_Tp, _Alloc> && __x ) [inline], [noexcept]`

List move constructor.

## Parameters

<code>__x</code>	A list of identical element and allocator types.
------------------	--

The newly-created list contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified list.

Definition at line 594 of file `stl_list.h`.

**4.616.2.7** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::list<_Tp, _Alloc>::list ( initializer_list<value_type> & __l, const allocator_type & __a = allocator_type() ) [inline]`

Builds a list from an `initializer_list`.

## Parameters

<code>__l</code>	An <code>initializer_list</code> of <code>value_type</code> .
<code>__a</code>	An allocator object.

Create a list consisting of copies of the elements in the `initializer_list` `__l`. This is linear in `__l.size()`.

Definition at line 605 of file `stl_list.h`.

**4.616.2.8** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::RequireInputIter<_InputIterator>> std::list<_Tp, _Alloc>::list ( _InputIterator __first, _InputIterator __last, const allocator_type & __a = allocator_type() ) [inline]`

Builds a list from a range.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__a</code>	An allocator object.

Create a list consisting of copies of the elements from `[__first, __last)`. This is linear in `N` (where `N` is `distance(__first, __last)`).

Definition at line 624 of file `stl_list.h`.

**4.616.3 Member Function Documentation**

**4.616.3.1** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> _Node* std::list<_Tp, _Alloc>::_M_create_node ( _Args &&... __args ) [inline], [protected]`

## Parameters

<code>__args</code>	An instance of user data.
---------------------	---------------------------

Allocates space for a new node and constructs a copy of `__args` in it.

Definition at line 500 of file `stl_list.h`.

**4.616.3.2** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::assign ( size_type __n, const value_type & __val ) [inline]`

Assigns a given value to a list.

Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a list with `__n` copies of the given value. Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 702 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::assign()`, and `std::list< __inp, __rebind_inp >::operator=()`.

**4.616.3.3** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>> void std::list<_Tp, _Alloc>::assign ( _InputIterator __first, _InputIterator __last ) [inline]`

Assigns a range to a list.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a list with copies of the elements in the range `[__first, __last)`.

Note that the assignment completely changes the list and that the resulting list's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 721 of file `stl_list.h`.

**4.616.3.4** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::assign ( initializer_list< value_type > __l ) [inline]`

Assigns an `initializer_list` to a list.

Parameters

<code>__l</code>	An <code>initializer_list</code> of <code>value_type</code> .
------------------	---

Replace the contents of the list with copies of the elements in the `initializer_list` `__l`. This is linear in `__l.size()`.

Definition at line 743 of file `stl_list.h`.

**4.616.3.5** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::list<_Tp, _Alloc>::back ( ) [inline]`

Returns a read/write reference to the data at the last element of the list.

Definition at line 943 of file `stl_list.h`.

**4.616.3.6** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::list<_Tp, _Alloc>::back ( )  
const [inline]`

Returns a read-only (constant) reference to the data at the last element of the list.

Definition at line 955 of file `stl_list.h`.

**4.616.3.7** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::begin ( )  
[inline], [noexcept]`

Returns a read/write iterator that points to the first element in the list. Iteration is done in ordinary element order.

Definition at line 758 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::crend()`, `std::list< __inp, __rebind_inp >::front()`, `std::list< __inp, __rebind_inp >::list()`, `std::operator==( )`, `std::list< __inp, __rebind_inp >::pop_front()`, `std::list< __inp, __rebind_inp >::push_front()`, `std::list< __inp, __rebind_inp >::rend()`, `std::list< __inp, __rebind_inp >::size()`, and `std::list< __inp, __rebind_inp >::splice()`.

**4.616.3.8** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list<_Tp, _Alloc>::begin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

Definition at line 767 of file `stl_list.h`.

**4.616.3.9** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list<_Tp, _Alloc>::cbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the list. Iteration is done in ordinary element order.

Definition at line 831 of file `stl_list.h`.

**4.616.3.10** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list<_Tp, _Alloc>::cend ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Definition at line 840 of file `stl_list.h`.

**4.616.3.11** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::clear ( ) [inline], [noexcept]`

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1228 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::operator=( )`.

**4.616.3.12** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list<_Tp, _Alloc>::crbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 849 of file `stl_list.h`.

**4.616.3.13** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list<_Tp, _Alloc>::crend ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 858 of file `stl_list.h`.

**4.616.3.14** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> iterator std::list<_Tp, _Alloc>::emplace ( iterator __position, _Args &&... __args )`

Constructs object in list before specified iterator.

#### Parameters

<code>__position</code>	A <code>const_iterator</code> into the list.
<code>__args</code>	Arguments.

#### Returns

An iterator that points to the inserted data.

This function will insert an object of type `T` constructed with `T(std::forward<Args>(args)...) before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.`

Referenced by `std::list< __inp, __rebind_inp >::insert()`.

**4.616.3.15** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> bool std::list<_Tp, _Alloc>::empty ( ) const [inline], [noexcept]`

Returns true if the list is empty. (Thus `begin()` would equal `end()`.)

Definition at line 868 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::splice()`.

**4.616.3.16** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::end ( ) [inline], [noexcept]`

Returns a read/write iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Definition at line 776 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::back()`, `std::list< __inp, __rebind_inp >::cbegin()`, `std::list< __inp, __rebind_inp >::list()`, `std::operator==()`, `std::list< __inp, __rebind_inp >::push_back()`, `std::list< __inp, __rebind_inp >::rbegin()`, `std::list< __inp, __rebind_inp >::size()`, and `std::list< __inp, __rebind_inp >::splice()`.

**4.616.3.17** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::list<_Tp, _Alloc>::end ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the list. Iteration is done in ordinary element order.

Definition at line 785 of file `stl_list.h`.

**4.616.3.18** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::erase ( iterator __position )`

Remove element at given position.

## Parameters

<code>__position</code>	Iterator pointing to element to be erased.
-------------------------	--

## Returns

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the list by one.

Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Referenced by `std::list< __inp, __rebind_inp >::erase()`.

```
4.616.3.19 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list< _Tp, _Alloc >::erase (
    iterator __first, iterator __last ) [inline]
```

Remove a range of elements.

## Parameters

<code>__first</code>	Iterator pointing to the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

## Returns

An iterator pointing to the element pointed to by *last* prior to erasing (or end()).

This function will erase the elements in the range [first,last) and shorten the list accordingly.

This operation is linear time in the size of the range and only invalidates iterators/references to the element being removed. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1193 of file `stl_list.h`.

```
4.616.3.20 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::list< _Tp, _Alloc >::front ( )
    [inline]
```

Returns a read/write reference to the data at the first element of the list.

Definition at line 927 of file `stl_list.h`.

```
4.616.3.21 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::list< _Tp, _Alloc >::front (
    ) const [inline]
```

Returns a read-only (constant) reference to the data at the first element of the list.

Definition at line 935 of file `stl_list.h`.

```
4.616.3.22 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> allocator_type std::list< _Tp, _Alloc
    >::get_allocator ( ) const [inline], [noexcept]
```

Get a copy of the memory allocation object.

Definition at line 749 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::insert()`.

4.616.3.23 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::insert (`  
`iterator __position, const value_type & __x )`

Inserts given value into list before specified iterator.

## Parameters

<code>__position</code>	An iterator into the list.
<code>__x</code>	Data to be inserted.

## Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Referenced by `std::list< __inp, __rebind_inp >::insert()`.

**4.616.3.24** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::list<_Tp, _Alloc>::insert ( iterator __position, value_type && __x ) [inline]`

Inserts given rvalue into list before specified iterator.

## Parameters

<code>__position</code>	An iterator into the list.
<code>__x</code>	Data to be inserted.

## Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 1089 of file `stl_list.h`.

**4.616.3.25** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::insert ( iterator __p, initializer_list< value_type > __l ) [inline]`

Inserts the contents of an `initializer_list` into list before specified iterator.

## Parameters

<code>__p</code>	An iterator into the list.
<code>__l</code>	An <code>initializer_list</code> of <code>value_type</code> .

This function will insert copies of the data in the `initializer_list` `l` into the list before the location specified by `p`.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 1106 of file `stl_list.h`.

**4.616.3.26** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::insert ( iterator __position, size_type __n, const value_type & __x ) [inline]`

Inserts a number of copies of given data into the list.

## Parameters

---

<code>__position</code>	An iterator into the list.
<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

This function will insert a specified number of copies of the given data before the location specified by *position*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 1123 of file `stl_list.h`.

```
4.616.3.27 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename =
std::_RequireInputIter<_InputIterator>> void std::list<_Tp, _Alloc>::insert ( iterator __position, _InputIterator
__first, _InputIterator __last ) [inline]
```

Inserts a range into the list.

Parameters

<code>__position</code>	An iterator into the list.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function will insert copies of the data in the range [*first,last*) into the list before the location specified by *position*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 1149 of file `stl_list.h`.

```
4.616.3.28 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::list<_Tp, _Alloc>::max_size ( )
const [inline],[noexcept]
```

Returns the `size()` of the largest possible list.

Definition at line 878 of file `stl_list.h`.

```
4.616.3.29 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::merge ( list<_Tp,
_Alloc> && __x )
```

Merge sorted lists.

Parameters

<code>__x</code>	Sorted list to merge.
------------------	-----------------------

Assumes that both `__x` and this list are sorted according to `operator<()`. Merges elements of `__x` into this list in sorted order, leaving `__x` empty when complete. Elements in this list precede elements in `__x` that are equal.

```
4.616.3.30 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _StrictWeakOrdering > void
std::list<_Tp, _Alloc>::merge ( list<_Tp, _Alloc> && __x, _StrictWeakOrdering __comp )
```

Merge sorted lists according to comparison function.

Template Parameters

<code>_StrictWeakOrdering</code>	Comparison function defining sort order.
----------------------------------	--

Parameters

<code>__x</code>	Sorted list to merge.
------------------	-----------------------

<code>__comp</code>	Comparison functor.
---------------------	---------------------

Assumes that both `__x` and this list are sorted according to `StrictWeakOrdering`. Merges elements of `__x` into this list in sorted order, leaving `__x` empty when complete. Elements in this list precede elements in `__x` that are equivalent according to `StrictWeakOrdering()`.

**4.616.3.31** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> list& std::list<_Tp, _Alloc>::operator= ( const list<_Tp, _Alloc> & __x )`

List assignment operator.

No explicit dtor needed as the `_Base` dtor takes care of things. The `_Base` dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

#### Parameters

<code>__x</code>	A list of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but unlike the copy constructor, the allocator object is not copied.

**4.616.3.32** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> list& std::list<_Tp, _Alloc>::operator= ( list<_Tp, _Alloc> && __x ) [inline]`

List move assignment operator.

#### Parameters

<code>__x</code>	A list of identical element and allocator types.
------------------	--

The contents of `__x` are moved into this list (without copying). `__x` is a valid, but unspecified list

Definition at line 667 of file `stl_list.h`.

**4.616.3.33** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> list& std::list<_Tp, _Alloc>::operator= ( initializer_list<value_type> __l ) [inline]`

List initializer list assignment operator.

#### Parameters

<code>__l</code>	An <code>initializer_list</code> of <code>value_type</code> .
------------------	---

Replace the contents of the list with copies of the elements in the `initializer_list` `__l`. This is linear in `l.size()`.

Definition at line 684 of file `stl_list.h`.

**4.616.3.34** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::pop_back ( ) [inline]`

Removes last element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

Definition at line 1041 of file `stl_list.h`.

**4.616.3.35** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::pop_front ( ) [inline]`

Removes first element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in

constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

Definition at line 1001 of file `stl_list.h`.

```
4.616.3.36  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::push_back ( const
            value_type & __x )  [inline]
```

Add data to the end of the list.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the end of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 1015 of file `stl_list.h`.

```
4.616.3.37  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::push_front ( const
            value_type & __x )  [inline]
```

Add data to the front of the list.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the front of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 974 of file `stl_list.h`.

```
4.616.3.38  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::list<_Tp, _Alloc>
            >::rbegin ( )  [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 794 of file `stl_list.h`.

```
4.616.3.39  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list<_Tp, _Alloc>
            >::rbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 803 of file `stl_list.h`.

```
4.616.3.40  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::remove ( const _Tp
            & __value )
```

Remove all elements equal to `value`.

Parameters

<code>__value</code>	The value to remove.
----------------------	----------------------

Removes every element in the list equal to `value`. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

4.616.3.41 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _Predicate> void std::list<_Tp, _Alloc>::remove_if ( _Predicate )`

Remove all elements satisfying a predicate.

## Template Parameters

<code>__Predicate</code>	Unary predicate function or object.
--------------------------	-------------------------------------

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**4.616.3.42** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::list<_Tp, _Alloc>::rend ( ) [inline], [noexcept]`

Returns a read/write reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 812 of file `stl_list.h`.

**4.616.3.43** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::list<_Tp, _Alloc>::rend ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 821 of file `stl_list.h`.

**4.616.3.44** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::resize ( size_type __new_size )`

Resizes the list to the specified number of elements.

## Parameters

<code>__new_size</code>	Number of elements the list should contain.
-------------------------	---

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise default constructed elements are appended.

**4.616.3.45** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::resize ( size_type __new_size, const value_type & __x )`

Resizes the list to the specified number of elements.

## Parameters

<code>__new_size</code>	Number of elements the list should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise the list is extended and new elements are populated with given data.

**4.616.3.46** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::reverse ( ) [inline], [noexcept]`

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

Definition at line 1449 of file `stl_list.h`.

**4.616.3.47** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::list<_Tp, _Alloc>::size ( ) const [inline], [noexcept]`

Returns the number of elements in the list.

Definition at line 873 of file stl\_list.h.

**4.616.3.48** template<typename \_Tp, typename \_Alloc = std::allocator<\_Tp>> void std::list<\_Tp, \_Alloc>::sort ( )

Sort the elements.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

**4.616.3.49** template<typename \_Tp, typename \_Alloc = std::allocator<\_Tp>> template<typename \_StrictWeakOrdering > void std::list<\_Tp, \_Alloc>::sort ( \_StrictWeakOrdering )

Sort the elements according to comparison function.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

**4.616.3.50** template<typename \_Tp, typename \_Alloc = std::allocator<\_Tp>> void std::list<\_Tp, \_Alloc>::splice ( iterator \_\_position, list<\_Tp, \_Alloc> && \_\_x ) [inline]

Insert contents of another list.

Parameters

<code>__position</code>	Iterator referencing the element to insert before.
<code>__x</code>	Source list.

The elements of `__x` are inserted in constant time in front of the element referenced by `__position`. `__x` becomes an empty list.

Requires this != `__x`.

Definition at line 1248 of file stl\_list.h.

Referenced by std::list< \_\_inp, \_\_rebind\_inp >::insert().

**4.616.3.51** template<typename \_Tp, typename \_Alloc = std::allocator<\_Tp>> void std::list<\_Tp, \_Alloc>::splice ( iterator \_\_position, list<\_Tp, \_Alloc> && \_\_x, iterator \_\_i ) [inline]

Insert element from another list.

Parameters

<code>__position</code>	Iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__i</code>	Iterator referencing the element to move.

Removes the element in list `__x` referenced by `__i` and inserts it into the current list before `__position`.

Definition at line 1278 of file stl\_list.h.

**4.616.3.52** template<typename \_Tp, typename \_Alloc = std::allocator<\_Tp>> void std::list<\_Tp, \_Alloc>::splice ( iterator \_\_position, list<\_Tp, \_Alloc> && \_\_x, iterator \_\_first, iterator \_\_last ) [inline]

Insert range from another list.

Parameters

<code>__position</code>	Iterator referencing the element to insert before.
<code>__x</code>	Source list.
<code>__first</code>	Iterator referencing the start of range in x.

<code>__last</code>	Iterator referencing the end of range in <code>x</code> .
---------------------	---

Removes elements in the range `[__first,__last)` and inserts them before `__position` in constant time.

Undefined if `__position` is in `[__first,__last)`.

Definition at line 1314 of file `stl_list.h`.

**4.616.3.53** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::swap ( list<_Tp, _Alloc> & __x ) [inline]`

Swaps data with another list.

#### Parameters

<code>__x</code>	A list of the same element and allocator types.
------------------	---

This exchanges the elements between two lists in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(l1,l2)` will feed to this function.

Definition at line 1210 of file `stl_list.h`.

Referenced by `std::list< __inp, __rebind_inp >::operator=()`, and `std::swap()`.

**4.616.3.54** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::unique ( )`

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**4.616.3.55** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _BinaryPredicate > void std::list<_Tp, _Alloc>::unique ( _BinaryPredicate )`

Remove consecutive elements satisfying a predicate.

#### Template Parameters

<code>_BinaryPredicate</code>	Binary predicate function or object.
-------------------------------	--------------------------------------

For each consecutive set of elements `[first,last)` that satisfy `predicate(first,i)` where `i` is an iterator in `[first,last)`, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

## 4.617.1 Detailed Description

Container class for localization functionality.

The locale class is first a class wrapper for C library locales. It is also an extensible container for user-defined localization. A locale is a collection of facets that implement various localization features such as money, time, and number printing.

Constructing C++ locales does not change the C library locale.

This library supports efficient construction and copying of locales through a reference counting implementation of the locale class.

Definition at line 62 of file locale\_classes.h.

#### 4.617.2 Member Typedef Documentation

##### 4.617.2.1 `typedef int std::locale::category`

Definition of `locale::category`.

Definition at line 67 of file `locale_classes.h`.

#### 4.617.3 Constructor & Destructor Documentation

##### 4.617.3.1 `std::locale::locale ( ) throw`

Default constructor.

Constructs a copy of the global locale. If no locale has been explicitly set, this is the C locale.

##### 4.617.3.2 `std::locale::locale ( const locale & __other ) throw`

Copy constructor.

Constructs a copy of *other*.

###### Parameters

<code>__other</code>	The locale to copy.
----------------------	---------------------

##### 4.617.3.3 `std::locale::locale ( const char * __s ) [explicit]`

Named locale constructor.

Constructs a copy of the named C library locale.

###### Parameters

<code>__s</code>	Name of the locale to construct.
------------------	----------------------------------

###### Exceptions

<code>std::runtime_error</code>	if <code>__s</code> is null or an undefined locale.
---------------------------------	---

##### 4.617.3.4 `std::locale::locale ( const locale & __base, const char * __s, category __cat )`

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If *base* is named, this locale instance will also be named.

###### Parameters

<code>__base</code>	The locale to copy.
<code>__s</code>	Name of the locale to use facets from.
<code>__cat</code>	Set of categories defining the facets to use from <code>__s</code> .

###### Exceptions

<code>std::runtime_error</code>	if <code>__s</code> is null or an undefined locale.
---------------------------------	---

#### 4.617.3.5 std::locale::locale ( const locale & \_\_base, const locale & \_\_add, category \_\_cat )

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale *add*. If *base* and *add* are named, this locale instance will also be named.

Parameters

<code>__base</code>	The locale to copy.
<code>__add</code>	The locale to use facets from.
<code>__cat</code>	Set of categories defining the facets to use from <i>add</i> .

#### 4.617.3.6 template<typename \_Facet > std::locale::locale ( const locale & \_\_other, \_Facet \* \_\_f )

Construct locale with another facet.

Constructs a copy of the locale *\_\_other*. The facet *\_\_f* is added to *\_\_other*, replacing an existing facet of type *Facet* if there is one. If *\_\_f* is null, this locale is a copy of *\_\_other*.

Parameters

<code>__other</code>	The locale to copy.
<code>__f</code>	The facet to add in.

#### 4.617.3.7 std::locale::~~locale ( ) throw

Locale destructor.

### 4.617.4 Member Function Documentation

#### 4.617.4.1 static const locale& std::locale::classic ( ) [static]

Return reference to the C locale.

#### 4.617.4.2 template<typename \_Facet > locale std::locale::combine ( const locale & \_\_other ) const

Construct locale with another facet.

Constructs and returns a new copy of this locale. Adds or replaces an existing facet of type *Facet* from the locale *other* into the new locale.

Template Parameters

<code>_Facet</code>	The facet type to copy from <i>other</i>
---------------------	--

Parameters

<code>__other</code>	The locale to copy from.
----------------------	--------------------------

Returns

Newly constructed locale.

## Exceptions

<code>std::runtime_error</code>	if <code>__other</code> has no facet of type <code>_Facet</code> .
---------------------------------	--

4.617.4.3 `static locale std::locale::global ( const locale & __loc ) [static]`

Set global locale.

This function sets the global locale to the argument and returns a copy of the previous global locale. If the argument has a name, it will also call `std::setlocale(LC_ALL, loc.name())`.

## Parameters

<code>__loc</code>	The new locale to make global.
--------------------	--------------------------------

## Returns

Copy of the old global locale.

4.617.4.4 `string std::locale::name ( ) const`

Return locale name.

## Returns

Locale name or "\*" if unnamed.

4.617.4.5 `bool std::locale::operator!=( const locale & __other ) const throw () [inline]`

Locale inequality.

## Parameters

<code>__other</code>	The locale to compare against.
----------------------	--------------------------------

## Returns

`! (*this == __other)`

Definition at line 235 of file `locale_classes.h`.

References `operator==( )`.

4.617.4.6 `template<typename _Char, typename _Traits, typename _Alloc> bool std::locale::operator() ( const basic_string<_Char, _Traits, _Alloc> & __s1, const basic_string<_Char, _Traits, _Alloc> & __s2 ) const`

Compare two strings according to collate.

Template operator to compare two strings using the compare function of the collate facet in this locale. One use is to provide the locale to the sort function. For example, a vector `v` of strings could be sorted according to locale `loc` by doing:

```
std::sort(v.begin(), v.end(), loc);
```

## Parameters

<code>__s1</code>	First string to compare.
<code>__s2</code>	Second string to compare.

## Returns

True if `collate<_Char> facet` compares `__s1 < __s2`, else false.

**4.617.4.7 const locale& std::locale::operator= ( const locale & \_\_other ) throw )**

Assignment operator.

Set this locale to be a copy of *other*.

## Parameters

<code>__other</code>	The locale to copy.
----------------------	---------------------

## Returns

A reference to this locale.

**4.617.4.8 bool std::locale::operator== ( const locale & \_\_other ) const throw )**

Locale equality.

## Parameters

<code>__other</code>	The locale to compare against.
----------------------	--------------------------------

## Returns

True if *other* and this refer to the same locale instance, are copies, or have the same name. False otherwise.

Referenced by `operator!=()`.

**4.617.5 Member Data Documentation****4.617.5.1 const category std::locale::all [static]**

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 105 of file `locale_classes.h`.

**4.617.5.2 const category std::locale::collate [static]**

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

- static void `_S_destroy_c_locale (__c_locale &__cloc)`
- static `__c_locale _S_get_c_locale ()`
- static const char \* `_S_get_c_name () throw ()`
- static `__c_locale _S_lc_ctype_c_locale (__c_locale __cloc, const char *__s)`

### Friends

- class `locale`
- class `locale::_Impl`

#### 4.618.1 Detailed Description

Localization functionality base class.

The facet class is the base class for a localization feature, such as money, time, and number printing. It provides common support for facets and reference management.

Facets may not be copied or assigned.

Definition at line 338 of file `locale_classes.h`.

#### 4.618.2 Constructor & Destructor Documentation

4.618.2.1 `std::locale::facet::facet ( size_t __refs = 0 ) throw ()` `[inline]`, `[explicit]`, `[protected]`

Facet constructor.

This is the constructor provided by the standard. If `refs` is 0, the facet is destroyed when the last referencing locale is destroyed. Otherwise the facet will never be destroyed.

##### Parameters

<code>__refs</code>	The initial value for reference count.
---------------------	--

Definition at line 370 of file `locale_classes.h`.

4.618.2.2 `virtual std::locale::facet::~facet ( )` `[protected]`, `[virtual]`

Facet destructor.

The documentation for this class was generated from the following file:

- [locale\\_classes.h](#)

#### 4.619 std::locale::id Class Reference

##### Public Member Functions

- class **locale**
- class **locale::Impl**
- template<typename \_Facet > const \_Facet & **use\_facet** (const [locale](#) &)

## 4.619.1 Detailed Description

Facet ID class.

The ID class provides facets with an index used to identify them. Every facet class must define a public static member locale::id, or be derived from a facet that provides this member, otherwise the facet cannot be used in a locale. The locale::id ensures that each class type gets a unique identifier.

Definition at line 436 of file locale\_classes.h.

## 4.619.2 Constructor &amp; Destructor Documentation

## 4.619.2.1 std::locale::id::id( ) [inline]

Constructor.

Definition at line 467 of file locale\_classes.h.

## 4.623.1 Detailed Description

template<typename \_RealType = double>class std::lognormal\_distribution<\_RealType>

A lognormal\_distribution random number distribution.

The formula for the normal probability mass function is

$$p(x|m, s) = \frac{1}{sx\sqrt{2\pi}} \exp - \frac{(\ln x - m)^2}{2s^2}$$

Definition at line 2298 of file random.h.

## 4.623.2 Member Typedef Documentation

4.623.2.1 template<typename \_RealType = double> typedef \_RealType std::lognormal\_distribution<\_RealType>::[result\\_type](#)

The type of the range of the distribution.

Definition at line 2301 of file random.h.

#### 4.623.3 Member Function Documentation

**4.623.3.1** `template<typename _RealType = double> result_type std::lognormal_distribution< _RealType >::max ( )  
const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 2389 of file random.h.

References std::max().

**4.623.3.2** `template<typename _RealType = double> result_type std::lognormal_distribution< _RealType >::min ( ) const  
[inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 2382 of file random.h.

**4.623.3.3** `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type  
std::lognormal_distribution< _RealType >::operator() ( _UniformRandomNumberGenerator & __urng )  
[inline]`

Generating functions.

Definition at line 2397 of file random.h.

**4.623.3.4** `template<typename _RealType = double> param_type std::lognormal_distribution< _RealType >::param ( )  
const [inline]`

Returns the parameter set of the distribution.

Definition at line 2367 of file random.h.

**4.623.3.5** `template<typename _RealType = double> void std::lognormal_distribution< _RealType >::param ( const  
param_type & __param ) [inline]`

Sets the parameter set of the distribution.

##### Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 2375 of file random.h.

**4.623.3.6** `template<typename _RealType = double> void std::lognormal_distribution< _RealType >::reset ( )  
[inline]`

Resets the distribution state.

Definition at line 2349 of file random.h.

References std::normal\_distribution< \_RealType >::reset().

#### 4.623.4 Friends And Related Function Documentation

**4.623.4.1** `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits  
> std::basic_ostream< _CharT , _Traits > & operator<< ( std::basic_ostream< _CharT , _Traits > & __os, const  
std::lognormal_distribution< _RealType1 > & __x ) [friend]`

Inserts a lognormal\_distribution random number distribution `__x` into the output stream `__os`.

## Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A lognormal_distribution random number distribution.

## Returns

The output stream with the state of `__x` inserted or in an error state.

4.623.4.2 `template<typename _RealType = double> bool operator==( const lognormal_distribution<_RealType> &__d1, const lognormal_distribution<_RealType> &__d2 ) [friend]`

Return true if two lognormal distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 2434 of file random.h.

4.623.4.3 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits> std::basic_istream<_CharT, _Traits>& operator>> ( std::basic_istream<_CharT, _Traits> &__is, std::lognormal_distribution<_RealType1> &__x ) [friend]`

Extracts a lognormal\_distribution random number distribution `__x` from the input stream `__is`.

## Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A lognormal_distribution random number generator engine.

## Returns

The input stream with `__x` extracted or in an error state.

#### 4.625.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const  
_Key, _Tp> >> class std::map< _Key, _Tp, _Compare, _Alloc >
```

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

## Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Compare</code>	Comparison function object type, defaults to <code>less&lt;_Key&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;pair&lt;const _Key, _Tp&gt;&gt;</code> .

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys). For a `map<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `std::pair<const Key, T>`.

Maps support bidirectional iterators.

The private tree data is declared exactly the same way for `map` and `multimap`; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

Definition at line 96 of file `stl_map.h`.

## 4.625.2 Constructor &amp; Destructor Documentation

4.625.2.1 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::map<_Key, _Tp, _Compare, _Alloc>::map ( ) [inline]`

Default constructor creates no elements.

Definition at line 160 of file `stl_map.h`.

4.625.2.2 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::map<_Key, _Tp, _Compare, _Alloc>::map ( const _Compare & __comp, const allocator_type & __a = allocator_type() ) [inline], [explicit]`

Creates a map with no elements.

## Parameters

<code>__comp</code>	A comparison object.
<code>__a</code>	An allocator object.

Definition at line 169 of file `stl_map.h`.

4.625.2.3 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::map<_Key, _Tp, _Compare, _Alloc>::map ( const map<_Key, _Tp, _Compare, _Alloc> & __x ) [inline]`

Map copy constructor.

## Parameters

<code>__x</code>	A map of identical element and allocator types.
------------------	---

The newly-created map uses a copy of the allocation object used by `__x`.

Definition at line 180 of file `stl_map.h`.

4.625.2.4 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::map<_Key, _Tp, _Compare, _Alloc>::map ( map<_Key, _Tp, _Compare, _Alloc> && __x ) [inline], [noexcept]`

Map move constructor.

## Parameters

<code>__x</code>	A map of identical element and allocator types.
------------------	---

The newly-created map contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified map.

Definition at line 191 of file `stl_map.h`.

```
4.625.2.5  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> std::map<_Key, _Tp, _Compare, _Alloc >::map (
            initializer_list< value_type > __l, const _Compare & __comp = _Compare(), const allocator_type & __a =
            allocator_type() ) [inline]
```

Builds a map from an `initializer_list`.

## Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__comp</code>	A comparison object.
<code>__a</code>	An allocator object.

Create a map consisting of copies of the elements in the `initializer_list` `__l`. This is linear in N if the range is already sorted, and NlogN otherwise (where N is `__l.size()`).

Definition at line 206 of file `stl_map.h`.

```
4.625.2.6  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > std::map<_Key, _Tp, _Compare,
            _Alloc >::map ( _InputIterator __first, _InputIterator __last ) [inline]
```

Builds a map from a range.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a map consisting of copies of the elements from `[__first,__last)`. This is linear in N if the range is already sorted, and NlogN otherwise (where N is `distance(__first,__last)`).

Definition at line 224 of file `stl_map.h`.

```
4.625.2.7  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > std::map<_Key, _Tp, _Compare,
            _Alloc >::map ( _InputIterator __first, _InputIterator __last, const _Compare & __comp, const allocator_type & __a =
            allocator_type() ) [inline]
```

Builds a map from a range.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a map consisting of copies of the elements from `[__first,__last)`. This is linear in N if the range is already sorted, and NlogN otherwise (where N is `distance(__first,__last)`).

Definition at line 241 of file `stl_map.h`.

## 4.625.3 Member Function Documentation

```
4.625.3.1 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp> >> mapped_type& std::map<_Key, _Tp, _Compare, _Alloc >::at ( const  
key_type & __k ) [inline]
```

Access to map data.

## Parameters

<code>__k</code>	The key for which data should be retrieved.
------------------	---

## Returns

A reference to the data whose key is equivalent to `__k`, if such a data is present in the map.

## Exceptions

<code>std::out_of_range</code>	If no such data is present.
--------------------------------	-----------------------------

Definition at line 501 of file `stl_map.h`.

References `std::map<_Key, _Tp, _Compare, _Alloc>::end()`, `std::map<_Key, _Tp, _Compare, _Alloc>::key_comp()`, and `std::map<_Key, _Tp, _Compare, _Alloc>::lower_bound()`.

**4.625.3.2** `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> iterator std::map<_Key, _Tp, _Compare, _Alloc>::begin ( )`  
`[inline], [noexcept]`

Returns a read/write iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 320 of file `stl_map.h`.

**4.625.3.3** `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::begin ( )`  
`const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 329 of file `stl_map.h`.

**4.625.3.4** `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::cbegin ( )`  
`const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 393 of file `stl_map.h`.

**4.625.3.5** `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::cend ( )`  
`const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 402 of file `stl_map.h`.

**4.625.3.6** `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::map<_Key, _Tp, _Compare, _Alloc>::clear ( )`  
`[inline], [noexcept]`

Erases all elements in a map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 788 of file stl\_map.h.

Referenced by std::map< \_Key, \_Tp, \_Compare, \_Alloc >::operator=().

**4.625.3.7** `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp>>> size_type std::map<_Key, _Tp, _Compare, _Alloc>::count ( const  
key_type & __x ) const [inline]`

Finds the number of elements with given key.

Parameters

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

Returns

Number of elements with specified key.

This function only makes sense for multimaps; for map the result will either be 0 (not present) or 1 (present).

Definition at line 848 of file stl\_map.h.

**4.625.3.8** `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc  
>::crbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 411 of file stl\_map.h.

**4.625.3.9** `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc  
>::crend ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 420 of file stl\_map.h.

**4.625.3.10** `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp>>> template<typename... _Args> std::pair<iterator, bool>  
std::map<_Key, _Tp, _Compare, _Alloc>::emplace ( _Args &&... __args ) [inline]`

Attempts to build and insert a std::pair into the map.

Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).
---------------------	---

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

Definition at line 540 of file `stl_map.h`.

```
4.625.3.11 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> template<typename... _Args> iterator std::map<_Key, _Tp,
_Compare, _Alloc >::emplace_hint ( const_iterator __pos, _Args &&... __args ) [inline]
```

Attempts to build and insert a `std::pair` into the map.

#### Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).

#### Returns

An iterator that points to the element with key of the `std::pair` built from `__args` (may or may not be that `std::pair`).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 570 of file `stl_map.h`.

```
4.625.3.12 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> bool std::map<_Key, _Tp, _Compare, _Alloc >::empty ( ) const
[inline], [noexcept]
```

Returns true if the map is empty. (Thus `begin()` would equal `end()`.)

Definition at line 429 of file `stl_map.h`.

```
4.625.3.13 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::map<_Key, _Tp, _Compare, _Alloc >::end ( )
[inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 338 of file `stl_map.h`.

Referenced by `std::map<_Key, _Tp, _Compare, _Alloc >::at()`, and `std::map<_Key, _Tp, _Compare, _Alloc >::operator[]()`.

```
4.625.3.14 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare, _Alloc >::end ( )
const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 347 of file `stl_map.h`.

```
4.625.3.15 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp> >> std::pair<iterator, iterator> std::map<_Key, _Tp, _Compare,  
_Alloc >::equal_range ( const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

Definition at line 917 of file stl\_map.h.

```
4.625.3.16 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> std::pair<const_iterator, const_iterator> std::map<_Key, _Tp,
_Compare, _Alloc >::equal_range ( const key_type & __x ) const    [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

**Returns**

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

Definition at line 936 of file stl\_map.h.

```
4.625.3.17 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> iterator std::map<_Key, _Tp, _Compare, _Alloc >::erase (
const_iterator __position )    [inline]
```

Erases an element from a map.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 690 of file `stl_map.h`.

```
4.625.3.18 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::map< _Key, _Tp, _Compare, _Alloc >::erase ( const
key_type & __x ) [inline]
```

Erases elements according to the provided key.

#### Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

#### Returns

The number of elements erased.

This function erases all the elements located by the given key from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 726 of file `stl_map.h`.

```
4.625.3.19 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::map< _Key, _Tp, _Compare, _Alloc >::erase (
const_iterator __first, const_iterator __last ) [inline]
```

Erases a `[first,last)` range of elements from a map.

#### Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

#### Returns

The iterator `__last`.

This function erases a sequence of elements from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 746 of file `stl_map.h`.

```
4.625.3.20 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::map< _Key, _Tp, _Compare, _Alloc >::find ( const
key_type & __x ) [inline]
```

Tries to locate an element in a map.

#### Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 821 of file `stl_map.h`.

```
4.625.3.21  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare, _Alloc>::find (
            const key_type & __x ) const    [inline]
```

Tries to locate an element in a map.

**Parameters**

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

**Returns**

Read-only (constant) iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 836 of file `stl_map.h`.

```
4.625.3.22  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> allocator_type std::map<_Key, _Tp, _Compare, _Alloc>
            >::get_allocator ( ) const    [inline], [noexcept]
```

Get a copy of the memory allocation object.

Definition at line 310 of file `stl_map.h`.

```
4.625.3.23  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, bool> std::map<_Key, _Tp, _Compare, _Alloc>
            >::insert ( const value_type & __x )    [inline]
```

Attempts to insert a `std::pair` into the map.

**Parameters**

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

Definition at line 594 of file `stl_map.h`.

Referenced by std::map< \_Key, \_Tp, \_Compare, \_Alloc >::insert(), std::map< \_Key, \_Tp, \_Compare, \_Alloc >::operator=(), and std::map< \_Key, \_Tp, \_Compare, \_Alloc >::operator[]().

4.625.3.24 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::map< _Key, _Tp, _Compare, _Alloc >::insert ( std::initializer_list< value_type > __list ) [inline]`

Attempts to insert a list of std::pairs into the map.

#### Parameters

<code>__list</code>	A std::initializer_list<value_type> of pairs to be inserted.
---------------------	--

Complexity similar to that of the range constructor.

Definition at line 615 of file stl\_map.h.

References std::map< \_Key, \_Tp, \_Compare, \_Alloc >::insert().

4.625.3.25 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> iterator std::map< _Key, _Tp, _Compare, _Alloc >::insert ( const_iterator __position, const value_type & __x ) [inline]`

Attempts to insert a std::pair into the map.

#### Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see std::make_pair for easy creation of pairs).

#### Returns

An iterator that points to the element with key of \_\_x (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument insert() does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 644 of file stl\_map.h.

4.625.3.26 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator > void std::map< _Key, _Tp, _Compare, _Alloc >::insert ( _InputIterator __first, _InputIterator __last ) [inline]`

Template function that attempts to insert a range of elements.

#### Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 670 of file stl\_map.h.

```

std::allocator<std::pair<const _Key, _Tp>>> key_compare std::map< _Key, _Tp, _Compare, _Alloc >::key_comp (
) const [inline]
```

Returns the key comparison object out of which the map was constructed.

Definition at line 797 of file stl\_map.h.

Referenced by std::map< \_Key, \_Tp, \_Compare, \_Alloc >::at(), and std::map< \_Key, \_Tp, \_Compare, \_Alloc >::operator[]().

```
4.625.3.28 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::map< _Key, _Tp, _Compare, _Alloc >::lower_bound (
const key_type & __x ) [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

__x	Key of (key, value) pair to be located.
-----	---

Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 863 of file stl\_map.h.

Referenced by std::map< \_Key, \_Tp, \_Compare, \_Alloc >::at(), and std::map< \_Key, \_Tp, \_Compare, \_Alloc >::operator[]().

```
4.625.3.29 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::map< _Key, _Tp, _Compare, _Alloc
>::lower_bound ( const key_type & __x ) const [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

__x	Key of (key, value) pair to be located.
-----	---

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 878 of file stl\_map.h.

```
4.625.3.30 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::map< _Key, _Tp, _Compare, _Alloc >::max_size ( )
const [inline], [noexcept]
```

Returns the maximum size of the map.

Definition at line 439 of file stl\_map.h.

```
4.625.3.31 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> map& std::map< _Key, _Tp, _Compare, _Alloc >::operator= ( const
map< _Key, _Tp, _Compare, _Alloc > &__x ) [inline]
```

Map assignment operator.

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

#### Parameters

<code>__x</code>	A map of identical element and allocator types.
------------------	---

All the elements of `__x` are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 264 of file `stl_map.h`.

```
4.625.3.32 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> map& std::map< _Key, _Tp, _Compare, _Alloc >::operator= (
map< _Key, _Tp, _Compare, _Alloc > &&__x ) [inline]
```

Map move assignment operator.

#### Parameters

<code>__x</code>	A map of identical element and allocator types.
------------------	---

The contents of `__x` are moved into this map (without copying). `__x` is a valid, but unspecified map.

Definition at line 279 of file `stl_map.h`.

References `std::map< _Key, _Tp, _Compare, _Alloc >::clear()`, and `std::map< _Key, _Tp, _Compare, _Alloc >::swap()`.

```
4.625.3.33 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> map& std::map< _Key, _Tp, _Compare, _Alloc >::operator= (
initializer_list< value_type > __l ) [inline]
```

Map list assignment operator.

#### Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills a map with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the map and that the resulting map's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 300 of file `stl_map.h`.

References `std::map< _Key, _Tp, _Compare, _Alloc >::clear()`, and `std::map< _Key, _Tp, _Compare, _Alloc >::insert()`.

```
4.625.3.34 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> mapped_type& std::map< _Key, _Tp, _Compare, _Alloc
>::operator[] ( const key_type &__k ) [inline]
```

Subscript ( `[]` ) access to map data.

#### Parameters

<code>__k</code>	The key for which data should be retrieved.
------------------	---

**Returns**

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( [] ) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires logarithmic time.

Definition at line 456 of file stl\_map.h.

References std::map< \_Key, \_Tp, \_Compare, \_Alloc >::end(), std::map< \_Key, \_Tp, \_Compare, \_Alloc >::insert(), std::map< \_Key, \_Tp, \_Compare, \_Alloc >::key\_comp(), std::map< \_Key, \_Tp, \_Compare, \_Alloc >::lower\_bound(), and std::piecewise\_construct.

```
4.625.3.35  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc
            >::rbegin ( ) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 356 of file stl\_map.h.

```
4.625.3.36  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc
            >::rbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 365 of file stl\_map.h.

```
4.625.3.37  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc >::rend (
            ) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 374 of file stl\_map.h.

```
4.625.3.38  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::map< _Key, _Tp, _Compare, _Alloc
            >::rend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 383 of file stl\_map.h.

```
4.625.3.39  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> size_type std::map< _Key, _Tp, _Compare, _Alloc >::size ( ) const
            [inline], [noexcept]
```

Returns the size of the map.

Definition at line 434 of file stl\_map.h.

```
4.625.3.40 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp> >> void std::map<_Key, _Tp, _Compare, _Alloc >::swap ( map<  
_Key, _Tp, _Compare, _Alloc > &__x ) [inline]
```

Swaps data with another map.

## Parameters

<code>__x</code>	A map of the same element and allocator types.
------------------	--

This exchanges the elements between two maps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Definition at line 778 of file `stl_map.h`.

Referenced by `std::map<_Key, _Tp, _Compare, _Alloc >::operator=()`, and `std::swap()`.

```
4.625.3.41  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> iterator std::map<_Key, _Tp, _Compare, _Alloc >::upper_bound (
            const key_type & __x ) [inline]
```

Finds the end of a subsequence matching given key.

## Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

## Returns

Iterator pointing to the first element greater than key, or `end()`.

Definition at line 888 of file `stl_map.h`.

```
4.625.3.42  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> const_iterator std::map<_Key, _Tp, _Compare, _Alloc
            >::upper_bound ( const key_type & __x ) const [inline]
```

Finds the end of a subsequence matching given key.

## Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

## Returns

Read-only (constant) iterator pointing to first iterator greater than key, or `end()`.

Definition at line 898 of file `stl_map.h`.

```
4.625.3.43  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp> >> value_compare std::map<_Key, _Tp, _Compare, _Alloc
            >::value_comp ( ) const [inline]
```

Returns a value comparison object, built from the key comparison object out of which the map was constructed.

Definition at line 805 of file `stl_map.h`.

## 4.626.1 Detailed Description

template<class \_Tp>class std::mask\_array< \_Tp >

Reference to selected subset of an array.

A **mask\_array** is a reference to the actual elements of an array specified by a bitmask in the form of an array of **bool**. The way to get a **mask\_array** is to call **operator[]**(**valarray<bool>**) on a **valarray**. The returned **mask\_array** then permits carrying operations out on the referenced subset of elements in the original **valarray**.

For example, if a **mask\_array** is obtained using the array (false, true, false, true) as an argument, the mask array has two elements referring to **array[1]** and **array[3]** in the underlying array.

## Parameters

<i>Tp</i>	Element type.
-----------	---------------

Definition at line 62 of file mask\_array.h.

## 4.627.1 Detailed Description

```
template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> class std::match_results<_Bi_iter, _Alloc>
```

The results of a match or search operation.

A collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template `match_results`.

This class satisfies the Sequence requirements, with the exception that only the operations defined for a const-qualified Sequence are supported.

The `sub_match` object stored at index 0 represents sub-expression 0, i.e. the whole match. In this case the `sub_match` member `matched` is always true. The `sub_match` object stored at index `n` denotes what matched the marked sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match then the `sub_match` member `matched` evaluates to true, and members `first` and `second` denote the range of characters `[first, second)` which formed that match. Otherwise `matched` is false, and members `first` and `second` point to the end of the sequence that was searched.

Definition at line 1429 of file `regex.h`.

#### 4.627.2 Constructor & Destructor Documentation

**4.627.2.1** `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> std::match_results<_Bi_iter, _Alloc>::match_results ( const _Alloc & __a = _Alloc() ) [inline], [explicit]`

Constructs a default `match_results` container.

##### Postcondition

`size()` returns 0 and `str()` returns an empty string.

Definition at line 1478 of file `regex.h`.

Referenced by `std::match_results<_FwdIterT, _Alloc>::operator=()`.

**4.627.2.2** `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> std::match_results<_Bi_iter, _Alloc>::match_results ( const match_results<_Bi_iter, _Alloc> & __rhs ) [inline]`

Copy constructs a `match_results`.

Definition at line 1485 of file `regex.h`.

**4.627.2.3** `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> std::match_results<_Bi_iter, _Alloc>::match_results ( match_results<_Bi_iter, _Alloc> && __rhs ) [inline], [noexcept]`

Move constructs a `match_results`.

Definition at line 1492 of file `regex.h`.

**4.627.2.4** `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> std::match_results<_Bi_iter, _Alloc>::~~match_results ( ) [inline]`

Destroys a `match_results` object.

Definition at line 1519 of file `regex.h`.

#### 4.627.3 Member Function Documentation

**4.627.3.1** `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> const_iterator std::match_results<_Bi_iter, _Alloc>::begin ( ) const [inline]`

Gets an iterator to the start of the `sub_match` collection.

Definition at line 1676 of file `regex.h`.

Referenced by `std::operator==( )`.

4.627.3.2 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_iterator  
std::match_results<_Bi_iter, _Alloc>::cbegin ( ) const [inline]`

Gets an iterator to the start of the sub\_match collection.

Definition at line 1683 of file regex.h.

4.627.3.3 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_iterator  
std::match_results<_Bi_iter, _Alloc>::cend ( ) const [inline]`

Gets an iterator to one-past-the-end of the collection.

Definition at line 1697 of file regex.h.

4.627.3.4 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> bool std::match_results<  
_Bi_iter, _Alloc>::empty ( ) const [inline]`

Indicates if the match\_results contains no results.

Return values

<i>true</i>	The match_results object is empty.
<i>false</i>	The match_results object is not empty.

Definition at line 1563 of file regex.h.

Referenced by std::match\_results<\_FwdIterT, \_Alloc>::end(), std::operator==( ), std::match\_results<\_FwdIterT, \_Alloc>::prefix(), and std::match\_results<\_FwdIterT, \_Alloc>::suffix().

4.627.3.5 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_iterator  
std::match_results<_Bi_iter, _Alloc>::end ( ) const [inline]`

Gets an iterator to one-past-the-end of the collection.

Definition at line 1690 of file regex.h.

Referenced by std::match\_results<\_FwdIterT, \_Alloc>::cend(), and std::operator==( ).

4.627.3.6 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> template<typename _Out_iter >  
_Out_iter std::match_results<_Bi_iter, _Alloc>::format ( _Out_iter __out, const char_type * __fmt_first, const  
char_type * __fmt_last, match_flag_type __flags = regex_constants::format_default ) const [inline]`

Precondition

ready() == true

**Todo** Implement this function.

Definition at line 1718 of file regex.h.

Precondition

ready() == true

Definition at line 1740 of file regex.h.

```
4.627.3.9  template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> string_type
            std::match_results< _Bi_iter, _Alloc >::format ( const char_type * __fmt, match_flag_type __flags =
            regex_constants::format_default ) const    [inline]
```

Precondition

ready() == true

Definition at line 1752 of file regex.h.

```
4.627.3.10 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> allocator_type
            std::match_results< _Bi_iter, _Alloc >::get_allocator ( ) const    [inline]
```

Gets a copy of the allocator.

Definition at line 1773 of file regex.h.

```
4.627.3.11 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> difference_type
            std::match_results< _Bi_iter, _Alloc >::length ( size_type __sub = 0 ) const    [inline]
```

Gets the length of the indicated submatch.

Parameters

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

Precondition

ready() == true

This function returns the length of the indicated submatch, or the length of the entire match if `__sub` is zero (the default).

Definition at line 1582 of file regex.h.

```
4.627.3.12 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> size_type
            std::match_results< _Bi_iter, _Alloc >::max_size ( ) const    [inline]
```

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or `mark_count() + 1` if a match was successful. Some matches may be empty.

Returns

the number of matches found.

Definition at line 1554 of file regex.h.

```
4.627.3.13 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> match_results&
std::match_results<_Bi_iter, _Alloc >::operator= ( const match_results<_Bi_iter, _Alloc > & __rhs )
[inline]
```

Assigns rhs to \*this.

Definition at line 1500 of file regex.h.

```
4.627.3.14 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> match_results&
std::match_results<_Bi_iter, _Alloc >::operator= ( match_results<_Bi_iter, _Alloc > && __rhs )
[inline]
```

Move-assigns rhs to \*this.

Definition at line 1510 of file regex.h.

```
4.627.3.15 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_reference
std::match_results<_Bi_iter, _Alloc >::operator[] ( size_type __sub ) const [inline]
```

Gets a sub\_match reference for the match or submatch.

Parameters

__sub	indicates the submatch.
-------	-------------------------

Precondition

ready() == true

This function gets a reference to the indicated submatch, or the entire match if \_\_sub is zero.

If \_\_sub >= size() then this function returns a sub\_match with a special value indicating no submatch.

Definition at line 1630 of file regex.h.

```
4.627.3.16 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> difference_type
std::match_results<_Bi_iter, _Alloc >::position ( size_type __sub = 0 ) const [inline]
```

Gets the offset of the beginning of the indicated submatch.

Parameters

__sub	indicates the submatch.
-------	-------------------------

Precondition

ready() == true

This function returns the offset from the beginning of the target sequence to the beginning of the submatch, unless the value of \_\_sub is zero (the default), in which case this function returns the offset from the beginning of the target sequence to the beginning of the match.

Returns -1 if \_\_sub is out of range.

Definition at line 1599 of file regex.h.

```
4.627.3.17 template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter> >> const_reference
std::match_results<_Bi_iter, _Alloc >::prefix ( ) const [inline]
```

Gets a sub\_match representing the match prefix.

**Precondition**

`ready() == true`

This function gets a reference to a `sub_match` object representing the part of the target range between the start of the target range and the start of the match.

Definition at line 1647 of file `regex.h`.

Referenced by `std::operator==()`, and `std::match_results<_FwdIterT, _Alloc>::position()`.

**4.627.3.18** `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> bool std::match_results<_Bi_iter, _Alloc>::ready( ) const [inline]`

Indicates if the `match_results` is ready.

**Return values**

<i>true</i>	The object has a fully-established result state.
<i>false</i>	The object is not ready.

Definition at line 1530 of file `regex.h`.

Referenced by `std::operator==()`, `std::match_results<_FwdIterT, _Alloc>::operator[]()`, `std::match_results<_FwdIterT, _Alloc>::prefix()`, and `std::match_results<_FwdIterT, _Alloc>::suffix()`.

**4.627.3.19** `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> size_type std::match_results<_Bi_iter, _Alloc>::size( ) const [inline]`

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or `mark_count() + 1` if a match was successful. Some matches may be empty.

**Returns**

the number of matches found.

Definition at line 1547 of file `regex.h`.

Referenced by `std::match_results<_FwdIterT, _Alloc>::empty()`, `std::operator==()`, `std::match_results<_FwdIterT, _Alloc>::operator[]()`, and `std::match_results<_FwdIterT, _Alloc>::position()`.

**4.627.3.20** `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> string_type std::match_results<_Bi_iter, _Alloc>::str( size_type __sub = 0 ) const [inline]`

Gets the match or submatch converted to a string type.

**Parameters**

<code>__sub</code>	indicates the submatch.
--------------------	-------------------------

**Precondition**

`ready() == true`

This function gets the submatch (or match, if `__sub` is zero) extracted from the target range and converted to the associated string type.

Definition at line 1615 of file `regex.h`.

4.627.3.21 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> const_reference  
std::match_results<_Bi_iter, _Alloc>::suffix ( ) const [inline]`

Gets a sub\_match representing the match suffix.

#### Precondition

`ready() == true`

This function gets a reference to a sub\_match object representing the part of the target range between the end of the match and the end of the target range.

Definition at line 1664 of file regex.h.

Referenced by std::operator==().

4.627.3.22 `template<typename _Bi_iter, typename _Alloc = allocator<sub_match<_Bi_iter>>> void std::match_results<  
_Bi_iter, _Alloc>::swap ( match_results<_Bi_iter, _Alloc> &__that ) [inline]`

Swaps the contents of two match\_results.

Definition at line 1787 of file regex.h.

Referenced by std::swap().

## 4.632.1 Detailed Description

```
template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s,
        _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f>class std::mersenne_twister_engine< _UIntType, __w, __n, __m,
        __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >
```

A generalized feedback shift register discrete random number generator.

This algorithm avoids multiplication and division and is designed to be friendly to a pipelined architecture. If the parameters are chosen correctly, this generator will produce numbers with a very long period and fairly good apparent entropy, although still not cryptographically strong.

The best way to use this generator is with the predefined mt19937 class.

This algorithm was originally invented by Makoto Matsumoto and Takuji Nishimura.

## Template Parameters

<code>__w</code>	Word size, the number of bits in each element of the state vector.
<code>__n</code>	The degree of recursion.
<code>__m</code>	The period parameter.
<code>__r</code>	The separation point bit index.
<code>__a</code>	The last row of the twist matrix.
<code>__u</code>	The first right-shift tempering matrix parameter.
<code>__d</code>	The first right-shift tempering matrix mask.
<code>__s</code>	The first left-shift tempering matrix parameter.
<code>__b</code>	The first left-shift tempering matrix mask.
<code>__t</code>	The second left-shift tempering matrix parameter.
<code>__c</code>	The second left-shift tempering matrix mask.
<code>__l</code>	The second right-shift tempering matrix parameter.

<code>__f</code>	Initialization multiplier.
------------------	----------------------------

Definition at line 449 of file random.h.

#### 4.632.2 Member Typedef Documentation

4.632.2.1 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> typedef _UIntType std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::result_type`

The type of the generated random value.

Definition at line 452 of file random.h.

#### 4.632.3 Constructor & Destructor Documentation

4.632.3.1 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> template<typename _Sseq, typename = typename std::enable_if<!std::is_same<_Sseq, mersenne_twister_engine>::value>::type> std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::mersenne_twister_engine ( _Sseq & __q ) [inline], [explicit]`

Constructs a mersenne\_twister\_engine random number generator engine seeded from the seed sequence `__q`.

Parameters

<code>__q</code>	the seed sequence.
------------------	--------------------

Definition at line 513 of file random.h.

#### 4.632.4 Member Function Documentation

4.632.4.1 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> void std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::discard ( unsigned long long __z )`

Discard a sequence of random numbers.

4.632.4.2 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> static constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::max ( ) [inline], [static]`

Gets the largest possible value in the output range.

Definition at line 534 of file random.h.

4.632.4.3 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> static constexpr result_type std::mersenne_twister_engine< _UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f >::min ( ) [inline], [static]`

Gets the smallest possible value in the output range.

Definition at line 527 of file random.h.

#### 4.632.5 Friends And Related Function Documentation

4.632.5.1 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> template<typename _UIntType1, size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT, typename _Traits> std::basic_ostream<_CharT, _Traits>& operator<< ( std::basic_ostream<_CharT, _Traits> & __os, const std::mersenne_twister_engine<_UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1> & __x ) [friend]`

Inserts the current state of a % mersenne\_twister\_engine random number generator engine `__x` into the output stream `__os`.

##### Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A % mersenne_twister_engine random number generator engine.

##### Returns

The output stream with the state of `__x` inserted or in an error state.

4.632.5.2 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> bool operator== ( const mersenne_twister_engine<_UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f> & __lhs, const mersenne_twister_engine<_UIntType, __w, __n, __m, __r, __a, __u, __d, __s, __b, __t, __c, __l, __f> & __rhs ) [friend]`

Compares two % mersenne\_twister\_engine random number generator objects of the same type for equality.

##### Parameters

<code>__lhs</code>	A % mersenne_twister_engine random number generator object.
<code>__rhs</code>	Another % mersenne_twister_engine random number generator object.

##### Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 559 of file random.h.

4.632.5.3 `template<typename _UIntType, size_t __w, size_t __n, size_t __m, size_t __r, _UIntType __a, size_t __u, _UIntType __d, size_t __s, _UIntType __b, size_t __t, _UIntType __c, size_t __l, _UIntType __f> template<typename _UIntType1, size_t __w1, size_t __n1, size_t __m1, size_t __r1, _UIntType1 __a1, size_t __u1, _UIntType1 __d1, size_t __s1, _UIntType1 __b1, size_t __t1, _UIntType1 __c1, size_t __l1, _UIntType1 __f1, typename _CharT, typename _Traits> std::basic_istream<_CharT, _Traits>& operator>> ( std::basic_istream<_CharT, _Traits> & __is, std::mersenne_twister_engine<_UIntType1, __w1, __n1, __m1, __r1, __a1, __u1, __d1, __s1, __b1, __t1, __c1, __l1, __f1> & __x ) [friend]`

Extracts the current state of a % mersenne\_twister\_engine random number generator engine `__x` from the input stream `__is`.

## Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A % mersenne_twister_engine random number generator engine.

## Returns

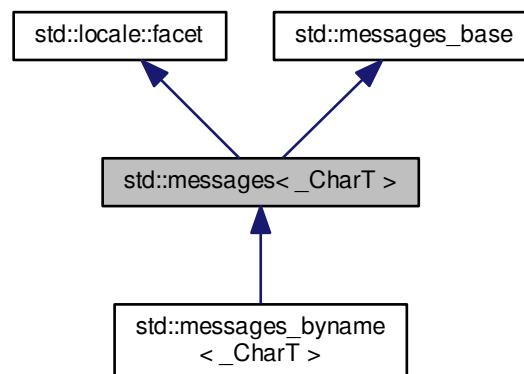

The input stream with the state of `__x` extracted or in an error state.

## 4.633.1 Detailed Description

template<typename \_CharT>class std::messages<\_CharT>

Primary class template messages.

This facet encapsulates the code to retrieve messages from message catalogs. The only thing defined by the standard for this facet is the interface. All underlying functionality is implementation-defined.

This library currently implements 3 versions of the message facet. The first version (gnu) is a wrapper around gettext, provided by libintl. The second version (ieee) is a wrapper around catgets. The final version (default) does no actual translation. These implementations are only provided for char and wchar\_t instantiations.

The messages template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the messages facet.

Definition at line 1695 of file locale\_facets\_nonio.h.

#### 4.633.2 Member Typedef Documentation

##### 4.633.2.1 `template<typename _CharT> typedef _CharT std::messages<_CharT>::char_type`

Public typedefs.

Definition at line 1701 of file `locale_facets_nonio.h`.

##### 4.633.2.2 `template<typename _CharT> typedef basic_string<_CharT> std::messages<_CharT>::string_type`

Public typedefs.

Definition at line 1702 of file `locale_facets_nonio.h`.

#### 4.633.3 Constructor & Destructor Documentation

##### 4.633.3.1 `template<typename _CharT> std::messages<_CharT>::messages ( size_t __refs = 0 ) [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 44 of file `messages_members.h`.

##### 4.633.3.2 `template<typename _CharT> std::messages<_CharT>::messages ( __c_locale __cloc, const char * __s, size_t __refs = 0 ) [explicit]`

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

<code>__cloc</code>	The C locale.
<code>__s</code>	The name of a locale.
<code>__refs</code>	RefCount to pass to the base class.

Definition at line 50 of file `messages_members.h`.

##### 4.633.3.3 `template<typename _CharT> std::messages<_CharT>::~messages ( ) [protected],[virtual]`

Destructor.

Definition at line 79 of file `messages_members.h`.

#### 4.633.4 Member Data Documentation

##### 4.633.4.1 `template<typename _CharT> locale::id std::messages<_CharT>::id [static]`

Numpunct facet id.

Definition at line 1713 of file `locale_facets_nonio.h`.

- static const char \* `_S_get_c_name()` throw()
- static `__c_locale _S_lc_ctype_c_locale(__c_locale __cloc, const char *__s)`

### 4.639.1 Detailed Description

`template<typename _CharT, typename _InIter> class std::money_get<_CharT, _InIter>`

Primary class template `money_get`.

This facet encapsulates the code to parse and return a monetary amount from a string.

The `money_get` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the `money_get` facet.

Definition at line 1370 of file `locale_facets_nonio.h`.

### 4.639.2 Member Typedef Documentation

4.639.2.1 `template<typename _CharT, typename _InIter> typedef _CharT std::money_get<_CharT, _InIter>::char_type`

Public typedefs.

Definition at line 1376 of file `locale_facets_nonio.h`.

4.639.2.2 `template<typename _CharT, typename _InIter> typedef _InIter std::money_get<_CharT, _InIter>::iter_type`

Public typedefs.

Definition at line 1377 of file `locale_facets_nonio.h`.

4.639.2.3 `template<typename _CharT, typename _Inlter > typedef basic_string<_CharT> std::money_get< _CharT, _Inlter >::string_type`

Public typedefs.

Definition at line 1378 of file locale\_facets\_nonio.h.

#### 4.639.3 Constructor & Destructor Documentation

4.639.3.1 `template<typename _CharT, typename _Inlter > std::money_get< _CharT, _Inlter >::money_get ( size_t __refs = 0 ) [inline], [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 1392 of file locale\_facets\_nonio.h.

4.639.3.2 `template<typename _CharT, typename _Inlter > virtual std::money_get< _CharT, _Inlter >::~~money_get ( ) [inline], [protected], [virtual]`

Destructor.

Definition at line 1460 of file locale\_facets\_nonio.h.

#### 4.639.4 Member Function Documentation

4.639.4.1 `template<typename _CharT, typename _Inlter > virtual iter_type std::money_get< _CharT, _Inlter >::do_get ( iter_type __s, iter_type __end, bool __intl, ios_base & __io, ios_base::iostate & __err, long double & __units ) const [protected], [virtual]`

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

`get()` for details.

Referenced by `std::money_get< _CharT, _Inlter >::get()`.

4.639.4.2 `template<typename _CharT, typename _Inlter > virtual iter_type std::money_get< _CharT, _Inlter >::do_get ( iter_type __s, iter_type __end, bool __intl, ios_base & __io, ios_base::iostate & __err, string_type & __digits ) const [protected], [virtual]`

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

`get()` for details.

4.639.4.3 `template<typename _CharT, typename _InIter> iter_type std::money_get<_CharT, _InIter>::get ( iter_type __s, iter_type __end, bool __intl, ios_base & __io, ios_base::iostate & __err, long double & __units ) const [inline]`

Read and parse a monetary value.

This function reads characters from `__s`, interprets them as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in `units` as an integral value `moneypunct::frac_digits() * the actual amount`. For example, the string \$10.01 in a US locale would store 1001 in `units`.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`. `units` is unchanged if parsing fails.

This function works by returning the result of `do_get()`.

#### Parameters

<code>__s</code>	Start of characters to parse.
<code>__end</code>	End of characters to parse.
<code>__intl</code>	Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt;&gt;</code> .
<code>__io</code>	Source of facets and io state.
<code>__err</code>	Error field to set if parsing fails.
<code>__units</code>	Place to store result of parsing.

#### Returns

Iterator referencing first character beyond valid money amount.

Definition at line 1422 of file `locale_facets_nonio.h`.

References `std::money_get<_CharT, _InIter>::do_get()`.

4.639.4.4 `template<typename _CharT, typename _InIter> iter_type std::money_get<_CharT, _InIter>::get ( iter_type __s, iter_type __end, bool __intl, ios_base & __io, ios_base::iostate & __err, string_type & __digits ) const [inline]`

Read and parse a monetary value.

This function reads characters from `__s`, interprets them as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in `digits`. For example, the string \$10.01 in a US locale would store 1001 in `digits`.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`.

This function works by returning the result of `do_get()`.

#### Parameters

<code>__s</code>	Start of characters to parse.
<code>__end</code>	End of characters to parse.
<code>__intl</code>	Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt;&gt;</code> .

<code>__io</code>	Source of facets and io state.
<code>__err</code>	Error field to set if parsing fails.
<code>__digits</code>	Place to store result of parsing.

**Returns**

Iterator referencing first character beyond valid money amount.

Definition at line 1453 of file locale\_facets\_nonio.h.

References `std::money_get< _CharT, _InIter >::do_get()`.

**4.639.5 Member Data Documentation**

**4.639.5.1** `template<typename _CharT, typename _InIter> locale::id std::money_get< _CharT, _InIter >::id` `[static]`

Numpunct facet id.

Definition at line 1382 of file locale\_facets\_nonio.h.

#### 4.640.3 Constructor & Destructor Documentation

4.640.3.1 `template<typename _CharT, typename _Outlter > std::money_put<_CharT, _Outlter >::money_put ( size_t __refs = 0 ) [inline], [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 1542 of file locale\_facets\_nonio.h.

4.640.3.2 `template<typename _CharT, typename _Outlter > virtual std::money_put<_CharT, _Outlter >::~~money_put ( ) [inline], [protected], [virtual]`

Destructor.

Definition at line 1592 of file locale\_facets\_nonio.h.

#### 4.640.4 Member Function Documentation

4.640.4.1 `template<typename _CharT, typename _Outlter > virtual iter_type std::money_put<_CharT, _Outlter >::do_put ( iter_type __s, bool __intl, ios_base & __io, char_type __fill, long double __units ) const [protected], [virtual]`

Format and output a monetary value.

This function formats *units* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to *\_\_s*. For example, the value 1001 in a US locale would write \$10.01 to *\_\_s*.

This function is a hook for derived classes to change the value returned.

See also

`put()`.

Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt; &gt;</code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__units</code>	Place to store result of parsing.

Returns

Iterator after writing.

Referenced by `std::money_put<_CharT, _Outlter >::put()`.

4.640.4.2 `template<typename _CharT, typename _Outiter> virtual iter_type std::money_put<_CharT, _Outiter>::do_put ( iter_type __s, bool __intl, ios_base & __io, char_type __fill, const string_type & __digits ) const [protected], [virtual]`

Format and output a monetary value.

This function formats *digits* as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the string `1001` in a US locale would write `$10.01` to `__s`.

This function is a hook for derived classes to change the value returned.

See also

`put()`.

#### Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt;&gt;</code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__digits</code>	Place to store result of parsing.

#### Returns

Iterator after writing.

4.640.4.3 `template<typename _CharT, typename _Outiter> iter_type std::money_put<_CharT, _Outiter>::put ( iter_type __s, bool __intl, ios_base & __io, char_type __fill, long double __units ) const [inline]`

Format and output a monetary value.

This function formats *units* as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the value `1001` in a US locale would write `$10.01` to `__s`.

This function works by returning the result of `do_put()`.

#### Parameters

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt;&gt;</code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__units</code>	Place to store result of parsing.

#### Returns

Iterator after writing.

Definition at line 1562 of file `locale_facets_nonio.h`.

References `std::money_put<_CharT, _Outiter>::do_put()`.

4.640.4.4 `template<typename _CharT, typename _Outiter> iter_type std::money_put<_CharT, _Outiter>::put ( iter_type __s, bool __intl, ios_base & __io, char_type __fill, const string_type & __digits ) const [inline]`

Format and output a monetary value.

This function formats *digits* as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and writes the resulting characters to `__s`. For example, the string `1001` in a US locale would write `$10.01` to `__s`.

This function works by returning the result of `do_put()`.

**Parameters**

<code>__s</code>	The stream to write to.
<code>__intl</code>	Parameter to use <code>_facet&lt;moneypunct&lt;CharT,intl&gt; &gt;</code> .
<code>__io</code>	Source of facets and io state.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__digits</code>	Place to store result of parsing.

**Returns**

Iterator after writing.

Definition at line 1585 of file `locale_facets_nonio.h`.

References `std::money_put<_CharT, _Outlter >::do_put()`.

#### 4.641.1 Detailed Description

`template<typename _CharT, bool _Intl>class std::moneypunct< _CharT, _Intl >`

Primary class template moneypunct.

This facet encapsulates the punctuation, grouping and other formatting features of money amount string representations.

Definition at line 934 of file locale\_facets\_nonio.h.

#### 4.641.2 Member Typedef Documentation

4.641.2.1 `template<typename _CharT, bool _Intl> typedef _CharT std::moneypunct< _CharT, _Intl >::char_type`

Public typedefs.

Definition at line 940 of file locale\_facets\_nonio.h.

4.641.2.2 `template<typename _CharT, bool _Intl> typedef basic_string<_CharT> std::moneypunct< _CharT, _Intl >::string_type`

Public typedefs.

Definition at line 941 of file locale\_facets\_nonio.h.

#### 4.641.3 Constructor & Destructor Documentation

4.641.3.1 `template<typename _CharT, bool _Intl> std::moneypunct< _CharT, _Intl >::moneypunct ( size_t __refs = 0 )  
[inline], [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

#### Parameters

---

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 963 of file locale\_facets\_nonio.h.

4.641.3.2 `template<typename _CharT, bool _Intl> std::moneypunct<_CharT, _Intl>::moneypunct ( __cache_type * __cache, size_t __refs = 0 ) [inline], [explicit]`

Constructor performs initialization.

This is an internal constructor.

Parameters

<code>__cache</code>	Cache for optimization.
<code>__refs</code>	Passed to the base facet class.

Definition at line 976 of file locale\_facets\_nonio.h.

4.641.3.3 `template<typename _CharT, bool _Intl> std::moneypunct<_CharT, _Intl>::moneypunct ( __c_locale __cloc, const char * __s, size_t __refs = 0 ) [inline], [explicit]`

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

<code>__cloc</code>	The C locale.
<code>__s</code>	The name of a locale.
<code>__refs</code>	Passed to the base facet class.

Definition at line 991 of file locale\_facets\_nonio.h.

4.641.3.4 `template<typename _CharT, bool _Intl> virtual std::moneypunct<_CharT, _Intl>::~~moneypunct ( ) [protected], [virtual]`

Destructor.

#### 4.641.4 Member Function Documentation

4.641.4.1 `template<typename _CharT, bool _Intl> string_type std::moneypunct<_CharT, _Intl>::curr_symbol ( ) const [inline]`

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. It does so by returning `moneypunct<char, _Intl>::do_curr_symbol()`.

Returns

*string\_type* representing a currency symbol.

Definition at line 1061 of file locale\_facets\_nonio.h.

References `std::moneypunct<_CharT, _Intl>::do_curr_symbol()`.

4.641.4.2 `template<typename _CharT, bool _Intl> char_type std::moneypunct<_CharT, _Intl>::decimal_point ( ) const [inline]`

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `money_punct<char_type>::do_decimal_point()`.

#### Returns

*char\_type* representing a decimal point.

Definition at line 1005 of file `locale_facets_nonio.h`.

References `std::money_punct<_CharT, _Intl>::do_decimal_point()`.

4.641.4.3 `template<typename _CharT, bool _Intl> virtual string_type std::money_punct<_CharT, _Intl>::do_curr_symbol ( ) const [inline], [protected], [virtual]`

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. This function is a hook for derived classes to change the value returned.

#### See also

`curr_symbol()` for details.

#### Returns

*string\_type* representing a currency symbol.

Definition at line 1207 of file `locale_facets_nonio.h`.

Referenced by `std::money_punct<_CharT, _Intl>::curr_symbol()`.

4.641.4.4 `template<typename _CharT, bool _Intl> virtual char_type std::money_punct<_CharT, _Intl>::do_decimal_point ( ) const [inline], [protected], [virtual]`

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

#### Returns

*char\_type* representing a decimal point.

Definition at line 1169 of file `locale_facets_nonio.h`.

Referenced by `std::money_punct<_CharT, _Intl>::decimal_point()`.

4.641.4.5 `template<typename _CharT, bool _Intl> virtual int std::money_punct<_CharT, _Intl>::do_frac_digits ( ) const [inline], [protected], [virtual]`

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

#### See also

`frac_digits()` for details.

**Returns**

Number of digits in amount fraction.

Definition at line 1247 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct< \_CharT, \_Intl >::frac\_digits().

4.641.4.6 `template<typename _CharT, bool _Intl> virtual string std::moneypunct< _CharT, _Intl >::do_grouping ( ) const`  
`[inline], [protected], [virtual]`

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

**See also**

grouping() for details.

**Returns**

String representing grouping specification.

Definition at line 1194 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct< \_CharT, \_Intl >::grouping().

4.641.4.7 `template<typename _CharT, bool _Intl> virtual pattern std::moneypunct< _CharT, _Intl >::do_neg_format ( ) const`  
`[inline], [protected], [virtual]`

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

**See also**

neg\_format() for details.

**Returns**

Pattern for money values.

Definition at line 1275 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct< \_CharT, \_Intl >::neg\_format().

4.641.4.8 `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct< _CharT, _Intl >::do_negative_sign ( ) const`  
`[inline], [protected], [virtual]`

Return negative sign string.

This function returns a string\_type to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

**See also**

negative\_sign() for details.

**Returns**

*string\_type* representing a negative sign.

Definition at line 1233 of file locale\_facets\_nonio.h.

Referenced by `std::moneypunct<_CharT, _Intl>::negative_sign()`.

**4.641.4.9** `template<typename _CharT, bool _Intl> virtual pattern std::moneypunct<_CharT, _Intl>::do_pos_format ( ) const [inline], [protected], [virtual]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

**See also**

`pos_format()` for details.

**Returns**

Pattern for money values.

Definition at line 1261 of file locale\_facets\_nonio.h.

Referenced by `std::moneypunct<_CharT, _Intl>::pos_format()`.

**4.641.4.10** `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct<_CharT, _Intl>::do_positive_sign ( ) const [inline], [protected], [virtual]`

Return positive sign string.

This function returns a *string\_type* to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

**See also**

`positive_sign()` for details.

**Returns**

*string\_type* representing a positive sign.

Definition at line 1220 of file locale\_facets\_nonio.h.

Referenced by `std::moneypunct<_CharT, _Intl>::positive_sign()`.

**4.641.4.11** `template<typename _CharT, bool _Intl> virtual char_type std::moneypunct<_CharT, _Intl>::do_thousands_sep ( ) const [inline], [protected], [virtual]`

Return thousands separator character.

Returns a *char\_type* to use as a thousands separator. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a thousands separator.

Definition at line 1181 of file locale\_facets\_nonio.h.

Referenced by `std::moneypunct<_CharT, _Intl>::thousands_sep()`.

**4.641.4.12** `template<typename _CharT, bool _Intl> int std::moneypunct<_CharT, _Intl>::frac_digits ( ) const`  
`[inline]`

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning `std::moneypunct<char_type>::do_frac_digits()`.

The fractional part of a money amount is optional. But if it is present, there must be `frac_digits()` digits.

#### Returns

Number of digits in amount fraction.

Definition at line 1111 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_frac_digits()`.

**4.641.4.13** `template<typename _CharT, bool _Intl> string std::moneypunct<_CharT, _Intl>::grouping ( ) const`  
`[inline]`

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `32`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `std::moneypunct<char_type>::do_grouping()`.

#### Returns

string representing grouping specification.

Definition at line 1048 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_grouping()`.

**4.641.4.14** `template<typename _CharT, bool _Intl> pattern std::moneypunct<_CharT, _Intl>::neg_format ( ) const`  
`[inline]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `std::moneypunct<char_type>::do_pos_format()` or `std::moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

#### Returns

Pattern for money values.

Definition at line 1151 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_neg_format()`.

**4.641.4.15** `template<typename _CharT, bool _Intl> string_type std::moneypunct<_CharT, _Intl>::negative_sign ( ) const`  
`[inline]`

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. It does so by returning `moneypunct<char_type>::do_negative_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `neg_format()` and the remainder appear at the end of the formatted string.

#### Returns

*string\_type* representing a negative sign.

Definition at line 1095 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_negative_sign()`.

**4.641.4.16** `template<typename _CharT, bool _Intl> pattern std::moneypunct<_CharT, _Intl>::pos_format ( ) const`  
`[inline]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is `$+10.01`.

#### Returns

Pattern for money values.

Definition at line 1147 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_pos_format()`.

**4.641.4.17** `template<typename _CharT, bool _Intl> string_type std::moneypunct<_CharT, _Intl>::positive_sign ( ) const`  
`[inline]`

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. It does so by returning `moneypunct<char_type>::do_positive_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `pos_format()` and the remainder appear at the end of the formatted string.

#### Returns

*string\_type* representing a positive sign.

Definition at line 1078 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_positive_sign()`.

**4.641.4.18** `template<typename _CharT, bool _Intl> char_type std::moneypunct<_CharT, _Intl>::thousands_sep ( ) const`  
[inline]

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `moneypunct<char_type>::do_thousands_sep()`.

#### Returns

`char_type` representing a thousands separator.

Definition at line 1018 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_thousands_sep()`.

### 4.641.5 Member Data Documentation

**4.641.5.1** `template<typename _CharT, bool _Intl> locale::id std::moneypunct<_CharT, _Intl>::id` [static]

Numpunct facet id.

Definition at line 953 of file `locale_facets_nonio.h`.

**4.641.5.2** `template<typename _CharT, bool _Intl> const bool std::moneypunct<_CharT, _Intl>::intl` [static]

## 4.642.1 Detailed Description

template<typename \_CharT, bool \_Intl> class std::moneypunct\_byname<\_CharT, \_Intl>

class moneypunct\_byname [22.2.6.4].

Definition at line 1324 of file locale\_facets\_nonio.h.

## 4.642.2 Member Function Documentation

4.642.2.1 template<typename \_CharT, bool \_Intl> [string\\_type](#) std::moneypunct<\_CharT, \_Intl>::curr\_symbol ( ) const  
[inline], [inherited]

Return currency symbol string.

This function returns a [string\\_type](#) to use as a currency symbol. It does so by returning returning moneypunct<char↵\_type>::do\_curr\_symbol().

**Returns**

*string\_type* representing a currency symbol.

Definition at line 1061 of file locale\_facets\_nonio.h.

References `std::moneypunct<_CharT, _Intl>::do_curr_symbol()`.

**4.642.2.2** `template<typename _CharT, bool _Intl> char_type std::moneypunct<_CharT, _Intl>::decimal_point ( ) const`  
`[inline], [inherited]`

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `moneypunct<char_type>::do_decimal_point()`.

**Returns**

*char\_type* representing a decimal point.

Definition at line 1005 of file locale\_facets\_nonio.h.

References `std::moneypunct<_CharT, _Intl>::do_decimal_point()`.

**4.642.2.3** `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct<_CharT, _Intl>::do_curr_symbol ( ) const`  
`[inline], [protected], [virtual], [inherited]`

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. This function is a hook for derived classes to change the value returned.

**See also**

`curr_symbol()` for details.

**Returns**

*string\_type* representing a currency symbol.

Definition at line 1207 of file locale\_facets\_nonio.h.

Referenced by `std::moneypunct<_CharT, _Intl>::curr_symbol()`.

**4.642.2.4** `template<typename _CharT, bool _Intl> virtual char_type std::moneypunct<_CharT, _Intl>::do_decimal_point ( ) const`  
`[inline], [protected], [virtual], [inherited]`

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

**Returns**

*char\_type* representing a decimal point.

Definition at line 1169 of file locale\_facets\_nonio.h.

Referenced by `std::moneypunct<_CharT, _Intl>::decimal_point()`.

**4.642.2.5** `template<typename _CharT, bool _Intl> virtual int std::moneypunct< _CharT, _Intl >::do_frac_digits ( ) const`  
`[inline], [protected], [virtual], [inherited]`

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

See also

frac\_digits() for details.

Returns

Number of digits in amount fraction.

Definition at line 1247 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct< \_CharT, \_Intl >::frac\_digits().

**4.642.2.6** `template<typename _CharT, bool _Intl> virtual string std::moneypunct< _CharT, _Intl >::do_grouping ( ) const`  
`[inline], [protected], [virtual], [inherited]`

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

grouping() for details.

Returns

String representing grouping specification.

Definition at line 1194 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct< \_CharT, \_Intl >::grouping().

**4.642.2.7** `template<typename _CharT, bool _Intl> virtual pattern std::moneypunct< _CharT, _Intl >::do_neg_format ( ) const`  
`[inline], [protected], [virtual], [inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

See also

neg\_format() for details.

Returns

Pattern for money values.

Definition at line 1275 of file locale\_facets\_nonio.h.

Referenced by std::moneypunct< \_CharT, \_Intl >::neg\_format().

4.642.2.8 `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct<_CharT, _Intl>::do_negative_sign ( ) const` `[inline], [protected], [virtual], [inherited]`

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

**See also**

`negative_sign()` for details.

**Returns**

*string\_type* representing a negative sign.

Definition at line 1233 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct<_CharT, _Intl>::negative_sign()`.

4.642.2.9 `template<typename _CharT, bool _Intl> virtual pattern std::moneypunct<_CharT, _Intl>::do_pos_format ( ) const` `[inline], [protected], [virtual], [inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

**See also**

`pos_format()` for details.

**Returns**

Pattern for money values.

Definition at line 1261 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct<_CharT, _Intl>::pos_format()`.

4.642.2.10 `template<typename _CharT, bool _Intl> virtual string_type std::moneypunct<_CharT, _Intl>::do_positive_sign ( ) const` `[inline], [protected], [virtual], [inherited]`

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

**See also**

`positive_sign()` for details.

**Returns**

*string\_type* representing a positive sign.

Definition at line 1220 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct<_CharT, _Intl>::positive_sign()`.

4.642.2.11 `template<typename _CharT, bool _Intl> virtual char_type std::moneypunct< _CharT, _Intl >::do_thousands_sep ( ) const` `[inline], [protected], [virtual], [inherited]`

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

#### Returns

*char\_type* representing a thousands separator.

Definition at line 1181 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct< _CharT, _Intl >::thousands_sep()`.

4.642.2.12 `template<typename _CharT, bool _Intl> int std::moneypunct< _CharT, _Intl >::frac_digits ( ) const` `[inline], [inherited]`

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning `moneypunct<char_type>::do_frac_digits()`.

The fractional part of a money amount is optional. But if it is present, there must be `frac_digits()` digits.

#### Returns

Number of digits in amount fraction.

Definition at line 1111 of file `locale_facets_nonio.h`.

References `std::moneypunct< _CharT, _Intl >::do_frac_digits()`.

4.642.2.13 `template<typename _CharT, bool _Intl> string std::moneypunct< _CharT, _Intl >::grouping ( ) const` `[inline], [inherited]`

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `\003\002` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `32`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `moneypunct<char_type>::do_grouping()`.

#### Returns

string representing grouping specification.

Definition at line 1048 of file `locale_facets_nonio.h`.

References `std::moneypunct< _CharT, _Intl >::do_grouping()`.

**4.642.2.14** `template<typename _CharT, bool _Intl> pattern std::moneypunct<_CharT, _Intl>::neg_format ( ) const`  
`[inline], [inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is \$+10.01.

#### Returns

Pattern for money values.

Definition at line 1151 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_neg_format()`.

**4.642.2.15** `template<typename _CharT, bool _Intl> string_type std::moneypunct<_CharT, _Intl>::negative_sign ( ) const`  
`[inline], [inherited]`

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. It does so by returning `moneypunct<char_type>::do_negative_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `neg_format()` and the remainder appear at the end of the formatted string.

#### Returns

*string\_type* representing a negative sign.

Definition at line 1095 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_negative_sign()`.

**4.642.2.16** `template<typename _CharT, bool _Intl> pattern std::moneypunct<_CharT, _Intl>::pos_format ( ) const`  
`[inline], [inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates

0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and pos\_format() pattern {symbol,sign,value,none}, curr\_symbol() == '\$' positive\_sign() == '+', and value 10.01, and options set to force the symbol, the corresponding string is \$+10.01.

#### Returns

Pattern for money values.

Definition at line 1147 of file locale\_facets\_nonio.h.

References std::moneypunct< \_CharT, \_Intl >::do\_pos\_format().

**4.642.2.17** `template<typename _CharT, bool _Intl> string_type std::moneypunct< _CharT, _Intl >::positive_sign ( ) const`  
`[inline], [inherited]`

Return positive sign string.

This function returns a string\_type to use as a sign for positive amounts. It does so by returning returning moneypunct<char\_type>::do\_positive\_sign().

If the return value contains more than one character, the first character appears in the position indicated by pos\_format() and the remainder appear at the end of the formatted string.

#### Returns

*string\_type* representing a positive sign.

Definition at line 1078 of file locale\_facets\_nonio.h.

References std::moneypunct< \_CharT, \_Intl >::do\_positive\_sign().

**4.642.2.18** `template<typename _CharT, bool _Intl> char_type std::moneypunct< _CharT, _Intl >::thousands_sep ( ) const`  
`[inline], [inherited]`

Return thousands separator character.

This function returns a char\_type to use as a thousands separator. It does so by returning returning moneypunct<char\_type>::do\_thousands\_sep().

#### Returns

char\_type representing a thousands separator.

Definition at line 1018 of file locale\_facets\_nonio.h.

References std::moneypunct< \_CharT, \_Intl >::do\_thousands\_sep().

##### 4.643.1 Detailed Description

template<typename `_Iterator`>class `std::move_iterator<_Iterator>`

Class template `move_iterator` is an iterator adapter with the same behavior as the underlying iterator except that its dereference operator implicitly converts the value returned by the underlying iterator's dereference operator to an rvalue reference. Some generic algorithms can be called with move iterators to replace copying with moving.

Definition at line 411 of file `cpp_type_traits.h`.

The documentation for this class was generated from the following files:

- [cpp\\_type\\_traits.h](#)
- [stl\\_iterator.h](#)

#### 4.644.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> class std::multimap<_Key, _Tp, _Compare, _Alloc>
```

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time.

#### Template Parameters

<a href="#">_Key</a>	Type of key objects.
<a href="#">_Tp</a>	Type of mapped objects.
<a href="#">_Compare</a>	Comparison function object type, defaults to less<_Key>.
<a href="#">_Alloc</a>	Allocator type, defaults to allocator<pair<const _Key, _Tp>>.

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a `multimap<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `std::pair<const Key, T>`.

Multimaps support bidirectional iterators.

The private tree data is declared exactly the same way for map and multimap; the distinction is made entirely in how the tree functions are called (\*\_unique versus \*\_equal, same as the standard).

Definition at line 95 of file stl\_multimap.h.

#### 4.644.2 Constructor & Destructor Documentation

4.644.2.1 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap ( )`  
[inline]

Default constructor creates no elements.

Definition at line 157 of file stl\_multimap.h.

4.644.2.2 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap ( const _Compare & __comp, const allocator_type & __a = allocator_type() )` [inline], [explicit]

Creates a multimap with no elements.

##### Parameters

<code>__comp</code>	A comparison object.
<code>__a</code>	An allocator object.

Definition at line 166 of file stl\_multimap.h.

4.644.2.3 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap ( const multimap<_Key, _Tp, _Compare, _Alloc> & __x )` [inline]

Multimap copy constructor.

##### Parameters

<code>__x</code>	A multimap of identical element and allocator types.
------------------	--

The newly-created multimap uses a copy of the allocation object used by `__x`.

Definition at line 177 of file stl\_multimap.h.

4.644.2.4 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc>::multimap ( multimap<_Key, _Tp, _Compare, _Alloc> && __x )` [inline], [noexcept]

Multimap move constructor.

##### Parameters

<code>__x</code>	A multimap of identical element and allocator types.
------------------	--

The newly-created multimap contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified multimap.

Definition at line 188 of file stl\_multimap.h.

```
4.644.2.5  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
            std::allocator<std::pair<const _Key, _Tp> >> std::multimap<_Key, _Tp, _Compare, _Alloc >::multimap  
            ( initializer_list< value_type > __l, const _Compare & __comp = _Compare(), const allocator_type & __a =  
              allocator_type() ) [inline]
```

Builds a multimap from an initializer\_list.

## Parameters

<code>__l</code>	An initializer_list.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multimap consisting of copies of the elements from the initializer\_list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is `__l.size()`).

Definition at line 202 of file `stl_multimap.h`.

```
4.644.2.6 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > std::multimap< _Key, _Tp,
_Compare, _Alloc >::multimap ( _InputIterator __first, _InputIterator __last ) [inline]
```

Builds a multimap from a range.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a multimap consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is `distance(__first, __last)`).

Definition at line 219 of file `stl_multimap.h`.

```
4.644.2.7 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > std::multimap< _Key, _Tp,
_Compare, _Alloc >::multimap ( _InputIterator __first, _InputIterator __last, const _Compare & __comp, const
allocator_type & __a = allocator_type() ) [inline]
```

Builds a multimap from a range.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multimap consisting of copies of the elements from [`__first`,`__last`). This is linear in N if the range is already sorted, and NlogN otherwise (where N is `distance(__first, __last)`).

Definition at line 235 of file `stl_multimap.h`.

## 4.644.3 Member Function Documentation

```
4.644.3.1 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::begin ( )
[inline], [noexcept]
```

Returns a read/write iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 314 of file `stl_multimap.h`.

```
4.644.3.2 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::begin
( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 323 of file stl\_multimap.h.

```
4.644.3.3 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::cbegin
( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 387 of file stl\_multimap.h.

```
4.644.3.4 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::cend
( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 396 of file stl\_multimap.h.

```
4.644.3.5 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::multimap<_Key, _Tp, _Compare, _Alloc>::clear ( )
[inline], [noexcept]
```

Erases all elements in a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 697 of file stl\_multimap.h.

Referenced by `std::multimap<_Key, _Tp, _Compare, _Alloc>::operator=()`.

```
4.644.3.6 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::multimap<_Key, _Tp, _Compare, _Alloc>::count (
const key_type & __x ) const [inline]
```

Finds the number of elements with given key.

#### Parameters

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

#### Returns

Number of elements with specified key.

Definition at line 754 of file stl\_multimap.h.

```
4.644.3.7 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::multimap<_Key, _Tp, _Compare,
_Alloc>::crbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 405 of file stl\_multimap.h.

```
4.644.3.8 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> const_reverse_iterator std::multimap<_Key, _Tp, _Compare,
_Alloc>::crend( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 414 of file stl\_multimap.h.

```
4.644.3.9 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> iterator std::multimap<_Key, _Tp,
_Compare, _Alloc>::emplace( _Args &&... _args ) [inline]
```

Build and insert a std::pair into the multimap.

Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).
---------------------	---

Returns

An iterator that points to the inserted (key,value) pair.

This function builds and inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Definition at line 454 of file stl\_multimap.h.

```
4.644.3.10 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> iterator std::multimap<_Key, _Tp,
_Compare, _Alloc>::emplace_hint( const_iterator __pos, _Args &&... _args ) [inline]
```

Builds and inserts a std::pair into the multimap.

Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see std::piecewise_construct for passing arguments to each part of the pair constructor).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a std::map the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html>.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 481 of file stl\_multimap.h.

```
4.644.3.11 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> bool std::multimap<_Key, _Tp, _Compare, _Alloc>::empty ( )
const [inline], [noexcept]
```

Returns true if the multimap is empty.

Definition at line 421 of file stl\_multimap.h.

```
4.644.3.12 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::end ( )
[inline], [noexcept]
```

Returns a read/write iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 332 of file stl\_multimap.h.

```
4.644.3.13 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::end (
) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 341 of file stl\_multimap.h.

```
4.644.3.14 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, iterator> std::multimap<_Key, _Tp, _Compare,
_Alloc>::equal_range ( const key_type & __x ) [inline]
```

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
c.upper_bound(val))
```

(but is faster than making the calls separately).

Definition at line 821 of file stl\_multimap.h.

```
4.644.3.15 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::pair<const_iterator, const_iterator> std::multimap<_Key,
_Tp, _Compare, _Alloc>::equal_range ( const key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

## Parameters

<code>__x</code>	Key of (key, value) pairs to be located.
------------------	--

## Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

Definition at line 838 of file stl\_multimap.h.

```
4.644.3.16 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
const_iterator __position ) [inline]
```

Erases an element from a multimap.

## Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

## Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 595 of file stl\_multimap.h.

```
4.644.3.17 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::erase (
const key_type & __x ) [inline]
```

Erases elements according to the provided key.

## Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

## Returns

The number of elements erased.

This function erases all elements located by the given key from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 631 of file stl\_multimap.h.

4.644.3.18 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp> >> iterator std::multimap<_Key, _Tp, _Compare, _Alloc >::erase (  
const_iterator __first, const_iterator __last ) [inline]`

Erases a [first,last) range of elements from a multimap.

## Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased .

## Returns

The iterator `__last`.

This function erases a sequence of elements from a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 652 of file `stl_multimap.h`.

```
4.644.3.19  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::find ( const
            key_type & __x ) [inline]
```

Tries to locate an element in a multimap.

## Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

## Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 730 of file `stl_multimap.h`.

```
4.644.3.20  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::find (
            const key_type & __x ) const [inline]
```

Tries to locate an element in a multimap.

## Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

## Returns

Read-only (constant) iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 745 of file `stl_multimap.h`.

```
4.644.3.21  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> allocator_type std::multimap<_Key, _Tp, _Compare, _Alloc>
            >::get_allocator ( ) const [inline], [noexcept]
```

Get a copy of the memory allocation object.

Definition at line 304 of file `stl_multimap.h`.

4.644.3.22 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::insert (  
const value_type & __x ) [inline]`

Inserts a `std::pair` into the `multimap`.

## Parameters

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

## Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Definition at line 501 of file `stl_multimap.h`.

Referenced by `std::multimap< _Key, _Tp, _Compare, _Alloc >::insert()`, and `std::multimap< _Key, _Tp, _Compare, _Alloc >::operator=()`.

```
4.644.3.23 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (
const_iterator __position, const value_type &__x ) [inline]
```

Inserts a `std::pair` into the multimap.

## Parameters

<code>__position</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

## Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a `std::map` the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html>.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 535 of file `stl_multimap.h`.

```
4.644.3.24 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator > void std::multimap< _Key,
_Tp, _Compare, _Alloc >::insert ( _InputIterator __first, _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

## Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 562 of file `stl_multimap.h`.

```
4.644.3.25  template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =  
            std::allocator<std::pair<const _Key, _Tp> >> void std::multimap<_Key, _Tp, _Compare, _Alloc >::insert (  
            initializer_list< value_type > __l ) [inline]
```

Attempts to insert a list of std::pairs into the multimap.

## Parameters

__l	A std::initializer_list<value_type> of pairs to be inserted.
-----	--

Complexity similar to that of the range constructor.

Definition at line 574 of file stl\_multimap.h.

References std::multimap< \_Key, \_Tp, \_Compare, \_Alloc >::insert().

```
4.644.3.26 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> key_compare std::multimap< _Key, _Tp, _Compare, _Alloc
>::key_comp ( ) const [inline]
```

Returns the key comparison object out of which the multimap was constructed.

Definition at line 706 of file stl\_multimap.h.

```
4.644.3.27 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap< _Key, _Tp, _Compare, _Alloc
>::lower_bound ( const key_type & __x ) [inline]
```

Finds the beginning of a subsequence matching given key.

## Parameters

__x	Key of (key, value) pair to be located.
-----	---

## Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 769 of file stl\_multimap.h.

```
4.644.3.28 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap< _Key, _Tp, _Compare, _Alloc
>::lower_bound ( const key_type & __x ) const [inline]
```

Finds the beginning of a subsequence matching given key.

## Parameters

__x	Key of (key, value) pair to be located.
-----	---

## Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful the iterator will point to the next greatest element or, if no such greater element exists, to end().

Definition at line 784 of file stl\_multimap.h.

```
4.644.3.29 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::max_size
( ) const [inline], [noexcept]
```

Returns the maximum size of the multimap.

Definition at line 431 of file `stl_multimap.h`.

```
4.644.3.30 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> multimap& std::multimap<_Key, _Tp, _Compare, _Alloc
>::operator= ( const multimap<_Key, _Tp, _Compare, _Alloc> & __x ) [inline]
```

Multimap assignment operator.

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Parameters

<code>__x</code>	A multimap of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 258 of file `stl_multimap.h`.

```
4.644.3.31 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> multimap& std::multimap<_Key, _Tp, _Compare, _Alloc
>::operator= ( multimap<_Key, _Tp, _Compare, _Alloc> && __x ) [inline]
```

Multimap move assignment operator.

Parameters

<code>__x</code>	A multimap of identical element and allocator types.
------------------	--

The contents of `__x` are moved into this multimap (without copying). `__x` is a valid, but unspecified multimap.

Definition at line 273 of file `stl_multimap.h`.

References `std::multimap<_Key, _Tp, _Compare, _Alloc>::clear()`, and `std::multimap<_Key, _Tp, _Compare, _Alloc>::swap()`.

```
4.644.3.32 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> multimap& std::multimap<_Key, _Tp, _Compare, _Alloc
>::operator= ( initializer_list<value_type> __l ) [inline]
```

Multimap list assignment operator.

Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills a multimap with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the multimap and that the resulting multimap's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 294 of file `stl_multimap.h`.

References `std::multimap<_Key, _Tp, _Compare, _Alloc>::clear()`, and `std::multimap<_Key, _Tp, _Compare, _Alloc>::insert()`.

```
4.644.3.33 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> reverse_iterator std::multimap<_Key, _Tp, _Compare, _Alloc
>::rbegin ( ) [inline],[noexcept]
```

Returns a read/write reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 350 of file `stl_multimap.h`.

```
4.644.3.34 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::multimap< _Key, _Tp, _Compare,
_Alloc >::rbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 359 of file stl\_multimap.h.

```
4.644.3.35 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> reverse_iterator std::multimap< _Key, _Tp, _Compare, _Alloc
>::rend ( ) [inline], [noexcept]
```

Returns a read/write reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 368 of file stl\_multimap.h.

```
4.644.3.36 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::multimap< _Key, _Tp, _Compare,
_Alloc >::rend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 377 of file stl\_multimap.h.

```
4.644.3.37 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::multimap< _Key, _Tp, _Compare, _Alloc >::size ( )
const [inline], [noexcept]
```

Returns the size of the multimap.

Definition at line 426 of file stl\_multimap.h.

```
4.644.3.38 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::multimap< _Key, _Tp, _Compare, _Alloc >::swap (
multimap< _Key, _Tp, _Compare, _Alloc > &__x ) [inline]
```

Swaps data with another multimap.

Parameters

__x	A multimap of the same element and allocator types.
-----	---

This exchanges the elements between two multimaps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Definition at line 687 of file stl\_multimap.h.

Referenced by `std::multimap< _Key, _Tp, _Compare, _Alloc >::operator=()`, and `std::swap()`.

```
4.644.3.39 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap< _Key, _Tp, _Compare, _Alloc
>::upper_bound ( const key_type &__x ) [inline]
```

Finds the end of a subsequence matching given key.

## Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

## Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 794 of file `stl_multimap.h`.

```
4.644.3.40 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc
>::upper_bound ( const key_type & __x ) const    [inline]
```

Finds the end of a subsequence matching given key.

## Parameters

<code>__x</code>	Key of (key, value) pair to be located.
------------------	---

## Returns

Read-only (constant) iterator pointing to first iterator greater than key, or end().

Definition at line 804 of file `stl_multimap.h`.

```
4.644.3.41 template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> value_compare std::multimap<_Key, _Tp, _Compare, _Alloc
>::value_comp ( ) const    [inline]
```

Returns a value comparison object, built from the key comparison object out of which the multimap was constructed.

Definition at line 714 of file `stl_multimap.h`.

#### 4.646.1 Detailed Description

template<typename \_Key, typename \_Compare = std::less<\_Key>, typename \_Alloc = std::allocator<\_Key>> class std::multiset<\_Key, \_Compare, \_Alloc >

A standard container made up of elements, which can be retrieved in logarithmic time.

##### Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Compare</code>	Comparison function object type, defaults to less<_Key>.
<code>_Alloc</code>	Allocator type, defaults to allocator<_Key>.

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a `multiset<Key>` the `key_type` and `value_type` are `Key`.

Multisets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (\*\_unique versus \*\_equal, same as the standard).

Definition at line 92 of file `stl_multiset.h`.

#### 4.646.2 Constructor & Destructor Documentation

4.646.2.1 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::multiset<_Key, _Compare, _Alloc>::multiset( ) [inline]`

Default constructor creates no elements.

Definition at line 137 of file `stl_multiset.h`.

4.646.2.2 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> std::multiset<_Key, _Compare, _Alloc>::multiset( const _Compare & __comp, const allocator_type & __a = allocator_type() ) [inline],[explicit]`

Creates a multiset with no elements.

## Parameters

<code>__comp</code>	Comparator to use.
<code>__a</code>	An allocator object.

Definition at line 146 of file `stl_multiset.h`.

```
4.646.2.3  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            template<typename _InputIterator > std::multiset< _Key, _Compare, _Alloc >::multiset ( _InputIterator __first,
            _InputIterator __last ) [inline]
```

Builds a multiset from a range.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a multiset consisting of copies of the elements from `[first,last)`. This is linear in  $N$  if the range is already sorted, and  $N\log N$  otherwise (where  $N$  is `distance(__first,__last)`).

Definition at line 160 of file `stl_multiset.h`.

```
4.646.2.4  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            template<typename _InputIterator > std::multiset< _Key, _Compare, _Alloc >::multiset ( _InputIterator __first,
            _InputIterator __last, const _Compare & __comp, const allocator_type & __a = allocator_type() )
            [inline]
```

Builds a multiset from a range.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multiset consisting of copies of the elements from `[__first,__last)`. This is linear in  $N$  if the range is already sorted, and  $N\log N$  otherwise (where  $N$  is `distance(__first,__last)`).

Definition at line 176 of file `stl_multiset.h`.

```
4.646.2.5  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::multiset< _Key, _Compare, _Alloc >::multiset ( const multiset< _Key, _Compare, _Alloc > & __x )
            [inline]
```

Multiset copy constructor.

## Parameters

<code>__x</code>	A multiset of identical element and allocator types.
------------------	--

The newly-created multiset uses a copy of the allocation object used by `__x`.

Definition at line 189 of file `stl_multiset.h`.

```
4.646.2.6  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::multiset< _Key, _Compare, _Alloc >::multiset ( multiset< _Key, _Compare, _Alloc > && __x ) [inline],
            [noexcept]
```

Multiset move constructor.

## Parameters

<code>__x</code>	A multiset of identical element and allocator types.
------------------	--

The newly-created multiset contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified multiset.

Definition at line 200 of file `stl_multiset.h`.

```
4.646.2.7 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::multiset< _Key, _Compare, _Alloc >::multiset ( initializer_list< value_type > __l, const _Compare & __comp =
_Compare(), const allocator_type & __a = allocator_type() ) [inline]
```

Builds a multiset from an `initializer_list`.

## Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a multiset consisting of copies of the elements from the list. This is linear in  $N$  if the list is already sorted, and  $N\log N$  otherwise (where  $N$  is `__l.size()`).

Definition at line 214 of file `stl_multiset.h`.

## 4.646.3 Member Function Documentation

```
4.646.3.1 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::multiset< _Key, _Compare, _Alloc >::begin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 295 of file `stl_multiset.h`.

```
4.646.3.2 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::multiset< _Key, _Compare, _Alloc >::cbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 332 of file `stl_multiset.h`.

```
4.646.3.3 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
std::multiset< _Key, _Compare, _Alloc >::cend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 341 of file `stl_multiset.h`.

```
4.646.3.4 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void
std::multiset< _Key, _Compare, _Alloc >::clear ( ) [inline], [noexcept]
```

Erases all elements in a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 616 of file `stl_multiset.h`.

Referenced by `std::multiset< _Key, _Compare, _Alloc >::operator=()`.

4.646.3.5 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>  
size_type std::multiset<_Key, _Compare, _Alloc>::count( const key_type & __x ) const [inline]`

Finds the number of elements with given key.

## Parameters

<code>__x</code>	Key of elements to be located.
------------------	--------------------------------

## Returns

Number of elements with specified key.

Definition at line 627 of file `stl_multiset.h`.

4.646.3.6 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>  
reverse_iterator std::multiset<_Key, _Compare, _Alloc>::rbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 350 of file `stl_multiset.h`.

4.646.3.7 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>  
reverse_iterator std::multiset<_Key, _Compare, _Alloc>::crend ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 359 of file `stl_multiset.h`.

4.646.3.8 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>  
template<typename... _Args> iterator std::multiset<_Key, _Compare, _Alloc>::emplace ( _Args &&... __args )  
[inline]`

Builds and inserts an element into the multiset.

## Parameters

<code>__args</code>	Arguments used to generate the element instance to be inserted.
---------------------	---

## Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

Definition at line 409 of file `stl_multiset.h`.

4.646.3.9 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>  
template<typename... _Args> iterator std::multiset<_Key, _Compare, _Alloc>::emplace_hint ( const_iterator __pos,  
_Args &&... __args ) [inline]`

Builds and inserts an element into the multiset.

## Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element instance to be inserted.

### Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 435 of file `stl_multiset.h`.

4.646.3.10 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> bool  
std::multiset<_Key, _Compare, _Alloc>::empty ( ) const [inline], [noexcept]`

Returns true if the set is empty.

Definition at line 365 of file `stl_multiset.h`.

4.646.3.11 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator  
std::multiset<_Key, _Compare, _Alloc>::end ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 304 of file `stl_multiset.h`.

4.646.3.12 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>  
std::pair<iterator, iterator> std::multiset<_Key, _Compare, _Alloc>::equal_range ( const key_type & __x )  
[inline]`

Finds a subsequence matching given key.

### Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

### Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 707 of file `stl_multiset.h`.

```
4.646.3.13 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::pair<const_iterator, const_iterator> std::multiset<_Key, _Compare, _Alloc >::equal_range ( const key_type
            &__x ) const    [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 711 of file `stl_multiset.h`.

```
4.646.3.14  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
             _GLIBCXX_ABI_TAG_CXX11 iterator std::multiset< _Key, _Compare, _Alloc >::erase ( const_iterator __position )
             [inline]
```

Erases an element from a multiset.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 537 of file `stl_multiset.h`.

```
4.646.3.15  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
             size_type std::multiset< _Key, _Compare, _Alloc >::erase ( const key_type & __x ) [inline]
```

Erases elements according to the provided key.

**Parameters**

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

**Returns**

The number of elements erased.

This function erases all elements located by the given key from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 567 of file `stl_multiset.h`.

```
4.646.3.16  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
             _GLIBCXX_ABI_TAG_CXX11 iterator std::multiset< _Key, _Compare, _Alloc >::erase ( const_iterator __first,
             const_iterator __last ) [inline]
```

Erases a [first,last) range of elements from a multiset.

**Parameters**

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

**Returns**

The iterator *last*.

This function erases a sequence of elements from a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 589 of file `stl_multiset.h`.

```
4.646.3.17  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
            std::multiset<_Key, _Compare, _Alloc>::find ( const key_type & __x ) [inline]
```

Tries to locate an element in a set.

**Parameters**

<code>__x</code>	Element to be located.
------------------	------------------------

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 645 of file `stl_multiset.h`.

```
4.646.3.18  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            const_iterator std::multiset<_Key, _Compare, _Alloc>::find ( const key_type & __x ) const [inline]
```

Tries to locate an element in a set.

**Parameters**

<code>__x</code>	Element to be located.
------------------	------------------------

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 649 of file `stl_multiset.h`.

```
4.646.3.19  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            allocator_type std::multiset<_Key, _Compare, _Alloc>::get_allocator ( ) const [inline], [noexcept]
```

Returns the memory allocation object.

Definition at line 286 of file `stl_multiset.h`.

4.646.3.20 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator  
std::multiset<_Key,_Compare,_Alloc>::insert( const value_type & __x ) [inline]`

Inserts an element into the multiset.

**Parameters**

<code>__x</code>	Element to be inserted.
------------------	-------------------------

**Returns**

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

Definition at line 454 of file `stl_multiset.h`.

Referenced by `std::multiset< _Key, _Compare, _Alloc >::insert()`, and `std::multiset< _Key, _Compare, _Alloc >::operator=()`.

4.646.3.21 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator std::multiset< _Key, _Compare, _Alloc >::insert ( const_iterator __position, const value_type & __x ) [inline]`

Inserts an element into the multiset.

**Parameters**

<code>__position</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

**Returns**

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 484 of file `stl_multiset.h`.

4.646.3.22 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> template<typename _InputIterator > void std::multiset< _Key, _Compare, _Alloc >::insert ( _InputIterator __first, _InputIterator __last ) [inline]`

A template function that tries to insert a range of elements.

**Parameters**

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 503 of file `stl_multiset.h`.

```
4.646.3.23  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void  
            std::multiset<_Key,_Compare,_Alloc>::insert ( initializer_list<value_type> __l )  [inline]
```

Attempts to insert a list of elements into the multiset.

**Parameters**

<code>__l</code>	A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted.
------------------	--

Complexity similar to that of the range constructor.

Definition at line 515 of file `stl_multiset.h`.

References `std::multiset<_Key, _Compare, _Alloc>::insert()`.

4.646.3.24 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>  
key_compare std::multiset<_Key, _Compare, _Alloc>::key_comp ( ) const [inline]`

Returns the comparison object.

Definition at line 278 of file `stl_multiset.h`.

4.646.3.25 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator  
std::multiset<_Key, _Compare, _Alloc>::lower_bound ( const key_type & __x ) [inline]`

Finds the beginning of a subsequence matching given key.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Iterator pointing to first element equal to or greater than key, or `end()`.

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or `end()` if no such element exists.

Definition at line 666 of file `stl_multiset.h`.

4.646.3.26 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>  
const_iterator std::multiset<_Key, _Compare, _Alloc>::lower_bound ( const key_type & __x ) const [inline]`

Finds the beginning of a subsequence matching given key.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Iterator pointing to first element equal to or greater than key, or `end()`.

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or `end()` if no such element exists.

Definition at line 670 of file `stl_multiset.h`.

4.646.3.27 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>  
size_type std::multiset<_Key, _Compare, _Alloc>::max_size ( ) const [inline], [noexcept]`

Returns the maximum size of the set.

Definition at line 375 of file `stl_multiset.h`.

```
4.646.3.28 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    multiset& std::multiset< _Key, _Compare, _Alloc >::operator= ( const multiset< _Key, _Compare, _Alloc > & __x
    ) [inline]
```

Multiset assignment operator.

## Parameters

<code>__x</code>	A multiset of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 229 of file `stl_multiset.h`.

```
4.646.3.29  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            multiset& std::multiset< _Key, _Compare, _Alloc >::operator= ( multiset< _Key, _Compare, _Alloc > && __x )
            [inline]
```

Multiset move assignment operator.

## Parameters

<code>__x</code>	A multiset of identical element and allocator types.
------------------	--

The contents of `__x` are moved into this multiset (without copying). `__x` is a valid, but unspecified multiset.

Definition at line 245 of file `stl_multiset.h`.

References `std::multiset< _Key, _Compare, _Alloc >::clear()`, and `std::multiset< _Key, _Compare, _Alloc >::swap()`.

```
4.646.3.30  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            multiset& std::multiset< _Key, _Compare, _Alloc >::operator= ( initializer_list< value_type > __l ) [inline]
```

Multiset list assignment operator.

## Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills a multiset with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the multiset and that the resulting multiset's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 266 of file `stl_multiset.h`.

References `std::multiset< _Key, _Compare, _Alloc >::clear()`, and `std::multiset< _Key, _Compare, _Alloc >::insert()`.

```
4.646.3.31  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rbegin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 313 of file `stl_multiset.h`.

```
4.646.3.32  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            reverse_iterator std::multiset< _Key, _Compare, _Alloc >::rend ( ) const [inline], [noexcept]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 322 of file `stl_multiset.h`.

```
4.646.3.33  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            size_type std::multiset< _Key, _Compare, _Alloc >::size ( ) const [inline], [noexcept]
```

Returns the size of the set.

Definition at line 370 of file `stl_multiset.h`.

4.646.3.34 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void  
std::multiset<_Key,_Compare,_Alloc>::swap ( multiset<_Key,_Compare,_Alloc> &__x ) [inline]`

Swaps data with another multiset.

**Parameters**

<code>__x</code>	A multiset of the same element and allocator types.
------------------	---

This exchanges the elements between two multisets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Definition at line 390 of file `stl_multiset.h`.

Referenced by `std::multiset<_Key, _Compare, _Alloc >::operator=()`, and `std::swap()`.

4.646.3.35 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator  
std::multiset<_Key, _Compare, _Alloc >::upper_bound ( const key_type & __x ) [inline]`

Finds the end of a subsequence matching given key.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Iterator pointing to the first element greater than key, or `end()`.

Definition at line 682 of file `stl_multiset.h`.

4.646.3.36 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>  
const_iterator std::multiset<_Key, _Compare, _Alloc >::upper_bound ( const key_type & __x ) const [inline]`

Finds the end of a subsequence matching given key.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Iterator pointing to the first element greater than key, or `end()`.

Definition at line 686 of file `stl_multiset.h`.

4.646.3.37 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>  
value_compare std::multiset<_Key, _Compare, _Alloc >::value_comp ( ) const [inline]`

Returns the comparison object.

Definition at line 282 of file `stl_multiset.h`.

#### 4.648.1 Detailed Description

`template<typename _IntType = int> class std::negative_binomial_distribution<_IntType>`

A `negative_binomial_distribution` random number distribution.

The formula for the negative binomial probability mass function is  $p(i) = \binom{n}{i} p^i (1-p)^{t-i}$  where  $t$  and  $p$  are the parameters of the distribution.

Definition at line 4208 of file random.h.

#### 4.648.2 Member Typedef Documentation

4.648.2.1 `template<typename _IntType = int> typedef _IntType std::negative_binomial_distribution<_IntType>::result_type`

The type of the range of the distribution.

Definition at line 4211 of file random.h.

#### 4.648.3 Member Function Documentation

4.648.3.1 `template<typename _IntType = int> _IntType std::negative_binomial_distribution<_IntType>::k ( ) const`  
`[inline]`

Return the  $k$  parameter of the distribution.

Definition at line 4266 of file random.h.

4.648.3.2 `template<typename _IntType = int> result_type std::negative_binomial_distribution<_IntType>::max ( )`  
`const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 4302 of file random.h.

References `std::max()`.

4.648.3.3 `template<typename _IntType = int> result_type std::negative_binomial_distribution<_IntType>::min ( )`  
`const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 4295 of file random.h.

4.648.3.4 `template<typename _IntType = int> template<typename UniformRandomNumberGenerator> result_type`  
`std::negative_binomial_distribution<_IntType>::operator() ( UniformRandomNumberGenerator & __urng )`

Generating functions.

4.648.3.5 `template<typename _IntType = int> double std::negative_binomial_distribution<_IntType>::p ( ) const`  
`[inline]`

Return the  $p$  parameter of the distribution.

Definition at line 4273 of file random.h.

4.648.3.6 `template<typename _IntType = int> param_type std::negative_binomial_distribution<_IntType>::param ( )`  
`const [inline]`

Returns the parameter set of the distribution.

Definition at line 4280 of file random.h.

4.648.3.7 `template<typename _IntType = int> void std::negative_binomial_distribution<_IntType>::param ( const`  
`param_type & __param ) [inline]`

Sets the parameter set of the distribution.

## Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 4288 of file random.h.

4.648.3.8 `template<typename _IntType = int> void std::negative_binomial_distribution< _IntType >::reset ( )`  
`[inline]`

Resets the distribution state.

Definition at line 4259 of file random.h.

References `std::gamma_distribution< _RealType >::reset()`.

## 4.648.4 Friends And Related Function Documentation

4.648.4.1 `template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits >`  
`std::basic_ostream< _CharT, _Traits>& operator<< ( std::basic_ostream< _CharT, _Traits > &__os, const`  
`std::negative_binomial_distribution< _IntType1 > &__x ) [friend]`

Inserts a `negative_binomial_distribution` random number distribution `__x` into the output stream `__os`.

## Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>negative_binomial_distribution</code> random number distribution.

## Returns

The output stream with the state of `__x` inserted or in an error state.

4.648.4.2 `template<typename _IntType = int> bool operator== ( const negative_binomial_distribution< _IntType > &__d1,`  
`const negative_binomial_distribution< _IntType > &__d2 ) [friend]`

Return true if two negative binomial distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 4351 of file random.h.

4.648.4.3 `template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits`  
`> std::basic_istream< _CharT, _Traits>& operator>> ( std::basic_istream< _CharT, _Traits > &__is,`  
`std::negative_binomial_distribution< _IntType1 > &__x ) [friend]`

Extracts a `negative_binomial_distribution` random number distribution `__x` from the input stream `__is`.

## Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>negative_binomial_distribution</code> random number generator engine.

## Returns

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following file:

#### 4.651.1 Detailed Description

template<typename `_RealType` = double>class `std::normal_distribution<_RealType>`

A normal continuous distribution for random numbers.

The formula for the normal probability density function is

$$p(x|\mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{x-\mu}{2\sigma^2}}$$

Definition at line 2085 of file `random.h`.

#### 4.651.2 Member Typedef Documentation

##### 4.651.2.1 `template<typename _RealType = double> typedef _RealType std::normal_distribution<_RealType>::result_type`

The type of the range of the distribution.

Definition at line 2088 of file `random.h`.

#### 4.651.3 Constructor & Destructor Documentation

##### 4.651.3.1 `template<typename _RealType = double> std::normal_distribution<_RealType>::normal_distribution ( result_type __mean = result_type(0), result_type __stddev = result_type(1) ) [inline], [explicit]`

Constructs a normal distribution with parameters *mean* and standard deviation.

Definition at line 2130 of file `random.h`.

#### 4.651.4 Member Function Documentation

##### 4.651.4.1 `template<typename _RealType = double> result_type std::normal_distribution<_RealType>::max ( ) const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 2187 of file `random.h`.

##### 4.651.4.2 `template<typename _RealType = double> _RealType std::normal_distribution<_RealType>::mean ( ) const [inline]`

Returns the mean of the distribution.

Definition at line 2151 of file `random.h`.

##### 4.651.4.3 `template<typename _RealType = double> result_type std::normal_distribution<_RealType>::min ( ) const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 2180 of file `random.h`.

##### 4.651.4.4 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator> result_type std::normal_distribution<_RealType>::operator() ( _UniformRandomNumberGenerator & __urng ) [inline]`

Generating functions.

Definition at line 2195 of file `random.h`.

Referenced by `std::normal_distribution<result_type>::operator()()`.

##### 4.651.4.5 `template<typename _RealType = double> param_type std::normal_distribution<_RealType>::param ( ) const [inline]`

Returns the parameter set of the distribution.

Definition at line 2165 of file `random.h`.

4.651.4.6 `template<typename _RealType = double> void std::normal_distribution<_RealType>::param ( const param_type & __param ) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 2173 of file random.h.

4.651.4.7 `template<typename _RealType = double> void std::normal_distribution<_RealType>::reset ( ) [inline]`

Resets the distribution state.

Definition at line 2144 of file random.h.

Referenced by `std::lognormal_distribution<_RealType>::reset()`, `std::gamma_distribution<result_type>::reset()`, `std::student_t_distribution<_RealType>::reset()`, `std::binomial_distribution<_IntType>::reset()`, and `std::poisson_distribution<_IntType>::reset()`.

4.651.4.8 `template<typename _RealType = double> _RealType std::normal_distribution<_RealType>::stddev ( ) const [inline]`

Returns the standard deviation of the distribution.

Definition at line 2158 of file random.h.

#### 4.651.5 Friends And Related Function Documentation

4.651.5.1 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits> std::basic_ostream<_CharT, _Traits>& operator<< ( std::basic_ostream<_CharT, _Traits> & __os, const std::normal_distribution<_RealType1> & __x ) [friend]`

Inserts a normal\_distribution random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A normal_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

4.651.5.2 `template<typename _RealType = double> template<typename _RealType1> bool operator== ( const std::normal_distribution<_RealType1> & __d1, const std::normal_distribution<_RealType1> & __d2 ) [friend]`

Return true if two normal distributions have the same parameters and the sequences that would be generated are equal.

4.651.5.3 `template<typename _RealType = double> template<typename _RealType1, typename _CharT, typename _Traits> std::basic_istream<_CharT, _Traits>& operator>> ( std::basic_istream<_CharT, _Traits> & __is, std::normal_distribution<_RealType1> & __x ) [friend]`

Extracts a normal\_distribution random number distribution `__x` from the input stream `__is`.

## Parameters

__is	An input stream.
__x	A normal_distribution random number generator engine.

## Returns

The input stream with \_\_x extracted or in an error state.

### 4.654.1 Detailed Description

```
template<typename _CharT, typename _InIter> class std::num_get< _CharT, _InIter >
```

Primary class template num\_get.

This facet encapsulates the code to parse and return a number from a string. It is used by the istream numeric extraction operators.

The num\_get template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the num\_get facet.

Definition at line 1915 of file locale\_facets.h.

#### 4.654.2 Member Typedef Documentation

##### 4.654.2.1 template<typename \_CharT, typename \_InIter > typedef \_CharT std::num\_get<\_CharT, \_InIter >::char\_type

Public typedefs.

Definition at line 1921 of file locale\_facets.h.

##### 4.654.2.2 template<typename \_CharT, typename \_InIter > typedef \_InIter std::num\_get<\_CharT, \_InIter >::iter\_type

Public typedefs.

Definition at line 1922 of file locale\_facets.h.

#### 4.654.3 Constructor & Destructor Documentation

##### 4.654.3.1 template<typename \_CharT, typename \_InIter > std::num\_get<\_CharT, \_InIter >::num\_get ( size\_t \_\_refs = 0 ) [inline], [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 1936 of file locale\_facets.h.

##### 4.654.3.2 template<typename \_CharT, typename \_InIter > virtual std::num\_get<\_CharT, \_InIter >::~~num\_get ( ) [inline], [protected], [virtual]

Destructor.

Definition at line 2108 of file locale\_facets.h.

#### 4.654.4 Member Function Documentation

##### 4.654.4.1 template<typename \_CharT, typename \_InIter > virtual iter\_type std::num\_get<\_CharT, \_InIter >::do\_get ( iter\_type, iter\_type, ios\_base &, ios\_base::iostate &, bool & ) const [protected], [virtual]

Numeric parsing.

Parses the input stream into the variable v. This function is a hook for derived classes to change the value returned.

See also

get() for more details.

**Parameters**

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

Referenced by `std::num_get<_CharT, _InIter>::get()`.

4.654.4.2 `template<typename _CharT, typename _InIter> virtual iter_type std::num_get<_CharT, _InIter>::do_get (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, long & __v ) const [inline], [protected], [virtual]`

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

**See also**

`get()` for more details.

**Parameters**

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

Definition at line 2176 of file `locale_facets.h`.

4.654.4.3 `template<typename _CharT, typename _InIter> virtual iter_type std::num_get<_CharT, _InIter>::do_get (iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned short & __v ) const [inline], [protected], [virtual]`

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

**See also**

`get()` for more details.

## Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

## Returns

Iterator after reading.

Definition at line 2181 of file locale\_facets.h.

```
4.654.4.4 template<typename _CharT, typename _Inlter > virtual iter_type std::num_get<_CharT, _Inlter >::do_get (
    iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned int & __v ) const
    [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

## See also

`get()` for more details.

## Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

## Returns

Iterator after reading.

Definition at line 2186 of file locale\_facets.h.

```
4.654.4.5 template<typename _CharT, typename _Inlter > virtual iter_type std::num_get<_CharT, _Inlter >::do_get (
    iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned long & __v ) const
    [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

## See also

`get()` for more details.

**Parameters**

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

Definition at line 2191 of file locale\_facets.h.

```
4.654.4.6 template<typename _CharT, typename _InIter > virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, long long & __v ) const
    [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

**See also**

`get()` for more details.

**Parameters**

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

Definition at line 2197 of file locale\_facets.h.

```
4.654.4.7 template<typename _CharT, typename _InIter > virtual iter_type std::num_get< _CharT, _InIter >::do_get (
    iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned long long & __v ) const
    [inline], [protected], [virtual]
```

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

**See also**

`get()` for more details.

## Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

## Returns

Iterator after reading.

Definition at line 2202 of file locale\_facets.h.

4.654.4.8 `template<typename _CharT, typename _Inlter > virtual iter_type std::num_get<_CharT, _Inlter >::do_get (iter_type, iter_type, ios_base &, ios_base::iostate &, float &) const` [protected], [virtual]

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

## See also

`get()` for more details.

## Parameters

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

## Returns

Iterator after reading.

4.654.4.9 `template<typename _CharT, typename _Inlter > virtual iter_type std::num_get<_CharT, _Inlter >::do_get (iter_type, iter_type, ios_base &, ios_base::iostate &, double &) const` [protected], [virtual]

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

## See also

`get()` for more details.

## Parameters

<code>__beg</code>	Start of input stream.
--------------------	------------------------

<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

4.654.4.10 `template<typename _CharT, typename _InIter > virtual iter_type std::num_get< _CharT, _InIter >::do_get ( iter_type, iter_type, ios_base &, ios_base::iostate &, long double & ) const` [protected], [virtual]

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

**See also**

`get()` for more details.

**Parameters**

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

4.654.4.11 `template<typename _CharT, typename _InIter > virtual iter_type std::num_get< _CharT, _InIter >::do_get ( iter_type, iter_type, ios_base &, ios_base::iostate &, void *& ) const` [protected], [virtual]

Numeric parsing.

Parses the input stream into the variable `v`. This function is a hook for derived classes to change the value returned.

**See also**

`get()` for more details.

**Parameters**

<code>__beg</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.

<code>__v</code>	Value to format and insert.
------------------	-----------------------------

**Returns**

Iterator after reading.

**4.654.4.12** `template<typename _CharT, typename _InIter > iter_type std::num_get<_CharT, _InIter >::get( iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, bool & __v ) const [inline]`

Numeric parsing.

Parses the input stream into the bool `v`. It does so by calling `num_get::do_get()`.

If `ios_base::boolalpha` is set, attempts to read `ctype<CharT>::truenamename()` or `ctype<CharT>::falsename()`. Sets `v` to true or false if successful. Sets `err` to `ios_base::failbit` if reading the string fails. Sets `err` to `ios_base::eofbit` if the stream is emptied.

If `ios_base::boolalpha` is not set, proceeds as with reading a long, except if the value is 1, sets `v` to true, if the value is 0, sets `v` to false, and otherwise set `err` to `ios_base::failbit`.

**Parameters**

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

Definition at line 1962 of file `locale_facets.h`.

References `std::num_get<_CharT, _InIter >::do_get()`.

**4.654.4.13** `template<typename _CharT, typename _InIter > iter_type std::num_get<_CharT, _InIter >::get( iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, long & __v ) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in `io`.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

Definition at line 1999 of file `locale_facets.h`.

References `std::num_get<_CharT, _InIter>::do_get()`.

4.654.4.14 `template<typename _CharT, typename _InIter> iter_type std::num_get<_CharT, _InIter>::get ( iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned short & __v ) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in `io`.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

Definition at line 2004 of file `locale_facets.h`.

References `std::num_get<_CharT, _InIter>::do_get()`.

4.654.4.15 `template<typename _CharT, typename _InIter> iter_type std::num_get<_CharT, _InIter>::get ( iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned int & __v ) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in `io`.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the

scanf o specifier. Else if equal to ios\_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands\_sep(). If the pattern of digit groups isn't consistent, sets err to ios\_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios\_base::failbit and leaves *v* unaltered. Sets err to ios\_base::eofbit if the stream is emptied.

#### Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after reading.

Definition at line 2009 of file locale\_facets.h.

References std::num\_get< \_CharT, \_InIter >::do\_get().

4.654.4.16 `template<typename _CharT, typename _InIter> iter_type std::num_get< _CharT, _InIter >::get( iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned long & __v ) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling num\_get::do\_get().

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of io.flags() & ios\_base::basefield. If equal to ios\_base::oct, parses like the scanf o specifier. Else if equal to ios\_base::hex, parses like X specifier. Else if basefield equal to 0, parses like the i specifier. Otherwise, parses like d for signed and u for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to numpunct::grouping() and numpunct::thousands\_sep(). If the pattern of digit groups isn't consistent, sets err to ios\_base::failbit.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to ios\_base::failbit and leaves *v* unaltered. Sets err to ios\_base::eofbit if the stream is emptied.

#### Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after reading.

Definition at line 2014 of file locale\_facets.h.

References std::num\_get< \_CharT, \_InIter >::do\_get().

4.654.4.17 `template<typename _CharT, typename _InIter> iter_type std::num_get<_CharT, _InIter>::get ( iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, long long & __v ) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets *err* to `ios_base::failbit`.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets *err* to `ios_base::failbit` and leaves *v* unaltered. Sets *err* to `ios_base::eofbit` if the stream is emptied.

#### Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after reading.

Definition at line 2020 of file `locale_facets.h`.

References `std::num_get<_CharT, _InIter>::do_get()`.

4.654.4.18 `template<typename _CharT, typename _InIter> iter_type std::num_get<_CharT, _InIter>::get ( iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, unsigned long long & __v ) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets *err* to `ios_base::failbit`.

References `std::num_get< _CharT, _InIter >::do_get()`.

**4.654.4.19** `template<typename _CharT, typename _InIter> iter_type std::num_get< _CharT, _InIter >::get( iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, float & __v ) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf g` specifier. The matching type length modifier is also used.

The decimal point character used is `num_punct::decimal_point()`. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

Definition at line 2059 of file locale\_facets.h.

References `std::num_get< _CharT, _InIter >::do_get()`.

**4.654.4.20** `template<typename _CharT, typename _InIter> iter_type std::num_get< _CharT, _InIter >::get( iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, double & __v ) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf g` specifier. The matching type length modifier is also used.

The decimal point character used is `num_punct::decimal_point()`. Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

Definition at line 2064 of file `locale_facets.h`.

References `std::num_get<_CharT, _InIter >::do_get()`.

4.654.4.21 `template<typename _CharT, typename _InIter > iter_type std::num_get<_CharT, _InIter >::get ( iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, long double & __v ) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf g` specifier. The matching type length modifier is also used.

The decimal point character used is `numpunct::decimal_point()`. Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

**Parameters**

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after reading.

Definition at line 2069 of file `locale_facets.h`.

References `std::num_get<_CharT, _InIter >::do_get()`.

4.654.4.22 `template<typename _CharT, typename _InIter > iter_type std::num_get<_CharT, _InIter >::get ( iter_type __in, iter_type __end, ios_base & __io, ios_base::iostate & __err, void *& __v ) const [inline]`

Numeric parsing.

Parses the input stream into the pointer variable `v`. It does so by calling `num_get::do_get()`.

The input characters are parsed like the `scanf p` specifier.

Digit grouping is interpreted according to `numpunct::grouping()` and `numpunct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

Note that the digit grouping effect for pointers is a bit ambiguous in the standard and shouldn't be relied on. See DR 344.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets *err* to *ios\_base::failbit* and leaves *v* unaltered. Sets *err* to *ios\_base::eofbit* if the stream is emptied.

#### Parameters

<code>__in</code>	Start of input stream.
<code>__end</code>	End of input stream.
<code>__io</code>	Source of locale and flags.
<code>__err</code>	Error flags to set.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after reading.

Definition at line 2102 of file `locale_facets.h`.

## 4.655.1 Detailed Description

```
template<typename _CharT, typename _Outiter>class std::num_put<_CharT, _Outiter>
```

Primary class template num\_put.

This facet encapsulates the code to convert a number to a string. It is used by the ostream numeric insertion operators.

The num\_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the num\_put facet.

Definition at line 2254 of file locale\_facets.h.

## 4.655.2 Member Typedef Documentation

```
4.655.2.1 template<typename _CharT, typename _Outiter> typedef _CharT std::num_put<_CharT, _Outiter>::char_type
```

Public typedefs.

Definition at line 2260 of file locale\_facets.h.

```
4.655.2.2 template<typename _CharT, typename _Outiter> typedef _Outiter std::num_put<_CharT, _Outiter>::iter_type
```

Public typedefs.

Definition at line 2261 of file locale\_facets.h.

## 4.655.3 Constructor &amp; Destructor Documentation

```
4.655.3.1 template<typename _CharT, typename _Outiter> std::num_put<_CharT, _Outiter>::num_put ( size_t __refs = 0
    ) [inline],[explicit]
```

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 2275 of file locale\_facets.h.

```
4.655.3.2 template<typename _CharT, typename _Outiter> virtual std::num_put<_CharT, _Outiter>::~~num_put ( )
    [inline],[protected],[virtual]
```

Destructor.

Definition at line 2454 of file locale\_facets.h.

## 4.655.4 Member Function Documentation

```
4.655.4.1 template<typename _CharT, typename _Outiter> virtual iter_type std::num_put<_CharT, _Outiter>::do_put (
    iter_type __s, ios_base& __io, char_type __fill, bool __v ) const [protected],[virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

## Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

## Returns

Iterator after writing.

Referenced by `std::num_put< _CharT, _Outlter >::put()`.

```
4.655.4.2 template<typename _CharT, typename _Outlter > virtual iter_type std::num_put< _CharT, _Outlter >::do_put
( iter_type __s, ios_base & __io, char_type __fill, long __v ) const [inline], [protected],
[virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

## Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

## Returns

Iterator after writing.

Definition at line 2474 of file `locale_facets.h`.

```
4.655.4.3 template<typename _CharT, typename _Outlter > virtual iter_type std::num_put< _CharT, _Outlter >::do_put (
iter_type __s, ios_base & __io, char_type __fill, unsigned long __v ) const [inline], [protected],
[virtual]
```

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

## Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

## Returns

Iterator after writing.

Definition at line 2478 of file `locale_facets.h`.

4.655.4.4 `template<typename _CharT, typename _Outiter > virtual iter_type std::num_put<_CharT, _Outiter >::do_put ( iter_type __s, ios_base & __io, char_type __fill, long long __v ) const [inline], [protected], [virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

#### Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	<code>Char_type</code> to use for filling.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after writing.

Definition at line 2484 of file `locale_facets.h`.

4.655.4.5 `template<typename _CharT, typename _Outiter > virtual iter_type std::num_put<_CharT, _Outiter >::do_put ( iter_type __s, ios_base & __io, char_type __fill, unsigned long long __v ) const [inline], [protected], [virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

#### Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	<code>Char_type</code> to use for filling.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after writing.

Definition at line 2489 of file `locale_facets.h`.

4.655.4.6 `template<typename _CharT, typename _Outiter > virtual iter_type std::num_put<_CharT, _Outiter >::do_put ( iter_type, ios_base &, char_type, double ) const [protected], [virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

#### Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after writing.

4.655.4.7 `template<typename _CharT, typename _Outiter> virtual iter_type std::num_put<_CharT, _Outiter>::do_put (iter_type, ios_base &, char_type, long double) const` `[protected]`, `[virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after writing.

4.655.4.8 `template<typename _CharT, typename _Outiter> virtual iter_type std::num_put<_CharT, _Outiter>::do_put (iter_type, ios_base &, char_type, const void *) const` `[protected]`, `[virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

**Parameters**

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after writing.

4.655.4.9 `template<typename _CharT, typename _Outiter> iter_type std::num_put<_CharT, _Outiter>::put (iter_type __s, ios_base & __io, char_type __fill, bool __v) const` `[inline]`

Numeric formatting.

Formats the boolean `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

If `ios_base::boolalpha` is set, writes `ctype<CharT>::truename()` or `ctype<CharT>::falsename()`. Otherwise formats `v` as an int.

**Parameters**

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after writing.

Definition at line 2293 of file locale\_facets.h.

References `std::num_put<_CharT, _Outlter>::do_put()`.

**4.655.4.10** `template<typename _CharT, typename _Outlter> iter_type std::num_put<_CharT, _Outlter>::put ( iter_type __s, ios_base & __io, char_type __fill, long __v ) const [inline]`

Numeric formatting.

Formats the integral value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in `io`.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf` `o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showbase` is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is `num_punct::decimal_point()`. Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`.

If `io.width()` is non-zero, enough `fill` characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

**Parameters**

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after writing.

Definition at line 2335 of file locale\_facets.h.

References `std::num_put<_CharT, _Outlter>::do_put()`.

**4.655.4.11** `template<typename _CharT, typename _Outlter> iter_type std::num_put<_CharT, _Outlter>::put ( iter_type __s, ios_base & __io, char_type __fill, unsigned long __v ) const [inline]`

Numeric formatting.

Formats the integral value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, `'+'` is output before positive values. If `ios_base::showbase` is set, `'0'` precedes octal values (except 0) and `'0[xX]'` precedes hex values.

The decimal point character used is `numput::decimal_point()`. Thousands separators are inserted according to `numput::grouping()` and `numput::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a `'+'` or `'-'` or after `'0x'` or `'0X'`. Otherwise, padding occurs at the beginning.

#### Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	<code>Char_type</code> to use for filling.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after writing.

Definition at line 2339 of file `locale_facets.h`.

References `std::num_put< _CharT, _Outlter >::do_put()`.

**4.655.4.12** `template<typename _CharT, typename _Outlter> iter_type std::num_put< _CharT, _Outlter >::put ( iter_type __s, ios_base & __io, char_type __fill, long long __v ) const [inline]`

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the `printf o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, `'+'` is output before positive values. If `ios_base::showbase` is set, `'0'` precedes octal values (except 0) and `'0[xX]'` precedes hex values.

The decimal point character used is `numput::decimal_point()`. Thousands separators are inserted according to `numput::grouping()` and `numput::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a `'+'` or `'-'` or after `'0x'` or `'0X'`. Otherwise, padding occurs at the beginning.

#### Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after writing.

Definition at line 2345 of file locale\_facets.h.

References `std::num_put<_CharT, _Outlter>::do_put()`.

**4.655.4.13** `template<typename _CharT, typename _Outlter> iter_type std::num_put<_CharT, _Outlter>::put ( iter_type __s, ios_base & __io, char_type __fill, unsigned long long __v ) const [inline]`

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the printf `o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showbase` is set, '0' precedes octal values (except 0) and '0[xX]' precedes hex values.

The decimal point character used is `numput::decimal_point()`. Thousands separators are inserted according to `numput::grouping()` and `numput::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

**Parameters**

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

**Returns**

Iterator after writing.

Definition at line 2349 of file locale\_facets.h.

References `std::num_put<_CharT, _Outlter>::do_put()`.

**4.655.4.14** `template<typename _CharT, typename _Outlter> iter_type std::num_put<_CharT, _Outlter>::put ( iter_type __s, ios_base & __io, char_type __fill, double __v ) const [inline]`

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::floatfield`. If equal to `ios_base::fixed`, formats like the `printf f` specifier. Else if equal to `ios_base::scientific`, formats like `e` or `E` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `g` or `G` depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like `g` or `G`.

The output precision is given by `io.precision()`. This precision is capped at `numeric_limits::digits10 + 2` (different for double and long double). The default precision is 6.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showpoint` is set, a decimal point will always be output.

The decimal point character used is `numput::decimal_point()`. Thousands separators are inserted according to `numput::grouping()` and `numput::thousands_sep()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

#### Parameters

<code>__s</code>	Stream to write to.
<code>__io</code>	Source of locale and flags.
<code>__fill</code>	Char_type to use for filling.
<code>__v</code>	Value to format and insert.

#### Returns

Iterator after writing.

Definition at line 2398 of file `locale_facets.h`.

References `std::num_put< _CharT, _OutIter >::do_put()`.

**4.655.4.15** `template<typename _CharT, typename _OutIter> iter_type std::num_put< _CharT, _OutIter >::put ( iter_type __s, ios_base & __io, char_type __fill, long double __v ) const [inline]`

Numeric formatting.

Formats the floating point value `v` and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in `io`.

The basic format is affected by the value of `io.flags()` & `ios_base::floatfield`. If equal to `ios_base::fixed`, formats like the `printf f` specifier. Else if equal to `ios_base::scientific`, formats like `e` or `E` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `g` or `G` depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like `g` or `G`.

The output precision is given by `io.precision()`. This precision is capped at `numeric_limits::digits10 + 2` (different for double and long double). The default precision is 6.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showpoint` is set, a decimal point will always be output.

#### 4.656.1 Detailed Description

`template<typename _CharT>class std::numpunct< _CharT >`

Primary class template `numpunct`.

This facet stores several pieces of information related to printing and scanning numbers, such as the decimal point character. It takes a template parameter specifying the char type. The `numpunct` facet is used by streams for many I/O operations involving numbers.

The `numpunct` template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from a `numpunct` facet.

Definition at line 1641 of file `locale_facets.h`.

#### 4.656.2 Member Typedef Documentation

4.656.2.1 `template<typename _CharT > typedef _CharT std::numpunct< _CharT >::char_type`

Public typedefs.

Definition at line 1647 of file `locale_facets.h`.

4.656.2.2 `template<typename _CharT > typedef basic_string<_CharT> std::numpunct< _CharT >::string_type`

Public typedefs.

Definition at line 1648 of file `locale_facets.h`.

## 4.656.3 Constructor &amp; Destructor Documentation

4.656.3.1 `template<typename _CharT> std::numpunct<_CharT>::numpunct ( size_t __refs = 0 ) [inline],  
[explicit]`

Numpunct constructor.

## Parameters

<code>__refs</code>	RefCount to pass to the base class.
---------------------	-------------------------------------

Definition at line 1665 of file locale\_facets.h.

```
4.656.3.2  template<typename _CharT> std::numpunct<_CharT>::numpunct ( __cache_type * __cache, size_t __refs = 0
    ) [inline],[explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up the predefined locale facets.

## Parameters

<code>__cache</code>	<code>__numpunct_cache</code> object.
<code>__refs</code>	RefCount to pass to the base class.

Definition at line 1679 of file locale\_facets.h.

```
4.656.3.3  template<typename _CharT> std::numpunct<_CharT>::numpunct ( __c_locale __cloc, size_t __refs = 0 )
    [inline],[explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

## Parameters

<code>__cloc</code>	The C locale.
<code>__refs</code>	RefCount to pass to the base class.

Definition at line 1693 of file locale\_facets.h.

```
4.656.3.4  template<typename _CharT> virtual std::numpunct<_CharT>::~numpunct ( ) [protected],
    [virtual]
```

Destructor.

## 4.656.4 Member Function Documentation

```
4.656.4.1  template<typename _CharT> char_type std::numpunct<_CharT>::decimal_point ( ) const [inline]
```

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning `numpunct<char_type>::do_decimal_point()`.

## Returns

*char\_type* representing a decimal point.

Definition at line 1707 of file locale\_facets.h.

References `std::numpunct<_CharT>::do_decimal_point()`.

```
4.656.4.2  template<typename _CharT> virtual char_type std::numpunct<_CharT>::do_decimal_point ( ) const
    [inline],[protected],[virtual]
```

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

#### Returns

*char\_type* representing a decimal point.

Definition at line 1794 of file `locale_facets.h`.

Referenced by `std::num_punct<_CharT>::decimal_point()`.

**4.656.4.3** `template<typename _CharT> virtual string_type std::num_punct<_CharT>::do_falsename ( ) const`  
[inline], [protected], [virtual]

Return string representation of bool false.

Returns a `string_type` containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

#### Returns

`string_type` representing printed form of false.

Definition at line 1845 of file `locale_facets.h`.

Referenced by `std::num_punct<_CharT>::falsename()`.

**4.656.4.4** `template<typename _CharT> virtual string std::num_punct<_CharT>::do_grouping ( ) const` [inline],  
[protected], [virtual]

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

#### See also

`grouping()` for details.

#### Returns

String representing grouping specification.

Definition at line 1819 of file `locale_facets.h`.

Referenced by `std::num_punct<_CharT>::grouping()`.

**4.656.4.5** `template<typename _CharT> virtual char_type std::num_punct<_CharT>::do_thousands_sep ( ) const`  
[inline], [protected], [virtual]

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

#### Returns

*char\_type* representing a thousands separator.

Definition at line 1806 of file `locale_facets.h`.

Referenced by `std::num_punct<_CharT>::thousands_sep()`.

**4.656.4.6** `template<typename _CharT> virtual string_type std::numpunct<_CharT>::do_truename ( ) const`  
`[inline], [protected], [virtual]`

Return string representation of bool true.

Returns a string\_type containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

#### Returns

string\_type representing printed form of true.

Definition at line 1832 of file locale\_facets.h.

Referenced by std::numpunct<\_CharT>::truename().

**4.656.4.7** `template<typename _CharT> string_type std::numpunct<_CharT>::falsename ( ) const` `[inline]`

Return string representation of bool false.

This function returns a string\_type containing the text representation for false bool variables. It does so by calling numpunct<char\_type>::do\_falsename().

#### Returns

string\_type representing printed form of false.

Definition at line 1777 of file locale\_facets.h.

References std::numpunct<\_CharT>::do\_falsename().

**4.656.4.8** `template<typename _CharT> string std::numpunct<_CharT>::grouping ( ) const` `[inline]`

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the grouping() returns "\003\002" and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was "32", this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling numpunct<char\_type>::do\_grouping().

#### Returns

string representing grouping specification.

Definition at line 1751 of file locale\_facets.h.

References std::numpunct<\_CharT>::do\_grouping().

**4.656.4.9** `template<typename _CharT> char_type std::numpunct<_CharT>::thousands_sep ( ) const` `[inline]`

Return thousands separator character.

This function returns a char\_type to use as a thousands separator. It does so by returning returning numpunct<char\_type>::do\_thousands\_sep().

**Returns**

char\_type representing a thousands separator.

Definition at line 1720 of file locale\_facets.h.

References std::numpunct<\_CharT>::do\_thousands\_sep().

**4.656.4.10** template<typename \_CharT> string\_type std::numpunct<\_CharT>::truename ( ) const [inline]

Return string representation of bool true.

This function returns a string\_type containing the text representation for true bool variables. It does so by calling numpunct<char\_type>::do\_truename().

**Returns**

string\_type representing printed form of true.

Definition at line 1764 of file locale\_facets.h.

References std::numpunct<\_CharT>::do\_truename().

**4.656.5 Member Data Documentation**

**4.656.5.1** template<typename \_CharT> locale::id std::numpunct<\_CharT>::id [static]

Numpunct facet id.

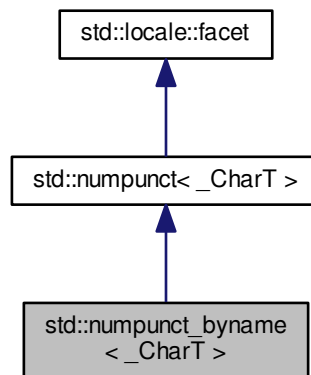

Definition at line 1657 of file locale\_facets.h.

The documentation for this class was generated from the following file:

- [locale\\_facets.h](#)

## 4.658.1 Detailed Description

```
template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>class std::ostream_iterator< _Tp, _CharT, _Traits >
```

Provides output iterator semantics for streams.

This class provides an iterator to write to an ostream. The type `Tp` is the only type written by this iterator and there must be an `operator<<(Tp)` defined.

## Template Parameters

<code>_Tp</code>	The type to write to the ostream.
<code>_CharT</code>	The ostream char_type.
<code>_Traits</code>	The ostream char_traits.

Definition at line 154 of file stream\_iterator.h.

## 4.658.2 Member Typedef Documentation

4.658.2.1 `template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> typedef _CharT  
std::ostream_iterator< _Tp, _CharT, _Traits >::char_type`

Public typedef.

Definition at line 160 of file stream\_iterator.h.

4.658.2.2 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type [inherited]`

Distance between iterators is represented as this type.

Definition at line 125 of file stl\_iterator\_base\_types.h.

4.658.2.3 `typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >::iterator_category  
[inherited]`

One of the [tag types](#).

Definition at line 121 of file stl\_iterator\_base\_types.h.

4.658.2.4 `template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> typedef  
basic_ostream<_CharT, _Traits> std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_type`

Public typedef.

Definition at line 162 of file stream\_iterator.h.

4.658.2.5 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer [inherited]`

This type represents a pointer-to-value\_type.

Definition at line 127 of file stl\_iterator\_base\_types.h.

4.658.2.6 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference [inherited]`

This type represents a reference-to-value\_type.

Definition at line 129 of file stl\_iterator\_base\_types.h.

4.658.2.7 `template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> typedef _Traits  
std::ostream_iterator< _Tp, _CharT, _Traits >::traits_type`

Public typedef.

Definition at line 161 of file stream\_iterator.h.

4.658.2.8 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type [inherited]`

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

#### 4.658.3 Constructor & Destructor Documentation

4.658.3.1 `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>  
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator ( ostream_type & __s ) [inline]`

Construct from an ostream.

Definition at line 171 of file `stream_iterator.h`.

4.658.3.2 `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>  
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator ( ostream_type & __s, const _CharT * __c )  
[inline]`

Construct from an ostream.

The delimiter string *c* is written to the stream after every *Tp* written to the stream. The delimiter is not copied, and thus must not be destroyed while this iterator is in use.

##### Parameters

<code>__s</code>	Underlying ostream to write to.
<code>__c</code>	<i>CharT</i> delimiter string to insert.

Definition at line 183 of file `stream_iterator.h`.

4.658.3.3 `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>>  
std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator ( const ostream_iterator< _Tp, _CharT,  
_Traits > & __obj ) [inline]`

Copy constructor.

Definition at line 187 of file `stream_iterator.h`.

#### 4.658.4 Member Function Documentation

4.658.4.1 `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>> ostream_iterator&  
std::ostream_iterator< _Tp, _CharT, _Traits >::operator= ( const _Tp & __value ) [inline]`

Writes *value* to underlying ostream using `operator<<`. If constructed with delimiter string, writes delimiter to ostream.

Definition at line 193 of file `stream_iterator.h`.

The documentation for this class was generated from the following file:

- [stream\\_iterator.h](#)

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

#### 4.659.3 Constructor & Destructor Documentation

4.659.3.1 `template<typename _CharT, typename _Traits > std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator( ostream_type & __s ) [inline], [noexcept]`

Construct output iterator from ostream.

Definition at line 241 of file `streambuf_iterator.h`.

4.659.3.2 `template<typename _CharT, typename _Traits > std::ostreambuf_iterator< _CharT, _Traits >::ostreambuf_iterator( streambuf_type * __s ) [inline], [noexcept]`

Construct output iterator from streambuf.

Definition at line 245 of file `streambuf_iterator.h`.

#### 4.659.4 Member Function Documentation

4.659.4.1 `template<typename _CharT, typename _Traits > bool std::ostreambuf_iterator< _CharT, _Traits >::failed( ) const [inline], [noexcept]`

Return true if previous operator=() failed.

Definition at line 275 of file `streambuf_iterator.h`.

4.659.4.2 `template<typename _CharT, typename _Traits > ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits >::operator*( ) [inline]`

Return \*this.

Definition at line 260 of file `streambuf_iterator.h`.

4.659.4.3 `template<typename _CharT, typename _Traits > ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits >::operator++( int ) [inline]`

Return \*this.

Definition at line 265 of file `streambuf_iterator.h`.

4.659.4.4 `template<typename _CharT, typename _Traits > ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits >::operator++( ) [inline]`

Return \*this.

Definition at line 270 of file `streambuf_iterator.h`.

4.659.4.5 `template<typename _CharT, typename _Traits> ostreambuf_iterator& std::ostreambuf_iterator< _CharT, _Traits>::operator=( _CharT __c ) [inline]`

Write character to streambuf. Calls streambuf.sputc().

Definition at line 250 of file streambuf\_iterator.h.

The documentation for this class was generated from the following files:

- [stl\\_algobase.h](#)
- [streambuf\\_iterator.h](#)

## 4.660 `std::output_iterator_tag` Struct Reference

### 4.660.1 Detailed Description

Marking output iterators.

Definition at line 92 of file stl\_iterator\_base\_types.h.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

## 4.661 `std::owner_less< _Tp>` Struct Template Reference

### 4.661.1 Detailed Description

`template<typename _Tp> struct std::owner_less< _Tp>`

Primary template `owner_less`.

Definition at line 523 of file shared\_ptr.h.

The documentation for this struct was generated from the following file:

- [shared\\_ptr.h](#)

## 4.662 `std::owner_less< shared_ptr< _Tp>>` Struct Template Reference

Inherits `std::_Sp_owner_less< _Tp, _Tp1>`.

### Public Types

- typedef `_Tp` [first\\_argument\\_type](#)
- typedef bool [result\\_type](#)
- typedef `_Tp` [second\\_argument\\_type](#)

### Public Member Functions

- bool **operator()** (const `_Tp` &\_\_lhs, const `_Tp` &\_\_rhs) const
- bool **operator()** (const `_Tp` &\_\_lhs, const `_Tp1` &\_\_rhs) const
- bool **operator()** (const `_Tp1` &\_\_lhs, const `_Tp` &\_\_rhs) const

#### 4.662.1 Detailed Description

```
template<typename _Tp>struct std::owner_less< shared_ptr< _Tp > >
```

Partial specialization of `owner_less` for `shared_ptr`.

Definition at line 527 of file `shared_ptr.h`.

#### 4.662.2 Member Typedef Documentation

4.662.2.1 `typedef _Tp std::binary_function< _Tp, _Tp, bool >::first_argument_type` [inherited]

`first_argument_type` is the type of the first argument

Definition at line 117 of file `stl_function.h`.

4.662.2.2 `typedef bool std::binary_function< _Tp, _Tp, bool >::result_type` [inherited]

`result_type` is the return type

Definition at line 123 of file `stl_function.h`.

4.662.2.3 `typedef _Tp std::binary_function< _Tp, _Tp, bool >::second_argument_type` [inherited]

`second_argument_type` is the type of the second argument

Definition at line 120 of file `stl_function.h`.

The documentation for this struct was generated from the following file:

- [shared\\_ptr.h](#)

#### 4.663 `std::owner_less< weak_ptr< _Tp > >` Struct Template Reference

Inherits `std::_Sp_owner_less< _Tp, _Tp1 >`.

##### Public Types

- `typedef _Tp first_argument_type`
- `typedef bool result_type`
- `typedef _Tp second_argument_type`

##### Public Member Functions

- `bool operator() (const _Tp &__lhs, const _Tp &__rhs) const`
- `bool operator() (const _Tp &__lhs, const _Tp1 &__rhs) const`
- `bool operator() (const _Tp1 &__lhs, const _Tp &__rhs) const`

#### 4.663.1 Detailed Description

```
template<typename _Tp>struct std::owner_less< weak_ptr< _Tp > >
```

Partial specialization of `owner_less` for `weak_ptr`.

Definition at line 533 of file `shared_ptr.h`.

## 4.663.2 Member Typedef Documentation

## 4.663.2.1 typedef \_Tp std::binary\_function&lt;\_Tp, \_Tp, bool&gt;::first\_argument\_type [inherited]

first\_argument\_type is the type of the first argument

Definition at line 117 of file stl\_function.h.

## 4.663.2.2 typedef bool std::binary\_function&lt;\_Tp, \_Tp, bool&gt;::result\_type [inherited]

result\_type is the return type

Definition at line 123 of file stl\_function.h.

## 4.663.2.3 typedef \_Tp std::binary\_function&lt;\_Tp, \_Tp, bool&gt;::second\_argument\_type [inherited]

second\_argument\_type is the type of the second argument

Definition at line 120 of file stl\_function.h.

The documentation for this struct was generated from the following file:

#### Public Attributes

- [\\_T1](#) [first](#)
- [\\_T2](#) [second](#)

#### 4.664.1 Detailed Description

template<class \_T1, class \_T2>struct std::pair<\_T1, \_T2 >

Struct holding two objects of arbitrary type.

#### Template Parameters

<a href="#">_T1</a>	Type of first object.
<a href="#">_T2</a>	Type of second object.

Definition at line 96 of file stl\_pair.h.

#### 4.664.2 Member Typedef Documentation

##### 4.664.2.1 template<class \_T1, class \_T2> typedef \_T2 std::pair<\_T1, \_T2 >::second\_type

[first\\_type](#) is the first bound type

Definition at line 99 of file stl\_pair.h.

#### 4.664.3 Constructor & Destructor Documentation

##### 4.664.3.1 template<class \_T1, class \_T2> constexpr std::pair<\_T1, \_T2 >::pair ( ) [inline]

[second](#) is a copy of the second object

The default constructor creates [first](#) and [second](#) using their respective default constructors.

Definition at line 108 of file stl\_pair.h.

4.664.3.2 `template<class _T1, class _T2> constexpr std::pair<_T1, _T2>::pair ( const _T1 & __a, const _T2 & __b )`  
`[inline]`

Two objects may be passed to a `pair` constructor to be copied.

Definition at line 112 of file `stl_pair.h`.

4.664.3.3 `template<class _T1, class _T2> template<class _U1, class _U2, class = typename enable_if<__and<is_↵  
 convertible<const _U1&, _T1>, is_convertible<const _U2&, _T2>>::value>::type> constexpr std::pair<_T1, _T2  
 >::pair ( const pair<_U1, _U2> & __p ) [inline]`

There is also a templated copy ctor for the `pair` class itself.

Definition at line 124 of file `stl_pair.h`.

#### 4.664.4 Member Data Documentation

4.664.4.1 `template<class _T1, class _T2> _T1 std::pair<_T1, _T2>::first`

`second_type` is the second bound type

Definition at line 101 of file `stl_pair.h`.

Referenced by `std::_Temporary_buffer<_ForwardIterator, _Tp>::_Temporary_buffer()`, `std::set<_StateIdT>::insert()`, `std::operator<()`, and `std::operator==()`.

4.664.4.2 `template<class _T1, class _T2> _T2 std::pair<_T1, _T2>::second`

`first` is a copy of the first object

Definition at line 102 of file `stl_pair.h`.

Referenced by `std::_Temporary_buffer<_ForwardIterator, _Tp>::_Temporary_buffer()`, `std::set<_StateIdT>::insert()`, and `std::operator==()`.

The documentation for this struct was generated from the following file:

- [stl\\_pair.h](#)

#### 4.665.1 Detailed Description

```
template<typename \_RealType = double>class std::piecewise\_constant\_distribution< \_RealType >
```

A [piecewise\\_constant\\_distribution](#) random number distribution.

The formula for the piecewise constant probability mass function is

Definition at line 5481 of file [random.h](#).

#### 4.665.2 Member Typedef Documentation

4.665.2.1 `template<typename \_RealType = double> typedef \_RealType std::piecewise\_constant\_distribution< \_RealType >::result\_type`

The type of the range of the distribution.

Definition at line 5484 of file [random.h](#).

#### 4.665.3 Member Function Documentation

4.665.3.1 `template<typename \_RealType = double> std::vector<double> std::piecewise\_constant\_distribution< \_RealType >::densities ( ) const` `[inline]`

Returns a vector of the probability densities.

Definition at line 5602 of file random.h.

References std::vector<\_Tp, \_Alloc>::empty().

**4.665.3.2** `template<typename _RealType = double> std::vector<_RealType> std::piecewise_constant_distribution<_RealType>::intervals ( ) const [inline]`

Returns a vector of the intervals.

Definition at line 5586 of file random.h.

References std::vector<\_Tp, \_Alloc>::empty().

**4.665.3.3** `template<typename _RealType = double> result_type std::piecewise_constant_distribution<_RealType>::max ( ) const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 5637 of file random.h.

References std::vector<\_Tp, \_Alloc>::back(), and std::vector<\_Tp, \_Alloc>::empty().

**4.665.3.4** `template<typename _RealType = double> result_type std::piecewise_constant_distribution<_RealType>::min ( ) const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 5627 of file random.h.

References std::vector<\_Tp, \_Alloc>::empty(), and std::vector<\_Tp, \_Alloc>::front().

**4.665.3.5** `template<typename _RealType = double> template<typename UniformRandomNumberGenerator> result_type std::piecewise_constant_distribution<_RealType>::operator() ( UniformRandomNumberGenerator & __urng ) [inline]`

Generating functions.

Definition at line 5648 of file random.h.

**4.665.3.6** `template<typename _RealType = double> param_type std::piecewise_constant_distribution<_RealType>::param ( ) const [inline]`

Returns the parameter set of the distribution.

Definition at line 5612 of file random.h.

**4.665.3.7** `template<typename _RealType = double> void std::piecewise_constant_distribution<_RealType>::param ( const param_type & __param ) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 5620 of file random.h.

**4.665.3.8** `template<typename _RealType = double> void std::piecewise_constant_distribution<_RealType>::reset ( ) [inline]`

Resets the distribution state.

Definition at line 5579 of file random.h.

#### 4.665.4 Friends And Related Function Documentation

4.665.4.1 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits  
> std::basic_ostream<_CharT, _Traits>& operator<< ( std::basic_ostream<_CharT, _Traits> & __os, const  
std::piecewise_constant_distribution<_RealType1> & __x ) [friend]`

Inserts a `piecewise_constant_distribution` random number distribution `__x` into the output stream `__os`.

##### Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>piecewise_constant_distribution</code> random number distribution.

##### Returns

The output stream with the state of `__x` inserted or in an error state.

4.665.4.2 `template<typename _RealType = double> bool operator==( const piecewise_constant_distribution<_RealType  
> & __d1, const piecewise_constant_distribution<_RealType> & __d2 ) [friend]`

Return true if two piecewise constant distributions have the same parameters.

Definition at line 5683 of file random.h.

4.665.4.3 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename  
_Traits> std::basic_istream<_CharT, _Traits>& operator>> ( std::basic_istream<_CharT, _Traits> & __is,  
std::piecewise_constant_distribution<_RealType1> & __x ) [friend]`

Extracts a `piecewise_constant_distribution` random number distribution `__x` from the input stream `__is`.

##### Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>piecewise_constant_distribution</code> random number generator engine.

##### Returns

The input stream with `__x` extracted or in an error state.

The documentation for this class was generated from the following file:

- [random.h](#)

#### 4.666 std::piecewise\_constant\_distribution<\_RealType>::param\_type Struct Reference

##### Public Types

#### 4.668.1 Detailed Description

```
template<typename _RealType = double>class std::piecewise_linear_distribution< _RealType >
```

A `piecewise_linear_distribution` random number distribution.

The formula for the piecewise linear probability mass function is

Definition at line 5748 of file `random.h`.

#### 4.668.2 Member Typedef Documentation

4.668.2.1 `template<typename _RealType = double> typedef _RealType std::piecewise\_linear\_distribution< _RealType >::result\_type`

The type of the range of the distribution.

Definition at line 5751 of file `random.h`.

## 4.668.3 Member Function Documentation

4.668.3.1 `template<typename _RealType = double> std::vector<double> std::piecewise_linear_distribution<_RealType>::densities ( ) const [inline]`

Return a vector of the probability densities of the distribution.

Definition at line 5872 of file random.h.

References `std::vector<_Tp, _Alloc>::empty()`.

4.668.3.2 `template<typename _RealType = double> std::vector<_RealType> std::piecewise_linear_distribution<_RealType>::intervals ( ) const [inline]`

Return the intervals of the distribution.

Definition at line 5855 of file random.h.

References `std::vector<_Tp, _Alloc>::empty()`.

4.668.3.3 `template<typename _RealType = double> result_type std::piecewise_linear_distribution<_RealType>::max ( ) const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 5907 of file random.h.

References `std::vector<_Tp, _Alloc>::back()`, and `std::vector<_Tp, _Alloc>::empty()`.

4.668.3.4 `template<typename _RealType = double> result_type std::piecewise_linear_distribution<_RealType>::min ( ) const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 5897 of file random.h.

References `std::vector<_Tp, _Alloc>::empty()`, and `std::vector<_Tp, _Alloc>::front()`.

4.668.3.5 `template<typename _RealType = double> template<typename _UniformRandomNumberGenerator> result_type std::piecewise_linear_distribution<_RealType>::operator() ( _UniformRandomNumberGenerator & __urng ) [inline]`

Generating functions.

Definition at line 5918 of file random.h.

4.668.3.6 `template<typename _RealType = double> param_type std::piecewise_linear_distribution<_RealType>::param ( ) const [inline]`

Returns the parameter set of the distribution.

Definition at line 5882 of file random.h.

4.668.3.7 `template<typename _RealType = double> void std::piecewise_linear_distribution<_RealType>::param ( const param_type & __param ) [inline]`

Sets the parameter set of the distribution.

## Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 5890 of file random.h.

4.668.3.8 `template<typename _RealType = double> void std::piecewise_linear_distribution<_RealType>::reset ( )`  
`[inline]`

Resets the distribution state.

Definition at line 5848 of file random.h.

## 4.668.4 Friends And Related Function Documentation

4.668.4.1 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits`  
`> std::basic_ostream<_CharT, _Traits>& operator<< ( std::basic_ostream<_CharT, _Traits> & __os, const`  
`std::piecewise_linear_distribution<_RealType1> & __x ) [friend]`

Inserts a `piecewise_linear_distribution` random number distribution `__x` into the output stream `__os`.

## Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>piecewise_linear_distribution</code> random number distribution.

## Returns

The output stream with the state of `__x` inserted or in an error state.

4.668.4.2 `template<typename _RealType = double> bool operator==( const piecewise_linear_distribution<_RealType> &`  
`__d1, const piecewise_linear_distribution<_RealType> & __d2 ) [friend]`

Return true if two `piecewise_linear_distribution` have the same parameters.

Definition at line 5953 of file random.h.

4.668.4.3 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename`  
`_Traits > std::basic_istream<_CharT, _Traits>& operator>> ( std::basic_istream<_CharT, _Traits> & __is,`  
`std::piecewise_linear_distribution<_RealType1> & __x ) [friend]`

Extracts a `piecewise_linear_distribution` random number distribution `__x` from the input stream `__is`.

## Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A <code>piecewise_linear_distribution</code> random number generator engine.

## Returns

The input stream with `__x` extracted or in an error state.

#### 4.675.1 Detailed Description

`template<typename _IntType = int> class std::poisson_distribution< _IntType >`

A discrete Poisson random number distribution.

The formula for the Poisson probability density function is  $p(i|\mu) = \frac{\mu^i}{i!} e^{-\mu}$  where  $\mu$  is the parameter of the distribution.

Definition at line 4430 of file random.h.

#### 4.675.2 Member Typedef Documentation

4.675.2.1 `template<typename _IntType = int> typedef _IntType std::poisson_distribution< _IntType >::result_type`

The type of the range of the distribution.

Definition at line 4433 of file random.h.

#### 4.675.3 Member Function Documentation

4.675.3.1 `template<typename _IntType = int> result_type std::poisson_distribution< _IntType >::max ( ) const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 4524 of file random.h.

References `std::max()`.

4.675.3.2 `template<typename _IntType = int> double std::poisson_distribution< _IntType >::mean ( ) const [inline]`

Returns the distribution parameter `mean`.

Definition at line 4495 of file random.h.

4.675.3.3 `template<typename _IntType = int> result_type std::poisson_distribution< _IntType >::min ( ) const`  
`[inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 4517 of file random.h.

4.675.3.4 `template<typename _IntType = int> template<typename _UniformRandomNumberGenerator > result_type`  
`std::poisson_distribution< _IntType >::operator() ( _UniformRandomNumberGenerator & __urng ) [inline]`

Generating functions.

Definition at line 4532 of file random.h.

4.675.3.5 `template<typename _IntType = int> param_type std::poisson_distribution< _IntType >::param ( ) const`  
`[inline]`

Returns the parameter set of the distribution.

Definition at line 4502 of file random.h.

4.675.3.6 `template<typename _IntType = int> void std::poisson_distribution< _IntType >::param ( const param_type &`  
`__param ) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 4510 of file random.h.

4.675.3.7 `template<typename _IntType = int> void std::poisson_distribution< _IntType >::reset ( ) [inline]`

Resets the distribution state.

Definition at line 4488 of file random.h.

References `std::normal_distribution< _RealType >::reset()`.

#### 4.675.4 Friends And Related Function Documentation

4.675.4.1 `template<typename _IntType = int> template<typename _IntType1 , typename _CharT , typename _Traits >`  
`std::basic_ostream< _CharT, _Traits>& operator<< ( std::basic_ostream< _CharT, _Traits > & __os, const`  
`std::poisson_distribution< _IntType1 > & __x ) [friend]`

Inserts a `poisson_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A <code>poisson_distribution</code> random number distribution.

**Returns**

The output stream with the state of `__x` inserted or in an error state.

4.675.4.2 `template<typename _IntType = int> bool operator==( const poisson_distribution< _IntType > &__d1, const poisson_distribution< _IntType > &__d2 ) [friend]`

Return true if two Poisson distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 4568 of file random.h.

4.675.4.3 `template<typename _IntType = int> template<typename _IntType1, typename _CharT, typename _Traits > std::basic_istream< _CharT, _Traits>& operator>> ( std::basic_istream< _CharT, _Traits > &__is, std::poisson_distribution< _IntType1 > &__x ) [friend]`

Extracts a `poisson_distribution` random number distribution `__x` from the input stream `__is`.

**Parameters**

<code>__is</code>	An input stream.
<code>__x</code>	A <code>poisson_distribution</code> random number generator engine.

**Returns**

The input stream with `__x` extracted or in an error state.

- `_Compare` **comp**

### 4.677.1 Detailed Description

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>>
class std::priority_queue< _Tp, _Sequence, _Compare >
```

A standard container automatically sorting its contents.

### Template Parameters

<code>_Tp</code>	Type of element.
<code>_Sequence</code>	Type of underlying sequence, defaults to <code>vector&lt;_Tp&gt;</code> .
<code>_Compare</code>	Comparison function object type, defaults to <code>less&lt;_Sequence::value_type&gt;</code> .

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces priority-based sorting and queue behavior. Very few of the standard container/sequence interface requirements are met (e.g., iterators).

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::vector`, but it can be any type that supports `front()`, `push_back`, `pop_back`, and random-access iterators, such as `std::deque` or an appropriate user-defined type.

The third template parameter supplies the means of making priority comparisons. It defaults to `less<value_type>` but can be anything defining a strict weak ordering.

Members not found in *normal* containers are `container_type`, which is a typedef for the second `Sequence` parameter, and `push`, `pop`, and `top`, which are standard queue operations.

#### Note

No equality/comparison operators are provided for `priority_queue`.

Sorting of the elements takes place as they are added to, and removed from, the `priority_queue` using the `priority_queue`'s member functions. If you access the elements by other means, and change their data such that the sorting order would be different, the `priority_queue` will not re-sort the elements for you. (How could it know to do so?)

Definition at line 367 of file `stl_queue.h`.

### 4.677.2 Constructor & Destructor Documentation

4.677.2.1 `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>> std::priority_queue<_Tp, _Sequence, _Compare>::priority_queue ( const _Compare &__x, const _Sequence &__s ) [inline], [explicit]`

Default constructor creates no elements.

Definition at line 402 of file `stl_queue.h`.

References `std::make_heap()`.

4.677.2.2 `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename _Sequence::value_type>> template<typename _InputIterator > std::priority_queue<_Tp, _Sequence, _Compare>::priority_queue ( _InputIterator __first, _InputIterator __last, const _Compare &__x, const _Sequence &__s ) [inline]`

Builds a queue from a range.

#### Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__x</code>	A comparison functor describing a strict weak ordering.
<code>__s</code>	An initial sequence with which to start.

Begins by copying `__s`, inserting a copy of the elements from `[first,last)` into the copy of `__s`, then ordering the copy according to `__x`.

For more information on function objects, see the documentation on [functor base classes](#).

Definition at line 442 of file `stl_queue.h`.

References std::make\_heap().

#### 4.677.3 Member Function Documentation

**4.677.3.1** `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename  
_Sequence::value_type>> bool std::priority_queue<_Tp, _Sequence, _Compare >::empty ( ) const  
[inline]`

Returns true if the queue is empty.

Definition at line 468 of file stl\_queue.h.

Referenced by \_\_gnu\_parallel::multiseq\_partition(), and \_\_gnu\_parallel::multiseq\_selection().

**4.677.3.2** `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename  
_Sequence::value_type>> void std::priority_queue<_Tp, _Sequence, _Compare >::pop ( ) [inline]`

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before pop() is called.

Definition at line 531 of file stl\_queue.h.

References std::pop\_heap().

Referenced by \_\_gnu\_parallel::multiseq\_partition(), and \_\_gnu\_parallel::multiseq\_selection().

**4.677.3.3** `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename  
_Sequence::value_type>> void std::priority_queue<_Tp, _Sequence, _Compare >::push ( const value_type & __x  
) [inline]`

Add data to the queue.

##### Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical queue operation. The time complexity of the operation depends on the underlying sequence.

Definition at line 496 of file stl\_queue.h.

References std::push\_heap().

Referenced by \_\_gnu\_parallel::multiseq\_partition(), and \_\_gnu\_parallel::multiseq\_selection().

**4.677.3.4** `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename  
_Sequence::value_type>> size_type std::priority_queue<_Tp, _Sequence, _Compare >::size ( ) const  
[inline]`

Returns the number of elements in the queue.

Definition at line 473 of file stl\_queue.h.

**4.677.3.5** `template<typename _Tp, typename _Sequence = vector<_Tp>, typename _Compare = less<typename  
_Sequence::value_type>> const_reference std::priority_queue<_Tp, _Sequence, _Compare >::top ( ) const  
[inline]`

Returns a read-only (constant) reference to the data at the first element of the queue.

Definition at line 481 of file `stl_queue.h`.

Referenced by `__gnu_parallel::multiseq_partition()`, and `__gnu_parallel::multiseq_selection()`.

#### 4.678.1 Detailed Description

`template<typename _Tp, typename _Sequence = deque<_Tp>> class std::queue<_Tp, _Sequence>`

A standard container giving FIFO behavior.

## Template Parameters

<code>_Tp</code>	Type of element.
<code>_Sequence</code>	Type of underlying sequence, defaults to <code>deque&lt;_Tp&gt;</code> .

Meets many of the requirements of a `container`, but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-first-out queue behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `front`, `back`, `push_back`, and `pop_front`, such as `std::list` or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second `Sequence` parameter, and `push` and `pop`, which are standard queue/FIFO operations.

Definition at line 93 of file `stl_queue.h`.

## 4.678.2 Constructor &amp; Destructor Documentation

4.678.2.1 `template<typename _Tp, typename _Sequence = deque<_Tp>> std::queue<_Tp, _Sequence>::queue ( const _Sequence &__c ) [inline], [explicit]`

Default constructor creates no elements.

Definition at line 138 of file `stl_queue.h`.

## 4.678.3 Member Function Documentation

4.678.3.1 `template<typename _Tp, typename _Sequence = deque<_Tp>> reference std::queue<_Tp, _Sequence>::back ( ) [inline]`

Returns a read/write reference to the data at the last element of the queue.

Definition at line 185 of file `stl_queue.h`.

4.678.3.2 `template<typename _Tp, typename _Sequence = deque<_Tp>> const_reference std::queue<_Tp, _Sequence>::back ( ) const [inline]`

Returns a read-only (constant) reference to the data at the last element of the queue.

Definition at line 196 of file `stl_queue.h`.

4.678.3.3 `template<typename _Tp, typename _Sequence = deque<_Tp>> bool std::queue<_Tp, _Sequence>::empty ( ) const [inline]`

Returns true if the queue is empty.

Definition at line 150 of file `stl_queue.h`.

4.678.3.4 `template<typename _Tp, typename _Sequence = deque<_Tp>> reference std::queue<_Tp, _Sequence>::front ( ) [inline]`

Returns a read/write reference to the data at the first element of the queue.

Definition at line 163 of file `stl_queue.h`.

**4.678.3.5** `template<typename _Tp, typename _Sequence = deque<_Tp>> const_reference std::queue<_Tp, _Sequence>::front ( ) const [inline]`

Returns a read-only (constant) reference to the data at the first element of the queue.

Definition at line 174 of file `stl_queue.h`.

**4.678.3.6** `template<typename _Tp, typename _Sequence = deque<_Tp>> void std::queue<_Tp, _Sequence>::pop ( ) [inline]`

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

Definition at line 238 of file `stl_queue.h`.

**4.678.3.7** `template<typename _Tp, typename _Sequence = deque<_Tp>> void std::queue<_Tp, _Sequence>::push ( const value_type &__x ) [inline]`

Add data to the end of the queue.

Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical queue operation. The function creates an element at the end of the queue and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

Definition at line 212 of file `stl_queue.h`.

**4.678.3.8** `template<typename _Tp, typename _Sequence = deque<_Tp>> size_type std::queue<_Tp, _Sequence>::size ( ) const [inline]`

Returns the number of elements in the queue.

Definition at line 155 of file `stl_queue.h`.

#### 4.678.4 Member Data Documentation

**4.678.4.1** `template<typename _Tp, typename _Sequence = deque<_Tp>> _Sequence std::queue<_Tp, _Sequence>::c [protected]`

'c' is the underlying container. Maintainers wondering why this isn't uglified as per style guidelines should note that this name is specified in the standard, [23.2.3.1]. (Why? Presumably for the same reason that it's protected instead of private: to allow derivation. But none of the other containers allow for derivation. Odd.)

Definition at line 126 of file `stl_queue.h`.

Referenced by `std::operator<()`, and `std::operator==()`.

The documentation for this class was generated from the following file:

- [stl\\_queue.h](#)

## 4.679 std::random\_access\_iterator\_tag Struct Reference

Inheritance diagram for std::random\_access\_iterator\_tag:

### 4.679.1 Detailed Description

Random-access iterators support a superset of bidirectional iterator operations.

Definition at line 103 of file `stl_iterator_base_types.h`.

The documentation for this struct was generated from the following file:

- [stl\\_iterator\\_base\\_types.h](#)

## 4.680 std::random\_device Class Reference

### Public Types

- typedef unsigned int [result\\_type](#)

### Public Member Functions

- **random\_device** (const [std::string](#) &\_\_token="mt19937")
- **random\_device** (const [random\\_device](#) &)=delete
- double **entropy** () const noexcept
- [result\\_type](#) **operator**() ()
- void **operator=** (const [random\\_device](#) &)=delete

### Static Public Member Functions

- static constexpr [result\\_type](#) **max** ()
- static constexpr [result\\_type](#) **min** ()

#### 4.680.1 Detailed Description

A standard interface to a platform-specific non-deterministic random number generator (if any are available).

Definition at line 1575 of file random.h.

#### 4.680.2 Member Typedef Documentation

##### 4.680.2.1 typedef unsigned int `std::random_device::result_type`

The type of the generated random value.

Definition at line 1579 of file random.h.

The documentation for this class was generated from the following file:

- [random.h](#)

#### 4.681 `std::raw_storage_iterator< _OutputIterator, _Tp >` Class Template Reference

Inheritance diagram for `std::raw_storage_iterator< _OutputIterator, _Tp >`:

### Public Types

- typedef void [difference\\_type](#)
- typedef [output\\_iterator\\_tag](#) [iterator\\_category](#)
- typedef void [pointer](#)
- typedef void [reference](#)
- typedef void [value\\_type](#)

## Public Member Functions

- [raw\\_storage\\_iterator](#) (\_OutputIterator \_\_x)
- [raw\\_storage\\_iterator](#) & **operator\*** ()
- [raw\\_storage\\_iterator](#)< \_OutputIterator, \_Tp > & **operator++** ()
- [raw\\_storage\\_iterator](#)< \_OutputIterator, \_Tp > **operator++** (int)
- [raw\\_storage\\_iterator](#) & **operator=** (const \_Tp &\_\_element)

## Protected Attributes

- \_OutputIterator **\_M\_iter**

## 4.681.1 Detailed Description

```
template<class _OutputIterator, class _Tp>class std::raw_storage_iterator< _OutputIterator, _Tp >
```

This iterator class lets algorithms store their results into uninitialized memory.

Definition at line 68 of file `stl_raw_storage_iter.h`.

## 4.681.2 Member Typedef Documentation

4.681.2.1 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type` `[inherited]`

Distance between iterators is represented as this type.

Definition at line 125 of file `stl_iterator_base_types.h`.

4.681.2.2 `typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >::iterator_category` `[inherited]`

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

4.681.2.3 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer` `[inherited]`

This type represents a pointer-to-value\_type.

Definition at line 127 of file `stl_iterator_base_types.h`.

4.681.2.4 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference` `[inherited]`

This type represents a reference-to-value\_type.

Definition at line 129 of file `stl_iterator_base_types.h`.

4.681.2.5 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type` `[inherited]`

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

The documentation for this class was generated from the following file:

- [stl\\_raw\\_storage\\_iter.h](#)

## 4.682 `std::regex_error` Class Reference

Inherits `runtime_error`.

### Public Member Functions

- [regex\\_error](#) ([regex\\_constants::error\\_type](#) \_\_ecode)
- [regex\\_constants::error\\_type](#) code () const

### 4.682.1 Detailed Description

A regular expression exception class.

The regular expression library throws objects of this class on error.

Definition at line 136 of file `regex_error.h`.

### 4.682.2 Constructor & Destructor Documentation

#### 4.682.2.1 `std::regex_error::regex_error ( regex_constants::error_type __ecode )` `[explicit]`

Constructs a `regex_error` object.

#### Parameters

<code>__ecode</code>	the <code>regex</code> error code.
----------------------	------------------------------------

### 4.682.3 Member Function Documentation

#### 4.682.3.1 `regex_constants::error_type` `std::regex_error::code ( )` const `[inline]`

Gets the `regex` error code.

#### Returns

the `regex` error code.

Definition at line 157 of file `regex_error.h`.

The documentation for this class was generated from the following file:

- [regex\\_error.h](#)

## 4.683 `std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >` Class Template Reference

### Public Types

- typedef `std::ptrdiff_t` **difference\_type**
- typedef [std::forward\\_iterator\\_tag](#) **iterator\_category**
- typedef const [value\\_type](#) \* **pointer**
- typedef const [value\\_type](#) & **reference**
- typedef [basic\\_regex](#)< `_Ch_type`, `_Rx_traits` > **regex\_type**
- typedef [match\\_results](#)< `_Bi_iter` > **value\_type**

## Public Member Functions

- `regex_iterator` ()
- `regex_iterator` ( \_Bi\_iter \_\_a, \_Bi\_iter \_\_b, const `regex_type` &\_\_re, `regex_constants::match_flag_type` \_\_m↵  
m=`regex_constants::match_default`)
- `regex_iterator` (const `regex_iterator` &\_\_rhs)
- `bool operator!=` (const `regex_iterator` &\_\_rhs)
- `const value_type & operator*` ()
- `regex_iterator & operator++` ()
- `regex_iterator operator++` (int)
- `const value_type * operator->` ()
- `regex_iterator & operator=` (const `regex_iterator` &\_\_rhs)
- `bool operator==` (const `regex_iterator` &\_\_rhs)

## 4.683.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> class std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >
```

An iterator adaptor that will provide repeated calls of `regex_search` over a range until no more matches remain.

Definition at line 2204 of file `regex.h`.

## 4.683.2 Constructor &amp; Destructor Documentation

```
4.683.2.1 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator ( )
```

Provides a singular iterator, useful for indicating one-past-the-end of a range.

**Todo** Implement this function.

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

```
4.683.2.2 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_iterator ( _Bi_iter __a, _Bi_iter __b, const regex_type & __re, regex_constants::match_flag_type __m = regex_constants::match_default )
```

Constructs a `regex_iterator`...

## Parameters

<code>__a</code>	[IN] The start of a text range to search.
<code>__b</code>	[IN] One-past-the-end of the text range to search.
<code>__re</code>	[IN] The regular expression to match.
<code>__m</code>	[IN] Policy flags for match rules.

**Todo** Implement this function.

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

4.683.2.3 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::regex_iterator ( const regex_iterator<_Bi_iter, _Ch_type, _Rx_traits> & __rhs )`

Copy constructs a `regex_iterator`.

**Todo** Implement this function.

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

#### 4.683.3 Member Function Documentation

4.683.3.1 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> bool std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator!= ( const regex_iterator<_Bi_iter, _Ch_type, _Rx_traits> & __rhs )`

**Todo** Implement this function.

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

4.683.3.2 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> const value_type& std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator* ( )`

**Todo** Implement this function.

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

4.683.3.3 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> regex_iterator& std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator++ ( )`

**Todo** Implement this function.

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

4.683.3.4 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> regex_iterator std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator++ ( int )`

**Todo** Implement this function.

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

4.683.3.5 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> const value_type* std::regex_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator-> ( )`

**Todo** Implement this function.

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

```
4.683.3.6 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> regex_iterator& std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator= (
const regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs )
```

**Todo** Implement this function.

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

```
4.683.3.7 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> bool std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >::operator== ( const
regex_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs )
```

**Todo** Implement this function.

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

## 4.684 `std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >` Class Template Reference

### Public Types

- typedef `std::ptrdiff_t` **difference\_type**
- typedef `std::forward_iterator_tag` **iterator\_category**
- typedef const `value_type` \* **pointer**
- typedef const `value_type` & **reference**
- typedef `basic_regex< _Ch_type, _Rx_traits >` **regex\_type**
- typedef `sub_match< _Bi_iter >` **value\_type**

### Public Member Functions

- `regex_token_iterator` ()
- `regex_token_iterator` ( `_Bi_iter` \_\_a, `_Bi_iter` \_\_b, const `regex_type` &\_\_re, int \_\_submatch=0, `regex_constants↵::match_flag_type` \_\_m=`regex_constants::match_default`)
- `regex_token_iterator` ( `_Bi_iter` \_\_a, `_Bi_iter` \_\_b, const `regex_type` &\_\_re, const `std::vector< int >` &\_\_↵submatches, `regex_constants::match_flag_type` \_\_m=`regex_constants::match_default`)
- template<`std::size_t` \_\_Nm> `regex_token_iterator` ( `_Bi_iter` \_\_a, `_Bi_iter` \_\_b, const `regex_type` &\_\_re, const int(&\_\_↵submatches)[\_\_Nm], `regex_constants::match_flag_type` \_\_m=`regex_constants::match_default`)
- `regex_token_iterator` (const `regex_token_iterator` &\_\_rhs)
- bool `operator!=` (const `regex_token_iterator` &\_\_rhs)
- const `value_type` & `operator*` ()
- `regex_token_iterator` & `operator++` ()
- `regex_token_iterator` `operator++` (int)
- const `value_type` \* `operator->` ()
- `regex_token_iterator` & `operator=` (const `regex_token_iterator` &\_\_rhs)
- bool `operator==` (const `regex_token_iterator` &\_\_rhs)

## 4.684.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>>class std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >
```

Iterates over submatches in a range (or *splits* a text string).

The purpose of this iterator is to enumerate all, or all specified, matches of a regular expression within a text range. The dereferenced value of an iterator of this class is a `std::sub_match` object.

Definition at line 2318 of file `regex.h`.

## 4.684.2 Constructor &amp; Destructor Documentation

```
4.684.2.1 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>> std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator ( )
```

Default constructs a `regex_token_iterator`.

**Todo** Implement this function.

A default-constructed `regex_token_iterator` is a singular iterator that will compare equal to the one-past-the-end value for any iterator of the same type.

```
4.684.2.2 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>>> std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator ( _Bi_iter __a, _Bi_iter __b, const regex_type & __re, int __submatch = 0, regex_constants::match_flag_type __m = regex_constants::match_default )
```

Constructs a `regex_token_iterator`...

## Parameters

<code>__a</code>	[IN] The start of the text to search.
<code>__b</code>	[IN] One-past-the-end of the text to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__submatch</code>	[IN] Which submatch to return. There are some special values for this parameter: <ul style="list-style-type: none"> <li>• -1 each enumerated subexpression does NOT match the regular expression (aka field splitting)</li> <li>• 0 the entire string matching the subexpression is returned for each match within the text.</li> <li>• &gt;0 enumerates only the indicated subexpression from a match within the text.</li> </ul>

<code>__m</code>	[IN] Policy flags for match rules.
------------------	------------------------------------

**Todo** Implement this function.

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

```
4.684.2.3 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator
( _Bi_iter __a, _Bi_iter __b, const regex_type & __re, const std::vector< int > & __submatches,
regex_constants::match_flag_type __m = regex_constants::match_default )
```

Constructs a regex\_token\_iterator...

Parameters

<code>__a</code>	[IN] The start of the text to search.
<code>__b</code>	[IN] One-past-the-end of the text to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__submatches</code>	[IN] A list of subexpressions to return for each regular expression match within the text.
<code>__m</code>	[IN] Policy flags for match rules.

**Todo** Implement this function.

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

```
4.684.2.4 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> template<std::size_t _Nm> std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits
>::regex_token_iterator ( _Bi_iter __a, _Bi_iter __b, const regex_type & __re, const int(&) __submatches[ _Nm],
regex_constants::match_flag_type __m = regex_constants::match_default )
```

Constructs a regex\_token\_iterator...

Parameters

<code>__a</code>	[IN] The start of the text to search.
<code>__b</code>	[IN] One-past-the-end of the text to search.
<code>__re</code>	[IN] The regular expression to search for.
<code>__submatches</code>	[IN] A list of subexpressions to return for each regular expression match within the text.
<code>__m</code>	[IN] Policy flags for match rules.

**Todo** Implement this function.

Needs documentation! See [http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵\\_style.html](http://gcc.gnu.org/onlinedocs/libstdc++/manual/documentation↵_style.html)

```
4.684.2.5 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator
( const regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs )
```

Copy constructs a regex\_token\_iterator.

## Parameters

<code>__rhs</code>	[IN] A <code>regex_token_iterator</code> to copy.
--------------------	---

**Todo** Implement this function.

## 4.684.3 Member Function Documentation

4.684.3.1 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> bool std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator!=( const regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits> & __rhs )`

Compares a `regex_token_iterator` to another for inequality.

**Todo** Implement this function.

4.684.3.2 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> const value_type& std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator* ( )`

Dereferences a `regex_token_iterator`.

**Todo** Implement this function.

4.684.3.3 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> regex_token_iterator& std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator++ ( )`

Increments a `regex_token_iterator`.

**Todo** Implement this function.

4.684.3.4 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> regex_token_iterator std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator++ ( int )`

Postincrements a `regex_token_iterator`.

**Todo** Implement this function.

4.684.3.5 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> const value_type* std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator-> ( )`

Selects a `regex_token_iterator` member.

**Todo** Implement this function.

4.684.3.6 `template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> regex_token_iterator& std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator= ( const regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits> & __rhs )`

Assigns a `regex_token_iterator` to another.

## Parameters

<code>__rhs</code>	[IN] A <code>regex_token_iterator</code> to copy.
--------------------	---

**Todo** Implement this function.

```
4.684.3.7 template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> bool std::regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits>::operator==( const
regex_token_iterator<_Bi_iter, _Ch_type, _Rx_traits> & __rhs )
```

Compares a `regex_token_iterator` to another for equality.

**Todo** Implement this function.

The documentation for this class was generated from the following file:

#### 4.685.1 Detailed Description

```
template<typename _Ch_type> struct std::regex_traits< _Ch_type >
```

Class `regex_traits`. Describes aspects of a regular expression.

A regular expression traits class that satisfies the requirements of section [28.7].

The class `regex` is parameterized around a set of related types and functions used to complete the definition of its semantics. This class satisfies the requirements of such a traits class.

Definition at line 51 of file `regex.h`.

#### 4.685.2 Constructor & Destructor Documentation

4.685.2.1 `template<typename _Ch_type > std::regex_traits< _Ch_type >::regex_traits ( ) [inline]`

Constructs a default traits object.

Definition at line 63 of file `regex.h`.

#### 4.685.3 Member Function Documentation

4.685.3.1 `template<typename _Ch_type > locale_type std::regex_traits< _Ch_type >::getloc ( ) const [inline]`

Gets a copy of the current locale in use by the `regex_traits` object.

Definition at line 270 of file `regex.h`.

4.685.3.2 `template<typename _Ch_type > locale_type std::regex_traits< _Ch_type >::imbue ( locale_type __loc ) [inline]`

Imbues the `regex_traits` object with a copy of a new locale.

##### Parameters

<code>__loc</code>	A locale.
--------------------	-----------

##### Returns

a copy of the previous locale in use by the `regex_traits` object.

##### Note

Calling `imbue` with a different locale than the one currently in use invalidates all cached data held by `*this`.

Definition at line 259 of file `regex.h`.

References `std::swap()`.

4.685.3.3 `template<typename _Ch_type > static std::size_t std::regex_traits< _Ch_type >::length ( const char_type * __p ) [inline], [static]`

Gives the length of a C-style string starting at `__p`.

## Parameters

<code>__p</code>	a pointer to the start of a character sequence.
------------------	---

## Returns

the number of characters between `*__p` and the first default-initialized value of type `char_type`. In other words, uses the C-string algorithm for determining the length of a sequence of characters.

Definition at line 76 of file `regex.h`.

4.685.3.4 `template<typename _Ch_type> template<typename _Fwd_iter> char_class_type std::regex_traits<_Ch_type>::lookup_classname ( _Fwd_iter __first, _Fwd_iter __last, bool __icase = false ) const [inline]`

Maps one or more characters to a named character classification.

## Parameters

<code>__first</code>	beginning of the character sequence.
<code>__last</code>	one-past-the-end of the character sequence.
<code>__icase</code>	ignores the case of the classification name.

## Returns

an unspecified value that represents the character classification named by the character sequence designated by the iterator range `[__first, __last)`. If `icase` is true, the returned mask identifies the classification regardless of the case of the characters to be matched (for example, `[[:lower:]]` is the same as `[[:alpha:]]`), otherwise a case-dependent classification is returned. The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns a value that compares equal to 0.

At least the following names (or their wide-character equivalent) are supported.

- `d`
- `w`
- `s`
- `alnum`
- `alpha`
- `blank`
- `cntrl`
- `digit`
- `graph`
- `lower`
- `print`
- `punct`
- `space`
- `upper`

- `xdigit`

**Todo** Implement this function.

Definition at line 215 of file `regex.h`.

4.685.3.5 `template<typename _Ch_type > template<typename _Fwd_iter > string_type std::regex_traits< _Ch_type >::lookup_collatename ( _Fwd_iter __first, _Fwd_iter __last ) const [inline]`

Gets a collation element by name.

#### Parameters

<code>__first</code>	beginning of the collation element name.
<code>__last</code>	one-past-the-end of the collation element name.

#### Returns

a sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range `[__first, __last)`. Returns an empty string if the character sequence is not a valid collating element.

**Todo** Implement this function.

Definition at line 171 of file `regex.h`.

4.685.3.6 `template<typename _Ch_type > template<typename _Fwd_iter > string_type std::regex_traits< _Ch_type >::transform ( _Fwd_iter __first, _Fwd_iter __last ) const [inline]`

Gets a sort key for a character sequence.

#### Parameters

<code>__first</code>	beginning of the character sequence.
<code>__last</code>	one-past-the-end of the character sequence.

Returns a sort key for the character sequence designated by the iterator range `[F1, F2)` such that if the character sequence `[G1, G2)` sorts before the character sequence `[H1, H2)` then `v.transform(G1, G2) < v.transform(H1, H2)`.

What this really does is provide a more efficient way to compare a string to multiple other strings in locales with fancy collation rules and equivalence classes.

#### Returns

a locale-specific sort key equivalent to the input range.

#### Exceptions

<code>std::bad_cast</code>	if the current locale does not have a collate facet.
----------------------------	--

Definition at line 129 of file `regex.h`.

References `std::basic_string< _CharT, _Traits, _Alloc >::data()`, and `std::basic_string< _CharT, _Traits, _Alloc >::size()`.

4.685.3.7 `template<typename _Ch_type > template<typename _Fwd_iter > string_type std::regex_traits< _Ch_type >::transform_primary ( _Fwd_iter __first, _Fwd_iter __last ) const [inline]`

Gets a sort key for a character sequence, independent of case.

## Parameters

<code>__first</code>	beginning of the character sequence.
<code>__last</code>	one-past-the-end of the character sequence.

Effects: if `typeid(use_facet<collate<_Ch_type>>) == typeid(collate_byname<_Ch_type>)` and the form of the sort key returned by `collate_byname<_Ch_type>::transform(__first, __last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

**Todo** Implement this function.

Definition at line 153 of file `regex.h`.

```
4.685.3.8 template<typename _Ch_type > char_type std::regex_traits<_Ch_type>::translate ( char_type __c ) const
[inline]
```

Performs the identity translation.

## Parameters

<code>__c</code>	A character to the locale-specific character set.
------------------	---

## Returns

`__c`.

Definition at line 87 of file `regex.h`.

```
4.685.3.9 template<typename _Ch_type > char_type std::regex_traits<_Ch_type>::translate_nocase ( char_type __c ) const
[inline]
```

Translates a character into a case-insensitive equivalent.

## Parameters

<code>__c</code>	A character to the locale-specific character set.
------------------	---

## Returns

the locale-specific lower-case equivalent of `__c`.

## Exceptions

<code>std::bad_cast</code>	if the imbued locale does not support the ctype facet.
----------------------------	--

Definition at line 100 of file `regex.h`.

## 4.686.1 Detailed Description

```
template<typename _Iterator> class std::reverse_iterator< _Iterator >
```

Bidirectional and random access iterators have corresponding reverse iterator adaptors that iterate through the data structure in the opposite direction. They have the same signatures as the corresponding iterators. The fundamental relation between a reverse iterator and its corresponding iterator `i` is established by the identity:

```
&*(reverse_iterator(i)) == &(i - 1)
```

*This mapping is dictated by the fact that while there is always a pointer past the end of an array, there might not be a valid pointer before the beginning of an array. [24.4.1]/1,2*

Reverse iterators can be tricky and surprising at first. Their semantics make sense, however, and the trickiness is a side effect of the requirement that the iterators must be safe.

Definition at line 96 of file `stl_iterator.h`.

## 4.686.2 Member Typedef Documentation

```
4.686.2.1 typedef iterator_traits< _Iterator >::iterator_category std::iterator< iterator_traits< _Iterator
>::iterator_category, iterator_traits< _Iterator >::value_type, iterator_traits< _Iterator >::difference_type,
iterator_traits< _Iterator >::pointer, iterator_traits< _Iterator >::reference >::iterator_category [inherited]
```

One of the [tag types](#).

Definition at line 121 of file `stl_iterator_base_types.h`.

```
4.686.2.2 typedef iterator_traits< _Iterator >::value_type std::iterator< iterator_traits< _Iterator >::iterator_category
, iterator_traits< _Iterator >::value_type, iterator_traits< _Iterator >::difference_type, iterator_traits< _Iterator
>::pointer, iterator_traits< _Iterator >::reference >::value_type [inherited]
```

The type "pointed to" by the iterator.

Definition at line 123 of file `stl_iterator_base_types.h`.

## 4.686.3 Constructor &amp; Destructor Documentation

```
4.686.3.1 template<typename _Iterator> std::reverse_iterator< _Iterator >::reverse_iterator ( ) [inline]
```

The default constructor value-initializes member `current`. If it is a pointer, that means it is zero-initialized.

Definition at line 120 of file `stl_iterator.h`.

Referenced by `std::reverse_iterator< _Iterator >::operator+()`, and `std::reverse_iterator< _Iterator >::operator-()`.

```
4.686.3.2 template<typename _Iterator> std::reverse_iterator< _Iterator >::reverse_iterator ( iterator_type __x )
[inline], [explicit]
```

This iterator will move in the opposite direction that `x` does.

Definition at line 126 of file `stl_iterator.h`.

4.686.3.3 `template<typename _Iterator> std::reverse_iterator<_Iterator>::reverse_iterator ( const reverse_iterator<_Iterator> &__x ) [inline]`

The copy constructor is normal.

Definition at line 131 of file `stl_iterator.h`.

4.686.3.4 `template<typename _Iterator> template<typename _Iter> std::reverse_iterator<_Iterator>::reverse_iterator ( const reverse_iterator<_Iter> &__x ) [inline]`

A `reverse_iterator` across other types can be copied if the underlying iterator can be converted to the type of `current`.

Definition at line 139 of file `stl_iterator.h`.

#### 4.686.4 Member Function Documentation

4.686.4.1 `template<typename _Iterator> iterator_type std::reverse_iterator<_Iterator>::base ( ) const [inline]`

##### Returns

`current`, the iterator used for underlying work.

Definition at line 146 of file `stl_iterator.h`.

Referenced by `std::operator==()`.

4.686.4.2 `template<typename _Iterator> reference std::reverse_iterator<_Iterator>::operator* ( ) const [inline]`

##### Returns

A reference to the value at `-current`

This requires that `-current` is dereferenceable.

##### Warning

This implementation requires that for an iterator of the underlying iterator type, `x`, a reference obtained by `*x` remains valid after `x` has been modified or destroyed. This is a bug: <http://gcc.gnu.org/PR51823>

Definition at line 160 of file `stl_iterator.h`.

Referenced by `std::reverse_iterator<_Iterator>::operator->()`.

4.686.4.3 `template<typename _Iterator> reverse_iterator std::reverse_iterator<_Iterator>::operator+ ( difference_type __n ) const [inline]`

##### Returns

A `reverse_iterator` that refers to `current - __n`

The underlying iterator must be a Random Access Iterator.

Definition at line 231 of file `stl_iterator.h`.

References `std::reverse_iterator<_Iterator>::reverse_iterator()`.

4.686.4.4 `template<typename _Iterator> reverse_iterator& std::reverse_iterator<_Iterator>::operator++ ( ) [inline]`

**Returns**

\*this

Decrements the underlying iterator.

Definition at line 181 of file stl\_iterator.h.

**4.686.4.5** `template<typename _Iterator> reverse_iterator std::reverse_iterator<_Iterator>::operator++ ( int )`  
`[inline]`

**Returns**

The original value of \*this

Decrements the underlying iterator.

Definition at line 193 of file stl\_iterator.h.

**4.686.4.6** `template<typename _Iterator> reverse_iterator& std::reverse_iterator<_Iterator>::operator+= ( difference_type __n )` `[inline]`

**Returns**

\*this

Moves the underlying iterator backwards \_\_n steps. The underlying iterator must be a Random Access Iterator.

Definition at line 241 of file stl\_iterator.h.

**4.686.4.7** `template<typename _Iterator> reverse_iterator std::reverse_iterator<_Iterator>::operator- ( difference_type __n ) const` `[inline]`

**Returns**

A reverse\_iterator that refers to current - \_\_n

The underlying iterator must be a Random Access Iterator.

Definition at line 253 of file stl\_iterator.h.

References std::reverse\_iterator<\_Iterator>::reverse\_iterator().

**4.686.4.8** `template<typename _Iterator> reverse_iterator& std::reverse_iterator<_Iterator>::operator-- ( )`  
`[inline]`

**Returns**

\*this

Increments the underlying iterator.

Definition at line 206 of file stl\_iterator.h.

**4.686.4.9** `template<typename _Iterator> reverse_iterator std::reverse_iterator<_Iterator>::operator-- ( int )`  
`[inline]`

**Returns**

A reverse\_iterator with the previous value of \*this

Increments the underlying iterator.

Definition at line 218 of file stl\_iterator.h.

4.686.4.10 `template<typename _Iterator> reverse_iterator& std::reverse_iterator<_Iterator>::operator=(  
difference_type __n) [inline]`

#### Returns

\*this

Moves the underlying iterator forwards `__n` steps. The underlying iterator must be a Random Access Iterator.

Definition at line 263 of file `stl_iterator.h`.

4.686.4.11 `template<typename _Iterator> pointer std::reverse_iterator<_Iterator>::operator->() const [inline]`

#### Returns

A pointer to the value at `-current`

This requires that `-current` is dereferenceable.

Definition at line 172 of file `stl_iterator.h`.

References `std::reverse_iterator<_Iterator>::operator*()`.

4.686.4.12 `template<typename _Iterator> reference std::reverse_iterator<_Iterator>::operator[]( difference_type __n )  
const [inline]`

#### Returns

The value at `current - __n - 1`

The underlying iterator must be a Random Access Iterator.

Definition at line 275 of file `stl_iterator.h`.

## 4.688.1 Detailed Description

```
template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> class std::set<_Key,
_Compare, _Alloc>
```

A standard container made up of unique keys, which can be retrieved in logarithmic time.

## Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Compare</code>	Comparison function object type, defaults to <code>less&lt;_Key&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .

Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys).

Sets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

Definition at line 90 of file `stl_set.h`.

_Rep_type::size_type std::set<_Key, _Compare, _Alloc>::size_type`

Iterator-related typedefs.

Definition at line 131 of file stl\_set.h.

4.688.2.14 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> typedef  
_Compare std::set<_Key, _Compare, _Alloc>::value_compare`

Public typedefs.

Definition at line 106 of file stl\_set.h.

4.688.2.15 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> typedef  
_Key std::set<_Key, _Compare, _Alloc>::value_type`

Public typedefs.

Definition at line 104 of file `stl_set.h`.

#### 4.688.3 Constructor & Destructor Documentation

4.688.3.1 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>  
std::set<_Key, _Compare, _Alloc>::set ( ) [inline]`

Default constructor creates no elements.

Definition at line 139 of file `stl_set.h`.

4.688.3.2 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>  
std::set<_Key, _Compare, _Alloc>::set ( const _Compare & __comp, const allocator_type & __a =  
allocator_type() ) [inline], [explicit]`

Creates a set with no elements.

Parameters

<code>__comp</code>	Comparator to use.
<code>__a</code>	An allocator object.

Definition at line 148 of file `stl_set.h`.

4.688.3.3 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>  
template<typename _InputIterator> std::set<_Key, _Compare, _Alloc>::set ( _InputIterator __first, _InputIterator  
__last ) [inline]`

Builds a set from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

Create a set consisting of copies of the elements from `[__first, __last)`. This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first, __last`)).

Definition at line 163 of file `stl_set.h`.

4.688.3.4 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>>  
template<typename _InputIterator> std::set<_Key, _Compare, _Alloc>::set ( _InputIterator __first, _InputIterator  
__last, const _Compare & __comp, const allocator_type & __a = allocator_type() ) [inline]`

Builds a set from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a set consisting of copies of the elements from `[__first, __last)`. This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(`__first, __last`)).

Definition at line 180 of file `stl_set.h`.

```
4.688.3.5  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
           std::set<_Key, _Compare, _Alloc>::set ( const set<_Key, _Compare, _Alloc> &__x )  [inline]
```

Set copy constructor.

## Parameters

<code>__x</code>	A set of identical element and allocator types.
------------------	---

The newly-created set uses a copy of the allocation object used by `__x`.

Definition at line 193 of file `stl_set.h`.

```
4.688.3.6  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::set<_Key, _Compare, _Alloc>::set ( set<_Key, _Compare, _Alloc> && __x )  [inline], [noexcept]
```

Set move constructor

## Parameters

<code>__x</code>	A set of identical element and allocator types.
------------------	---

The newly-created set contains the exact contents of `x`. The contents of `x` are a valid, but unspecified set.

Definition at line 204 of file `stl_set.h`.

```
4.688.3.7  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::set<_Key, _Compare, _Alloc>::set ( initializer_list<value_type> & __l, const _Compare & __comp =
            _Compare(), const allocator_type & __a = allocator_type() )  [inline]
```

Builds a set from an `initializer_list`.

## Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__comp</code>	A comparison functor.
<code>__a</code>	An allocator object.

Create a set consisting of copies of the elements in the list. This is linear in  $N$  if the list is already sorted, and  $N \log N$  otherwise (where  $N$  is `__l.size()`).

Definition at line 218 of file `stl_set.h`.

## 4.688.4 Member Function Documentation

```
4.688.4.1  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
            std::set<_Key, _Compare, _Alloc>::begin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

Definition at line 298 of file `stl_set.h`.

```
4.688.4.2  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
            std::set<_Key, _Compare, _Alloc>::cbegin ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

Definition at line 335 of file `stl_set.h`.

```
4.688.4.3  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> iterator
            std::set<_Key, _Compare, _Alloc>::cend ( ) const  [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

Definition at line 344 of file stl\_set.h.

4.688.4.4 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void  
std::set< _Key, _Compare, _Alloc >::clear ( ) [inline], [noexcept]`

Erases all elements in a set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 630 of file stl\_set.h.

Referenced by `std::set< _StateIdT >::operator=()`.

4.688.4.5 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>  
size_type std::set< _Key, _Compare, _Alloc >::count ( const key_type & __x ) const [inline]`

Finds the number of elements.

Parameters

<code>__x</code>	Element to located.
------------------	---------------------

Returns

Number of elements with specified key.

This function only makes sense for multisets; for set the result will either be 0 (not present) or 1 (present).

Definition at line 644 of file stl\_set.h.

4.688.4.6 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>  
reverse_iterator std::set< _Key, _Compare, _Alloc >::rbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

Definition at line 353 of file stl\_set.h.

4.688.4.7 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>  
reverse_iterator std::set< _Key, _Compare, _Alloc >::crend ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

Definition at line 362 of file stl\_set.h.

4.688.4.8 `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>  
template<typename... _Args> std::pair<iterator, bool> std::set< _Key, _Compare, _Alloc >::emplace ( _Args  
&&... __args ) [inline]`

Attempts to build and insert an element into the set.

Parameters

<code>__args</code>	Arguments used to generate an element.
---------------------	--

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

Definition at line 413 of file `stl_set.h`.

```
4.688.4.9  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
           template<typename... _Args> iterator std::set<_Key, _Compare, _Alloc>::emplace_hint ( const_iterator __pos,
           _Args &&... __args ) [inline]
```

Attempts to insert an element into the set.

**Parameters**

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

**Returns**

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html>.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 439 of file `stl_set.h`.

```
4.688.4.10 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> bool
           std::set<_Key, _Compare, _Alloc>::empty ( ) const [inline], [noexcept]
```

Returns true if the set is empty.

Definition at line 368 of file `stl_set.h`.

```
4.688.4.11 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
           iterator std::set<_Key, _Compare, _Alloc>::end ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

Definition at line 307 of file `stl_set.h`.

```
4.688.4.12 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
           std::pair<iterator, iterator> std::set<_Key, _Compare, _Alloc>::equal_range ( const key_type & __x )
           [inline]
```

Finds a subsequence matching given key.

## Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

## Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 724 of file stl\_set.h.

```
4.688.4.13 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            std::pair<const_iterator, const_iterator> std::set<_Key, _Compare, _Alloc >::equal_range ( const
            key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

## Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

## Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 728 of file stl\_set.h.

```
4.688.4.14 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            _GLIBCXX_ABI_TAG_CXX11 iterator std::set<_Key, _Compare, _Alloc >::erase ( const_iterator __position )
            [inline]
```

Erases an element from a set.

## Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

## Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 551 of file `stl_set.h`.

```
4.688.4.15  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            size_type std::set<_Key, _Compare, _Alloc>::erase ( const key_type & __x )  [inline]
```

Erases elements according to the provided key.

#### Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

#### Returns

The number of elements erased.

This function erases all the elements located by the given key from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 581 of file `stl_set.h`.

```
4.688.4.16  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            _GLIBCXX_ABI_TAG_CXX11 iterator std::set<_Key, _Compare, _Alloc>::erase ( const_iterator __first,
            const_iterator __last )  [inline]
```

Erases a [`__first`,`__last`) range of elements from a set.

#### Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

#### Returns

The iterator `__last`.

This function erases a sequence of elements from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 603 of file `stl_set.h`.

```
4.688.4.17  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            iterator std::set<_Key, _Compare, _Alloc>::find ( const key_type & __x )  [inline]
```

Tries to locate an element in a set.

#### Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

Definition at line 662 of file stl\_set.h.

```
4.688.4.18 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    const_iterator std::set< _Key, _Compare, _Alloc >::find ( const key_type & __x ) const    [inline]
```

Tries to locate an element in a set.

**Parameters**

<code>__x</code>	Element to be located.
------------------	------------------------

**Returns**

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

Definition at line 666 of file stl\_set.h.

```
4.688.4.19 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    allocator_type std::set< _Key, _Compare, _Alloc >::get_allocator ( ) const    [inline], [noexcept]
```

Returns the allocator object with which the set was constructed.

Definition at line 289 of file stl\_set.h.

```
4.688.4.20 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    std::pair<iterator, bool> std::set< _Key, _Compare, _Alloc >::insert ( const value_type & __x )    [inline]
```

Attempts to insert an element into the set.

**Parameters**

<code>__x</code>	Element to be inserted.
------------------	-------------------------

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

Definition at line 460 of file stl\_set.h.

Referenced by std::set< \_StateIdT >::insert(), and std::set< \_StateIdT >::operator=().

```
4.688.4.21 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
    iterator std::set< _Key, _Compare, _Alloc >::insert ( const_iterator __position, const value_type & __x )
    [inline]
```

Attempts to insert an element into the set.

## Parameters

<code>__position</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

## Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html>.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 497 of file `stl_set.h`.

```
4.688.4.22 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
template<typename _InputIterator > void std::set<_Key, _Compare, _Alloc >::insert ( _InputIterator __first,
_InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

## Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 517 of file `stl_set.h`.

```
4.688.4.23 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void
std::set<_Key, _Compare, _Alloc >::insert ( initializer_list< value_type > __l ) [inline]
```

Attempts to insert a list of elements into the set.

## Parameters

<code>__l</code>	A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted.
------------------	--

Complexity similar to that of the range constructor.

Definition at line 529 of file `stl_set.h`.

```
4.688.4.24 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
key_compare std::set<_Key, _Compare, _Alloc >::key_comp ( ) const [inline]
```

Returns the comparison object with which the set was constructed.

Definition at line 281 of file `stl_set.h`.

```
4.688.4.25 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
iterator std::set<_Key, _Compare, _Alloc >::lower_bound ( const key_type & __x ) [inline]
```

Finds the beginning of a subsequence matching given key.

## Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

## Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 683 of file stl\_set.h.

```
4.688.4.26 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
const_iterator std::set<_Key, _Compare, _Alloc>::lower_bound( const key_type & __x ) const [inline]
```

Finds the beginning of a subsequence matching given key.

## Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

## Returns

Iterator pointing to first element equal to or greater than key, or end().

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or end() if no such element exists.

Definition at line 687 of file stl\_set.h.

```
4.688.4.27 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
size_type std::set<_Key, _Compare, _Alloc>::max_size( ) const [inline], [noexcept]
```

Returns the maximum size of the set.

Definition at line 378 of file stl\_set.h.

```
4.688.4.28 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> set&
std::set<_Key, _Compare, _Alloc>::operator= ( const set<_Key, _Compare, _Alloc> & __x ) [inline]
```

Set assignment operator.

## Parameters

<code>__x</code>	A set of identical element and allocator types.
------------------	---

All the elements of `__x` are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 233 of file stl\_set.h.

```
4.688.4.29 template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> set&
std::set<_Key, _Compare, _Alloc>::operator= ( set<_Key, _Compare, _Alloc> && __x ) [inline]
```

Set move assignment operator.

## Parameters

<code>__x</code>	A set of identical element and allocator types.
------------------	---

The contents of `__x` are moved into this set (without copying). `__x` is a valid, but unspecified set.

Definition at line 248 of file `stl_set.h`.

**4.688.4.30** `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> set& std::set<_Key, _Compare, _Alloc>::operator= ( initializer_list<value_type> __l ) [inline]`

Set list assignment operator.

## Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills a set with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the set and that the resulting set's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 269 of file `stl_set.h`.

**4.688.4.31** `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> reverse_iterator std::set<_Key, _Compare, _Alloc>::rbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

Definition at line 316 of file `stl_set.h`.

**4.688.4.32** `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> reverse_iterator std::set<_Key, _Compare, _Alloc>::rend ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

Definition at line 325 of file `stl_set.h`.

**4.688.4.33** `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> size_type std::set<_Key, _Compare, _Alloc>::size ( ) const [inline], [noexcept]`

Returns the size of the set.

Definition at line 373 of file `stl_set.h`.

**4.688.4.34** `template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> void std::set<_Key, _Compare, _Alloc>::swap ( set<_Key, _Compare, _Alloc> & __x ) [inline]`

Swaps data with another set.

## Parameters

<code>__x</code>	A set of the same element and allocator types.
------------------	--

This exchanges the elements between two sets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Definition at line 393 of file `stl_set.h`.

Referenced by `std::set<_StateIDT>::operator=()`, and `std::swap()`.

```
4.688.4.35  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>  
            iterator std::set<_Key, _Compare, _Alloc>::upper_bound( const key_type & __x )  [inline]
```

Finds the end of a subsequence matching given key.

## Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

## Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 699 of file `stl_set.h`.

```
4.688.4.36  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            const_iterator std::set<_Key, _Compare, _Alloc >::upper_bound ( const key_type & __x ) const  [inline]
```

Finds the end of a subsequence matching given key.

## Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

## Returns

Iterator pointing to the first element greater than key, or end().

Definition at line 703 of file `stl_set.h`.

```
4.688.4.37  template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>>
            value_compare std::set<_Key, _Compare, _Alloc >::value_comp ( ) const  [inline]
```

Returns the comparison object with which the set was constructed.

Definition at line 285 of file `stl_set.h`.

The documentation for this class was generated from the following file:

- [stl\\_set.h](#)

## 4.689 `std::shared_ptr<_Tp>` Class Template Reference

## 4.689.1 Detailed Description

`template<typename _Tp>class std::shared_ptr< _Tp >`

A smart pointer with reference-counted copy semantics.

The object pointed to is deleted when the last `shared_ptr` pointing to it is destroyed or reset.

Definition at line 93 of file `shared_ptr.h`.

## 4.689.2 Constructor & Destructor Documentation

### 4.689.2.1 `template<typename _Tp> constexpr std::shared_ptr< _Tp >::shared_ptr ( ) [inline], [noexcept]`

Construct an empty `shared_ptr`.

#### Postcondition

`use_count()==0 && get()==0`

Definition at line 100 of file `shared_ptr.h`.

4.689.2.2 `template<typename _Tp> template<typename _Tp1 > std::shared_ptr< _Tp >::shared_ptr ( _Tp1 * __p )`  
`[inline], [explicit]`

Construct a `shared_ptr` that owns the pointer `__p`.

## Parameters

<code>__p</code>	A pointer that is convertible to <code>element_type*</code> .
------------------	---

## Postcondition

`use_count() == 1 && get() == __p`

## Exceptions

<code>std::bad_alloc</code> , in	which case <code>delete __p</code> is called.
----------------------------------	---

Definition at line 112 of file `shared_ptr.h`.

4.689.2.3 `template<typename _Tp> template<typename _Tp1, typename _Deleter> std::shared_ptr< _Tp >::shared_ptr ( _Tp1 * __p, _Deleter __d ) [inline]`

Construct a `shared_ptr` that owns the pointer `__p` and the deleter `__d`.

## Parameters

<code>__p</code>	A pointer.
<code>__d</code>	A deleter.

## Postcondition

`use_count() == 1 && get() == __p`

## Exceptions

<code>std::bad_alloc</code> , in	which case <code>__d(__p)</code> is called.
----------------------------------	---

Requirements: `_Deleter`'s copy constructor and destructor must not throw

`__shared_ptr` will release `__p` by calling `__d(__p)`

Definition at line 129 of file `shared_ptr.h`.

4.689.2.4 `template<typename _Tp> template<typename _Deleter> std::shared_ptr< _Tp >::shared_ptr ( nullptr_t __p, _Deleter __d ) [inline]`

Construct a `shared_ptr` that owns a null pointer and the deleter `__d`.

## Parameters

<code>__p</code>	A null pointer constant.
<code>__d</code>	A deleter.

## Postcondition

`use_count() == 1 && get() == __p`

## Exceptions

<code>std::bad_alloc</code> , in	which case <code>__d(__p)</code> is called.
----------------------------------	---

Requirements: `_Deleter`'s copy constructor and destructor must not throw

The last owner will call `__d(__p)`

Definition at line 146 of file `shared_ptr.h`.

4.689.2.5 `template<typename _Tp> template<typename _Tp1 , typename _Deleter , typename _Alloc > std::shared_ptr<_Tp>::shared_ptr ( _Tp1 * __p, _Deleter __d, _Alloc __a ) [inline]`

Construct a `shared_ptr` that owns the pointer `__p` and the deleter `__d`.

## Parameters

<code>__p</code>	A pointer.
<code>__d</code>	A deleter.
<code>__a</code>	An allocator.

## Postcondition

`use_count() == 1 && get() == __p`

## Exceptions

<i>std::bad_alloc</i> , in	which case <code>__d(__p)</code> is called.
----------------------------	---

Requirements: `_Deleter`'s copy constructor and destructor must not throw `_Alloc`'s copy constructor and destructor must not throw.

`__shared_ptr` will release `__p` by calling `__d(__p)`

Definition at line 165 of file `shared_ptr.h`.

**4.689.2.6** `template<typename _Tp> template<typename _Deleter, typename _Alloc > std::shared_ptr< _Tp >::shared_ptr ( nullptr_t __p, _Deleter __d, _Alloc __a ) [inline]`

Construct a `shared_ptr` that owns a null pointer and the deleter `__d`.

## Parameters

<code>__p</code>	A null pointer constant.
<code>__d</code>	A deleter.
<code>__a</code>	An allocator.

## Postcondition

`use_count() == 1 && get() == __p`

## Exceptions

<i>std::bad_alloc</i> , in	which case <code>__d(__p)</code> is called.
----------------------------	---

Requirements: `_Deleter`'s copy constructor and destructor must not throw `_Alloc`'s copy constructor and destructor must not throw.

The last owner will call `__d(__p)`

Definition at line 184 of file `shared_ptr.h`.

**4.689.2.7** `template<typename _Tp> template<typename _Tp1 > std::shared_ptr< _Tp >::shared_ptr ( const shared_ptr< _Tp1 > & __r, _Tp* __p ) [inline], [noexcept]`

Constructs a `shared_ptr` instance that stores `__p` and shares ownership with `__r`.

## Parameters

<code>__r</code>	A <code>shared_ptr</code> .
<code>__p</code>	A pointer that will remain valid while <code>*__r</code> is valid.

**Postcondition**

```
get() == __p && use_count() == __r.use_count()
```

This can be used to construct a `shared_ptr` to a sub-object of an object managed by an existing `shared_ptr`.

```
shared_ptr< pair<int,int> > pii(new pair<int,int>());
shared_ptr<int> pi(pii, &pii->first);
assert(pii.use_count() == 2);
```

Definition at line 206 of file `shared_ptr.h`.

```
4.689.2.8 template<typename _Tp> template<typename _Tp1, typename = typename std::enable_if<std::is_convertible<_Tp1*,
    _Tp*>::value>::type> std::shared_ptr<_Tp>::shared_ptr( const shared_ptr<_Tp1> & __r )
    [inline], [noexcept]
```

If `__r` is empty, constructs an empty `shared_ptr`; otherwise construct a `shared_ptr` that shares ownership with `__r`.

**Parameters**

<code>__r</code>	A <code>shared_ptr</code> .
------------------	-----------------------------

**Postcondition**

```
get() == __r.get() && use_count() == __r.use_count()
```

Definition at line 218 of file `shared_ptr.h`.

```
4.689.2.9 template<typename _Tp> std::shared_ptr<_Tp>::shared_ptr( shared_ptr<_Tp> && __r ) [inline],
    [noexcept]
```

Move-constructs a `shared_ptr` instance from `__r`.

**Parameters**

<code>__r</code>	A <code>shared_ptr</code> rvalue.
------------------	-----------------------------------

**Postcondition**

\*this contains the old value of `__r`, `__r` is empty.

Definition at line 226 of file `shared_ptr.h`.

```
4.689.2.10 template<typename _Tp> template<typename _Tp1, typename = typename std::enable_if<std::is_convertible<_Tp1*,
    _Tp*>::value>::type> std::shared_ptr<_Tp>::shared_ptr( shared_ptr<_Tp1> && __r ) [inline],
    [noexcept]
```

Move-constructs a `shared_ptr` instance from `__r`.

**Parameters**

<code>__r</code>	A <code>shared_ptr</code> rvalue.
------------------	-----------------------------------

**Postcondition**

\*this contains the old value of `__r`, `__r` is empty.

Definition at line 236 of file `shared_ptr.h`.

```
4.689.2.11 template<typename _Tp> template<typename _Tp1> std::shared_ptr<_Tp>::shared_ptr( const weak_ptr<_Tp1> &__r ) [inline], [explicit]
```

Constructs a shared\_ptr that shares ownership with \_\_r and stores a copy of the pointer stored in \_\_r.

## Parameters

<code>__r</code>	A weak_ptr.
------------------	-------------

## Postcondition

`use_count() == __r.use_count()`

## Exceptions

<i>bad_weak_ptr</i>	when <code>__r.expired()</code> , in which case the constructor has no effect.
---------------------	--

Definition at line 248 of file `shared_ptr.h`.

4.689.2.12 `template<typename _Tp> constexpr std::shared_ptr<_Tp>::shared_ptr ( nullptr_t __p ) [inline],  
[noexcept]`

Construct an empty `shared_ptr`.

## Parameters

<code>__p</code>	A null pointer constant.
------------------	--------------------------

## Postcondition

`use_count() == 0 && get() == nullptr`

Definition at line 265 of file `shared_ptr.h`.

## 4.689.3 Friends And Related Function Documentation

4.689.3.1 `template<typename _Tp> template<typename _Tp1, typename _Alloc, typename... _Args> shared_ptr<_Tp1>  
allocate_shared ( const _Alloc & __a, _Args &&... __args ) [friend]`

Create an object that is owned by a `shared_ptr`.

## Parameters

<code>__a</code>	An allocator.
<code>__args</code>	Arguments for the <code>_Tp</code> object's constructor.

## Returns

A `shared_ptr` that owns the newly created object.

## Exceptions

<i>An</i>	exception thrown from <code>_Alloc::allocate</code> or from the constructor of <code>_Tp</code> .
-----------	---

A copy of `__a` will be used to allocate memory for the `shared_ptr` and the new object.

Definition at line 595 of file `shared_ptr.h`.

## 4.690.1 Detailed Description

`template<typename _RandomNumberEngine, size_t __k>class std::shuffle_order_engine<_RandomNumberEngine, __k>`

Produces random numbers by combining random numbers from some base engine to produce random numbers with a specifies number of bits `__w`.

Definition at line 1292 of file random.h.

#### 4.690.2 Member Typedef Documentation

4.690.2.1 `template<typename _RandomNumberEngine, size_t __k> typedef _RandomNumberEngine::result_type  
std::shuffle_order_engine< _RandomNumberEngine, __k >::result_type`

The type of the generated random value.

Definition at line 1295 of file random.h.

#### 4.690.3 Constructor & Destructor Documentation

4.690.3.1 `template<typename _RandomNumberEngine, size_t __k> std::shuffle_order_engine< _RandomNumberEngine,  
__k >::shuffle_order_engine ( ) [inline]`

Constructs a default shuffle\_order\_engine engine.

The underlying engine is default constructed as well.

Definition at line 1308 of file random.h.

4.690.3.2 `template<typename _RandomNumberEngine, size_t __k> std::shuffle_order_engine< _RandomNumberEngine,  
__k >::shuffle_order_engine ( const _RandomNumberEngine & __rng ) [inline],[explicit]`

Copy constructs a shuffle\_order\_engine engine.

Copies an existing base class random number generator.

##### Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 1319 of file random.h.

4.690.3.3 `template<typename _RandomNumberEngine, size_t __k> std::shuffle_order_engine< _RandomNumberEngine,  
__k >::shuffle_order_engine ( _RandomNumberEngine && __rng ) [inline],[explicit]`

Move constructs a shuffle\_order\_engine engine.

Copies an existing base class random number generator.

##### Parameters

<code>__rng</code>	An existing (base class) engine object.
--------------------	---

Definition at line 1330 of file random.h.

4.690.3.4 `template<typename _RandomNumberEngine, size_t __k> std::shuffle_order_engine< _RandomNumberEngine,  
__k >::shuffle_order_engine ( result_type __s ) [inline],[explicit]`

Seed constructs a shuffle\_order\_engine engine.

Constructs the underlying generator engine seeded with `__s`.

##### Parameters

<code>__s</code>	A seed value for the base class engine.
------------------	---

Definition at line 1341 of file random.h.

```
4.690.3.5 template<typename _RandomNumberEngine, size_t __k> template<typename _Sseq, typename =  
    typename std::enable_if<!std::is_same<_Sseq, shuffle_order_engine>::value && !std::is_same<_Sseq,  
    _RandomNumberEngine>::value> ::type> std::shuffle_order_engine<_RandomNumberEngine, __k  
    >::shuffle_order_engine ( _Sseq & __q ) [inline], [explicit]
```

Generator construct a shuffle\_order\_engine engine.

## Parameters

<code>__q</code>	A seed sequence.
------------------	------------------

Definition at line 1355 of file random.h.

## 4.690.4 Member Function Documentation

4.690.4.1 `template<typename _RandomNumberEngine, size_t __k> const _RandomNumberEngine& std::shuffle_order_engine< _RandomNumberEngine, __k >::base ( ) const [inline], [noexcept]`

Gets a const reference to the underlying generator engine object.

Definition at line 1398 of file random.h.

4.690.4.2 `template<typename _RandomNumberEngine, size_t __k> void std::shuffle_order_engine< _RandomNumberEngine, __k >::discard ( unsigned long long __z ) [inline]`

Discard a sequence of random numbers.

Definition at line 1419 of file random.h.

4.690.4.3 `template<typename _RandomNumberEngine, size_t __k> static constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::max ( ) [inline], [static]`

Gets the maximum value in the generated random number range.

Definition at line 1412 of file random.h.

References `std::max()`.

4.690.4.4 `template<typename _RandomNumberEngine, size_t __k> static constexpr result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::min ( ) [inline], [static]`

Gets the minimum value in the generated random number range.

Definition at line 1405 of file random.h.

References `std::min()`.

4.690.4.5 `template<typename _RandomNumberEngine, size_t __k> result_type std::shuffle_order_engine< _RandomNumberEngine, __k >::operator() ( )`

Gets the next value in the generated random number sequence.

4.690.4.6 `template<typename _RandomNumberEngine, size_t __k> void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed ( ) [inline]`

Reseeds the `shuffle_order_engine` object with the default seed for the underlying base class generator engine.

Definition at line 1364 of file random.h.

4.690.4.7 `template<typename _RandomNumberEngine, size_t __k> void std::shuffle_order_engine< _RandomNumberEngine, __k >::seed ( result_type __s ) [inline]`

Reseeds the `shuffle_order_engine` object with the default seed for the underlying base class generator engine.

Definition at line 1375 of file random.h.

```
4.690.4.8  template<typename _RandomNumberEngine, size_t __k> template<typename _Sseq > void  
           std::shuffle_order_engine<_RandomNumberEngine, __k>::seed ( _Sseq & __q ) [inline]
```

Reseeds the `shuffle_order_engine` object with the given seed sequence.

## Parameters

<code>__q</code>	A seed generator function.
------------------	----------------------------

Definition at line 1388 of file random.h.

## 4.690.5 Friends And Related Function Documentation

4.690.5.1 `template<typename _RandomNumberEngine, size_t __k> template<typename _RandomNumberEngine1, size_t __k1, typename _CharT, typename _Traits> std::basic_ostream<_CharT, _Traits>& operator<< ( std::basic_ostream<_CharT, _Traits> & __os, const std::shuffle_order_engine<_RandomNumberEngine1, __k1> & __x )`  
`[friend]`

Inserts the current state of a shuffle\_order\_engine random number generator engine `__x` into the output stream `__os`.

## Parameters

<code>__os</code>	An output stream.
<code>__x</code>	A shuffle_order_engine random number generator engine.

## Returns

The output stream with the state of `__x` inserted or in an error state.

4.690.5.2 `template<typename _RandomNumberEngine, size_t __k> bool operator== ( const shuffle_order_engine<_RandomNumberEngine, __k> & __lhs, const shuffle_order_engine<_RandomNumberEngine, __k> & __rhs )`  
`[friend]`

Compares two shuffle\_order\_engine random number generator objects of the same type for equality.

## Parameters

<code>__lhs</code>	A shuffle_order_engine random number generator object.
<code>__rhs</code>	Another shuffle_order_engine random number generator object.

## Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1443 of file random.h.

4.690.5.3 `template<typename _RandomNumberEngine, size_t __k> template<typename _RandomNumberEngine1, size_t __k1, typename _CharT, typename _Traits> std::basic_istream<_CharT, _Traits>& operator>> ( std::basic_istream<_CharT, _Traits> & __is, std::shuffle_order_engine<_RandomNumberEngine1, __k1> & __x )` `[friend]`

Extracts the current state of a % subtract\_with\_carry\_engine random number generator engine `__x` from the input stream `__is`.

## Parameters

<code>__is</code>	An input stream.
<code>__x</code>	A shuffle_order_engine random number generator engine.

## Returns

The input stream with the state of `__x` extracted or in an error state.

- [slice](#) (size\_t \_\_o, size\_t \_\_d, size\_t \_\_s)
- size\_t [size](#) () const
- size\_t [start](#) () const
- size\_t [stride](#) () const

## 4.691.1 Detailed Description

Class defining one-dimensional subset of an array.

The slice class represents a one-dimensional subset of an array, specified by three parameters: start offset, size, and stride. The start offset is the index of the first element of the array that is part of the subset. The size is the total number of elements in the subset. Stride is the distance between each successive array element to include in the subset.

For example, with an array of size 10, and a slice with offset 1, size 3 and stride 2, the subset consists of array elements 1, 3, and 5.

Definition at line 59 of file `slice_array.h`.

#### Friends

- class **valarray**< \_Tp >

#### 4.692.1 Detailed Description

template<typename \_Tp>class std::slice\_array< \_Tp >

Reference to one-dimensional subset of an array.

A slice\_array is a reference to the actual elements of an array specified by a slice. The way to get a slice\_array is to call operator[](slice) on a valarray. The returned slice\_array then permits carrying operations out on the referenced subset of elements in the original valarray. For example, operator+=(valarray) will add values to the subset of elements in the underlying valarray this slice\_array refers to.

#### Parameters

<i>Tp</i>	Element type.
-----------	---------------

Definition at line 123 of file slice\_array.h.

The documentation for this class was generated from the following file:

- `template<typename _Tp1, typename _Seq1> bool operator==` (`const stack<_Tp1, _Seq1> &`, `const stack<_Tp1, _Seq1> &`)

## 4.693.1 Detailed Description

`template<typename _Tp, typename _Sequence = deque<_Tp>>class std::stack<_Tp, _Sequence>`

A standard container giving FILO behavior.

## Template Parameters

<code>_Tp</code>	Type of element.
<code>_Sequence</code>	Type of underlying sequence, defaults to <code>deque&lt;_Tp&gt;</code> .

Meets many of the requirements of a `container`, but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-last-out stack behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `back`, `push_back`, and `pop_front`, such as `std::list`, `std::vector`, or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second `Sequence` parameter, and `push`, `pop`, and `top`, which are standard stack/FILO operations.

Definition at line 96 of file `stl_stack.h`.

#### 4.693.2 Constructor & Destructor Documentation

4.693.2.1 `template<typename _Tp, typename _Sequence = deque<_Tp>> std::stack<_Tp, _Sequence>::stack ( const _Sequence &__c ) [inline], [explicit]`

Default constructor creates no elements.

Definition at line 134 of file `stl_stack.h`.

#### 4.693.3 Member Function Documentation

4.693.3.1 `template<typename _Tp, typename _Sequence = deque<_Tp>> bool std::stack<_Tp, _Sequence>::empty ( ) const [inline]`

Returns true if the stack is empty.

Definition at line 146 of file `stl_stack.h`.

4.693.3.2 `template<typename _Tp, typename _Sequence = deque<_Tp>> void std::stack<_Tp, _Sequence>::pop ( ) [inline]`

Removes first element.

This is a typical stack operation. It shrinks the stack by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

Definition at line 212 of file `stl_stack.h`.

4.693.3.3 `template<typename _Tp, typename _Sequence = deque<_Tp>> void std::stack<_Tp, _Sequence>::push ( const value_type &__x ) [inline]`

Add data to the top of the stack.

##### Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the top of the stack and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

Definition at line 186 of file `stl_stack.h`.

4.693.3.4 `template<typename _Tp, typename _Sequence = deque<_Tp>> size_type std::stack<_Tp, _Sequence>::size ( ) const [inline]`

Returns the number of elements in the stack.

Definition at line 151 of file `stl_stack.h`.

4.693.3.5 `template<typename _Tp, typename _Sequence = deque<_Tp>> reference std::stack<_Tp, _Sequence>::top ( ) [inline]`

Returns a read/write reference to the data at the first element of the stack.

Definition at line 159 of file `stl_stack.h`.

4.693.3.6 `template<typename _Tp, typename _Sequence = deque<_Tp>> const_reference std::stack<_Tp, _Sequence>::top  
( ) const [inline]`

Returns a read-only (constant) reference to the data at the first element of the stack.

Definition at line 170 of file `stl_stack.h`.

## 4.694.1 Detailed Description

```
template<typename _RealType = double>class std::student_t_distribution< _RealType >
```

A student\_t\_distribution random number distribution.

The formula for the normal probability mass function is:

$$p(x|n) = \frac{1}{\sqrt{(n\pi)}} \frac{\Gamma((n+1)/2)}{\Gamma(n/2)} \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2}$$

Definition at line 3354 of file random.h.

## 4.694.2 Member Typedef Documentation

```
4.694.2.1 template<typename _RealType = double> typedef _RealType std::student_t_distribution< _RealType
>::result_type
```

The type of the range of the distribution.

Definition at line 3357 of file random.h.

## 4.694.3 Member Function Documentation

```
4.694.3.1 template<typename _RealType = double> result_type std::student_t_distribution< _RealType >::max ( ) const
[inline]
```

Returns the least upper bound value of the distribution.

Definition at line 3437 of file random.h.

References std::max().

```
4.694.3.2 template<typename _RealType = double> result_type std::student_t_distribution< _RealType >::min ( ) const
[inline]
```

Returns the greatest lower bound value of the distribution.

Definition at line 3430 of file random.h.

```
4.694.3.3 template<typename _RealType = double> template<typename _UniformRandomNumberGenerator > result_type
std::student_t_distribution< _RealType >::operator() ( _UniformRandomNumberGenerator & __urng )
[inline]
```

Generating functions.

Definition at line 3445 of file random.h.

```
4.694.3.4 template<typename _RealType = double> param_type std::student_t_distribution< _RealType >::param ( )
const [inline]
```

Returns the parameter set of the distribution.

Definition at line 3415 of file random.h.

```
4.694.3.5  template<typename _RealType = double> void std::student_t_distribution<_RealType>::param ( const  
           param_type & __param ) [inline]
```

Sets the parameter set of the distribution.

**Parameters**

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 3423 of file random.h.

4.694.3.6 `template<typename _RealType = double> void std::student_t_distribution< _RealType >::reset ( )`  
`[inline]`

Resets the distribution state.

Definition at line 3398 of file random.h.

References `std::normal_distribution< _RealType >::reset()`, and `std::gamma_distribution< _RealType >::reset()`.

**4.694.4 Friends And Related Function Documentation**

4.694.4.1 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > std::basic_ostream<_CharT, _Traits>& operator<< ( std::basic_ostream<_CharT, _Traits > & __os, const std::student_t_distribution< _RealType1 > & __x )` `[friend]`

Inserts a `student_t_distribution` random number distribution `__x` into the output stream `__os`.

**Parameters**

<code>__os</code>	An output stream.
<code>__x</code>	A <code>student_t_distribution</code> random number distribution.

**Returns**

The output stream with the state of `__x` inserted or in an error state.

4.694.4.2 `template<typename _RealType = double> bool operator==( const student_t_distribution< _RealType > & __d1, const student_t_distribution< _RealType > & __d2 )` `[friend]`

Return true if two Student t distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 3494 of file random.h.

4.694.4.3 `template<typename _RealType = double> template<typename _RealType1 , typename _CharT , typename _Traits > std::basic_istream<_CharT, _Traits>& operator>> ( std::basic_istream<_CharT, _Traits > & __is, std::student_t_distribution< _RealType1 > & __x )` `[friend]`

Extracts a `student_t_distribution` random number distribution `__x` from the input stream `__is`.

**Parameters**

<code>__is</code>	An input stream.
<code>__x</code>	A <code>student_t_distribution</code> random number generator engine.

**Returns**

The input stream with `__x` extracted or in an error state.

- bool **matched**
- `_Bilter` `second`

#### 4.696.1 Detailed Description

`template<typename _Bilter> class std::sub_match< _Bilter >`

A sequence of characters matched by a particular marked sub-expression.

An object of this class is essentially a pair of iterators marking a matched subexpression within a regular expression pattern match. Such objects can be converted to and compared with `std::basic_string` objects of a similar base character type as the pattern matched by the regular expression.

The iterators that make up the pair are the usual half-open interval referencing the actual original pattern matched.

Definition at line 741 of file `regex.h`.

#### 4.696.2 Member Typedef Documentation

4.696.2.1 `typedef _Bilter std::pair< _Bilter , _Bilter >::second_type` `[inherited]`

`first_type` is the first bound type

Definition at line 99 of file `stl_pair.h`.

#### 4.696.3 Member Function Documentation

4.696.3.1 `template<typename _Bilter> int std::sub_match< _Bilter >::compare ( const sub_match< _Bilter > & __s )`  
`const` `[inline]`

Compares this and another matched sequence.

## Parameters

<code>__s</code>	Another matched sequence to compare to this one.
------------------	--

## Return values

<code>&lt;0</code>	this matched sequence will collate before <code>__s</code> .
<code>=0</code>	this matched sequence is equivalent to <code>__s</code> .
<code>&lt;0</code>	this matched sequence will collate after <code>__s</code> .

Definition at line 802 of file regex.h.

Referenced by `std::operator!=()`, `std::operator<()`, `std::operator<=()`, `std::operator==()`, `std::operator>()`, and `std::operator>=()`.

4.696.3.2 `template<typename _Bilter> int std::sub_match<_Bilter>::compare ( const string_type & __s ) const`  
`[inline]`

Compares this `sub_match` to a string.

## Parameters

<code>__s</code>	A string to compare to this <code>sub_match</code> .
------------------	--

## Return values

<code>&lt;0</code>	this matched sequence will collate before <code>__s</code> .
<code>=0</code>	this matched sequence is equivalent to <code>__s</code> .
<code>&lt;0</code>	this matched sequence will collate after <code>__s</code> .

Definition at line 815 of file regex.h.

4.696.3.3 `template<typename _Bilter> int std::sub_match<_Bilter>::compare ( const value_type * __s ) const`  
`[inline]`

Compares this `sub_match` to a C-style string.

## Parameters

<code>__s</code>	A C-style string to compare to this <code>sub_match</code> .
------------------	--

## Return values

<code>&lt;0</code>	this matched sequence will collate before <code>__s</code> .
<code>=0</code>	this matched sequence is equivalent to <code>__s</code> .
<code>&lt;0</code>	this matched sequence will collate after <code>__s</code> .

Definition at line 828 of file regex.h.

4.696.3.4 `template<typename _Bilter> difference_type std::sub_match<_Bilter>::length ( ) const` `[inline]`

Gets the length of the matching sequence.

Definition at line 759 of file regex.h.

4.696.3.5 `template<typename _Bilter> std::sub_match<_Bilter>::operator string_type ( ) const` `[inline]`

Gets the matching sequence as a string.

**Returns**

the matching sequence as a string.

This is the implicit conversion operator. It is identical to the `str()` member function except that it will want to pop up in unexpected places and cause a great deal of confusion and cursing from the unwary.

Definition at line 772 of file `regex.h`.

**4.696.3.6** `template<typename _Bilter> string_type std::sub_match<_Bilter>::str ( ) const [inline]`

Gets the matching sequence as a string.

**Returns**

the matching sequence as a string.

Definition at line 785 of file `regex.h`.

Referenced by `std::sub_match<_Bi_iter>::compare()`, and `std::operator<<()`.

**4.696.4 Member Data Documentation**

**4.696.4.1** `_Bilter std::pair<_Bilter, _Bilter>::first [inherited]`

`second_type` is the second bound type

Definition at line 101 of file `stl_pair.h`.

Referenced by `std::sub_match<_Bi_iter>::length()`, `std::sub_match<_Bi_iter>::operator string_type()`, and `std::sub_match<_Bi_iter>::str()`.

**4.696.4.2** `_Bilter std::pair<_Bilter, _Bilter>::second [inherited]`

`first` is a copy of the first object

Definition at line 102 of file `stl_pair.h`.

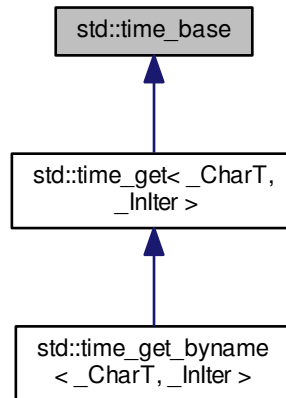

Referenced by `std::sub_match<_Bi_iter>::length()`, `std::sub_match<_Bi_iter>::operator string_type()`, and `std::sub_match<_Bi_iter>::str()`.

## 4.698.1 Detailed Description

template<typename \_CharT, typename \_InIter> class std::time\_get<\_CharT, \_InIter>

Primary class template time\_get.

This facet encapsulates the code to parse and return a date or time from a string. It is used by the istream numeric extraction operators.

The time\_get template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the time\_get facet.

Definition at line 368 of file locale\_facets\_nonio.h.

## 4.698.2 Member Typedef Documentation

4.698.2.1 template<typename \_CharT, typename \_InIter> typedef \_CharT std::time\_get<\_CharT, \_InIter>::char\_type

Public typedefs.

Definition at line 374 of file locale\_facets\_nonio.h.

4.698.2.2 `template<typename _CharT, typename _Inlter > typedef _Inlter std::time_get< _CharT, _Inlter >::iter_type`

Public typedefs.

Definition at line 375 of file `locale_facets_nonio.h`.

#### 4.698.3 Constructor & Destructor Documentation

4.698.3.1 `template<typename _CharT, typename _Inlter > std::time_get< _CharT, _Inlter >::time_get ( size_t __refs = 0 )`  
`[inline], [explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

##### Parameters

<code>__refs</code>	Passed to the base facet class.
---------------------	---------------------------------

Definition at line 390 of file `locale_facets_nonio.h`.

4.698.3.2 `template<typename _CharT, typename _Inlter > virtual std::time_get< _CharT, _Inlter >::~time_get ( )`  
`[inline], [protected], [virtual]`

Destructor.

Definition at line 546 of file `locale_facets_nonio.h`.

#### 4.698.4 Member Function Documentation

4.698.4.1 `template<typename _CharT, typename _Inlter > dateorder std::time_get< _CharT, _Inlter >::date_order ( ) const`  
`[inline]`

Return preferred order of month, day, and year.

This function returns an enum from `timebase::dateorder` giving the preferred ordering if the format `x` given to `time_put::put()` only uses month, day, and year. If the format `x` for the associated locale uses other fields, this function returns `timebase::dateorder::noorder`.

NOTE: The library always returns `noorder` at the moment.

##### Returns

A member of `timebase::dateorder`.

Definition at line 407 of file `locale_facets_nonio.h`.

References `std::time_get< _CharT, _Inlter >::do_date_order()`.

4.698.4.2 `template<typename _CharT, typename _Inlter > virtual dateorder std::time_get< _CharT, _Inlter >::do_date_order ( ) const`  
`[protected], [virtual]`

Return preferred order of month, day, and year.

This function returns an enum from `timebase::dateorder` giving the preferred ordering if the format `x` given to `time_put::put()` only uses month, day, and year. This function is a hook for derived classes to change the value returned.

**Returns**

A member of timebase::dateorder.

Referenced by std::time\_get< \_CharT, \_InIter >::date\_order().

4.698.4.3 `template<typename _CharT, typename _InIter > virtual iter_type std::time_get< _CharT, _InIter >::do_get_date  
( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const  
[protected], [virtual]`

Parse input date string.

This function parses a date according to the format *X* and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

get\_date() for details.

**Parameters**

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

**Returns**

Iterator to first char beyond date string.

Referenced by std::time\_get< \_CharT, \_InIter >::get\_date().

4.698.4.4 `template<typename _CharT, typename _InIter > virtual iter_type std::time_get< _CharT, _InIter  
>::do_get_monthname( iter_type __beg, iter_type __end, ios_base & , ios_base::iostate & __err, tm * __tm )  
const [protected], [virtual]`

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

get\_monthname() for details.

**Parameters**

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.

<code>__tm</code>	Pointer to struct tm to fill in.
-------------------	----------------------------------

**Returns**

Iterator to first char beyond month name.

Referenced by `std::time_get<_CharT, _InIter>::get_monthname()`.

```
4.698.4.5 template<typename _CharT, typename _InIter> virtual iter_type std::time_get<_CharT, _InIter>::do_get_time
( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const
[protected], [virtual]
```

Parse input time string.

This function parses a time according to the format `x` and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

`get_time()` for details.

**Parameters**

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

**Returns**

Iterator to first char beyond time string.

Referenced by `std::time_get<_CharT, _InIter>::get_time()`.

```
4.698.4.6 template<typename _CharT, typename _InIter> virtual iter_type std::time_get<_CharT, _InIter>::do_get_weekday
( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const
[protected], [virtual]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

`get_weekday()` for details.

**Parameters**

<code>__beg</code>	Start of string to parse.
--------------------	---------------------------

<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

**Returns**

Iterator to first char beyond weekday name.

Referenced by `std::time_get< _CharT, _InIter >::get_weekday()`.

```
4.698.4.7 template<typename _CharT, typename _InIter> virtual iter_type std::time_get< _CharT, _InIter >::do_get_year
( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const
[protected], [virtual]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

`get_year()` for details.

**Parameters**

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

**Returns**

Iterator to first char beyond year.

Referenced by `std::time_get< _CharT, _InIter >::get_year()`.

```
4.698.4.8 template<typename _CharT, typename _InIter> iter_type std::time_get< _CharT, _InIter >::get_date ( iter_type
__beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const [inline]
```

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_date()`.

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, `err` |= `ios_base::failbit`. If parsing reads all the characters, `err` |= `ios_base::eofbit`.

**Parameters**

<code>__beg</code>	Start of string to parse.
--------------------	---------------------------

<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

#### Returns

Iterator to first char beyond date string.

Definition at line 456 of file `locale_facets_nonio.h`.

References `std::time_get<_CharT, _InIter>::do_get_date()`.

```
4.698.4.9  template<typename _CharT, typename _InIter> iter_type std::time_get<_CharT, _InIter>::get_monthname (
            iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const  [inline]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_monthname()`.

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

#### Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

#### Returns

Iterator to first char beyond month name.

Definition at line 513 of file `locale_facets_nonio.h`.

References `std::time_get<_CharT, _InIter>::do_get_monthname()`.

```
4.698.4.10 template<typename _CharT, typename _InIter> iter_type std::time_get<_CharT, _InIter>::get_time ( iter_type
            __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const  [inline]
```

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_time()`.

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

## Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

## Returns

Iterator to first char beyond time string.

Definition at line 431 of file locale\_facets\_nonio.h.

References std::time\_get< \_CharT, \_InIter >::do\_get\_time().

4.698.4.11 `template<typename _CharT, typename _InIter> iter_type std::time_get< _CharT, _InIter >::get_weekday ( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const [inline]`

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling time\_get::do\_get\_weekday().

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, err |= ios\_base::failbit. If parsing reads all the characters, err |= ios\_base::eofbit.

## Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

## Returns

Iterator to first char beyond weekday name.

Definition at line 484 of file locale\_facets\_nonio.h.

References std::time\_get< \_CharT, \_InIter >::do\_get\_weekday().

4.698.4.12 `template<typename _CharT, typename _InIter> iter_type std::time_get< _CharT, _InIter >::get_year ( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const [inline]`

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling time\_get::do\_get\_year().

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, err |= ios\_base::failbit. If parsing reads all the characters, err |= ios\_base::eofbit.

## Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

## Returns

Iterator to first char beyond year.

Definition at line 539 of file `locale_facets_nonio.h`.

References `std::time_get<_CharT, _InIter>::do_get_year()`.

#### 4.699.1 Detailed Description

template<typename `_CharT`, typename `_InIter`>class std::time\_get\_byname< `_CharT`, `_InIter` >

class time\_get\_byname [22.2.5.2].

Definition at line 686 of file locale\_facets\_nonio.h.

#### 4.699.2 Member Function Documentation

4.699.2.1 template<typename `_CharT`, typename `_InIter` > dateorder std::time\_get< `_CharT`, `_InIter` >::date\_order ( ) const  
[inline], [inherited]

Return preferred order of month, day, and year.

This function returns an enum from `timebase::dateorder` giving the preferred ordering if the format `x` given to `time_put::put()` only uses month, day, and year. If the format `x` for the associated locale uses other fields, this function returns `timebase::dateorder::noorder`.

NOTE: The library always returns `noorder` at the moment.

##### Returns

A member of `timebase::dateorder`.

Definition at line 407 of file locale\_facets\_nonio.h.

References `std::time_get< _CharT, _InIter >::do_date_order()`.

4.699.2.2 template<typename `_CharT`, typename `_InIter` > virtual dateorder std::time\_get< `_CharT`, `_InIter` >::do\_date\_order ( ) const  
[protected], [virtual], [inherited]

Return preferred order of month, day, and year.

This function returns an enum from `timebase::dateorder` giving the preferred ordering if the format `x` given to `time_put::put()` only uses month, day, and year. This function is a hook for derived classes to change the value returned.

##### Returns

A member of `timebase::dateorder`.

Referenced by `std::time_get< _CharT, _InIter >::date_order()`.

4.699.2.3 template<typename `_CharT`, typename `_InIter` > virtual iter\_type std::time\_get< `_CharT`, `_InIter` >::do\_get\_date ( iter\_type `__beg`, iter\_type `__end`, ios\_base & `__io`, ios\_base::iostate & `__err`, tm \* `__tm` ) const  
[protected], [virtual], [inherited]

Parse input date string.

This function parses a date according to the format `X` and puts the results into a user-supplied struct `tm`. This function is a hook for derived classes to change the value returned.

See also

get\_date() for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

Referenced by std::time\_get< \_CharT, \_InIter >::get\_date().

```
4.699.2.4 template<typename _CharT, typename _InIter> virtual iter_type std::time_get< _CharT, _InIter
>::do_get_monthname( iter_type __beg, iter_type __end, ios_base &, ios_base::iostate & __err, tm * __tm )
const [protected], [virtual], [inherited]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get\_monthname() for details.

Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Referenced by std::time\_get< \_CharT, \_InIter >::get\_monthname().

```
4.699.2.5 template<typename _CharT, typename _InIter> virtual iter_type std::time_get< _CharT, _InIter>::do_get_time
( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const
[protected], [virtual], [inherited]
```

Parse input time string.

This function parses a time according to the format x and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

get\_time() for details.

**Parameters**

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

**Returns**

Iterator to first char beyond time string.

Referenced by `std::time_get<_CharT, _InIter>::get_time()`.

```
4.699.2.6 template<typename _CharT, typename _InIter> virtual iter_type std::time_get<_CharT, _InIter>::do_get_weekday
( iter_type __beg, iter_type __end, ios_base &, ios_base::iostate & __err, tm * __tm ) const
[protected], [virtual], [inherited]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

`get_weekday()` for details.

**Parameters**

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

**Returns**

Iterator to first char beyond weekday name.

Referenced by `std::time_get<_CharT, _InIter>::get_weekday()`.

```
4.699.2.7 template<typename _CharT, typename _InIter> virtual iter_type std::time_get<_CharT, _InIter>::do_get_year
( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const
[protected], [virtual], [inherited]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

**See also**

`get_year()` for details.

## Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

## Returns

Iterator to first char beyond year.

Referenced by `std::time_get< _CharT, _InIter >::get_year()`.

**4.699.2.8** `template<typename _CharT, typename _InIter> iter_type std::time_get< _CharT, _InIter >::get_date ( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const [inline], [inherited]`

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_date()`.

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

## Parameters

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

## Returns

Iterator to first char beyond date string.

Definition at line 456 of file `locale_facets_nonio.h`.

References `std::time_get< _CharT, _InIter >::do_get_date()`.

**4.699.2.9** `template<typename _CharT, typename _InIter> iter_type std::time_get< _CharT, _InIter >::get_monthname ( iter_type __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const [inline], [inherited]`

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_monthname()`.

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

**Parameters**

<code>__beg</code>	Start of string to parse.
<code>__end</code>	End of string to parse.
<code>__io</code>	Source of the locale.
<code>__err</code>	Error flags to set.
<code>__tm</code>	Pointer to struct tm to fill in.

**Returns**

Iterator to first char beyond month name.

Definition at line 513 of file locale\_facets\_nonio.h.

References `std::time_get<_CharT, _InIter>::do_get_monthname()`.

```
4.699.2.10 template<typename _CharT, typename _InIter> iter_type std::time_get<_CharT, _InIter>::get_time ( iter_type
    __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err, tm * __tm ) const [inline],
    [inherited]
```

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_time()`.

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, `err |= ios_base::failbit`. If parsing reads all the characters, `err |= ios_base::eofbit`.

**Parameters**

## 4.700.1 Detailed Description

template<typename \_CharT, typename \_Outiter>class std::time\_put<\_CharT, \_Outiter>

Primary class template time\_put.

This facet encapsulates the code to format and output dates and times according to formats used by strftime().

The time\_put template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the time\_put facet.

Definition at line 715 of file locale\_facets\_nonio.h.

## 4.700.2 Member Typedef Documentation

4.700.2.1 template<typename \_CharT, typename \_Outiter> typedef \_CharT std::time\_put<\_CharT, \_Outiter>::char\_type

Public typedefs.

Definition at line 721 of file locale\_facets\_nonio.h.

4.700.2.2 template<typename \_CharT, typename \_Outiter> typedef \_Outiter std::time\_put<\_CharT, \_Outiter>::iter\_type

Public typedefs.

Definition at line 722 of file locale\_facets\_nonio.h.

## 4.700.3 Constructor &amp; Destructor Documentation

4.700.3.1 template<typename \_CharT, typename \_Outiter> std::time\_put<\_CharT, \_Outiter>::time\_put ( size\_t \_\_refs = 0 )  
[inline], [explicit]

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

<b>__refs</b>	Passed to the base facet class.
---------------	---------------------------------

Definition at line 736 of file locale\_facets\_nonio.h.

4.700.3.2 template<typename \_CharT, typename \_Outiter> virtual std::time\_put<\_CharT, \_Outiter>::~~time\_put ( )  
[inline], [protected], [virtual]

Destructor.

Definition at line 782 of file locale\_facets\_nonio.h.

#### 4.700.4 Member Function Documentation

4.700.4.1 `template<typename _CharT, typename _Outlter > virtual iter_type std::time_put< _CharT, _Outlter >::do_put ( iter_type __s, ios_base & __io, char_type __fill, const tm * __tm, char __format, char __mod ) const`  
`[protected], [virtual]`

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

See also

`put()` for more details.

##### Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	char_type to use for padding.
<code>__tm</code>	Struct tm with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

##### Returns

Iterator after writing.

Referenced by `std::time_put< _CharT, _Outlter >::put()`.

4.700.4.2 `template<typename _CharT, typename _Outlter > iter_type std::time_put< _CharT, _Outlter >::put ( iter_type __s, ios_base & __io, char_type __fill, const tm * __tm, const _CharT * __beg, const _CharT * __end ) const`

Format and output a time or date.

This function formats the data in struct tm according to the provided format string. The format string is interpreted as by `strftime()`.

##### Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	char_type to use for padding.
<code>__tm</code>	Struct tm with date and time info to format.
<code>__beg</code>	Start of format string.
<code>__end</code>	End of format string.

##### Returns

Iterator after writing.

4.700.4.3 `template<typename _CharT, typename _Outlter > iter_type std::time_put< _CharT, _Outlter >::put ( iter_type __s, ios_base & __io, char_type __fill, const tm * __tm, char __format, char __mod = 0 ) const` `[inline]`

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. The format and modifier are interpreted as by `strftime()`. It does so by returning `time_put::do_put()`.

## Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	char_type to use for padding.
<code>__tm</code>	Struct tm with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

## Returns

Iterator after writing.

Definition at line 775 of file locale\_facets\_nonio.h.

References `std::time_put< _CharT, _Outlter >::do_put()`.

## 4.700.5 Member Data Documentation

4.700.5.1 `template<typename _CharT, typename _Outlter> locale::id std::time_put< _CharT, _Outlter >::id` `[static]`

Numpunct facet id.

Definition at line 726 of file locale\_facets\_nonio.h.

The documentation for this class was generated from the following file:

- [locale\\_facets\\_nonio.h](#)

- static const char \* **\_S\_get\_c\_name** () throw ()
- static `_c_locale` **\_S\_lc\_ctype\_c\_locale** (`_c_locale` \_\_cloc, const char \*\_\_s)

**4.701.1 Detailed Description**

```
template<typename _CharT, typename _Outlter>class std::time_put_byname< _CharT, _Outlter >
```

class time\_put\_byname [22.2.5.4].

Definition at line 811 of file locale\_facets\_nonio.h.

**4.701.2 Member Function Documentation**

**4.701.2.1** `template<typename _CharT, typename _Outlter > virtual iter_type std::time_put< _CharT, _Outlter >::do_put (iter_type __s, ios_base & __io, char_type __fill, const tm *__tm, char __format, char __mod ) const`  
 [protected], [virtual], [inherited]

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

See also

put() for more details.

#### Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	char_type to use for padding.
<code>__tm</code>	Struct tm with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

#### Returns

Iterator after writing.

Referenced by std::time\_put< \_CharT, \_Outlter >::put().

**4.701.2.2** `template<typename _CharT, typename _Outlter> iter_type std::time_put< _CharT, _Outlter >::put ( iter_type __s, ios_base & __io, char_type __fill, const tm * __tm, const _CharT * __beg, const _CharT * __end ) const` [inherited]

Format and output a time or date.

This function formats the data in struct tm according to the provided format string. The format string is interpreted as by strftime().

#### Parameters

<code>__s</code>	The stream to write to.
<code>__io</code>	Source of locale.
<code>__fill</code>	char_type to use for padding.
<code>__tm</code>	Struct tm with date and time info to format.
<code>__beg</code>	Start of format string.
<code>__end</code>	End of format string.

#### Returns

Iterator after writing.

**4.701.2.3** `template<typename _CharT, typename _Outlter> iter_type std::time_put< _CharT, _Outlter >::put ( iter_type __s, ios_base & __io, char_type __fill, const tm * __tm, char __format, char __mod = 0 ) const` [inline], [inherited]

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. The format and modifier are interpreted as by strftime(). It does so by returning time\_put::do\_put().

#### Parameters

<code>__s</code>	The stream to write to.
------------------	-------------------------

<code>__io</code>	Source of locale.
<code>__fill</code>	<code>char_type</code> to use for padding.
<code>__tm</code>	Struct <code>tm</code> with date and time info to format.
<code>__format</code>	Format char.
<code>__mod</code>	Optional modifier char.

#### Returns

Iterator after writing.

Definition at line 775 of file `locale_facets_nonio.h`.

References `std::time_put< _CharT, _Outlter >::do_put()`.

#### 4.701.3 Member Data Documentation

4.701.3.1 `template<typename _CharT, typename _Outlter > locale::id std::time_put< _CharT, _Outlter >::id` `[static]`, `[inherited]`

Numpunct facet id.

#### 4.704.1 Detailed Description

template<typename \_IntType = int> class std::uniform\_int\_distribution< \_IntType >

Uniform discrete distribution for random numbers. A discrete random distribution on the range  $[min, max]$  with equal probability throughout the range.

Definition at line 1666 of file random.h.

#### 4.704.2 Member Typedef Documentation

4.704.2.1 template<typename \_IntType = int> typedef \_IntType std::uniform\_int\_distribution< \_IntType >::result\_type

The type of the range of the distribution.

Definition at line 1669 of file random.h.

#### 4.704.3 Constructor & Destructor Documentation

4.704.3.1 template<typename \_IntType = int> std::uniform\_int\_distribution< \_IntType >::uniform\_int\_distribution ( \_IntType \_\_a = 0, \_IntType \_\_b = std::numeric\_limits<\_IntType>::max() ) [inline], [explicit]

Constructs a uniform distribution object.

Definition at line 1709 of file random.h.

#### 4.704.4 Member Function Documentation

4.704.4.1 `template<typename _IntType = int> result_type std::uniform_int_distribution< _IntType >::max ( ) const`  
`[inline]`

Returns the inclusive upper bound of the distribution range.

Definition at line 1761 of file random.h.

4.704.4.2 `template<typename _IntType = int> result_type std::uniform_int_distribution< _IntType >::min ( ) const`  
`[inline]`

Returns the inclusive lower bound of the distribution range.

Definition at line 1754 of file random.h.

4.704.4.3 `template<typename _IntType = int> template<typename _UniformRandomNumberGenerator > result_type`  
`std::uniform_int_distribution< _IntType >::operator() ( _UniformRandomNumberGenerator & __urng )`  
`[inline]`

Generating functions.

Definition at line 1769 of file random.h.

4.704.4.4 `template<typename _IntType = int> param_type std::uniform_int_distribution< _IntType >::param ( ) const`  
`[inline]`

Returns the parameter set of the distribution.

Definition at line 1739 of file random.h.

4.704.4.5 `template<typename _IntType = int> void std::uniform_int_distribution< _IntType >::param ( const param_type`  
`& __param ) [inline]`

Sets the parameter set of the distribution.

Parameters

<code>__param</code>	The new parameter set of the distribution.
----------------------	--

Definition at line 1747 of file random.h.

4.704.4.6 `template<typename _IntType = int> void std::uniform_int_distribution< _IntType >::reset ( ) [inline]`

Resets the distribution state.

Does nothing for the uniform integer distribution.

Definition at line 1725 of file random.h.

#### 4.704.5 Friends And Related Function Documentation

4.704.5.1 `template<typename _IntType = int> bool operator==( const uniform_int_distribution< _IntType > & __d1, const`  
`uniform_int_distribution< _IntType > & __d2 ) [friend]`

Return true if two uniform integer distributions have the same parameters.

Definition at line 1804 of file random.h.

The documentation for this class was generated from the following file:

- [random.h](#)

#### 4.706.1 Detailed Description

`template<typename _RealType = double> class std::uniform_real_distribution< _RealType >`

Uniform continuous distribution for random numbers.

A continuous random distribution on the range [min, max) with equal probability throughout the range. The URNG should be real-valued and deliver number in the range [0, 1).

Definition at line 1867 of file random.h.

#### 4.706.2 Member Typedef Documentation

4.706.2.1 `template<typename _RealType = double> typedef _RealType std::uniform_real_distribution< _RealType >::result_type`

The type of the range of the distribution.

Definition at line 1870 of file random.h.

#### 4.706.3 Constructor & Destructor Documentation

4.706.3.1 `template<typename _RealType = double> std::uniform_real_distribution< _RealType >::uniform_real_distribution ( _RealType __a = _RealType(0), _RealType __b = _RealType(1) )`  
`[inline], [explicit]`

Constructs a uniform\_real\_distribution object.

##### Parameters

<code>__a</code>	[IN] The lower bound of the distribution.
<code>__b</code>	[IN] The upper bound of the distribution.

Definition at line 1913 of file random.h.

#### 4.706.4 Member Function Documentation

4.706.4.1 `template<typename _RealType = double> result_type std::uniform_real_distribution<_RealType>::max ( )`  
`const [inline]`

Returns the inclusive upper bound of the distribution range.

Definition at line 1965 of file random.h.

4.706.4.2 `template<typename _RealType = double> result_type std::uniform_real_distribution<_RealType>::min ( )`  
`const [inline]`

Returns the inclusive lower bound of the distribution range.

Definition at line 1958 of file random.h.

4.706.4.3 `template<typename _RealType = double> template<typename UniformRandomNumberGenerator> result_type`

## Friends

- `template<typename _Key1, typename _Tp1, typename _Hash1, typename _Pred1, typename _Alloc1 > bool operator==` (const `unordered_map< _Key1, _Tp1, _Hash1, _Pred1, _Alloc1 >` &, const `unordered_map< _Key1, _Tp1, _Hash1, _Pred1, _Alloc1 >` &)

## 4.710.1 Detailed Description

```
template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> class std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of unique keys (containing at most one of each key value) that associates values of another type with the keys.

## Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__umap_hashtable`.

Definition at line 97 of file `unordered_map.h`.

## 4.710.2 Member Typedef Documentation

**4.710.2.1** `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> typedef _Hashtable::allocator_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::allocator_type`

Public typedefs.

Definition at line 111 of file `unordered_map.h`.

**4.710.2.2** `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> typedef _Hashtable::const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::const_iterator`

Public typedefs.

Definition at line 107 of file unordered\_map.h.

#### 4.710.3 Constructor & Destructor Documentation

4.710.3.1 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_map ( size_type __n = 10, const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type() ) [inline], [explicit]`

Default constructor creates no elements.

Parameters

<code>__n</code>	Initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Definition at line 138 of file unordered\_map.h.

4.710.3.2 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::unordered_map ( _InputIterator __f, _InputIterator __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type() ) [inline]`

Builds an unordered\_map from a range.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_map` consisting of copies of the elements from `[__first,__last)`. This is linear in  $N$  (where  $N$  is `distance(__first,__last)`).

Definition at line 159 of file `unordered_map.h`.

```
4.710.3.3  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
           = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
           >::unordered_map ( const unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc> & ) [default]
```

Copy constructor.

```
4.710.3.4  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
           = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
           >::unordered_map ( unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc> && ) [default]
```

Move constructor.

```
4.710.3.5  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
           = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
           >::unordered_map ( initializer_list<value_type> & __l, size_type __n = 0, const hasher & __hf = hasher(),
           const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type() ) [inline]
```

Builds an `unordered_map` from an `initializer_list`.

## Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_map` consisting of copies of the elements in the list. This is linear in  $N$  (where  $N$  is `__l.size()`).

Definition at line 184 of file `unordered_map.h`.

## 4.710.4 Member Function Documentation

```
4.710.4.1  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
           std::allocator<std::pair<const _Key, _Tp>>> mapped_type& std::unordered_map<_Key, _Tp, _Hash, _Pred,
           _Alloc>::at ( const key_type & __k ) [inline]
```

Access to `unordered_map` data.

## Parameters

<code>__k</code>	The key for which data should be retrieved.
------------------	---

**Returns**

A reference to the data whose key is equal to `__k`, if such a data is present in the `unordered_map`.

**Exceptions**

<code>std::out_of_range</code>	If no such data is present.
--------------------------------	-----------------------------

Definition at line 612 of file `unordered_map.h`.

```
4.710.4.2 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const mapped_type& std::unordered_map<_Key, _Tp, _Hash,
_Pred, _Alloc>::at ( const key_type & __k ) const [inline]
```

Access to `unordered_map` data.

**Parameters**

<code>__k</code>	The key for which data should be retrieved.
------------------	---

**Returns**

A reference to the data whose key is equal to `__k`, if such a data is present in the `unordered_map`.

**Exceptions**

<code>std::out_of_range</code>	If no such data is present.
--------------------------------	-----------------------------

Definition at line 616 of file `unordered_map.h`.

```
4.710.4.3 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::begin ( ) [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the `unordered_map`.

Definition at line 248 of file `unordered_map.h`.

```
4.710.4.4 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::begin ( ) const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_map`.

Definition at line 257 of file `unordered_map.h`.

```
4.710.4.5 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::begin ( size_type __n ) [inline]
```

Returns a read/write iterator pointing to the first bucket element.

**Parameters**

<code>__n</code>	The bucket index.
------------------	-------------------

**Returns**

A read/write local iterator.

Definition at line 657 of file `unordered_map.h`.

```
4.710.4.6  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_map<_Key, _Tp, _Hash,
_Pred, _Alloc>::begin ( size_type __n ) const    [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

<code>__n</code>	The bucket index.
------------------	-------------------

**Returns**

A read-only local iterator.

Definition at line 668 of file `unordered_map.h`.

```
4.710.4.7  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::bucket_count ( ) const    [inline], [noexcept]
```

Returns the number of buckets of the `unordered_map`.

Definition at line 624 of file `unordered_map.h`.

```
4.710.4.8  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::cbegin ( ) const    [inline], [noexcept]
```

Returns a read-only (constant) iterator that points to the first element in the `unordered_map`.

Definition at line 261 of file `unordered_map.h`.

```
4.710.4.9  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_map<_Key, _Tp, _Hash,
_Pred, _Alloc>::cbegin ( size_type __n ) const    [inline]
```

Returns a read-only (constant) iterator pointing to the first bucket element.

**Parameters**

<code>__n</code>	The bucket index.
------------------	-------------------

**Returns**

A read-only local iterator.

Definition at line 672 of file `unordered_map.h`.

4.710.4.10 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::cend( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the unordered\_map.

Definition at line 283 of file unordered\_map.h.

4.710.4.11 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::cend( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 698 of file unordered\_map.h.

4.710.4.12 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::clear( ) [inline], [noexcept]`

Erases all elements in an unordered\_map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 497 of file unordered\_map.h.

4.710.4.13 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::count( const key_type &__x ) const [inline]`

Finds the number of elements.

Parameters

<code>__x</code>	Key to count.
------------------	---------------

Returns

Number of elements with specified key.

This function only makes sense for unordered\_multimap; for unordered\_map the result will either be 0 (not present) or 1 (present).

Definition at line 560 of file unordered\_map.h.

4.710.4.14 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename... _Args> std::pair<iterator, bool> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::emplace( _Args &&... __args ) [inline]`

Attempts to build and insert a std::pair into the unordered\_map.

## Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).
---------------------	--

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to build and insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`.

Insertion requires amortized constant time.

Definition at line 310 of file `unordered_map.h`.

```
4.710.4.15  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>>> template<typename... _Args> iterator std::unordered_map<
            _Key, _Tp, _Hash, _Pred, _Alloc >::emplace_hint ( const_iterator __pos, _Args &&... __args ) [inline]
```

Attempts to build and insert a `std::pair` into the `unordered_map`.

## Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).

## Returns

An iterator that points to the element with key of the `std::pair` built from `__args` (may or may not be that `std::pair`).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 340 of file `unordered_map.h`.

```
4.710.4.16  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>>> bool std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
            >::empty ( ) const [inline], [noexcept]
```

Returns true if the `unordered_map` is empty.

Definition at line 228 of file `unordered_map.h`.

```
4.710.4.17  template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
            >::end ( ) [inline], [noexcept]
```

Returns a read/write iterator that points one past the last element in the `unordered_map`.

Definition at line 270 of file `unordered_map.h`.

4.710.4.18 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::end( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the unordered\_map.

Definition at line 279 of file unordered\_map.h.

4.710.4.19 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::end( size_type __n ) [inline]`

Returns a read/write iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read/write local iterator.

Definition at line 683 of file unordered\_map.h.

4.710.4.20 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::end( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 694 of file unordered\_map.h.

4.710.4.21 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, iterator> std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::equal_range( const key_type & __x ) [inline]`

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered\_multimap.

Definition at line 573 of file unordered\_map.h.

4.710.4.22 `template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class  
_Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::pair<const_iterator, const_iterator>  
std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc >::equal_range ( const key_type & __x ) const  
[inline]`

Finds a subsequence matching given key.

## Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

## Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for unordered\_multimap.

Definition at line 577 of file unordered\_map.h.

```
4.710.4.23 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::erase( const_iterator __position ) [inline]
```

Erases an element from an unordered\_map.

## Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

## Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered\_map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 447 of file unordered\_map.h.

```
4.710.4.24 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::erase( iterator __it ) [inline]
```

Erases an element from an unordered\_map.

## Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

## Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered\_map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 452 of file unordered\_map.h.

```
4.710.4.25 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::erase( const key_type & __x ) [inline]
```

Erases elements according to the provided key.

## Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

## Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_map`. For an `unordered_map` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 469 of file `unordered_map.h`.

```
4.710.4.26 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::erase( const_iterator __first, const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_map`.

## Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

## Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_map`. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 487 of file `unordered_map.h`.

```
4.710.4.27 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::find( const key_type &__x ) [inline]
```

Tries to locate an element in an `unordered_map`.

## Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

## Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 542 of file `unordered_map.h`.

```
4.710.4.28 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::find( const key_type &__x ) const [inline]
```

Tries to locate an element in an `unordered_map`.

## Parameters

__x	Key to be located.
-----	--------------------

## Returns

Iterator pointing to sought-after element, or end() if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( end() ) iterator.

Definition at line 546 of file unordered\_map.h.

```
4.710.4.29 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> allocator_type std::unordered_map<_Key, _Tp, _Hash, _Pred,
_Alloc>::get_allocator ( ) const [inline], [noexcept]
```

Returns the allocator object with which the unordered\_map was constructed.

Definition at line 221 of file unordered\_map.h.

```
4.710.4.30 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> hasher std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::hash_function ( ) const [inline]
```

Returns the hash functor object with which the unordered\_map was constructed.

Definition at line 518 of file unordered\_map.h.

```
4.710.4.31 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, bool> std::unordered_map<_Key, _Tp,
_Hash, _Pred, _Alloc>::insert ( const value_type & __x ) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

## Parameters

__x	Pair to be inserted (see std::make_pair for easy creation of pairs).
-----	--

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the unordered\_map. An unordered\_map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the unordered\_map.

Insertion requires amortized constant time.

Definition at line 362 of file unordered\_map.h.

```
4.710.4.32 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class
_Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename _Pair, typename = typename
std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> std::pair<iterator, bool>
std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::insert ( _Pair && __x ) [inline]
```

Attempts to insert a std::pair into the unordered\_map.

## Parameters

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

This function attempts to insert a (key, value) pair into the `unordered_map`. An `unordered_map` relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the `unordered_map`.

Insertion requires amortized constant time.

Definition at line 369 of file `unordered_map.h`.

```
4.710.4.33 template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc
>::insert ( const_iterator __hint, const value_type & __x ) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

## Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

## Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 396 of file `unordered_map.h`.

```
4.710.4.34 template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class
_Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _Pair , typename = typename
std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> iterator std::unordered_map<_Key,
_Tp, _Hash, _Pred, _Alloc>::insert ( const_iterator __hint, _Pair && __x ) [inline]
```

Attempts to insert a `std::pair` into the `unordered_map`.

## Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

## Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 403 of file `unordered_map.h`.

```
4.710.4.35 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator> void std::unordered_map<
_Key, _Tp, _Hash, _Pred, _Alloc>::insert( _InputIterator __first, _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

## Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 418 of file `unordered_map.h`.

```
4.710.4.36 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>
::insert( initializer_list<value_type> __l ) [inline]
```

Attempts to insert a list of elements into the `unordered_map`.

## Parameters

<code>__l</code>	A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted.
------------------	--

Complexity similar to that of the range constructor.

Definition at line 429 of file `unordered_map.h`.

```
4.710.4.37 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> key_equal std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>
::key_eq( ) const [inline]
```

Returns the key comparison object with which the `unordered_map` was constructed.

Definition at line 524 of file `unordered_map.h`.

```
4.710.4.38 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> float std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>
::load_factor( ) const [inline], [noexcept]
```

Returns the average number of elements per bucket.

Definition at line 706 of file `unordered_map.h`.

4.710.4.39 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::max_bucket_count( ) const [inline], [noexcept]`

Returns the maximum number of buckets of the unordered\_map.

Definition at line 629 of file unordered\_map.h.

4.710.4.40 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> float std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::max_load_factor( ) const [inline], [noexcept]`

Returns a positive number that the unordered\_map tries to keep the load factor less than or equal to.

Definition at line 712 of file unordered\_map.h.

4.710.4.41 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::max_load_factor( float __z ) [inline]`

Change the unordered\_map maximum load factor.

Parameters

<code>__z</code>	The new maximum load factor.
------------------	------------------------------

Definition at line 720 of file unordered\_map.h.

4.710.4.42 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::max_size( ) const [inline], [noexcept]`

Returns the maximum size of the unordered\_map.

Definition at line 238 of file unordered\_map.h.

4.710.4.43 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> unordered_map& std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::operator=( const unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc> & ) [default]`

Copy assignment operator.

4.710.4.44 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> unordered_map& std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::operator=( unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc> && ) [default]`

Move assignment operator.

4.710.4.45 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> unordered_map& std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::operator=( initializer_list<value_type> & ) [inline]`

Unordered\_map list assignment operator.

Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills an unordered\_map with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered\_map and that the resulting unordered\_map's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 212 of file unordered\_map.h.

**4.710.4.46** `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> mapped_type& std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::operator[]( const key_type &__k ) [inline]`

Subscript ( `[]` ) access to unordered\_map data.

Parameters

<code>__k</code>	The key for which data should be retrieved.
------------------	---

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( `[]` ) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires constant time.

Definition at line 595 of file unordered\_map.h.

**4.710.4.47** `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> mapped_type& std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::operator[]( key_type &&__k ) [inline]`

Subscript ( `[]` ) access to unordered\_map data.

Parameters

<code>__k</code>	The key for which data should be retrieved.
------------------	---

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ( `[]` ) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires constant time.

Definition at line 599 of file unordered\_map.h.

References `std::move()`.

**4.710.4.48** `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_map<_Key, _Tp, _Hash, _Pred, _Alloc>::rehash( size_type __n ) [inline]`

May rehash the unordered\_map.

## Parameters

<code>__n</code>	The new number of buckets.
------------------	----------------------------

Rehash will occur only if the new number of buckets respect the `unordered_map` maximum load factor.

Definition at line 731 of file `unordered_map.h`.

```
4.710.4.49 template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
= std::allocator<std::pair<const _Key, _Tp> >> void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc
>::reserve ( size_type __n ) [inline]
```

Prepare the `unordered_map` for a specified number of elements.

## Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

Same as `rehash(ceil(n / max_load_factor()))`.

Definition at line 742 of file `unordered_map.h`.

```
4.710.4.50 template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> size_type std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc
>::size ( ) const [inline], [noexcept]
```

Returns the size of the `unordered_map`.

Definition at line 233 of file `unordered_map.h`.

```
4.710.4.51 template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc
= std::allocator<std::pair<const _Key, _Tp> >> void std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc
>::swap ( unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc > &__x ) [inline]
```

Swaps data with another `unordered_map`.

## Parameters

<code>__x</code>	An <code>unordered_map</code> of the same element and allocator types.
------------------	--

This exchanges the elements between two `unordered_map` in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Definition at line 510 of file `unordered_map.h`.

The documentation for this class was generated from the following file:

- [unordered\\_map.h](#)

## 4.711 `std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >` Class Template Reference

Inherits `std::__allow_copy_cons< bool >`.

#### Friends

- template<typename `_Key1` , typename `_Tp1` , typename `_Hash1` , typename `_Pred1` , typename `_Alloc1` > bool **operator==** (const `unordered_multimap`< `_Key1`, `_Tp1`, `_Hash1`, `_Pred1`, `_Alloc1` > &, const `unordered_multimap`< `_Key1`, `_Tp1`, `_Hash1`, `_Pred1`, `_Alloc1` > &)

#### 4.711.1 Detailed Description

```
template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> class std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of equivalent keys (possibly containing multiple of each key value) that associates values of another type with the keys.

## Template Parameters

<code>_Key</code>	Type of key objects.
<code>_Tp</code>	Type of mapped objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

The resulting value type of the container is `std::pair<const _Key, _Tp>`.

Base is `_Hashtable`, dispatched at compile time via template alias `__ummap_hashtable`.

Definition at line 778 of file `unordered_map.h`.

## 4.711.2 Member Typedef Documentation

4.711.2.1 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> typedef _Hashtable::allocator_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::allocator_type`

Public typedefs.

Public typedefs.

Definition at line 788 of file unordered\_map.h.

#### 4.711.3 Constructor & Destructor Documentation

4.711.3.1 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap ( size_type __n=10, const hasher & __hf=hasher(), const key_equal & __eq= key_equal(), const allocator_type & __a=allocator_type() ) [inline],[explicit]`

Default constructor creates no elements.

Parameters

<code>__n</code>	Initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq</code>	A key equality functor.
<code>__a</code>	An allocator object.

Definition at line 819 of file unordered\_map.h.

4.711.3.2 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::unordered_multimap ( _InputIterator __f, _InputIterator __l, size_type __n=0, const hasher & __hf=hasher(), const key_equal & __eq= key_equal(), const allocator_type & __a= allocator_type() ) [inline]`

Builds an unordered\_multimap from a range.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_multimap` consisting of copies of the elements from `[__first,__last)`. This is linear in `N` (where `N` is `distance(__first,__last)`).

Definition at line 840 of file `unordered_map.h`.

```
4.711.3.3  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc
>::unordered_multimap ( const unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

```
4.711.3.4  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc
>::unordered_multimap ( unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

```
4.711.3.5  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc
>::unordered_multimap ( initializer_list< value_type > __l, size_type __n = 0, const hasher & __hf
= hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type() )
[inline]
```

Builds an `unordered_multimap` from an `initializer_list`.

## Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_multimap` consisting of copies of the elements in the list. This is linear in `N` (where `N` is `__l.size()`).

Definition at line 865 of file `unordered_map.h`.

## 4.711.4 Member Function Documentation

```
4.711.4.1  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp> >> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred,
_Alloc >::begin ( ) [inline], [noexcept]
```

Returns a read/write iterator that points to the first element in the `unordered_multimap`.

Definition at line 929 of file `unordered_map.h`.

4.711.4.2 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::begin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the unordered\_multimap.

Definition at line 938 of file unordered\_map.h.

4.711.4.3 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::begin ( size_type __n ) [inline]`

Returns a read/write iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read/write local iterator.

Definition at line 1277 of file unordered\_map.h.

4.711.4.4 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::begin ( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 1288 of file unordered\_map.h.

4.711.4.5 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::bucket_count ( ) const [inline], [noexcept]`

Returns the number of buckets of the unordered\_multimap.

Definition at line 1244 of file unordered\_map.h.

4.711.4.6 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::cbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the unordered\_multimap.

Definition at line 942 of file unordered\_map.h.

4.711.4.7 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =  
std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_multimap<_Key, _Tp,  
_Hash, _Pred, _Alloc>::cbegin ( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

## Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

## Returns

A read-only local iterator.

Definition at line 1292 of file unordered\_map.h.

4.711.4.8 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::cend( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the unordered\_multimap.

Definition at line 964 of file unordered\_map.h.

4.711.4.9 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::cend( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

## Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

## Returns

A read-only local iterator.

Definition at line 1318 of file unordered\_map.h.

4.711.4.10 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::clear( ) [inline], [noexcept]`

Erases all elements in an unordered\_multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1161 of file unordered\_map.h.

4.711.4.11 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::count( const key_type &__x ) const [inline]`

Finds the number of elements.

## Parameters

<code>__x</code>	Key to count.
------------------	---------------

## Returns

Number of elements with specified key.

Definition at line 1221 of file unordered\_map.h.

```
4.711.4.12  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>,  
              class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename... _Args> iterator  
              std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::emplace ( _Args &&... _args ) [inline]
```

Attempts to build and insert a `std::pair` into the `unordered_multimap`.

## Parameters

<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).
---------------------	--

## Returns

An iterator that points to the inserted pair.

This function attempts to build and insert a (key, value) pair into the `unordered_multimap`.

Insertion requires amortized constant time.

Definition at line 987 of file `unordered_map.h`.

```
4.711.4.13 template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>,
class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename... _Args> iterator
std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::emplace_hint ( const_iterator __pos, _Args
&&... __args ) [inline]
```

Attempts to build and insert a `std::pair` into the `unordered_multimap`.

## Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__args</code>	Arguments used to generate a new pair instance (see <code>std::piecewise_construct</code> for passing arguments to each part of the pair constructor).

## Returns

An iterator that points to the element with key of the `std::pair` built from `__args`.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1013 of file `unordered_map.h`.

```
4.711.4.14 template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> bool std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc
>::empty ( ) const [inline],[noexcept]
```

Returns true if the `unordered_multimap` is empty.

Definition at line 909 of file `unordered_map.h`.

```
4.711.4.15 template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
_Alloc>::end ( ) [inline],[noexcept]
```

Returns a read/write iterator that points one past the last element in the `unordered_multimap`.

Definition at line 951 of file `unordered_map.h`.

4.711.4.16 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::end( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the `unordered_multimap`.

Definition at line 960 of file `unordered_map.h`.

4.711.4.17 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::end( size_type __n ) [inline]`

Returns a read/write iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read/write local iterator.

Definition at line 1303 of file `unordered_map.h`.

4.711.4.18 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_local_iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::end( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 1314 of file `unordered_map.h`.

4.711.4.19 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, iterator> std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::equal_range( const key_type & __x ) [inline]`

Finds a subsequence matching given key.

Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1232 of file `unordered_map.h`.

4.711.4.20 `template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class  
_Alloc = std::allocator<std::pair<const _Key, _Tp> >> std::pair<const_iterator, const_iterator>  
std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc >::equal_range ( const key_type & __x ) const  
[inline]`

Finds a subsequence matching given key.

## Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

## Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1236 of file `unordered_map.h`.

```
4.711.4.21  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
            _Alloc>::erase ( const_iterator __position ) [inline]
```

Erases an element from an `unordered_multimap`.

## Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

## Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1111 of file `unordered_map.h`.

```
4.711.4.22  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
            _Alloc>::erase ( iterator __it ) [inline]
```

Erases an element from an `unordered_multimap`.

## Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

## Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1116 of file `unordered_map.h`.

```
4.711.4.23  template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
            std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
            _Alloc>::erase ( const key_type & __x ) [inline]
```

Erases elements according to the provided key.

## Parameters

<code>__x</code>	Key of elements to be erased.
------------------	-------------------------------

## Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_multimap`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1132 of file `unordered_map.h`.

```
4.711.4.24 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred,
_Alloc >::erase ( const_iterator __first, const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_multimap`.

## Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

## Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multimap`. Note that this function only erases the elements, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1151 of file `unordered_map.h`.

```
4.711.4.25 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred,
_Alloc >::find ( const key_type & __x ) [inline]
```

Tries to locate an element in an `unordered_multimap`.

## Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

## Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 1207 of file `unordered_map.h`.

```
4.711.4.26 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::unordered_multimap< _Key, _Tp, _Hash,
_Pred, _Alloc >::find ( const key_type & __x ) const [inline]
```

Tries to locate an element in an `unordered_multimap`.

## Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

## Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 1211 of file `unordered_map.h`.

```
4.711.4.27 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> allocator_type std::unordered_multimap<_Key, _Tp, _Hash,
_Pred, _Alloc>::get_allocator ( ) const [inline], [noexcept]
```

Returns the allocator object with which the `unordered_multimap` was constructed.

Definition at line 902 of file `unordered_map.h`.

```
4.711.4.28 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> hasher std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
_Alloc>::hash_function ( ) const [inline]
```

Returns the hash functor object with which the `unordered_multimap` was constructed.

Definition at line 1183 of file `unordered_map.h`.

```
4.711.4.29 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
_Alloc>::insert ( const value_type & __x ) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

## Parameters

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

## Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

Definition at line 1027 of file `unordered_map.h`.

```
4.711.4.30 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class
_Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename _Pair, typename = typename
std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> iterator std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc>::insert ( _Pair && __x ) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

## Parameters

<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).
------------------	---

## Returns

An iterator that points to the inserted pair.

Insertion requires amortized constant time.

Definition at line 1034 of file `unordered_map.h`.

```
4.711.4.31 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> iterator std::unordered_multimap< _Key, _Tp, _Hash, _Pred,
_Alloc >::insert( const_iterator __hint, const value_type & __x ) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

## Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

## Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1059 of file `unordered_map.h`.

```
4.711.4.32 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class
_Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename _Pair, typename = typename
std::enable_if<std::is_constructible<value_type, _Pair&&>::value>::type> iterator std::unordered_multimap<
_Key, _Tp, _Hash, _Pred, _Alloc >::insert( const_iterator __hint, _Pair && __x ) [inline]
```

Inserts a `std::pair` into the `unordered_multimap`.

## Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the pair should be inserted.
<code>__x</code>	Pair to be inserted (see <code>std::make_pair</code> for easy creation of pairs).

## Returns

An iterator that points to the element with key of `__x` (may or may not be the pair passed in).

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires amortized constant time.

Definition at line 1066 of file `unordered_map.h`.

4.711.4.33 `template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> template<typename _InputIterator > void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert ( _InputIterator __first, _InputIterator __last ) [inline]`

A template function that attempts to insert a range of elements.

Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 1081 of file `unordered_map.h`.

4.711.4.34 `template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> void std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::insert ( initializer_list< value_type > __l ) [inline]`

Attempts to insert a list of elements into the `unordered_multimap`.

Parameters

<code>__l</code>	A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted.
------------------	--

Complexity similar to that of the range constructor.

Definition at line 1093 of file `unordered_map.h`.

4.711.4.35 `template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> key_equal std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::key_eq ( ) const [inline]`

Returns the key comparison object with which the `unordered_multimap` was constructed.

Definition at line 1189 of file `unordered_map.h`.

4.711.4.36 `template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::load_factor ( ) const [inline], [noexcept]`

Returns the average number of elements per bucket.

Definition at line 1326 of file `unordered_map.h`.

4.711.4.37 `template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> size_type std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_bucket_count ( ) const [inline], [noexcept]`

Returns the maximum number of buckets of the `unordered_multimap`.

Definition at line 1249 of file `unordered_map.h`.

4.711.4.38 `template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp> >> float std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >::max_load_factor ( ) const [inline], [noexcept]`

Returns a positive number that the `unordered_multimap` tries to keep the load factor less than or equal to.

Definition at line 1332 of file `unordered_map.h`.

```
4.711.4.39 template<class _Key , class _Tp , class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =  
std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc  
>::max_load_factor( float __z ) [inline]
```

Change the unordered\_multimap maximum load factor.

## Parameters

<code>__z</code>	The new maximum load factor.
------------------	------------------------------

Definition at line 1340 of file `unordered_map.h`.

```
4.711.4.40 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred,
_Alloc>::max_size( ) const [inline], [noexcept]
```

Returns the maximum size of the `unordered_multimap`.

Definition at line 919 of file `unordered_map.h`.

```
4.711.4.41 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> unordered_multimap& std::unordered_multimap<_Key,
_Tp, _Hash, _Pred, _Alloc>::operator=( const unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc> & )
[default]
```

Copy assignment operator.

```
4.711.4.42 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> unordered_multimap& std::unordered_multimap<_Key,
_Tp, _Hash, _Pred, _Alloc>::operator=( unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc> && )
[default]
```

Move assignment operator.

```
4.711.4.43 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> unordered_multimap& std::unordered_multimap<_Key, _Tp,
_Hash, _Pred, _Alloc>::operator=( initializer_list<value_type> __l ) [inline]
```

`Unordered_multimap` list assignment operator.

## Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills an `unordered_multimap` with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the `unordered_multimap` and that the resulting `unordered_multimap`'s size is the same as the number of elements assigned. Old data may be lost.

Definition at line 893 of file `unordered_map.h`.

```
4.711.4.44 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =
std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>
::rehash( size_type __n ) [inline]
```

May rehash the `unordered_multimap`.

## Parameters

<code>__n</code>	The new number of buckets.
------------------	----------------------------

Rehash will occur only if the new number of buckets respect the `unordered_multimap` maximum load factor.

Definition at line 1351 of file `unordered_map.h`.

```
4.711.4.45 template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc =  
std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc  
>::reserve ( size_type __n ) [inline]
```

Prepare the unordered\_multimap for a specified number of elements.

## Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

Same as `rehash(ceil(n / max_load_factor()))`.

Definition at line 1362 of file `unordered_map.h`.

4.711.4.46 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> size_type std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::size ( ) const [inline], [noexcept]`

Returns the size of the `unordered_multimap`.

Definition at line 914 of file `unordered_map.h`.

4.711.4.47 `template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred = std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc>::swap ( unordered_multimap<_Key, _Tp, _Hash, _Pred, _Alloc> &__x ) [inline]`

Swaps data with another `unordered_multimap`.

## Parameters

<code>__x</code>	An <code>unordered_multimap</code> of the same element and allocator types.
------------------	---

This exchanges the elements between two `unordered_multimap` in constant time. Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Definition at line 1175 of file `unordered_map.h`.

#### 4.712.1 Detailed Description

`template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> class std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >`

A standard container composed of equivalent keys (possibly containing multiple of each key value) in which the elements' keys are the elements themselves.

##### Template Parameters

<code>_Value</code>	Type of key objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .

Meets the requirements of a `container`, and `unordered associative container`

Base is `_Hashtable`, dispatched at compile time via template alias `__umset_hashtable`.

Definition at line 698 of file `unordered_set.h`.

#### 4.712.2 Member Typedef Documentation

4.712.2.1 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> typedef _Hashtable::allocator_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::allocator_type`

Public typedefs.

Definition at line 711 of file `unordered_set.h`.

4.712.2.2 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> typedef _Hashtable::const_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::const_iterator`

Iterator-related typedefs.

Definition at line 721 of file unordered\_set.h.

4.712.2.3 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> typedef _Hashtable::const_local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::const_local_iterator`

Iterator-related typedefs.

Definition at line 723 of file unordered\_set.h.

4.712.2.4 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> typedef allocator_type::const_pointer std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::const_pointer`

Iterator-related typedefs.

Definition at line 717 of file unordered\_set.h.

4.712.2.5 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> typedef allocator_type::const_reference std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::const_reference`

Iterator-related typedefs.

Definition at line 719 of file unordered\_set.h.

4.712.2.6 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> typedef _Hashtable::difference_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::difference_type`

Iterator-related typedefs.

Definition at line 725 of file unordered\_set.h.

4.712.2.7 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> typedef _Hashtable::hasher std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::hasher`

Public typedefs.

Definition at line 709 of file unordered\_set.h.

4.712.2.8 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> typedef _Hashtable::iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::iterator`

Iterator-related typedefs.

Definition at line 720 of file unordered\_set.h.

4.712.2.9 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> typedef _Hashtable::key_equal std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_equal`

Public typedefs.

Definition at line 710 of file `unordered_set.h`.

4.712.2.10 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> typedef _Hashtable::key_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::key_type`

Public typedefs.

Definition at line 707 of file `unordered_set.h`.

4.712.2.11 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> typedef _Hashtable::local_iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::local_iterator`

Iterator-related typedefs.

Definition at line 722 of file `unordered_set.h`.

4.712.2.12 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> typedef allocator_type::pointer std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::pointer`

Iterator-related typedefs.

Definition at line 716 of file `unordered_set.h`.

4.712.2.13 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> typedef allocator_type::reference std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::reference`

Iterator-related typedefs.

Definition at line 718 of file `unordered_set.h`.

4.712.2.14 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> typedef _Hashtable::size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::size_type`

Iterator-related typedefs.

Definition at line 724 of file `unordered_set.h`.

4.712.2.15 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> typedef _Hashtable::value_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::value_type`

Public typedefs.

Definition at line 708 of file `unordered_set.h`.

#### 4.712.3 Constructor & Destructor Documentation

```
4.712.3.1 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =  
std::allocator<_Value>> std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::unordered_multiset  
( size_type __n = 10, const hasher & __hf = hasher(), const key_equal & __eq/ = key_equal(), const  
allocator_type & __a = allocator_type() ) [inline], [explicit]
```

Default constructor creates no elements.

## Parameters

<code>__n</code>	Initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq/</code>	A key equality functor.
<code>__a</code>	An allocator object.

Definition at line 737 of file `unordered_set.h`.

```
4.712.3.2  template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> template<typename _InputIterator > std::unordered_multiset< _Value, _Hash, _Pred,
_Alloc >::unordered_multiset ( _InputIterator __f, _InputIterator __l, size_type __n = 0, const hasher & __hf
= hasher(), const key_equal & __eq/ = key_equal(), const allocator_type & __a = allocator_type() )
[inline]
```

Builds an `unordered_multiset` from a range.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eq/</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_multiset` consisting of copies of the elements from `[__first,__last)`. This is linear in `N` (where `N` is `distance(__first,__last)`).

Definition at line 758 of file `unordered_set.h`.

```
4.712.3.3  template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
const unordered_multiset< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

```
4.712.3.4  template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
unordered_multiset< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

```
4.712.3.5  template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::unordered_multiset (
initializer_list< value_type > __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal & __eq/
= key_equal(), const allocator_type & __a = allocator_type() ) [inline]
```

Builds an `unordered_multiset` from an `initializer_list`.

## Parameters

<code>__l</code>	An <code>initializer_list</code> .
<code>__n</code>	Minimal initial number of buckets.

<code>__hf</code>	A hash functor.
<code>__eq/</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an `unordered_multiset` consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

Definition at line 783 of file `unordered_set.h`.

#### 4.712.4 Member Function Documentation

**4.712.4.1** `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::begin ( )`  
`[inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `unordered_multiset`.

Definition at line 848 of file `unordered_set.h`.

**4.712.4.2** `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::begin ( )`  
`const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `unordered_multiset`.

Definition at line 852 of file `unordered_set.h`.

**4.712.4.3** `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> local_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::begin (`  
`size_type __n ) [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

##### Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

##### Returns

A read-only local iterator.

Definition at line 1175 of file `unordered_set.h`.

**4.712.4.4** `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::begin`  
`( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

##### Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

##### Returns

A read-only local iterator.

Definition at line 1179 of file `unordered_set.h`.

4.712.4.5 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::bucket_count ( ) const [inline], [noexcept]`

Returns the number of buckets of the unordered\_multiset.

Definition at line 1141 of file unordered\_set.h.

4.712.4.6 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::cbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the unordered\_multiset.

Definition at line 875 of file unordered\_set.h.

4.712.4.7 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::cbegin ( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 1183 of file unordered\_set.h.

4.712.4.8 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::cend ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the unordered\_multiset.

Definition at line 883 of file unordered\_set.h.

4.712.4.9 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::cend ( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

**Returns**

A read-only local iterator.

Definition at line 1203 of file unordered\_set.h.

```
4.712.4.10 template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
           = std::allocator<_Value>> void std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::clear ( )
           [inline], [noexcept]
```

Erases all elements in an unordered\_multiset.

Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1059 of file unordered\_set.h.

```
4.712.4.11 template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
           = std::allocator<_Value>> size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::count ( const
           key_type & __x ) const [inline]
```

Finds the number of elements.

**Parameters**

<code>__x</code>	Element to located.
------------------	---------------------

**Returns**

Number of elements with specified key.

Definition at line 1118 of file unordered\_set.h.

```
4.712.4.12 template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
           = std::allocator<_Value>> template<typename... _Args> iterator std::unordered_multiset< _Value, _Hash,
           _Pred, _Alloc >::emplace ( _Args &&... __args ) [inline]
```

Builds and insert an element into the unordered\_multiset.

**Parameters**

<code>__args</code>	Arguments used to generate an element.
---------------------	--

**Returns**

An iterator that points to the inserted element.

Insertion requires amortized constant time.

Definition at line 897 of file unordered\_set.h.

```
4.712.4.13 template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
           = std::allocator<_Value>> template<typename... _Args> iterator std::unordered_multiset< _Value, _Hash,
           _Pred, _Alloc >::emplace_hint ( const_iterator __pos, _Args &&... __args ) [inline]
```

Inserts an element into the unordered\_multiset.

## Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

## Returns

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html>.

Insertion requires amortized constant time.

Definition at line 919 of file `unordered_set.h`.

```
4.712.4.14  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> bool std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::empty ( ) const
            [inline], [noexcept]
```

Returns true if the `unordered_multiset` is empty.

Definition at line 827 of file `unordered_set.h`.

```
4.712.4.15  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::end ( )
            [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_multiset`.

Definition at line 862 of file `unordered_set.h`.

```
4.712.4.16  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> const_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::end ( )
            const [inline], [noexcept]
```

Returns a read-only (constant) iterator that points one past the last element in the `unordered_multiset`.

Definition at line 866 of file `unordered_set.h`.

```
4.712.4.17  template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> local_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::end (
            size_type __n ) [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

## Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

## Returns

A read-only local iterator.

Definition at line 1195 of file `unordered_set.h`.

```
4.712.4.18 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =  
std::allocator<_Value>> const_local_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::end  
( size_type __n )const [inline]
```

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

## Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

## Returns

A read-only local iterator.

Definition at line 1199 of file `unordered_set.h`.

```
4.712.4.19  template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> std::pair<iterator, iterator> std::unordered_multiset< _Value, _Hash, _Pred,
            _Alloc >::equal_range ( const key_type & __x )  [inline]
```

Finds a subsequence matching given key.

## Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

## Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1129 of file `unordered_set.h`.

```
4.712.4.20  template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> std::pair<const_iterator, const_iterator> std::unordered_multiset< _Value,
            _Hash, _Pred, _Alloc >::equal_range ( const key_type & __x ) const  [inline]
```

Finds a subsequence matching given key.

## Parameters

<code>__x</code>	Key to be located.
------------------	--------------------

## Returns

Pair of iterators that possibly points to the subsequence matching given key.

Definition at line 1133 of file `unordered_set.h`.

```
4.712.4.21  template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
            const_iterator __position )  [inline]
```

Erases an element from an `unordered_multiset`.

## Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

## Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1005 of file unordered\_set.h.

```
4.712.4.22 template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase ( iterator
__it ) [inline]
```

Erases an element from an unordered\_multiset.

Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an unordered\_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1010 of file unordered\_set.h.

```
4.712.4.23 template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase ( const
key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

Returns

The number of elements erased.

This function erases all the elements located by the given key from an unordered\_multiset.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1028 of file unordered\_set.h.

```
4.712.4.24 template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::erase (
const_iterator __first, const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from an unordered\_multiset.

Parameters

---

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

**Returns**

The iterator `__last`.

This function erases a sequence of elements from an `unordered_multiset`.

Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1048 of file `unordered_set.h`.

```
4.712.4.25  template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::find ( const
            key_type & __x ) [inline]
```

Tries to locate an element in an `unordered_multiset`.

**Parameters**

<code>__x</code>	Element to be located.
------------------	------------------------

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 1104 of file `unordered_set.h`.

```
4.712.4.26  template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> const_iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::find ( const
            key_type & __x ) const [inline]
```

Tries to locate an element in an `unordered_multiset`.

**Parameters**

<code>__x</code>	Element to be located.
------------------	------------------------

**Returns**

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 1108 of file `unordered_set.h`.

```
4.712.4.27  template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc
            = std::allocator<_Value>> allocator_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc
            >::get_allocator ( ) const [inline], [noexcept]
```

Returns the allocator object with which the `unordered_multiset` was constructed.

Definition at line 820 of file `unordered_set.h`.

4.712.4.28 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> hasher std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::hash_function ( ) const [inline]`

Returns the hash functor object with which the unordered\_multiset was constructed.

Definition at line 1080 of file unordered\_set.h.

4.712.4.29 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert ( const value_type & __x ) [inline]`

Inserts an element into the unordered\_multiset.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

Definition at line 931 of file unordered\_set.h.

4.712.4.30 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert ( value_type && __x ) [inline]`

Inserts an element into the unordered\_multiset.

Parameters

<code>__x</code>	Element to be inserted.
------------------	-------------------------

Returns

An iterator that points to the inserted element.

Insertion requires amortized constant time.

Definition at line 935 of file unordered\_set.h.

References std::move().

4.712.4.31 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_multiset< _Value, _Hash, _Pred, _Alloc >::insert ( const_iterator __hint, const value_type & __x ) [inline]`

Inserts an element into the unordered\_multiset.

Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
---------------------	---

<code>__x</code>	Element to be inserted.
------------------	-------------------------

**Returns**

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.↵html>

Insertion requires amortized constant.

Definition at line 957 of file `unordered_set.h`.

```
4.712.4.32 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::insert (
const_iterator __hint, value_type && __x ) [inline]
```

Inserts an element into the `unordered_multiset`.

**Parameters**

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

**Returns**

An iterator that points to the inserted element.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.↵html>

Insertion requires amortized constant.

Definition at line 961 of file `unordered_set.h`.

References `std::move()`.

```
4.712.4.33 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> template<typename _InputIterator> void std::unordered_multiset<_Value, _Hash,
_Pred, _Alloc>::insert ( _InputIterator __first, _InputIterator __last ) [inline]
```

A template function that inserts a range of elements.

**Parameters**

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 975 of file `unordered_set.h`.

```
4.712.4.34  template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =  
            std::allocator<_Value>> void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::insert ( initializer_list<  
            value_type > __l ) [inline]
```

Inserts a list of elements into the unordered\_multiset.

## Parameters

<code>__l</code>	A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted.
------------------	--

Complexity similar to that of the range constructor.

Definition at line 986 of file `unordered_set.h`.

```
4.712.4.35 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> key_equal std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::key_eq ( )
const [inline]
```

Returns the key comparison object with which the `unordered_multiset` was constructed.

Definition at line 1086 of file `unordered_set.h`.

```
4.712.4.36 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> float std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::load_factor ( ) const
[inline], [noexcept]
```

Returns the average number of elements per bucket.

Definition at line 1211 of file `unordered_set.h`.

```
4.712.4.37 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::max_bucket_count ( ) const
[inline], [noexcept]
```

Returns the maximum number of buckets of the `unordered_multiset`.

Definition at line 1146 of file `unordered_set.h`.

```
4.712.4.38 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> float std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::max_load_factor ( )
const [inline], [noexcept]
```

Returns a positive number that the `unordered_multiset` tries to keep the load factor less than or equal to.

Definition at line 1217 of file `unordered_set.h`.

```
4.712.4.39 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::max_load_factor ( float
__z ) [inline]
```

Change the `unordered_multiset` maximum load factor.

## Parameters

<code>__z</code>	The new maximum load factor.
------------------	------------------------------

Definition at line 1225 of file `unordered_set.h`.

```
4.712.4.40 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::max_size ( )
const [inline], [noexcept]
```

Returns the maximum size of the `unordered_multiset`.

Definition at line 837 of file `unordered_set.h`.

4.712.4.41 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> unordered_multiset& std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::operator= ( const unordered_multiset<_Value, _Hash, _Pred, _Alloc> & ) [default]`

Copy assignment operator.

4.712.4.42 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> unordered_multiset& std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::operator= ( unordered_multiset<_Value, _Hash, _Pred, _Alloc> &&_x ) [default]`

Move assignment operator.

4.712.4.43 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> unordered_multiset& std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::operator= ( initializer_list<value_type> >_l ) [inline]`

Unordered\_multiset list assignment operator.

Parameters

<code>_l</code>	An initializer_list.
-----------------	----------------------

This function fills an unordered\_multiset with copies of the elements in the initializer list `_l`.

Note that the assignment completely changes the unordered\_multiset and that the resulting unordered\_set's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 811 of file unordered\_set.h.

4.712.4.44 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::rehash ( size_type __n ) [inline]`

May rehash the unordered\_multiset.

Parameters

<code>__n</code>	The new number of buckets.
------------------	----------------------------

Rehash will occur only if the new number of buckets respect the unordered\_multiset maximum load factor.

Definition at line 1236 of file unordered\_set.h.

4.712.4.45 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::reserve ( size_type __n ) [inline]`

Prepare the unordered\_multiset for a specified number of elements.

Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

Same as `rehash(ceil(n / max_load_factor()))`.

Definition at line 1247 of file unordered\_set.h.

4.712.4.46 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_multiset<_Value, _Hash, _Pred, _Alloc>::size ( ) const [inline], [noexcept]`

Returns the size of the unordered\_multiset.

Definition at line 832 of file unordered\_set.h.

```
4.712.4.47 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc
           = std::allocator<_Value>> void std::unordered_multiset<_Value, _Hash, _Pred, _Alloc >::swap (
           unordered_multiset<_Value, _Hash, _Pred, _Alloc > &__x ) [inline]
```

Swaps data with another unordered\_multiset.

#### Parameters

__x	An unordered_multiset of the same element and allocator types.
-----	--

This exchanges the elements between two sets in constant time. Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.

Definition at line 1072 of file unordered\_set.h.

#### 4.713.1 Detailed Description

`template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> class std::unordered_set<_Value, _Hash, _Pred, _Alloc >`

A standard container composed of unique keys (containing at most one of each key value) in which the elements' keys are the elements themselves.

#### Template Parameters

<code>_Value</code>	Type of key objects.
<code>_Hash</code>	Hashing function object type, defaults to <code>hash&lt;_Value&gt;</code> .
<code>_Pred</code>	Predicate function object type, defaults to <code>equal_to&lt;_Value&gt;</code> .
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Key&gt;</code> .

Meets the requirements of a [container](#), and [unordered associative container](#)

Base is `_Hashtable`, dispatched at compile time via template alias `__uset_hashtable`.

Definition at line 93 of file `unordered_set.h`.

#### 4.713.3 Constructor & Destructor Documentation

4.713.3.1 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set( size_type __n = 10, const hasher & __hf = hasher(), const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type() ) [inline], [explicit]`

Default constructor creates no elements.

Parameters

<code>__n</code>	Initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 132 of file unordered\_set.h.

```
4.713.3.2 template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> template<typename _InputIterator > std::unordered_set< _Value, _Hash, _Pred, _Alloc
>::unordered_set ( _InputIterator __f, _InputIterator __l, size_type __n = 0, const hasher & __hf = hasher(),
const key_equal & __eqf = key_equal(), const allocator_type & __a = allocator_type() ) [inline]
```

Builds an unordered\_set from a range.

Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered\_set consisting of copies of the elements from [`__first`,`__last`). This is linear in N (where N is `distance(__first, __last)`).

Definition at line 153 of file unordered\_set.h.

```
4.713.3.3 template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set ( const
unordered_set< _Value, _Hash, _Pred, _Alloc > & ) [default]
```

Copy constructor.

```
4.713.3.4 template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set (
unordered_set< _Value, _Hash, _Pred, _Alloc > && ) [default]
```

Move constructor.

```
4.713.3.5 template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::unordered_set< _Value, _Hash, _Pred, _Alloc >::unordered_set ( initializer_list<
value_type > __l, size_type __n = 0, const hasher & __hf = hasher(), const key_equal & __eqf =
key_equal(), const allocator_type & __a = allocator_type() ) [inline]
```

Builds an unordered\_set from an initializer\_list.

Parameters

<code>__l</code>	An initializer_list.
<code>__n</code>	Minimal initial number of buckets.
<code>__hf</code>	A hash functor.
<code>__eqf</code>	A key equality functor.
<code>__a</code>	An allocator object.

Create an unordered\_set consisting of copies of the elements in the list. This is linear in N (where N is `__l.size()`).

Definition at line 178 of file unordered\_set.h.

#### 4.713.4 Member Function Documentation

4.713.4.1 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin ( ) [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

Definition at line 243 of file `unordered_set.h`.

4.713.4.2 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the `unordered_set`.

Definition at line 247 of file `unordered_set.h`.

4.713.4.3 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin ( size_type __n ) [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 593 of file `unordered_set.h`.

4.713.4.4 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::begin ( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 597 of file `unordered_set.h`.

4.713.4.5 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::bucket_count ( ) const [inline], [noexcept]`

Returns the number of buckets of the `unordered_set`.

Definition at line 559 of file `unordered_set.h`.

4.713.4.6 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::cbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the unordered\_set.

Definition at line 270 of file unordered\_set.h.

4.713.4.7 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::cbegin ( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to the first bucket element.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 601 of file unordered\_set.h.

4.713.4.8 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::cend ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the unordered\_set.

Definition at line 278 of file unordered\_set.h.

4.713.4.9 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::cend ( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 621 of file unordered\_set.h.

4.713.4.10 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_set<_Value, _Hash, _Pred, _Alloc >::clear ( ) [inline], [noexcept]`

Erases all elements in an unordered\_set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 471 of file unordered\_set.h.

4.713.4.11 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =  
std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc >::count ( const  
key_type & __x ) const [inline]`

Finds the number of elements.

## Parameters

<code>__x</code>	Element to located.
------------------	---------------------

## Returns

Number of elements with specified key.

This function only makes sense for unordered\_multisets; for unordered\_set the result will either be 0 (not present) or 1 (present).

Definition at line 534 of file unordered\_set.h.

4.713.4.12 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> template<typename... _Args> std::pair<iterator, bool> std::unordered_set<_Value, _Hash, _Pred, _Alloc >::emplace ( _Args &&... __args ) [inline]`

Attempts to build and insert an element into the unordered\_set.

## Parameters

<code>__args</code>	Arguments used to generate an element.
---------------------	--

## Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to build and insert an element into the unordered\_set. An unordered\_set relies on unique keys and thus an element is only inserted if it is not already present in the unordered\_set.

Insertion requires amortized constant time.

Definition at line 300 of file unordered\_set.h.

4.713.4.13 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> template<typename... _Args> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::emplace_hint ( const_iterator __pos, _Args &&... __args ) [inline]`

Attempts to insert an element into the unordered\_set.

## Parameters

<code>__pos</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__args</code>	Arguments used to generate the element to be inserted.

## Returns

An iterator that points to the element with key equivalent to the one generated from `__args` (may or may not be the element itself).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `emplace()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html>

Insertion requires amortized constant time.

Definition at line 326 of file unordered\_set.h.

4.713.4.14 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> bool std::unordered_set<_Value, _Hash, _Pred, _Alloc>::empty ( ) const [inline], [noexcept]`

Returns true if the `unordered_set` is empty.

Definition at line 222 of file `unordered_set.h`.

4.713.4.15 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::end ( ) [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the `unordered_set`.

Definition at line 257 of file `unordered_set.h`.

4.713.4.16 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::end ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the `unordered_set`.

Definition at line 261 of file `unordered_set.h`.

4.713.4.17 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::end ( size_type __n ) [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

Returns

A read-only local iterator.

Definition at line 613 of file `unordered_set.h`.

4.713.4.18 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> const_local_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::end ( size_type __n ) const [inline]`

Returns a read-only (constant) iterator pointing to one past the last bucket elements.

Parameters

<code>__n</code>	The bucket index.
------------------	-------------------

**Returns**

A read-only local iterator.

Definition at line 617 of file `unordered_set.h`.

```
4.713.4.19 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =  
std::allocator<_Value>> std::pair<iterator, iterator> std::unordered_set<_Value, _Hash, _Pred, _Alloc  
>::equal_range( const key_type &__x ) [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

Definition at line 547 of file `unordered_set.h`.

```
4.713.4.20 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::pair<const_iterator, const_iterator> std::unordered_set<_Value, _Hash,
_Pred, _Alloc>::equal_range ( const key_type & __x ) const [inline]
```

Finds a subsequence matching given key.

**Parameters**

<code>__x</code>	Key to be located.
------------------	--------------------

**Returns**

Pair of iterators that possibly points to the subsequence matching given key.

This function probably only makes sense for multisets.

Definition at line 551 of file `unordered_set.h`.

```
4.713.4.21 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::erase ( const_iterator
__position ) [inline]
```

Erases an element from an `unordered_set`.

**Parameters**

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

**Returns**

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 421 of file `unordered_set.h`.

```
4.713.4.22 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::erase ( iterator __it )
[inline]
```

Erases an element from an `unordered_set`.

## Parameters

<code>__position</code>	An iterator pointing to the element to be erased.
-------------------------	---

## Returns

An iterator pointing to the element immediately following `__position` prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 426 of file `unordered_set.h`.

```
4.713.4.23 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::erase ( const
key_type & __x ) [inline]
```

Erases elements according to the provided key.

## Parameters

<code>__x</code>	Key of element to be erased.
------------------	------------------------------

## Returns

The number of elements erased.

This function erases all the elements located by the given key from an `unordered_set`. For an `unordered_set` the result of this function can only be 0 (not present) or 1 (present). Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 443 of file `unordered_set.h`.

```
4.713.4.24 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::erase ( const_iterator
__first, const_iterator __last ) [inline]
```

Erases a [`__first`,`__last`) range of elements from an `unordered_set`.

## Parameters

<code>__first</code>	Iterator pointing to the start of the range to be erased.
<code>__last</code>	Iterator pointing to the end of the range to be erased.

## Returns

The iterator `__last`.

This function erases a sequence of elements from an `unordered_set`. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 461 of file `unordered_set.h`.

4.713.4.25 `template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =  
std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::find ( const key_type &  
__x ) [inline]`

Tries to locate an element in an `unordered_set`.

## Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

## Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 516 of file `unordered_set.h`.

```
4.713.4.26 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> const_iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::find( const
key_type & __x ) const [inline]
```

Tries to locate an element in an `unordered_set`.

## Parameters

<code>__x</code>	Element to be located.
------------------	------------------------

## Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end ( `end()` ) iterator.

Definition at line 520 of file `unordered_set.h`.

```
4.713.4.27 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> allocator_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::get_allocator( )
const [inline], [noexcept]
```

Returns the allocator object with which the `unordered_set` was constructed.

Definition at line 215 of file `unordered_set.h`.

```
4.713.4.28 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> hasher std::unordered_set<_Value, _Hash, _Pred, _Alloc>::hash_function( ) const
[inline]
```

Returns the hash functor object with which the `unordered_set` was constructed.

Definition at line 492 of file `unordered_set.h`.

```
4.713.4.29 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::pair<iterator, bool> std::unordered_set<_Value, _Hash, _Pred, _Alloc>::insert
( const value_type & __x ) [inline]
```

Attempts to insert an element into the `unordered_set`.

**Parameters**

<code>__x</code>	Element to be inserted.
------------------	-------------------------

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the `unordered_set`. An `unordered_set` relies on unique keys and thus an element is only inserted if it is not already present in the `unordered_set`.

Insertion requires amortized constant time.

Definition at line 344 of file `unordered_set.h`.

```
4.713.4.30 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> std::pair<iterator, bool> std::unordered_set<_Value, _Hash, _Pred, _Alloc>::insert
( value_type && __x ) [inline]
```

Attempts to insert an element into the `unordered_set`.

**Parameters**

<code>__x</code>	Element to be inserted.
------------------	-------------------------

**Returns**

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the `unordered_set`. An `unordered_set` relies on unique keys and thus an element is only inserted if it is not already present in the `unordered_set`.

Insertion requires amortized constant time.

Definition at line 348 of file `unordered_set.h`.

References `std::move()`.

```
4.713.4.31 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc>::insert ( const_iterator
__hint, const value_type & __x ) [inline]
```

Attempts to insert an element into the `unordered_set`.

**Parameters**

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

**Returns**

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17>.↵  
html

Insertion requires amortized constant.

Definition at line 373 of file unordered\_set.h.

```
4.713.4.32 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> iterator std::unordered_set<_Value, _Hash, _Pred, _Alloc >::insert ( const_iterator
__hint, value_type && __x ) [inline]
```

Attempts to insert an element into the unordered\_set.

#### Parameters

<code>__hint</code>	An iterator that serves as a hint as to where the element should be inserted.
<code>__x</code>	Element to be inserted.

#### Returns

An iterator that points to the element with key of `__x` (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17>.↵

```
4.713.4.33 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> template<typename _InputIterator > void std::unordered_set<_Value, _Hash, _Pred,
_Alloc >::insert ( _InputIterator __first, _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

#### Parameters

<code>__first</code>	Iterator pointing to the start of the range to be inserted.
<code>__last</code>	Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 392 of file unordered\_set.h.

```
4.713.4.34 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> void std::unordered_set<_Value, _Hash, _Pred, _Alloc >::insert ( initializer_list<
value_type > __l ) [inline]
```

Attempts to insert a list of elements into the unordered\_set.

#### Parameters

<code>__l</code>	A <code>std::initializer_list&lt;value_type&gt;</code> of elements to be inserted.
------------------	--

Complexity similar to that of the range constructor.

Definition at line 403 of file `unordered_set.h`.

```
4.713.4.35 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =

```

Returns the key comparison object with which the `unordered_set` was constructed.

Definition at line 498 of file `unordered_set.h`.

```
4.713.4.36 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> float std::unordered_set<_Value, _Hash, _Pred, _Alloc>::load_factor ( ) const
[inline], [noexcept]
```

Returns the average number of elements per bucket.

Definition at line 629 of file `unordered_set.h`.

```
4.713.4.37 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::max_bucket_count ( )
const [inline], [noexcept]
```

Returns the maximum number of buckets of the `unordered_set`.

Definition at line 564 of file `unordered_set.h`.

```
4.713.4.38 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> float std::unordered_set<_Value, _Hash, _Pred, _Alloc>::max_load_factor ( ) const
[inline], [noexcept]
```

Returns a positive number that the `unordered_set` tries to keep the load factor less than or equal to.

Definition at line 635 of file `unordered_set.h`.

```
4.713.4.39 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> void std::unordered_set<_Value, _Hash, _Pred, _Alloc>::max_load_factor ( float __z )
[inline]
```

Change the `unordered_set` maximum load factor.

Parameters

<code>__z</code>	The new maximum load factor.
------------------	------------------------------

Definition at line 643 of file `unordered_set.h`.

```
4.713.4.40 template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::max_size ( ) const
[inline], [noexcept]
```

Returns the maximum size of the `unordered_set`.

Definition at line 232 of file `unordered_set.h`.

4.713.4.41 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> unordered_set& std::unordered_set<_Value, _Hash, _Pred, _Alloc>::operator= (const unordered_set<_Value, _Hash, _Pred, _Alloc> & ) [default]`

Copy assignment operator.

4.713.4.42 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> unordered_set& std::unordered_set<_Value, _Hash, _Pred, _Alloc>::operator= (unordered_set<_Value, _Hash, _Pred, _Alloc> && ) [default]`

Move assignment operator.

4.713.4.43 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> unordered_set& std::unordered_set<_Value, _Hash, _Pred, _Alloc>::operator= (initializer_list<value_type> __l ) [inline]`

Unordered\_set list assignment operator.

Parameters

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills an unordered\_set with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the unordered\_set and that the resulting unordered\_set's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 206 of file unordered\_set.h.

4.713.4.44 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_set<_Value, _Hash, _Pred, _Alloc>::rehash ( size_type __n ) [inline]`

May rehash the unordered\_set.

Parameters

<code>__n</code>	The new number of buckets.
------------------	----------------------------

Rehash will occur only if the new number of buckets respect the unordered\_set maximum load factor.

Definition at line 654 of file unordered\_set.h.

4.713.4.45 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> void std::unordered_set<_Value, _Hash, _Pred, _Alloc>::reserve ( size_type __n ) [inline]`

Prepare the unordered\_set for a specified number of elements.

Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

Same as `rehash(ceil(n / max_load_factor()))`.

Definition at line 665 of file unordered\_set.h.

4.713.4.46 `template<class _Value, class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc = std::allocator<_Value>> size_type std::unordered_set<_Value, _Hash, _Pred, _Alloc>::size ( ) const [inline], [noexcept]`

Returns the size of the unordered\_set.

Definition at line 227 of file unordered\_set.h.

```
4.713.4.47  template<class _Value , class _Hash = hash<_Value>, class _Pred = std::equal_to<_Value>, class _Alloc =
            std::allocator<_Value>> void std::unordered_set< _Value, _Hash, _Pred, _Alloc >::swap ( unordered_set<
            _Value, _Hash, _Pred, _Alloc > &__x )  [inline]
```

Swaps data with another unordered\_set.

Parameters

__x	An unordered_set of the same element and allocator types.
-----	---

This exchanges the elements between two sets in constant time. Note that the global std::swap() function is specialized such that std::swap(s1,s2) will feed to this function.

Definition at line 484 of file unordered\_set.h.

## 4.715.1 Detailed Description

```
template<typename _Tp, typename _Alloc = std::allocator<_Tp>> class std::vector< _Tp, _Alloc >
```

A standard container which offers fixed time access to individual elements in any order.

## Template Parameters

<code>_Tp</code>	Type of element.
<code>_Alloc</code>	Allocator type, defaults to <code>allocator&lt;_Tp&gt;</code> .

Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `push_front` and `pop_front`.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ( `[]` ) access is also provided as with C-style arrays.

Definition at line 210 of file `stl_vector.h`.

## 4.715.2 Constructor &amp; Destructor Documentation

```
4.715.2.1 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector ( )
[inline]
```

Default constructor creates no elements.

Definition at line 248 of file `stl_vector.h`.

```
4.715.2.2 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector ( const
allocator_type &__a ) [inline],[explicit]
```

Creates a vector with no elements.

## Parameters

<code>__a</code>	An allocator object.
------------------	----------------------

Definition at line 256 of file `stl_vector.h`.

```
4.715.2.3 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector ( size_type
__n, const allocator_type &__a=allocator_type() ) [inline],[explicit]
```

Creates a vector with default constructed elements.

## Parameters

<code>__n</code>	The number of elements to initially create.
<code>__a</code>	An allocator.

This constructor fills the vector with `__n` default constructed elements.

Definition at line 269 of file `stl_vector.h`.

```
4.715.2.4 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector ( size_type
__n, const value_type &__value, const allocator_type &__a=allocator_type() ) [inline]
```

Creates a vector with copies of an exemplar element.

## Parameters

<code>__n</code>	The number of elements to initially create.
<code>__value</code>	An element to copy.
<code>__a</code>	An allocator.

This constructor fills the vector with `__n` copies of `__value`.

Definition at line 281 of file `stl_vector.h`.

**4.715.2.5** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector ( const vector< _Tp, _Alloc > & __x ) [inline]`

Vector copy constructor.

## Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

The newly-created vector uses a copy of the allocation object used by `__x`. All the elements of `__x` are copied, but any extra memory in `__x` (for fast expansion) will not be copied.

Definition at line 310 of file `stl_vector.h`.

**4.715.2.6** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector ( vector< _Tp, _Alloc > && __x ) [inline], [noexcept]`

Vector move constructor.

## Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

The newly-created vector contains the exact contents of `__x`. The contents of `__x` are a valid, but unspecified vector.

Definition at line 327 of file `stl_vector.h`.

**4.715.2.7** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector ( const vector< _Tp, _Alloc > & __x, const allocator_type & __a ) [inline]`

Copy constructor with alternative allocator.

Definition at line 331 of file `stl_vector.h`.

**4.715.2.8** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector ( vector< _Tp, _Alloc > && __rv, const allocator_type & __m ) [inline]`

Move constructor with alternative allocator.

Definition at line 340 of file `stl_vector.h`.

**4.715.2.9** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector< _Tp, _Alloc >::vector ( initializer_list< value_type > __l, const allocator_type & __a = allocator_type() ) [inline]`

Builds a vector from an initializer list.

## Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

<code>__a</code>	An allocator.
------------------	---------------

Create a vector consisting of copies of the elements in the initializer\_list `__l`.

This will call the element type's copy constructor  $N$  times (where  $N$  is `__l.size()`) and do no memory reallocation.

Definition at line 364 of file `stl_vector.h`.

**4.715.2.10** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>> std::vector<_Tp, _Alloc>::vector ( _InputIterator __first, _InputIterator __last, const allocator_type & __a = allocator_type() ) [inline]`

Builds a vector from a range.

#### Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.
<code>__a</code>	An allocator.

Create a vector consisting of copies of the elements from `[first,last)`.

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor  $N$  times (where  $N$  is `distance(first,last)`) and do no memory reallocation. But if only input iterators are used, then this will do at most  $2N$  calls to the copy constructor, and  $\log N$  memory reallocations.

Definition at line 392 of file `stl_vector.h`.

**4.715.2.11** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> std::vector<_Tp, _Alloc>::~~vector ( ) [inline], [noexcept]`

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 414 of file `stl_vector.h`.

### 4.715.3 Member Function Documentation

**4.715.3.1** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _ForwardIterator> pointer std::vector<_Tp, _Alloc>::M_allocate_and_copy ( size_type __n, _ForwardIterator __first, _ForwardIterator __last ) [inline], [protected]`

Memory expansion handler. Uses the member allocation function to obtain  $n$  bytes of memory, and then copies `[first,last)` into it.

Definition at line 1135 of file `stl_vector.h`.

**4.715.3.2** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::M_range_check ( size_type __n ) const [inline], [protected]`

Safety check used only from `at()`.

Definition at line 791 of file `stl_vector.h`.

Referenced by `std::vector<_State>::at()`.

**4.715.3.3** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::assign ( size_type __n, const value_type & __val ) [inline]`

Assigns a given value to a vector.

## Parameters

<code>__n</code>	Number of elements to be assigned.
<code>__val</code>	Value to be assigned.

This function fills a vector with `__n` copies of the given value. Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 479 of file `stl_vector.h`.

Referenced by `std::vector< _State >::assign()`, and `std::vector< _State >::operator=()`.

**4.715.3.4** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename = std::_RequireInputIter<_InputIterator>> void std::vector< _Tp, _Alloc >::assign ( _InputIterator __first, _InputIterator __last ) [inline]`

Assigns a range to a vector.

## Parameters

<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function fills a vector with copies of the elements in the range `[__first,__last)`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 498 of file `stl_vector.h`.

**4.715.3.5** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::assign ( initializer_list< value_type > __l ) [inline]`

Assigns an initializer list to a vector.

## Parameters

<code>__l</code>	An <code>initializer_list</code> .
------------------	------------------------------------

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 524 of file `stl_vector.h`.

**4.715.3.6** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector< _Tp, _Alloc >::at ( size_type __n ) [inline]`

Provides access to the data contained in the vector.

## Parameters

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

## Returns

Read/write reference to data.

**Exceptions**

<i>std::out_of_range</i>	If <code>__n</code> is an invalid index.
--------------------------	--

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

Definition at line 810 of file `stl_vector.h`.

**4.715.3.7** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector<_Tp, _Alloc>::at (size_type __n) const [inline]`

Provides access to the data contained in the vector.

**Parameters**

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

**Returns**

Read-only (constant) reference to data.

**Exceptions**

<i>std::out_of_range</i>	If <code>__n</code> is an invalid index.
--------------------------	--

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws `out_of_range` if the check fails.

Definition at line 828 of file `stl_vector.h`.

**4.715.3.8** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector<_Tp, _Alloc>::back ( ) [inline]`

Returns a read/write reference to the data at the last element of the vector.

Definition at line 855 of file `stl_vector.h`.

Referenced by `std::piecewise_constant_distribution<_RealType>::max()`, and `std::piecewise_linear_distribution<_RealType>::max()`.

**4.715.3.9** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector<_Tp, _Alloc>::back ( ) const [inline]`

Returns a read-only (constant) reference to the data at the last element of the vector.

Definition at line 863 of file `stl_vector.h`.

**4.715.3.10** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::begin ( ) [inline], [noexcept]`

Returns a read/write iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 538 of file `stl_vector.h`.

Referenced by `std::vector<_State>::crend()`, `std::vector<_State>::empty()`, `std::vector<_State>::front()`, `__gnu_parallel::multiseq_partition()`, `__gnu_parallel::multiseq_selection()`, `__gnu_parallel::multiway_merge_exact_splitting()`, `std::operator==( )`, `std::vector<_State>::rend()`, and `std::vector<_State>::vector()`.

**4.715.3.11** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector<_Tp, _Alloc>::begin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 547 of file `stl_vector.h`.

**4.715.3.12** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::vector<_Tp, _Alloc>::capacity ( ) const [inline], [noexcept]`

Returns the total number of elements that the vector can hold before needing to allocate more memory.

Definition at line 725 of file `stl_vector.h`.

**4.715.3.13** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector<_Tp, _Alloc>::cbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 611 of file `stl_vector.h`.

**4.715.3.14** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector<_Tp, _Alloc>::cend ( ) const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 620 of file `stl_vector.h`.

**4.715.3.15** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::clear ( ) [inline], [noexcept]`

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1125 of file `stl_vector.h`.

**4.715.3.16** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector<_Tp, _Alloc>::crbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 629 of file `stl_vector.h`.

**4.715.3.17** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector<_Tp, _Alloc>::crend ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 638 of file `stl_vector.h`.

**4.715.3.18** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> _Tp* std::vector<_Tp, _Alloc>::data ( ) [inline], [noexcept]`

Returns a pointer such that `[data(), data() + size())` is a valid range. For a non-empty vector, `data() == &front()`.

Definition at line 878 of file `stl_vector.h`.

**4.715.3.19** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename... _Args> iterator  
std::vector<_Tp, _Alloc>::emplace ( iterator __position, _Args &&... __args )`

Inserts an object in vector before specified iterator.

#### Parameters

<code>__position</code>	An iterator into the vector.
<code>__args</code>	Arguments.

#### Returns

An iterator that points to the inserted data.

This function will insert an object of type `T` constructed with `T(std::forward<Args>(args)...) before the specified location`. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Referenced by `std::vector<_State>::insert()`.

**4.715.3.20** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> bool std::vector<_Tp, _Alloc>::empty ( )  
const [inline], [noexcept]`

Returns true if the vector is empty. (Thus `begin()` would equal `end()`.)

Definition at line 734 of file `stl_vector.h`.

Referenced by `std::piecewise_constant_distribution<_RealType>::densities()`, `std::piecewise_linear_distribution<_RealType>::densities()`, `std::piecewise_constant_distribution<_RealType>::intervals()`, `std::piecewise_linear_distribution<_RealType>::intervals()`, `std::discrete_distribution<_IntType>::max()`, `std::piecewise_constant_distribution<_RealType>::max()`, `std::piecewise_linear_distribution<_RealType>::max()`, `std::piecewise_constant_distribution<_RealType>::min()`, `std::piecewise_linear_distribution<_RealType>::min()`, and `std::discrete_distribution<_IntType>::probabilities()`.

**4.715.3.21** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::end ( )  
[inline], [noexcept]`

Returns a read/write iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 556 of file `stl_vector.h`.

Referenced by `std::vector<_State>::back()`, `std::vector<_State>::cbegin()`, `std::vector<_State>::empty()`, `__gnu_parallel::multiseq_partition()`, `__gnu_parallel::multiseq_selection()`, `__gnu_parallel::multiway_merge_exact_splitting()`, `std::operator==()`, `std::vector<_State>::push_back()`, `std::vector<_State>::rbegin()`, `std::vector<_State>::resize()`, and `std::vector<_State>::vector()`.

**4.715.3.22** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector<_Tp, _Alloc>::end ( )  
const [inline], [noexcept]`

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 565 of file `stl_vector.h`.

4.715.3.23 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc >::erase (`  
`iterator __position )`

Remove element at given position.

**Parameters**

<code>__position</code>	Iterator pointing to element to be erased.
-------------------------	--

**Returns**

An iterator pointing to the next element (or end()).

This function will erase the element at the given position and thus shorten the vector by one.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**4.715.3.24** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::erase (`  
`iterator __first, iterator __last )`

Remove a range of elements.

**Parameters**

<code>__first</code>	Iterator pointing to the first element to be erased.
<code>__last</code>	Iterator pointing to one past the last element to be erased.

**Returns**

An iterator pointing to the element pointed to by `__last` prior to erasing (or end()).

This function will erase the elements in the range `[__first,__last)` and shorten the vector accordingly.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

**4.715.3.25** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector<_Tp, _Alloc>::front ( )`  
`[inline]`

Returns a read/write reference to the data at the first element of the vector.

Definition at line 839 of file `stl_vector.h`.

Referenced by `std::vector<_State>::data()`, `std::piecewise_constant_distribution<_RealType>::min()`, and `std::piecewise_linear_distribution<_RealType>::min()`.

**4.715.3.26** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector<_Tp, _Alloc>::front ( ) const` `[inline]`

Returns a read-only (constant) reference to the data at the first element of the vector.

Definition at line 847 of file `stl_vector.h`.

**4.715.3.27** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector<_Tp, _Alloc>::insert (`  
`iterator __position, const value_type & __x )`

Inserts given value into vector before specified iterator.

## Parameters

<code>__position</code>	An iterator into the vector.
<code>__x</code>	Data to be inserted.

## Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Referenced by `std::vector< _State >::insert()`, and `std::vector< _State >::resize()`.

**4.715.3.28** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector< _Tp, _Alloc >::insert ( iterator __position, value_type && __x ) [inline]`

Inserts given rvalue into vector before specified iterator.

## Parameters

<code>__position</code>	An iterator into the vector.
<code>__x</code>	Data to be inserted.

## Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 988 of file `stl_vector.h`.

**4.715.3.29** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::insert ( iterator __position, initializer_list< value_type > __l ) [inline]`

Inserts an `initializer_list` into the vector.

## Parameters

<code>__position</code>	An iterator into the vector.
<code>__l</code>	An <code>initializer_list</code> .

This function will insert copies of the data in the `initializer_list l` into the vector before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1005 of file `stl_vector.h`.

**4.715.3.30** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::insert ( iterator __position, size_type __n, const value_type & __x ) [inline]`

Inserts a number of copies of given data into the vector.

## Parameters

---

<code>__position</code>	An iterator into the vector.
<code>__n</code>	Number of elements to be inserted.
<code>__x</code>	Data to be inserted.

This function will insert a specified number of copies of the given data before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1023 of file `stl_vector.h`.

```
4.715.3.31  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> template<typename _InputIterator, typename =
std:: _RequireInputIter<_InputIterator>> void std::vector< _Tp, _Alloc >::insert ( iterator __position, _InputIterator
__first, _InputIterator __last ) [inline]
```

Inserts a range into the vector.

Parameters

<code>__position</code>	An iterator into the vector.
<code>__first</code>	An input iterator.
<code>__last</code>	An input iterator.

This function will insert copies of the data in the range `[__first,__last)` into the vector before the location specified by *pos*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using `std::list`.

Definition at line 1044 of file `stl_vector.h`.

```
4.715.3.32  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::vector< _Tp, _Alloc >::max_size (
) const [inline],[noexcept]
```

Returns the `size()` of the largest possible vector.

Definition at line 650 of file `stl_vector.h`.

```
4.715.3.33  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> vector& std::vector< _Tp, _Alloc >::operator= (
const vector< _Tp, _Alloc > & __x )
```

Vector assignment operator.

Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

All the elements of `__x` are copied, but any extra memory in `__x` (for fast expansion) will not be copied. Unlike the copy constructor, the allocator object is not copied.

```
4.715.3.34  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> vector& std::vector< _Tp, _Alloc >::operator= (
vector< _Tp, _Alloc > && __x ) [inline],[noexcept]
```

Vector move assignment operator.

Parameters

<code>__x</code>	A vector of identical element and allocator types.
------------------	--

The contents of `__x` are moved into this vector (without copying, if the allocators permit it). `__x` is a valid, but unspecified vector.

Definition at line 439 of file `stl_vector.h`.

```
4.715.3.35 template<typename _Tp, typename _Alloc = std::allocator<_Tp>> vector& std::vector<_Tp, _Alloc>::operator= (  
    initializer_list< value_type > __l ) [inline]
```

Vector list assignment operator.

**Parameters**

<code>__l</code>	An initializer_list.
------------------	----------------------

This function fills a vector with copies of the elements in the initializer list `__l`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 461 of file `stl_vector.h`.

```
4.715.3.36  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reference std::vector< _Tp, _Alloc >::operator[ ]
            ( size_type __n ) [inline]
```

Subscript access to the data contained in the vector.

**Parameters**

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

**Returns**

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 770 of file `stl_vector.h`.

```
4.715.3.37  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reference std::vector< _Tp, _Alloc
            >::operator[ ]( size_type __n ) const [inline]
```

Subscript access to the data contained in the vector.

**Parameters**

<code>__n</code>	The index of the element for which data should be accessed.
------------------	---

**Returns**

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and `out_of_range` lookups are not defined. (For checked lookups see `at()`.)

Definition at line 785 of file `stl_vector.h`.

```
4.715.3.38  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::pop_back ( )
            [inline]
```

Removes last element.

This is a typical stack operation. It shrinks the vector by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

Definition at line 937 of file `stl_vector.h`.

```
4.715.3.39  template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector< _Tp, _Alloc >::push_back (
            const value_type &__x ) [inline]
```

Add data to the end of the vector.

## Parameters

<code>__x</code>	Data to be added.
------------------	-------------------

This is a typical stack operation. The function creates an element at the end of the vector and assigns the given data to it. Due to the nature of a vector this operation can be done in constant time if the vector has preallocated space available.

Definition at line 901 of file `stl_vector.h`.

Referenced by `__gnu_parallel::multiseq_partition()`, and `__gnu_parallel::multiseq_selection()`.

**4.715.3.40** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::vector<_Tp, _Alloc>::rbegin ( ) [inline], [noexcept]`

Returns a read/write reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 574 of file `stl_vector.h`.

**4.715.3.41** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector<_Tp, _Alloc>::rbegin ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 583 of file `stl_vector.h`.

**4.715.3.42** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> reverse_iterator std::vector<_Tp, _Alloc>::rend ( ) [inline], [noexcept]`

Returns a read/write reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 592 of file `stl_vector.h`.

**4.715.3.43** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_reverse_iterator std::vector<_Tp, _Alloc>::rend ( ) const [inline], [noexcept]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 601 of file `stl_vector.h`.

**4.715.3.44** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::reserve ( size_type __n )`

Attempt to preallocate enough memory for specified number of elements.

## Parameters

<code>__n</code>	Number of elements required.
------------------	------------------------------

## Exceptions

<code>std::length_error</code>	If <code>n</code> exceeds <code>max_size()</code> .
--------------------------------	---

This function attempts to reserve enough memory for the vector to hold the specified number of elements. If the number requested is more than `max_size()`, `length_error` is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the number of elements that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory

and copying of vector data.

**4.715.3.45** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::resize ( size_type __new_size ) [inline]`

Resizes the vector to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the vector should contain.
-------------------------	---

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise default constructed elements are appended.

Definition at line 664 of file `stl_vector.h`.

Referenced by `__gnu_parallel::__shrink_and_double()`, and `__gnu_parallel::multiway_merge_exact_splitting()`.

**4.715.3.46** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::resize ( size_type __new_size, const value_type & __x ) [inline]`

Resizes the vector to the specified number of elements.

Parameters

<code>__new_size</code>	Number of elements the vector should contain.
<code>__x</code>	Data with which new elements should be populated.

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise the vector is extended and new elements are populated with given data.

Definition at line 684 of file `stl_vector.h`.

**4.715.3.47** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::shrink_to_fit ( ) [inline]`

A non-binding request to reduce `capacity()` to `size()`.

Definition at line 716 of file `stl_vector.h`.

**4.715.3.48** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::vector<_Tp, _Alloc>::size ( ) const [inline],[noexcept]`

Returns the number of elements in the vector.

Definition at line 645 of file `stl_vector.h`.

Referenced by `__gnu_parallel::__shrink()`, `__gnu_parallel::__shrink_and_double()`, `std::vector<_State>::_M_range_check()`, `__gnu_parallel::list_partition()`, `std::discrete_distribution<_IntType>::max()`, `std::operator==()`, and `std::vector<_State>::resize()`.

**4.715.3.49** `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::vector<_Tp, _Alloc>::swap ( vector<_Tp, _Alloc> & __x ) [inline],[noexcept]`

Swaps data with another vector.

Parameters

<code>__x</code>	A vector of the same element and allocator types.
------------------	---

This exchanges the elements between two vectors in constant time. (Three pointers, so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(v1,v2)` will feed to this function.

Definition at line 1108 of file `stl_vector.h`.

Referenced by std::swap().

#### 4.716.1 Detailed Description

`template<typename _Alloc> class std::vector< bool, _Alloc >`

A specialization of `vector` for booleans which offers fixed time access to individual elements in any order.

## Template Parameters

<code>_Alloc</code>	Allocator type.
---------------------	-----------------

Note that `vector<bool>` does not actually meet the requirements for being a container. This is because the reference and pointer types are not really references and pointers to `bool`. See DR96 for details.

## See also

`vector` for function documentation.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting ( `[]` ) access is also provided as with C-style arrays.

Definition at line 518 of file `stl_bvector.h`.

The documentation for this class was generated from the following file:

- [stl\\_bvector.h](#)

### 4.718.1 Detailed Description

template<typename \_RealType = double> class std::weibull\_distribution<\_RealType>

A weibull\_distribution random number distribution.

The formula for the normal probability density function is:

$$p(x|\alpha, \beta) = \frac{\alpha}{\beta} \left(\frac{x}{\beta}\right)^{\alpha-1} \exp\left(-\left(\frac{x}{\beta}\right)^{\alpha}\right)$$

Definition at line 4848 of file random.h.

#### 4.718.2 Member Typedef Documentation

##### 4.718.2.1 `template<typename _RealType = double> typedef _RealType std::weibull_distribution< _RealType >::result_type`

The type of the range of the distribution.

Definition at line 4851 of file random.h.

#### 4.718.3 Member Function Documentation

##### 4.718.3.1 `template<typename _RealType = double> _RealType std::weibull_distribution< _RealType >::a ( ) const` [inline]

Return the  $a$  parameter of the distribution.

Definition at line 4906 of file random.h.

##### 4.718.3.2 `template<typename _RealType = double> _RealType std::weibull_distribution< _RealType >::b ( ) const` [inline]

Return the  $b$  parameter of the distribution.

Definition at line 4913 of file random.h.

##### 4.718.3.3 `template<typename _RealType = double> result_type std::weibull_distribution< _RealType >::max ( ) const` [inline]

Returns the least upper bound value of the distribution.

Definition at line 4942 of file random.h.

References `std::max()`.

##### 4.718.3.4 `template<typename _RealType = double> result_type std::weibull_distribution< _RealType >::min ( ) const` [inline]

Returns the greatest lower bound value of the distribution.

Definition at line 4935 of file random.h.

### 5.1.1 Detailed Description

Parallel STL function calls corresponding to the `stl_algo.h` header.

The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

## 5.16.1 Detailed Description

Implementation of a dynamically load-balanced parallel quicksort.

It works in-place and needs only logarithmic extra memory. The algorithm is similar to the one proposed in

P. Tsigas and Y. Zhang. A simple, fast parallel implementation of quicksort and its performance evaluation on SUN enterprise 10000. In 11th Euromicro Conference on Parallel, Distributed and Network-Based Processing, page 372, 2003.

This file is a GNU parallel extension to the Standard C++ Library.

### 5.18.1 Detailed Description

Sequential helper functions. This file is a GNU parallel extension to the Standard C++ Library.

## 5.19 [basic\\_file.h](#) File Reference

### Namespaces

- [std](#)

### 5.19.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ios>`.

## 5.20 [basic\\_ios.h](#) File Reference

### Classes

- class [std::basic\\_ios<\\_CharT, \\_Traits >](#)

### Namespaces

- [std](#)

### Functions

- template<typename \_Facet > const \_Facet & [std::\\_\\_check\\_facet](#) (const \_Facet \*\_\_f)

### 5.20.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ios>`.

## 5.21 `basic_iterator.h` File Reference

### 5.21.1 Detailed Description

Includes the original header files concerned with iterators except for stream iterators. This file is a GNU parallel extension to the Standard C++ Library.

## 5.22 `basic_string.h` File Reference

### Classes

- class `std::basic_string<_CharT, _Traits, _Alloc>`
- struct `std::hash<string>`
- struct `std::hash<u16string>`
- struct `std::hash<u32string>`
- struct `std::hash<wstring>`

### Namespaces

- `std`

### Functions

- template<typename \_CharT, typename \_Traits, typename \_Alloc> `basic_istream<_CharT, _Traits>` & `std::getline` (`basic_istream<_CharT, _Traits>` & \_\_is, `basic_string<_CharT, _Traits, _Alloc>` & \_\_str, `_CharT` \_\_delim)
- template<typename \_CharT, typename \_Traits, typename \_Alloc> `basic_istream<_CharT, _Traits>` & `std::getline` (`basic_istream<_CharT, _Traits>` & \_\_is, `basic_string<_CharT, _Traits, _Alloc>` & \_\_str)
- template<> `basic_istream<char>` & `std::getline` (`basic_istream<char>` & \_\_in, `basic_string<char>` & \_\_str, `char` \_\_delim)
- template<> `basic_istream<wchar_t>` & `std::getline` (`basic_istream<wchar_t>` & \_\_in, `basic_string<wchar_t>` & \_\_str, `wchar_t` \_\_delim)
- template<typename \_CharT, typename \_Traits, typename \_Alloc> `bool` `std::operator!=` (`const basic_string<_CharT, _Traits, _Alloc>` & \_\_lhs, `const basic_string<_CharT, _Traits, _Alloc>` & \_\_rhs)
- template<typename \_CharT, typename \_Traits, typename \_Alloc> `bool` `std::operator!=` (`const _CharT *` \_\_lhs, `const basic_string<_CharT, _Traits, _Alloc>` & \_\_rhs)
- template<typename \_CharT, typename \_Traits, typename \_Alloc> `bool` `std::operator!=` (`const basic_string<_CharT, _Traits, _Alloc>` & \_\_lhs, `const _CharT *` \_\_rhs)
- template<typename \_CharT, typename \_Traits, typename \_Alloc> `basic_string<_CharT, _Traits, _Alloc>` & `std::operator+` (`const basic_string<_CharT, _Traits, _Alloc>` & \_\_lhs, `const basic_string<_CharT, _Traits, _Alloc>` & \_\_rhs)
- template<typename \_CharT, typename \_Traits, typename \_Alloc> `basic_string<_CharT, _Traits, _Alloc>` & `std::operator+` (`const _CharT *` \_\_lhs, `const basic_string<_CharT, _Traits, _Alloc>` & \_\_rhs)
- template<typename \_CharT, typename \_Traits, typename \_Alloc> `basic_string<_CharT, _Traits, _Alloc>` & `std::operator+` (`_CharT` \_\_lhs, `const basic_string<_CharT, _Traits, _Alloc>` & \_\_rhs)
- template<typename \_CharT, typename \_Traits, typename \_Alloc> `basic_string<_CharT, _Traits, _Alloc>` & `std::operator+` (`const basic_string<_CharT, _Traits, _Alloc>` & \_\_lhs, `const _CharT *` \_\_rhs)
- template<typename \_CharT, typename \_Traits, typename \_Alloc> `basic_string<_CharT, _Traits, _Alloc>` & `std::operator+` (`const basic_string<_CharT, _Traits, _Alloc>` & \_\_lhs, `_CharT` \_\_rhs)
- template<typename \_CharT, typename \_Traits, typename \_Alloc> `basic_string<_CharT, _Traits, _Alloc>` & `std::operator+` (`basic_string<_CharT, _Traits, _Alloc>` && \_\_lhs, `const basic_string<_CharT, _Traits, _Alloc>` & \_\_rhs)
- template<typename \_CharT, typename \_Traits, typename \_Alloc> `basic_string<_CharT, _Traits, _Alloc>` & `std::operator+` (`const basic_string<_CharT, _Traits, _Alloc>` & \_\_lhs, `basic_string<_CharT, _Traits, _Alloc>` && \_\_rhs)

### 5.22.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<string>`.

## 5.23 bin\_search\_tree\_.hpp File Reference

### Namespaces

- [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_ASSERT_NODE_CONSISTENT(_Node)`
- `#define PB_DS_BIN_TREE_NAME`
- `#define PB_DS_BIN_TREE_TRAITS_BASE`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_STRUCT_ONLY_ASSERT_VALID(X)`

### 5.23.1 Detailed Description

Contains an implementation class for binary search tree.

## 5.24 binary\_heap\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::binary\\_heap< Value\\_Type, Cmp\\_Fn, \\_Alloc >](#)

### Namespaces

- [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_ASSERT_VALID(X)`
- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_DEBUG_VERIFY(_Cond)`
- `#define PB_DS_ENTRY_CMP_DEC`
- `#define PB_DS_RESIZE_POLICY_DEC`

### 5.24.1 Detailed Description

Contains an implementation class for a binary heap.

## 5.25 binders.h File Reference

### Classes

- class [std::binder1st<\\_Operation>](#)
- class [std::binder2nd<\\_Operation>](#)

### Namespaces

- [std](#)

### Functions

- `template<typename _Operation, typename _Tp> binder1st<_Operation> std::bind1st (const _Operation &__fn, const _Tp &__x)`
- `template<typename _Operation, typename _Tp> binder2nd<_Operation> std::bind2nd (const _Operation &__fn, const _Tp &__x)`

#### 5.25.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<functional>`.

## 5.26 binomial\_heap\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::binomial\\_heap<Value\\_Type, Cmp\\_Fn, \\_Alloc>](#)

### Namespaces

- [\\_\\_gnu\\_pbds](#)

### Macros

- `#define PB_DS_CLASS_C_DEC`
- `#define PB_DS_CLASS_T_DEC`

#### 5.26.1 Detailed Description

Contains an implementation class for a binomial heap.

## 5.27 binomial\_heap\_base\_.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::binomial\\_heap\\_base<Value\\_Type, Cmp\\_Fn, \\_Alloc>](#)

## Namespaces

- [\\_\\_gnu\\_pbds](#)

## Macros

- #define **PB\_DS\_ASSERT\_BASE\_NODE\_CONSISTENT**(\_Node, \_Bool)
- #define **PB\_DS\_ASSERT\_VALID\_COND**(X, \_StrictlyBinomial)
- #define **PB\_DS\_B\_HEAP\_BASE**
- #define **PB\_DS\_CLASS\_C\_DEC**
- #define **PB\_DS\_CLASS\_T\_DEC**

## 5.27.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

## 5.28 bitmap\_allocator.h File Reference

## Classes

- class [\\_\\_gnu\\_cxx::\\_\\_detail::\\_\\_mini\\_vector<\\_Tp>](#)
- class [\\_\\_gnu\\_cxx::\\_\\_detail::\\_\\_Bitmap\\_counter<\\_Tp>](#)
- class [\\_\\_gnu\\_cxx::\\_\\_detail::\\_\\_Ffit\\_finder<\\_Tp>](#)
- class [\\_\\_gnu\\_cxx::bitmap\\_allocator<\\_Tp>](#)
- class [\\_\\_gnu\\_cxx::bitmap\\_allocator<\\_Tp>](#)
- class [\\_\\_gnu\\_cxx::free\\_list](#)

## Namespaces

- [\\_\\_gnu\\_cxx](#)
- [\\_\\_gnu\\_cxx::\\_\\_detail](#)

## Macros

- #define [\\_BALLOC\\_ALIGN\\_BYTES](#)

## Enumerations

- enum { **bits\_per\_byte**, **bits\_per\_block** }

## Functions

- void [\\_\\_gnu\\_cxx::\\_\\_detail::\\_\\_bit\\_allocate](#) (size\_t \* \_\_pmap, size\_t \_\_pos) throw ()
- void [\\_\\_gnu\\_cxx::\\_\\_detail::\\_\\_bit\\_free](#) (size\_t \* \_\_pmap, size\_t \_\_pos) throw ()
- template<typename \_ForwardIterator, typename \_Tp, typename \_Compare> \_ForwardIterator [\\_\\_gnu\\_cxx::\\_\\_detail::\\_\\_lower\\_bound](#) (\_ForwardIterator \_\_first, \_ForwardIterator \_\_last, const \_Tp & \_\_val, \_Compare \_\_comp)
- template<typename \_AddrPair> size\_t [\\_\\_gnu\\_cxx::\\_\\_detail::\\_\\_num\\_bitmaps](#) (\_AddrPair \_\_ap)
- template<typename \_AddrPair> size\_t [\\_\\_gnu\\_cxx::\\_\\_detail::\\_\\_num\\_blocks](#) (\_AddrPair \_\_ap)

- `size_t __gnu_cxx::Bit_scan_forward (size_t __num)`
- `template<typename _Tp1, typename _Tp2> bool __gnu_cxx::operator!= (const bitmap_allocator< _Tp1 > &, const bitmap_allocator< _Tp2 > &) throw ()`
- `template<typename _Tp1, typename _Tp2> bool __gnu_cxx::operator== (const bitmap_allocator< _Tp1 > &, const bitmap_allocator< _Tp2 > &) throw ()`

### 5.28.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

### 5.28.2 Macro Definition Documentation

#### 5.28.2.1 `#define _BALLOC_ALIGN_BYTES`

The constant in the expression below is the alignment required in bytes.

Definition at line 43 of file `bitmap_allocator.h`.

## 5.29 `boost_concept_check.h` File Reference

### Namespaces

- `__gnu_cxx`

### Macros

- `#define _GLIBCXX_CLASS_REQUIRES(_type_var, _ns, _concept)`
- `#define _GLIBCXX_CLASS_REQUIRES2(_type_var1, _type_var2, _ns, _concept)`
- `#define _GLIBCXX_CLASS_REQUIRES3(_type_var1, _type_var2, _type_var3, _ns, _concept)`
- `#define _GLIBCXX_CLASS_REQUIRES4(_type_var1, _type_var2, _type_var3, _type_var4, _ns, _concept)`

- `template<class _Concept> void __gnu_cxx::__function_requires ()`

### 5.29.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iterator>`.

## 5.30 `branch_policy.hpp` File Reference

### Classes

- struct `__gnu_pbds::detail::branch_policy< Node_Cltr, Node_Itr, _Alloc >`
- struct `__gnu_pbds::detail::branch_policy< Node_Cltr, Node_Cltr, _Alloc >`

### Namespaces

- `__gnu_pbds`

#### 5.30.1 Detailed Description

Contains a base class for branch policies.

## 5.31 `c++0x_warning.h` File Reference

#### 5.31.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iosfwd>`.

## 5.32 `c++allocator.h` File Reference

### Namespaces

- `std`

### Typedefs

- `template<typename _Tp> using std::__allocator_base = __gnu_cxx::new_allocator< _Tp >`

#### 5.32.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<memory>`.

## 5.33 `c++config.h` File Reference

### Namespaces

- `std`

## 5.46.1 Detailed Description

Compatibility layer, mostly concerned with atomic operations.

This file is a GNU parallel extension to the Standard C++ Library and contains implementation details for the library's internal use.

## 5.47 compiletime\_settings.h File Reference

## Macros

- `#define _GLIBCXX_ASSERTIONS`
- `#define _GLIBCXX_CALL(__n)`
- `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1`
- `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB`
- `#define _GLIBCXX_SCALE_DOWN_FPU`
- `#define _GLIBCXX_VERBOSE_LEVEL`

## 5.47.1 Detailed Description

Defines on options concerning debugging and performance, at compile-time. This file is a GNU parallel extension to the Standard C++ Library.

## 5.47.2 Macro Definition Documentation

5.47.2.1 `#define _GLIBCXX_ASSERTIONS`

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Should be switched on only locally.

Definition at line 61 of file `compiletime_settings.h`.

Referenced by `__gnu_parallel::__qsb_local_sort_with_helping()`.

5.47.2.2 `#define _GLIBCXX_CALL( __n )`

Macro to produce log message when entering a function.

## Parameters

<code>__n</code>	Input size.
------------------	-------------

## See also

`_GLIBCXX_VERBOSE_LEVEL`

Definition at line 44 of file `compiletime_settings.h`.

Referenced by `__gnu_parallel::__find_template()`, `__gnu_parallel::__for_each_template_random_access_workstealing()`, `__gnu_parallel::__merge_advance()`, `__gnu_parallel::__parallel_nth_element()`, `__gnu_parallel::__parallel_partial_sum()`, `__gnu_parallel::__parallel_partition()`, `__gnu_parallel::__parallel_random_shuffle_drs()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort_qs()`, `__gnu_parallel::__parallel_sort_qsb()`, `__gnu_parallel::__parallel_unique_copy()`, `__gnu_parallel::__search_template()`, `__gnu_parallel::__sequential_multiway_merge()`, `__gnu_parallel::__multiseq_partition()`, `__gnu_parallel::__multiseq_selection()`, `__gnu_parallel::__multiway_merge()`, `__gnu_parallel::__multiway_merge_3_variant()`, `__gnu_parallel::__multiway_merge_4_variant()`, `__gnu_parallel::__multiway_merge`

`_loser_tree()`, `__gnu_parallel::multiway_merge_loser_tree_sentinel()`, `__gnu_parallel::multiway_merge_loser_tree_↵`  
`unguarded()`, `__gnu_parallel::multiway_merge_sentinels()`, `__gnu_parallel::parallel_multiway_merge()`, and `__gnu_↵`  
`parallel::parallel_sort_mwms()`.

#### 5.47.2.3 `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1`

Switch on many `_GLIBCXX_PARALLEL_ASSERTions` in parallel code. Consider the size of the L1 cache for `gnu_↵`  
`parallel::__parallel_random_shuffle()`.

Definition at line 68 of file `comptime_settings.h`.

#### 5.47.2.4 `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB`

Switch on many `_GLIBCXX_PARALLEL_ASSERTions` in parallel code. Consider the size of the TLB for `gnu_parallel_↵`  
`::__parallel_random_shuffle()`.

Definition at line 74 of file `comptime_settings.h`.

#### 5.47.2.5 `#define _GLIBCXX_SCALE_DOWN_FPU`

Use floating-point scaling instead of modulo for mapping random numbers to a range. This can be faster on certain CPUs.

Definition at line 55 of file `comptime_settings.h`.

#### 5.47.2.6 `#define _GLIBCXX_VERBOSE_LEVEL`

Determine verbosity level of the parallel mode. Level 1 prints a message each time a parallel-mode function is entered.

Definition at line 37 of file `comptime_settings.h`.

## 5.48 `complex.h` File Reference

### Macros

- `#define _GLIBCXX_COMPLEX_H`

#### 5.48.1 Detailed Description

This is a Standard C++ Library header.

## 5.49 `concept_check.h` File Reference

### Macros

- `#define __glibcxx_class_requires(_a, _b)`
- `#define __glibcxx_class_requires2(_a, _b, _c)`
- `#define __glibcxx_class_requires3(_a, _b, _c, _d)`
- `#define __glibcxx_class_requires4(_a, _b, _c, _d, _e)`
- `#define __glibcxx_function_requires(...)`

#### 5.49.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iterator>`.

### 5.50 **concurrency.h** File Reference

#### Classes

- class [\\_\\_gnu\\_cxx::\\_\\_scoped\\_lock](#)

#### Namespaces

- [\\_\\_gnu\\_cxx](#)

#### Enumerations

- enum **\_Lock\_policy** { **\_S\_single**, **\_S\_mutex**, **\_S\_atomic** }

#### Functions

- void **\_\_gnu\_cxx::\_\_throw\_concurrency\_lock\_error** ()
- void **\_\_gnu\_cxx::\_\_throw\_concurrency\_unlock\_error** ()

#### Variables

- static const \_Lock\_policy **\_\_gnu\_cxx::\_\_default\_lock\_policy**

#### 5.50.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

### 5.51 **cond\_dealtor.hpp** File Reference

#### Classes

- class [\\_\\_gnu\\_pbds::detail::cond\\_dealtor< Entry, \\_Alloc >](#)

#### Namespaces

- [\\_\\_gnu\\_pbds](#)

#### 5.51.1 Detailed Description

Contains a conditional deallocator.

## 5.52 cond\_key\_dtor\_entry\_dealtor.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::cond\\_dealtor< Entry, \\_Alloc >](#)

### Namespaces

- [\\_\\_gnu\\_pbds](#)

### 5.52.1 Detailed Description

Contains a conditional key destructor, used for exception handling.

## 5.53 const\_iterator.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::binary\\_heap\\_const\\_iterator\\_< Value\\_Type, Entry, Simple, \\_Alloc >](#)

### Namespaces

- [\\_\\_gnu\\_pbds](#)

### Macros

- **#define PB\_DS\_BIN\_HEAP\_CIT\_BASE**

### 5.53.1 Detailed Description

Contains an iterator class returned by the table's const find and insert methods.

## 5.54 const\_iterator.hpp File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::left\\_child\\_next\\_sibling\\_heap\\_const\\_iterator\\_< Node, \\_Alloc >](#)

### Namespaces

- [\\_\\_gnu\\_pbds](#)

### Macros

- **#define PB\_DS\_BASIC\_HEAP\_CIT\_BASE**
- **#define PB\_DS\_CLASS\_C\_DEC**

#### 5.54.1 Detailed Description

Contains an iterator class returned by the table's `const find` and `insert` methods.

### 5.55 `const_iterator.hpp` File Reference

#### Classes

- class `const_iterator_`

#### 5.55.1 Detailed Description

Contains an iterator class used for `const` ranging over the elements of the table.

### 5.56 `constructor_destructor_fn_imps.hpp` File Reference

#### 5.56.1 Detailed Description

Contains implementations of `cc_ht_map_`'s constructors, destructor, and related functions.

### 5.57 `constructor_destructor_fn_imps.hpp` File Reference

#### 5.57.1 Detailed Description

Contains implementations of `gp_ht_map_`'s constructors, destructor, and related functions.

### 5.58 `constructor_destructor_fn_imps.hpp` File Reference

### 5.59 `constructor_destructor_no_store_hash_fn_imps.hpp` File Reference

#### 5.59.1 Detailed Description

Contains implementations of `cc_ht_map_`'s constructors, destructor, and related functions.

### 5.60 `constructor_destructor_no_store_hash_fn_imps.hpp` File Reference

#### 5.60.1 Detailed Description

Contains implementations of `gp_ht_map_`'s constructors, destructor, and related functions.

### 5.61 `constructor_destructor_store_hash_fn_imps.hpp` File Reference

#### 5.61.1 Detailed Description

Contains implementations of `cc_ht_map_`'s constructors, destructor, and related functions.

## 5.62 `constructor_destructor_store_hash_fn_imps.hpp` File Reference

### 5.62.1 Detailed Description

Contains implementations of `gp_ht_map_`'s constructors, destructor, and related functions.

## 5.63 `constructors_destructor_fn_imps.hpp` File Reference

### 5.63.1 Detailed Description

Contains an implementation class for `binary_heap_`.

## 5.64 `constructors_destructor_fn_imps.hpp` File Reference

### 5.64.1 Detailed Description

Contains an implementation for `binomial_heap_`.

## 5.65 `constructors_destructor_fn_imps.hpp` File Reference

### 5.65.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

## 5.66 `constructors_destructor_fn_imps.hpp` File Reference

### 5.66.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

## 5.67 `constructors_destructor_fn_imps.hpp` File Reference

### 5.67.1 Detailed Description

Contains an implementation class for `left_child_next_sibling_heap_`.

## 5.68 `constructors_destructor_fn_imps.hpp` File Reference

### 5.68.1 Detailed Description

Contains an implementation class for `ov_tree_`.

## 5.69 `constructors_destructor_fn_imps.hpp` File Reference

### 5.69.1 Detailed Description

Contains an implementation class for a pairing heap.

## 5.70 constructors\_destructor\_fn\_imps.hpp File Reference

### 5.70.1 Detailed Description

Contains an implementation class for pat\_trie.

## 5.71 constructors\_destructor\_fn\_imps.hpp File Reference

### 5.71.1 Detailed Description

Contains an implementation for rb\_tree\_.

## 5.72 constructors\_destructor\_fn\_imps.hpp File Reference

### 5.72.1 Detailed Description

Contains an implementation for rc\_binomial\_heap\_.

## 5.73 constructors\_destructor\_fn\_imps.hpp File Reference

### 5.73.1 Detailed Description

Contains an implementation class for splay\_tree\_.

## 5.74 constructors\_destructor\_fn\_imps.hpp File Reference

### 5.74.1 Detailed Description

Contains an implementation for thin\_heap\_.

## 5.75 container\_base\_dispatch.hpp File Reference

### 5.80.1 Detailed Description

The header provides an interface to the C++ ABI.

## 5.81 `cxxabi_forced.h` File Reference

### Classes

- class [\\_\\_cxxabiv1::\\_\\_forced\\_unwind](#)

#### 5.81.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<cxxabi.h>`.

## 5.82 `cxxabi_tweaks.h` File Reference

### Macros

- `#define _GLIBCXX_CXA_VEC_CTOR_RETURN(x)`
- `#define _GLIBCXX_GUARD_BIT`
- `#define _GLIBCXX_GUARD_PENDING_BIT`
- `#define _GLIBCXX_GUARD_SET(x)`
- `#define _GLIBCXX_GUARD_TEST(x)`
- `#define _GLIBCXX_GUARD_WAITING_BIT`

### Typedefs

- typedef void `__cxxabiv1::__cxa_cdtor_return_type`
- typedef void `__cxxabiv1::__cxa_vec_ctor_return_type`

### Functions

- `__extension__ typedef int __guard __cxxabiv1::__attribute__ ((mode(__DI__)))`

#### 5.82.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<cxxabi.h>`.

## 5.83 `debug.h` File Reference

### 5.84.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

## 5.85 `debug_fn_imps.hpp` File Reference

### 5.85.1 Detailed Description

Contains an implementation class for a binary\_heap.

## 5.86 debug\_fn\_imps.hpp File Reference

### 5.86.1 Detailed Description

Contains an implementation for binomial\_heap\_.

## 5.87 debug\_fn\_imps.hpp File Reference

### 5.87.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

## 5.88 debug\_fn\_imps.hpp File Reference

### 5.88.1 Detailed Description

Contains an implementation class for bin\_search\_tree\_.

## 5.89 debug\_fn\_imps.hpp File Reference

### 5.89.1 Detailed Description

Contains implementations of cc\_ht\_map\_'s debug-mode functions.

## 5.90 debug\_fn\_imps.hpp File Reference

### 5.90.1 Detailed Description

Contains implementations of gp\_ht\_map\_'s debug-mode functions.

## 5.91 debug\_fn\_imps.hpp File Reference

### 5.91.1 Detailed Description

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

## 5.92 debug\_fn\_imps.hpp File Reference

### 5.92.1 Detailed Description

Contains implementations of cc\_ht\_map\_'s debug-mode functions.

## 5.93 debug\_fn\_imps.hpp File Reference

### 5.93.1 Detailed Description

Contains an implementation class for ov\_tree\_.

### 5.94 `debug_fn_imps.hpp` File Reference

#### 5.94.1 Detailed Description

Contains an implementation class for a pairing heap.

### 5.95 `debug_fn_imps.hpp` File Reference

#### 5.95.1 Detailed Description

Contains an implementation class for `pat_trie_`.

### 5.96 `debug_fn_imps.hpp` File Reference

#### 5.96.1 Detailed Description

Contains an implementation for `rb_tree_`.

### 5.97 `debug_fn_imps.hpp` File Reference

#### 5.97.1 Detailed Description

Contains an implementation for `rc_binomial_heap_`.

### 5.98 `debug_fn_imps.hpp` File Reference

#### 5.98.1 Detailed Description

Contains an implementation class for `splay_tree_`.

### 5.99 `debug_fn_imps.hpp` File Reference

#### 5.99.1 Detailed Description

Contains an implementation for `thin_heap_`.

### 5.100 `debug_map_base.hpp` File Reference

#### 5.100.1 Detailed Description

Contains a debug-mode base for all maps.

### 5.101 `debug_no_store_hash_fn_imps.hpp` File Reference

#### 5.101.1 Detailed Description

Contains implementations of `cc_ht_map_`'s debug-mode functions.

## 5.102 debug\_no\_store\_hash\_fn\_imps.hpp File Reference

### 5.102.1 Detailed Description

Contains implementations of gp\_ht\_map\_'s debug-mode functions.

## 5.103 debug\_store\_hash\_fn\_imps.hpp File Reference

### 5.103.1 Detailed Description

Contains implementations of cc\_ht\_map\_'s debug-mode functions.

## 5.104 debug\_store\_hash\_fn\_imps.hpp File Reference

### 5.104.1 Detailed Description

Contains implementations of gp\_ht\_map\_'s debug-mode functions.

## 5.105 direct\_mask\_range\_hashing\_imp.hpp File Reference

### 5.105.1 Detailed Description

Contains a range-hashing policy implementation

## 5.106 direct\_mod\_range\_hashing\_imp.hpp File Reference

### 5.106.1 Detailed Description

Contains a range-hashing policy implementation

## 5.107 enc\_filebuf.h File Reference

### Classes

- class [\\_\\_gnu\\_cxx::enc\\_filebuf<\\_CharT>](#)

### Namespaces

- [\\_\\_gnu\\_cxx](#)

### 5.107.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

## 5.108 entry\_cmp.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::entry\\_cmp<\\_VTp, Cmp\\_Fn, \\_Alloc, No\\_Throw >](#)
- struct [\\_\\_gnu\\_pbds::detail::entry\\_cmp<\\_VTp, Cmp\\_Fn, \\_Alloc, false >](#)

### Namespaces

- [\\_\\_gnu\\_pbds](#)

#### 5.108.1 Detailed Description

Contains an implementation class for a binary\_heap.

## 5.109 entry\_list\_fn\_imps.hpp File Reference

#### 5.109.1 Detailed Description

Contains implementations of cc\_ht\_map\_'s entry-list related functions.

## 5.110 entry\_metadata\_base.hpp File Reference

### Namespaces

- [\\_\\_gnu\\_pbds](#)

#### 5.110.1 Detailed Description

Contains an implementation for a list update map.

## 5.111 entry\_pred.hpp File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::entry\\_pred<\\_VTp, Pred, \\_Alloc, No\\_Throw >](#)
- struct [\\_\\_gnu\\_pbds::detail::entry\\_pred<\\_VTp, Pred, \\_Alloc, false >](#)
- struct [\\_\\_gnu\\_pbds::detail::entry\\_pred<\\_VTp, Pred, \\_Alloc, true >](#)

### Namespaces

- [\\_\\_gnu\\_pbds](#)

#### 5.111.1 Detailed Description

Contains an implementation class for a binary\_heap.

## 5.112 `eq_by_less.hpp` File Reference

### Classes

- struct [\\_\\_gnu\\_pbds::detail::eq\\_by\\_less](#)< Key, Cmp\_Fn >

### Namespaces

- [\\_\\_gnu\\_pbds](#)

#### 5.112.1 Detailed Description

Contains an equivalence function.

## 5.113 `equally_split.h` File Reference

### Namespaces

- [\\_\\_gnu\\_parallel](#)

### Functions

- template<typename \_DifferenceType , typename \_OutputIterator > \_OutputIterator [\\_\\_gnu\\_parallel::\\_\\_equally\\_split](#) (\_↔ DifferenceType \_\_n, \_ThreadIndex \_\_num\_threads, \_OutputIterator \_\_s)

#### 5.113.1 Detailed Description

This file is a GNU parallel extension to the Standard C++ Library.

## 5.114 `erase_fn_imps.hpp` File Reference

#### 5.114.1 Detailed Description

Contains an implementation class for a binary\_heap.

## 5.115 `erase_fn_imps.hpp` File Reference

#### 5.115.1 Detailed Description

Contains an implementation class for a base of binomial heaps.

## 5.116 `erase_fn_imps.hpp` File Reference

#### 5.116.1 Detailed Description

Contains an implementation class for bin\_search\_tree\_.

### 5.117 `erase_fn_imps.hpp` File Reference

#### 5.117.1 Detailed Description

Contains implementations of `cc_ht_map_`'s erase related functions.

### 5.118 `erase_fn_imps.hpp` File Reference

#### 5.118.1 Detailed Description

Contains implementations of `gp_ht_map_`'s erase related functions.

### 5.119 `erase_fn_imps.hpp` File Reference

#### 5.119.1 Detailed Description

Contains an implementation class for `left_child_next_sibling_heap_`.

### 5.120 `erase_fn_imps.hpp` File Reference

#### 5.120.1 Detailed Description

Contains implementations of `lu_map_`.

### 5.121 `erase_fn_imps.hpp` File Reference

#### 5.121.1 Detailed Description

Contains an implementation class for `ov_tree_`.

### 5.122 `erase_fn_imps.hpp` File Reference

#### 5.122.1 Detailed Description

Contains an implementation class for a pairing heap.

### 5.123 `erase_fn_imps.hpp` File Reference

#### 5.123.1 Detailed Description

Contains an implementation class for `pat_trie`.

### 5.124 `erase_fn_imps.hpp` File Reference

#### 5.124.1 Detailed Description

Contains an implementation for `rb_tree_`.

## 5.125 `erase_fn_imps.hpp` File Reference

### 5.125.1 Detailed Description

Contains an implementation for `rc_binomial_heap_`.

## 5.126 `erase_fn_imps.hpp` File Reference

### 5.126.1 Detailed Description

Contains an implementation class for `splay_tree_`.

## 5.127 `erase_fn_imps.hpp` File Reference

### 5.127.1 Detailed Description

Contains an implementation for `thin_heap_`.

## 5.128 `erase_no_store_hash_fn_imps.hpp` File Reference

### 5.128.1 Detailed Description

Contains implementations of `cc_ht_map_`'s erase related functions, when the hash value is not stored.

## 5.129 `erase_no_store_hash_fn_imps.hpp` File Reference

### 5.129.1 Detailed Description

Contains implementations of `gp_ht_map_`'s erase related functions, when the hash value is not stored.

## 5.130 `erase_store_hash_fn_imps.hpp` File Reference

### 5.130.1 Detailed Description

Contains implementations of `cc_ht_map_`'s erase related functions, when the hash value is stored.

## 5.131 `erase_store_hash_fn_imps.hpp` File Reference

### 5.131.1 Detailed Description

Contains implementations of `gp_ht_map_`'s erase related functions, when the hash value is stored.

#### 5.138.1 Detailed Description

Defines on whether to include algorithm variants.

Less variants reduce executable size and compile time. This file is a GNU parallel extension to the Standard C++ Library.

### 5.138.2 Macro Definition Documentation

#### 5.138.2.1 `#define _GLIBCXX_BAL_QUICKSORT`

Include parallel dynamically load-balanced quicksort.

See also

`__gnu_parallel::_Settings::sort_algorithm`

Definition at line 55 of file features.h.

#### 5.138.2.2 `#define _GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS`

Include the equal-sized blocks variant for `std::find`.

See also

`__gnu_parallel::_Settings::find_algorithm`

Definition at line 67 of file features.h.

#### 5.138.2.3 `#define _GLIBCXX_FIND_EQUAL_SPLIT`

Include the equal splitting variant for `std::find`.

See also

`__gnu_parallel::_Settings::find_algorithm`

Definition at line 74 of file features.h.

#### 5.138.2.4 `#define _GLIBCXX_FIND_GROWING_BLOCKS`

Include the growing blocks variant for `std::find`.

See also

`__gnu_parallel::_Settings::find_algorithm`

Definition at line 61 of file features.h.

#### 5.138.2.5 `#define _GLIBCXX_MERGESORT`

Include parallel multi-way mergesort.

See also

`__gnu_parallel::_Settings::sort_algorithm`

Definition at line 41 of file features.h.

#### 5.138.2.6 `#define _GLIBCXX_QUICKSORT`

Include parallel unbalanced quicksort.

See also

`__gnu_parallel::_Settings::sort_algorithm`

Definition at line 48 of file features.h.

**5.138.2.7 #define \_GLIBCXX\_TREE\_DYNAMIC\_BALANCING**

Include the dynamic balancing variant for `_Rb_tree::insert_unique(_Iter beg, _Iter __end)`.

See also

`__gnu_parallel::_Rb_tree`

Definition at line 91 of file `features.h`.

**5.138.2.8 #define \_GLIBCXX\_TREE\_FULL\_COPY**

In order to sort the input sequence of `_Rb_tree::insert_unique(_Iter beg, _Iter __end)` a full copy of the input elements is done.

See also

`__gnu_parallel::_Rb_tree`

Definition at line 100 of file `features.h`.

**5.138.2.9 #define \_GLIBCXX\_TREE\_INITIAL\_SPLITTING**

Include the initial splitting variant for `_Rb_tree::insert_unique(_Iter beg, _Iter __end)`.

See also

`__gnu_parallel::_Rb_tree`

Definition at line 83 of file `features.h`.

**5.139 fenv.h File Reference****5.139.1 Detailed Description**

This is a Standard C++ Library header.

**5.140 find.h File Reference****Namespaces**

- [\\_\\_gnu\\_parallel](#)

## 5.179 info\_fn\_imps.hpp File Reference

### 5.179.1 Detailed Description

Contains an implementation class for a binary\_heap.

## 5.180 info\_fn\_imps.hpp File Reference

### 5.180.1 Detailed Description

Contains an implementation class for bin\_search\_tree\_.

## 5.181 info\_fn\_imps.hpp File Reference

### 5.181.1 Detailed Description

Contains implementations of cc\_ht\_map\_'s entire container info related functions.

## 5.182 info\_fn\_imps.hpp File Reference

### 5.182.1 Detailed Description

Contains implementations of gp\_ht\_map\_'s entire container info related functions.

## 5.183 info\_fn\_imps.hpp File Reference

### 5.183.1 Detailed Description

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

## 5.184 info\_fn\_imps.hpp File Reference

### 5.184.1 Detailed Description

Contains implementations of lu\_map\_.

## 5.185 info\_fn\_imps.hpp File Reference

### 5.185.1 Detailed Description

Contains an implementation class for ov\_tree\_.

## 5.186 info\_fn\_imps.hpp File Reference

### 5.186.1 Detailed Description

Contains an implementation class for pat\_trie.

**5.187 info\_fn\_imps.hpp File Reference****5.187.1 Detailed Description**

Contains an implementation for rb\_tree\_.

**5.188 info\_fn\_imps.hpp File Reference****5.188.1 Detailed Description**

Contains an implementation.

**5.189 insert\_fn\_imps.hpp File Reference****5.189.1 Detailed Description**

Contains an implementation class for a binary\_heap.

**5.190 insert\_fn\_imps.hpp File Reference****5.190.1 Detailed Description**

Contains an implementation class for a base of binomial heaps.

**5.191 insert\_fn\_imps.hpp File Reference****5.191.1 Detailed Description**

Contains an implementation class for bin\_search\_tree\_.

**5.192 insert\_fn\_imps.hpp File Reference****5.192.1 Detailed Description**

Contains implementations of cc\_ht\_map\_'s insert related functions.

**5.193 insert\_fn\_imps.hpp File Reference****5.193.1 Detailed Description**

Contains implementations of gp\_ht\_map\_'s insert related functions.

**5.194 insert\_fn\_imps.hpp File Reference****5.194.1 Detailed Description**

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

## 5.195 insert\_fn\_imps.hpp File Reference

### 5.195.1 Detailed Description

Contains implementations of lu\_map\_.

## 5.196 insert\_fn\_imps.hpp File Reference

### 5.196.1 Detailed Description

Contains an implementation class for ov\_tree\_.

## 5.197 insert\_fn\_imps.hpp File Reference

### 5.197.1 Detailed Description

Contains an implementation class for a pairing heap.

## 5.198 insert\_fn\_imps.hpp File Reference

### 5.198.1 Detailed Description

Contains an implementation for rb\_tree\_.

## 5.199 insert\_fn\_imps.hpp File Reference

### 5.199.1 Detailed Description

Contains an implementation for rc\_binomial\_heap\_.

## 5.200 insert\_fn\_imps.hpp File Reference

### 5.200.1 Detailed Description

Contains an implementation class for splay\_tree\_.

## 5.201 insert\_fn\_imps.hpp File Reference

### 5.201.1 Detailed Description

Contains an implementation for thin\_heap\_.

## 5.202 insert\_join\_fn\_imps.hpp File Reference

### 5.202.1 Detailed Description

Contains an implementation class for pat\_trie.

### 5.203 `insert_no_store_hash_fn_imps.hpp` File Reference

#### 5.203.1 Detailed Description

Contains implementations of `cc_ht_map_'s` insert related functions, when the hash value is not stored.

### 5.204 `insert_no_store_hash_fn_imps.hpp` File Reference

#### 5.204.1 Detailed Description

Contains implementations of `gp_ht_map_'s` insert related functions, when the hash value is not stored.

### 5.205 `insert_store_hash_fn_imps.hpp` File Reference

#### 5.205.1 Detailed Description

Contains implementations of `cc_ht_map_'s` insert related functions, when the hash value is stored.

### 5.206 `insert_store_hash_fn_imps.hpp` File Reference

#### 5.206.1 Detailed Description

Contains implementations of `gp_ht_map_'s` find related functions, when the hash value is stored.

### 5.230.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

## 5.230.2 Macro Definition Documentation

5.230.2.1 `#define __glibcxx_check_erase( _Position )`

Verify that we can erase the element referenced by the iterator `_Position`. We can erase the element if the `_Position` iterator is dereferenceable and references this sequence.

Definition at line 135 of file `macros.h`.

5.230.2.2 `#define __glibcxx_check_erase_after( _Position )`

Verify that we can erase the element after the iterator `_Position`. We can erase the element if the `_Position` iterator is before a dereferenceable one and references this sequence.

Definition at line 149 of file `macros.h`.

5.230.2.3 `#define __glibcxx_check_erase_range( _First, _Last )`

Verify that we can erase the elements in the iterator range `[_First, _Last)`. We can erase the elements if `[_First, _Last)` is a valid iterator range within this sequence.

Definition at line 163 of file `macros.h`.

5.230.2.4 `#define __glibcxx_check_erase_range_after( _First, _Last )`

Verify that we can erase the elements in the iterator range `[_First, _Last)`. We can erase the elements if `[_First, _Last)` is a valid iterator range within this sequence.

Definition at line 175 of file `macros.h`.

5.230.2.5 `#define __glibcxx_check_heap_pred( _First, _Last, _Pred )`

Verify that the iterator range `[_First, _Last)` is a heap w.r.t. the predicate `_Pred`.

Definition at line 318 of file `macros.h`.

5.230.2.6 `#define __glibcxx_check_insert( _Position )`

Verify that we can insert into `*this` with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular, either dereferenceable or past-the-end, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

Definition at line 73 of file `macros.h`.

5.230.2.7 `#define __glibcxx_check_insert_after( _Position )`

Verify that we can insert into `*this` after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular, either dereferenceable or before-begin, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

Definition at line 90 of file `macros.h`.

5.230.2.8 `#define __glibcxx_check_insert_range( _Position, _First, _Last )`

Verify that we can insert the values in the iterator range `[_First, _Last)` into `*this` with the iterator `_Position`. Insertion into a container at a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

**Todo** We would like to be able to check for noninterference of `_Position` and the range `[_First, _Last)`, but that can't (in general) be done.

Definition at line 110 of file `macros.h`.

5.230.2.9 `#define __glibcxx_check_insert_range_after( _Position, _First, _Last )`

Verify that we can insert the values in the iterator range `[_First, _Last)` into `*this` after the iterator `_Position`. Insertion into a container after a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range `[_First, _Last)` is a valid (possibly empty) range. Note that this macro is only valid when the container is a `_Safe_sequence` and the iterator is a `_Safe_iterator`.

**Todo** We would like to be able to check for noninterference of `_Position` and the range `[_First, _Last)`, but that can't (in general) be done.

Definition at line 127 of file `macros.h`.

5.230.2.10 `#define __glibcxx_check_partitioned_lower( _First, _Last, _Value )`

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value`.

Definition at line 262 of file `macros.h`.

5.230.2.11 `#define __glibcxx_check_partitioned_lower_pred( _First, _Last, _Value, _Pred )`

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

Definition at line 284 of file `macros.h`.

5.230.2.12 `#define __glibcxx_check_partitioned_upper_pred( _First, _Last, _Value, _Pred )`

Verify that the iterator range `[_First, _Last)` is partitioned w.r.t. the value `_Value` and predicate `_Pred`.

Definition at line 297 of file `macros.h`.

5.230.2.13 `#define __glibcxx_check_sorted_pred( _First, _Last, _Pred )`

Verify that the iterator range `[_First, _Last)` is sorted by the predicate `_Pred`.

Definition at line 233 of file `macros.h`.

5.230.2.14 `#define _GLIBCXX_DEBUG_VERIFY_AT( _Condition, _ErrorMessage, _File, _Line )`

Macros used by the implementation to verify certain properties. These macros may only be used directly by the debug wrappers. Note that these are macros (instead of the more obviously *correct* choice of making them functions) because we need line and file information at the call site, to minimize the distance between the user error and where the error is reported.

Definition at line 41 of file `macros.h`.

### 5.244.1 Detailed Description

Functions to find elements of a certain global `__rank` in multiple sorted sequences. Also serves for splitting such sequence sets.

The algorithm description can be found in

P. J. Varman, S. D. Scheufler, B. R. Iyer, and G. R. Ricard. Merging Multiple Lists on Hierarchical-Memory Multiprocessors. *Journal of Parallel and Distributed Computing*, 12(2):171–177, 1991.

This file is a GNU parallel extension to the Standard C++ Library.

### 5.247.1 Detailed Description

Implementation of sequential and parallel multiway merge.

Explanations on the high-speed merging routines in the appendix of

P. Sanders. Fast priority queues for cached memory. ACM Journal of Experimental Algorithmics, 5, 2000.

This file is a GNU parallel extension to the Standard C++ Library.

### 5.247.2 Macro Definition Documentation

#### 5.247.2.1 `#define GLIBCXX_PARALLEL_LENGTH( __s )`

Length of a sequence described by a pair of iterators.

Definition at line 54 of file `multiway_merge.h`.

Referenced by `__gnu_parallel::__sequential_multiway_merge()`, `__gnu_parallel::multiway_merge_exact_splitting()`, `__gnu_parallel::multiway_merge_loser_tree()`, `__gnu_parallel::multiway_merge_sampling_splitting()`, and `__gnu_parallel::parallel_multiway_merge()`.

### 5.260.1 Detailed Description

This file is a GNU parallel extension to the Standard C++ Library.

## 5.261 omp\_loop.h File Reference

### Namespaces

- [\\_\\_gnu\\_parallel](#)

### Functions

- `template<typename _RAIter, typename _Op, typename _Fu, typename _Red, typename _Result > _Op __gnu_parallel::__for↔  
_each_template_random_access_omp_loop (_RAIter __begin, _RAIter __end, _Op __o, _Fu &__f, _Red __r,  
_Result __base, _Result &__output, typename std::iterator_traits< _RAIter >::difference_type __bound)`

#### 5.261.1 Detailed Description

Parallelization of embarrassingly parallel execution by means of an OpenMP for loop. This file is a GNU parallel extension to the Standard C++ Library.

## 5.262 omp\_loop\_static.h File Reference

### Namespaces

- [\\_\\_gnu\\_parallel](#)

### Functions

- `template<typename _RAIter, typename _Op, typename _Fu, typename _Red, typename _Result > _Op __gnu_parallel::__for↔  
_each_template_random_access_omp_loop_static (_RAIter __begin, _RAIter __end, _Op __o, _Fu &__f, _Red  
__r, _Result __base, _Result &__output, typename std::iterator_traits< _RAIter >::difference_type __bound)`

#### 5.262.1 Detailed Description

Parallelization of embarrassingly parallel execution by means of an OpenMP for loop with static scheduling. This file is a GNU parallel extension to the Standard C++ Library.

## 5.263 opt\_random.h File Reference

### Namespaces

- [std](#)

#### 5.263.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<random>`.

## 5.264 `order_statistics_imp.hpp` File Reference

### 5.264.1 Detailed Description

Contains forward declarations for `order_statistics_key`

## 5.265 `order_statistics_imp.hpp` File Reference

### 5.265.1 Detailed Description

Contains forward declarations for `order_statistics_key`

## 5.266 `os_defines.h` File Reference

### Macros

- `#define __NO_CTYPE`

### 5.266.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<iosfwd>`.

## 5.267 `ostream_insert.h` File Reference

### Namespaces

- [std](#)

### Functions

- `template<typename _CharT, typename _Traits> void std::__ostream_fill (basic_ostream< _CharT, _Traits> &__out, streamsize __n)`
- `template<typename _CharT, typename _Traits> basic_ostream< _CharT, _Traits> & std::__ostream_insert (basic_ostream< _CharT, _Traits> &__out, const _CharT *__s, streamsize __n)`
- `template<typename _CharT, typename _Traits> void std::__ostream_write (basic_ostream< _CharT, _Traits> &__out, const _CharT *__s, streamsize __n)`

### 5.267.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ostream>`.

## 5.268 `ov_tree_map.hpp` File Reference

### Classes

- class [\\_\\_gnu\\_pbds::detail::ov\\_tree\\_map< Key, Mapped, Cmp\\_Fn, Node\\_And\\_It\\_Traits, \\_Alloc>](#)

- class [\\_\\_gnu\\_pbds::detail::ov\\_tree\\_map](#)< Key, Mapped, Cmp\_Fn, Node\_And\_It\_Traits, \_Alloc >::cond\_dtor< Size\_Type >

#### Namespaces

- #define **PB\_DS\_CONST\_NODE\_ITERATOR\_NAME**
- #define **PB\_DS\_OV\_TREE\_NAME**
- #define **PB\_DS\_OV\_TREE\_TRAITS\_BASE**

#### 5.268.1 Detailed Description

Contains an implementation class for ov\_tree.

## 5.269 pairing\_heap\_.hpp File Reference

#### Classes

- class [\\_\\_gnu\\_pbds::detail::pairing\\_heap](#)< Value\_Type, Cmp\_Fn, \_Alloc >

#### Namespaces

- [\\_\\_gnu\\_pbds](#)

#### Macros

- #define **PB\_DS\_ASSERT\_NODE\_CONSISTENT**(\_Node, \_Bool)
- #define **PB\_DS\_CLASS\_C\_DEC**
- #define **PB\_DS\_CLASS\_T\_DEC**
- #define **PB\_DS\_P\_HEAP\_BASE**

#### 5.269.1 Detailed Description

Contains an implementation class for a pairing heap.

## 5.270 par\_loop.h File Reference

#### Namespaces

- [\\_\\_gnu\\_parallel](#)

## Functions

- `template<typename _RAIter, typename _Op, typename _Fu, typename _Red, typename _Result > _Op \_\_gnu\_parallel::\_\_for↔  
\_\_each\_template\_random\_access\_ed (_RAIter __begin, _RAIter __end, _Op __o, _Fu &__f, _Red __r, _Result  
__base, _Result &__output, typename std::iterator_traits< _RAIter >::difference_type __bound)`

### 5.270.1 Detailed Description

Parallelization of embarrassingly parallel execution by means of equal splitting. This file is a GNU parallel extension to the Standard C++ Library.

## 5.271 `parallel.h` File Reference

### 5.271.1 Detailed Description

End-user include file. Provides advanced settings and tuning options. This file is a GNU parallel extension to the Standard C++ Library.

## 5.272 `partial_sum.h` File Reference

## Namespaces

- [\\_\\_gnu\\_parallel](#)

## Functions

- `template<typename _Iter, typename _OutputIterator, typename _BinaryOperation > _OutputIterator \_\_gnu\_parallel::\_\_↔  
parallel\_partial\_sum (_Iter __begin, _Iter __end, _OutputIterator __result, _BinaryOperation __bin_op)`
- `template<typename _Iter, typename _OutputIterator, typename _BinaryOperation > _OutputIterator \_\_gnu\_parallel::\_\_↔  
parallel\_partial\_sum\_basecase (_Iter __begin, _Iter __end, _OutputIterator __result, _BinaryOperation __↔  
bin_op, typename std::iterator_traits< _Iter >::value_type __value)`

parallel\_partial\_sum\_linear (_Iter __begin, _Iter __end, _OutputIterator __result, _BinaryOperation __bin_op,  
typename std::iterator_traits< _Iter >::difference_type __n)`

### 5.272.1 Detailed Description

Parallel implementation of `std::partial_sum()`, i.e. prefix sums. This file is a GNU parallel extension to the Standard C++ Library.

## 5.273 `partition.h` File Reference

## Namespaces

- [\\_\\_gnu\\_parallel](#)

## Macros

- `#define \_GLIBCXX\_VOLATILE`

## Functions

- `template<typename _RAIter, typename _Compare> void \_\_gnu\_parallel::\_\_parallel\_nth\_element (_RAIter __begin, _RAIter __nth, _RAIter __end, _Compare __comp)`
- `template<typename _RAIter, typename _Compare> void \_\_gnu\_parallel::\_\_parallel\_partial\_sort (_RAIter __begin, _RAIter __middle, _RAIter __end, _Compare __comp)`
- `template<typename _RAIter, typename _Predicate> std::iterator_traits< _RAIter >::difference_type \_\_gnu\_parallel::\_\_parallel\_partition (_RAIter __begin, _RAIter __end, _Predicate __pred, _ThreadIndex __num_threads)`

## 5.273.1 Detailed Description

Parallel implementation of `std::partition()`, `std::nth_element()`, and `std::partial_sort()`. This file is a GNU parallel extension to the Standard C++ Library.

## 5.273.2 Macro Definition Documentation

5.273.2.1 `#define GLIBCXX_VOLATILE`

Decide whether to declare certain variables volatile.

Definition at line 43 of file `partition.h`.

Referenced by `__gnu_parallel::__parallel_partition()`.

## 5.274 pat\_trie.hpp File Reference

### 5.282.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

#### Author

Bob Walters

Provides reusable `_Pointer_adapter` for assisting in the development of custom pointer types that can be used with the standard containers via the `allocator::pointer` and `allocator::const_pointer` typedefs.

## 5.283 `policy_access_fn_imps.hpp` File Reference

### 5.283.1 Detailed Description

Contains an implementation class for a `binary_heap`.

## 5.284 `policy_access_fn_imps.hpp` File Reference

### 5.284.1 Detailed Description

Contains an implementation class for `bin_search_tree_`.

## 5.285 policy\_access\_fn\_imps.hpp File Reference

### 5.285.1 Detailed Description

Contains implementations of cc\_ht\_map\_'s policy access functions.

## 5.286 policy\_access\_fn\_imps.hpp File Reference

### 5.286.1 Detailed Description

Contains implementations of gp\_ht\_map\_'s policy access functions.

## 5.287 policy\_access\_fn\_imps.hpp File Reference

### 5.287.1 Detailed Description

Contains an implementation class for left\_child\_next\_sibling\_heap\_.

## 5.288 policy\_access\_fn\_imps.hpp File Reference

### 5.288.1 Detailed Description

Contains an implementation class for ov\_tree.

## 5.289 policy\_access\_fn\_imps.hpp File Reference

### 5.289.1 Detailed Description

Contains an implementation class for pat\_trie.

## 5.290 pool\_allocator.h File Reference

### Classes

- class [\\_\\_gnu\\_cxx::\\_\\_pool\\_alloc<\\_Tp>](#)
- class [\\_\\_gnu\\_cxx::\\_\\_pool\\_alloc\\_base](#)

### Namespaces

- [\\_\\_gnu\\_cxx](#)

### Functions

- template<typename \_Tp> bool [\\_\\_gnu\\_cxx::operator!=](#) (const \_\_pool\_alloc<\_Tp> &, const \_\_pool\_alloc<\_Tp> &)
- template<typename \_Tp> bool [\\_\\_gnu\\_cxx::operator==](#) (const \_\_pool\_alloc<\_Tp> &, const \_\_pool\_alloc<\_Tp> &)

### 5.290.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

## 5.291 postypes.h File Reference

### Classes

- class [std::fpos<\\_StateT>](#)

### Namespaces

typename _Container::size_type __n)`

### 5.297.1 Detailed Description

Algorithms used by the profile extension.

This file is needed to avoid including `<algorithm>` or `<bits/stl_algo.h>`. Including those files would result in recursive includes. These implementations are oversimplified. In general, efficiency may be sacrificed to minimize maintenance overhead.

### 5.309.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<memory>`.

## 5.310 `quadratic_probe_fn_imp.hpp` File Reference

### 5.310.1 Detailed Description

Contains a probe policy implementation

## 5.311 `queue.h` File Reference

### Classes

- class [\\_\\_gnu\\_parallel::\\_RestrictedBoundedConcurrentQueue<\\_Tp>](#)

### Namespaces

- [\\_\\_gnu\\_parallel](#)

### Macros

- [#define \\_GLIBCXX\\_VOLATILE](#)

### 5.311.1 Detailed Description

Lock-free double-ended queue. This file is a GNU parallel extension to the Standard C++ Library.

### 5.311.2 Macro Definition Documentation

#### 5.311.2.1 [#define \\_GLIBCXX\\_VOLATILE](#)

Decide whether to declare certain variable volatile in this file.

Definition at line 40 of file `queue.h`.

## 5.312 `quicksort.h` File Reference

### Namespaces

- [\\_\\_gnu\\_parallel](#)

## Functions

- `template<typename _RAIter, typename _Compare> void __gnu_parallel::__parallel_sort_qs (_RAIter __begin, _RAIter __end, _Compare __comp, _ThreadIndex __num_threads)`

- constexpr error\_type [std::regex\\_constants::error\\_space](#) ([\\_S\\_error\\_space](#))
- constexpr error\_type [std::regex\\_constants::error\\_badrepeat](#) ([\\_S\\_error\\_badrepeat](#))
- constexpr error\_type [std::regex\\_constants::error\\_complexity](#) ([\\_S\\_error\\_complexity](#))
- constexpr error\_type [std::regex\\_constants::error\\_stack](#) ([\\_S\\_error\\_stack](#))

#### 5.329.1 Detailed Description

Error and exception objects for the std regex library.

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<regex>`.

### 5.330 regex\_grep\_matcher.h File Reference

#### Classes

- class [std::\\_\\_detail::\\_Grep\\_matcher](#)
- class [std::\\_\\_detail::\\_SpecializedResults<\\_FwdIterT, \\_Alloc>](#)
- class [std::match\\_results<\\_Bi\\_iter, \\_Alloc>](#)
- class [std::sub\\_match<\\_Biter>](#)

#### Namespaces

- [std](#)
- [std::\\_\\_detail](#)

#### Typedefs

- typedef [std::stack<\\_StateIdT, std::vector<\\_StateIdT>>](#) [std::\\_\\_detail::\\_StateStack](#)

#### 5.330.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<regex>`.

## 5.331 `regex_nfa.h` File Reference

### Classes

- class `std::__detail::_Automaton`
- struct `std::__detail::_CharMatcher<_InIterT, _TraitsT>`
- struct `std::__detail::_EndTagger<_FwdIterT, _TraitsT>`
- class `std::__detail::_Nfa`
- struct `std::__detail::_RangeMatcher<_InIterT, _TraitsT>`
- struct `std::__detail::_Results`
- struct `std::__detail::_StartTagger<_FwdIterT, _TraitsT>`
- struct `std::__detail::_State`
- class `std::__detail::_StateSeq`

### Namespaces

- `std`
- `std::__detail`

### Typedefs

- typedef `std::shared_ptr<_Automaton>` `std::__detail::_AutomatonPtr`
- typedef `std::function<bool(const _PatternCursor &)>` `std::__detail::_Matcher`
- typedef `int` `std::__detail::_StateIdT`
- typedef `std::set<_StateIdT>` `std::__detail::_StateSet`
- typedef `std::function<void(const _PatternCursor &, _Results &)>` `std::__detail::_Tagger`

### Enumerations

- enum `std::__detail::_Opcode` { `_S_opcode_unknown`, `_S_opcode_alternative`, `_S_opcode_subexpr_begin`, `_S_opcode_subexpr_end`, `_S_opcode_match`, `_S_opcode_accept` }

### Functions

- bool `std::__detail::_AnyMatcher` (const `_PatternCursor` &)

### Variables

- static const `_StateIdT` `std::__detail::_S_invalid_state_id`

### 5.331.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<regex>`.

## 5.332 `resize_fn_imps.hpp` File Reference

### 5.332.1 Detailed Description

Contains implementations of `cc_ht_map_`'s resize related functions.

### 5.333 `resize_fn_imps.hpp` File Reference

#### 5.333.1 Detailed Description

Contains implementations of `gp_ht_map_`'s resize related functions.

### 5.334 `resize_no_store_hash_fn_imps.hpp` File Reference

#### 5.334.1 Detailed Description

Contains implementations of `cc_ht_map_`'s resize related functions, when the hash value is not stored.

### 5.335 `resize_no_store_hash_fn_imps.hpp` File Reference

#### 5.335.1 Detailed Description

Contains implementations of `gp_ht_map_`'s resize related functions, when the hash value is not stored.

### 5.336 `resize_policy.hpp` File Reference

#### Classes

- class [`\_\_gnu\_pbds::detail::resize\_policy< \_Tp >`](#)

#### Namespaces

- [`\_\_gnu\_pbds`](#)

#### 5.336.1 Detailed Description

Contains an implementation class for a `binary_heap`.

### 5.337 `resize_store_hash_fn_imps.hpp` File Reference

#### 5.337.1 Detailed Description

Contains implementations of `cc_ht_map_`'s resize related functions, when the hash value is stored.

### 5.338 `resize_store_hash_fn_imps.hpp` File Reference

#### 5.338.1 Detailed Description

Contains implementations of `gp_ht_map_`'s resize related functions, when the hash value is stored.

## 5.339 ropeimpl.h File Reference

### Namespaces

- [\\_\\_gnu\\_cxx](#)

### Functions

- `template<class _CharT, class _Traits> void __gnu_cxx::Rope_fill (basic_ostream< _CharT, _Traits> &__o, size_t __n)`
- `template<class _CharT> bool __gnu_cxx::Rope_is_simple (_CharT *)`
- `bool __gnu_cxx::Rope_is_simple (char *)`
- `bool __gnu_cxx::Rope_is_simple (wchar_t *)`
- `template<class _Rope_iterator> void __gnu_cxx::Rope_rotate (_Rope_iterator __first, _Rope_iterator __middle, _Rope_iterator __last)`
- `template<class _CharT, class _Traits, class _Alloc> basic_ostream< _CharT, _Traits> & __gnu_cxx::operator<< (basic_ostream< _CharT, _Traits> &__o, const rope< _CharT, _Alloc> &__r)`
- `void __gnu_cxx::rotate (_Rope_iterator< char, __STL_DEFAULT_ALLOCATOR(char)> __first, _Rope_iterator< char, __STL_DEFAULT_ALLOCATOR(char)> __middle, _Rope_iterator< char, __STL_DEFAULT_ALLOCATOR(char)> __last)`

### 5.339.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<ext/rope>`.

## 5.340 rotate\_fn\_imps.hpp File Reference

### 5.340.1 Detailed Description

Contains imps for rotating nodes.

## 5.341 rotate\_fn\_imps.hpp File Reference

### 5.341.1 Detailed Description

Contains imps for rotating nodes.

## 5.342 safe\_base.h File Reference

### Classes

- class [\\_\\_gnu\\_debug::\\_Safe\\_iterator\\_base](#)
- class [\\_\\_gnu\\_debug::\\_Safe\\_sequence\\_base](#)

### Namespaces

- [\\_\\_gnu\\_debug](#)

## 5.342.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

5.343 `safe_iterator.h` File Reference

## Classes

- struct [\\_\\_gnu\\_debug::\\_BeforeBeginHelper<\\_Sequence>](#)

## 5.363.1 Detailed Description

Runtime settings and tuning parameters, heuristics to decide whether to use parallelized algorithms. This file is a GNU parallel extension to the Standard C++ Library.

## 5.363.2 parallelization\_decision

The decision whether to run an algorithm in parallel.

There are several ways the user can switch on and \_\_off the parallel execution of an algorithm, both at compile- and run-time.

Only sequential execution can be forced at compile-time. This reduces code size and protects code parts that have non-thread-safe side effects.

Ultimately, forcing parallel execution at compile-time makes sense. Often, the sequential algorithm implementation is used as a subroutine, so no reduction in code size can be achieved. Also, the machine the program is run on might have only one processor core, so to avoid overhead, the algorithm is executed sequentially.

To force sequential execution of an algorithm ultimately at compile-time, the user must add the tag `gnu_parallel::sequential_tag()` to the end of the parameter list, e. g.

```
std::sort (__v.begin(), __v.end(), __gnu_parallel::sequential_tag());
```

This is compatible with all overloaded algorithm variants. No additional code will be instantiated, at all. The same holds for most algorithm calls with iterators not providing random access.

If the algorithm call is not forced to be executed sequentially at compile-time, the decision is made at run-time. The global variable `__gnu_parallel::_Settings::algorithm_strategy` is checked. It is a tristate variable corresponding to:

a. `force_sequential`, meaning the sequential algorithm is executed. b. `force_parallel`, meaning the parallel algorithm is executed. c. `heuristic`

For heuristic, the parallel algorithm implementation is called only if the input size is sufficiently large. For most algorithms, the input size is the (combined) length of the input sequence(`__s`). The threshold can be set by the user, individually for each algorithm. The according variables are called `gnu_parallel::_Settings::[algorithm]_minimal_n`.

For some of the algorithms, there are even more tuning options, e. g. the ability to choose from multiple algorithm variants. See below for details.

### 5.363.3 Macro Definition Documentation

#### 5.363.3.1 `#define GLIBCXX_PARALLEL_CONDITION( __c )`

Determine at compile(?) -time if the parallel variant of an algorithm should be called.

##### Parameters

<code>__c</code>	A condition that is convertible to <code>bool</code> that is overruled by <code>__gnu_parallel::_Settings::algorithm_strategy</code> . Usually a decision based on the input size.
------------------	--

Definition at line 95 of file `settings.h`.

### 5.387.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<algorithm>`.

## 5.388 `stl_algobase.h` File Reference

### Classes

- struct [std::char\\_traits<\\_CharT>](#)
- class [std::istreambuf\\_iterator<\\_CharT, \\_Traits>](#)
- class [std::ostreambuf\\_iterator<\\_CharT, \\_Traits>](#)

### Namespaces

- [std](#)

### Macros

- `#define GLIBCXX_MOVE3(_Tp, _Up, _Vp)`
- `#define GLIBCXX_MOVE_BACKWARD3(_Tp, _Up, _Vp)`

### Functions

### 5.391.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<deque>`.

### 5.391.2 Macro Definition Documentation

#### 5.391.2.1 `#define _GLIBCXX_DEQUE_BUF_SIZE`

This function controls the size of memory nodes.

## Parameters

<code>__size</code>	The size of an element.
---------------------	-------------------------

## Returns

The number (not byte size) of elements per node.

This function started off as a compiler kludge from SGI, but seems to be a useful wrapper around a repeated constant expression. The **512** is tunable (and no other code needs to change), but no investigation has been done since inheriting the SGI code. Touch `_GLIBCXX_DEQUE_BUF_SIZE` only if you know what you are doing, however: changing it breaks the binary compatibility!!

Definition at line 85 of file `std_deque.h`.

- `template<class _Tp> bool std::rel_ops::operator> (const _Tp &__x, const _Tp &__y)`
- `template<class _Tp> bool std::rel_ops::operator>= (const _Tp &__x, const _Tp &__y)`

### 5.405.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<utility>`.

Inclusion of this file has been removed from all of the other STL headers for safety reasons, except `std_` utility.h. For more information, see the thread of about twenty messages starting with <http://gcc.gnu.org/ml/libstdc++/2001-01/msg00223.html>, or [http://gcc.gnu.org/onlinedocs/libstdc++/faq.html#faq.ambiguous\\_overloads](http://gcc.gnu.org/onlinedocs/libstdc++/faq.html#faq.ambiguous_overloads)

Short summary: the `rel_ops` operators should be avoided for the present.

### 5.421.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Contains two exception-generating types (`throw_value`, `throw_allocator`) intended to be used as value and allocator types while testing exception safety in templated containers and algorithms. The allocator has additional log and debug features. The exception generated is of type `forced_exception_error`.

## 5.422 `time_members.h` File Reference

Contains an implementation of `trie_policy_base`.

5.441 `trie_string_access_traits_imp.hpp` File Reference

## 5.441.1 Detailed Description

Contains a policy for extracting character positions from a string for a vector-based PATRICIA tree

5.442 `type_traits.h` File Reference

## Namespaces

- [\\_\\_gnu\\_cxx](#)

## Functions

- `template<typename _Type> bool __gnu_cxx::__is_null_pointer (_Type * __ptr)`
- `template<typename _Type> bool __gnu_cxx::__is_null_pointer (_Type)`

## 5.442.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

5.443 `type_utils.hpp` File Reference

## Namespaces

- [\\_\\_gnu\\_pbds](#)

## Macros

- `#define PB_DS_STATIC_ASSERT(UNIQUE, E)`

## Typedefs

- `typedef std::tr1::integral_constant< int, 0 > __gnu_pbds::detail::false_type`
- `typedef std::tr1::integral_constant< int, 1 > __gnu_pbds::detail::true_type`

### 5.443.1 Detailed Description

Contains utilities for handling types. All of these classes are based on Modern C++ by Andrei Alexandrescu.

#### 5.453.1 Detailed Description

This is an internal header file, included by other library headers. Do not attempt to use it directly. Instead, include `<valarray>`.

### 5.459.1 Detailed Description

Parallelization of embarrassingly parallel execution by means of work-stealing.

Work stealing is described in

R. D. Blumofe and C. E. Leiserson. Scheduling multithreaded computations by work stealing. *Journal of the ACM*, 46(5):720–748, 1999.

This file is a GNU parallel extension to the Standard C++ Library.
